CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. Cation exchangers may also be effective.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent or cation exchanger on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

This page may be used for notes.

January 1988

ETHYL ACETATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl acetate is a fairly volatile colorless liquid with a pleasant and fruity odor. It is used as a solvent for lacquers, shellacs, varnishes, dopes, coatings and other products, and has several other uses. It is significantly soluble in water and lighter, so may be expected to form a floating surface slick that dissolves fairly rapidly. Its flash point of 24°F indicates that the product can be easily ignited under a wide range of ambient temperature conditions. Vapors may be somewhat heavier than air and may travel a significant distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.5 pounds per gallon. Ethyl acetate does not react with water or many other common materials and is stable in normal transportation. It is reactive with various chemicals, however, and may attack some plastics, rubber, or coatings. Toxicity is low to moderate by the various potential routes of exposure, but relatively high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 8.7 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 0.902 at 68°F (20°C)
Boiling Point: 171°F (77°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –117°F (–83°C)
Molecular Weight: 88.11
Heat of Combustion: –5616 cal/g
Vapor Pressure: 76 mm Hg (1.47 psia) at 68°F (20°C)
Flash Point: 24°F (–4.4°C), closed cup; 28–55°F (–2.2 to 12.8°C), open cup.
Autoignition Temperature: Min. 752°F (400°C); max. 907°F (486°C); reported values vary
Burning Rate: 3.7 mm/minute
Stability: Stable, but hydrolyzes upon long standing to form acetic acid and ethyl alcohol.
Corrosiveness: May attack some plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with nitrates, strong oxidizers, strong alkalies, and strong acids

IDENTIFICATION

Shipping Names: Ethyl acetate (USDOT and IMO)
Synonyms and Tradenames: Acetic acid, ethyl ester; acetic ether; ethyl ethanoate, acetic ester; vinegar naphtha.
Chemical Formula: $CH_3C0_2CH_2CH_3$
Constituent Components(% each): 85–100% pure with remainder mostly ethyl alcohol (see separate guide)
49 STCC: 49 091 60
UN/NA Designation: UN1173
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pleasant, fruity, sweet
Common Uses: Solvent for lacquers, shellacs, varnishes, dopes, coatings, inks, rubber, resins; mfg. of smokeless powder, artificial leather, photo film, linoleum, plastic wood, dyes, pharmaceuticals, and other products.

ETHYL ACETATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor **Concentration:** 0.0056–70 ppm; reported values vary widely.

Unusual Hazards: Fairly volatile flammable liquid. Vapors may be somewhat heavier than air and may travel to a source of ignition.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 400 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the local spill area and some distance downwind.

Hazards of Skin or Eye Contact: Repeated or prolonged contact of the skin with liquid ethyl acetate may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Contact with the eyes may result in painful but temporary irritation. '

Hazards of Inhalation: Vapors of ethyl acetate may be irritating to the eyes, nose, and throat. High concentrations in air may cause narcosis and central nervous system depression with symptoms including weakness, drowsiness, headache, dizziness, nausea, unconsciousness, and possibly death. Severe acute exposures may result in pulmonary edema with hemorrhage and hyperemia of the respiratory tract.

Hazards of **Ingestion:** Data unavailable. Product is of relatively low oral toxicity in animal experiments.

FIRE HAZARDS

Lower Flammable Limit: 2–2.2%

Upper Flammable Limit: 11–11.5% (one source gives 9%)

Behavior in Fire: Flammable liquid. May generate significant amounts of flammable vapor upon release. Vapors may be heavier than air and may travel a significant distance to a source of ignition and flash back. There is some limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

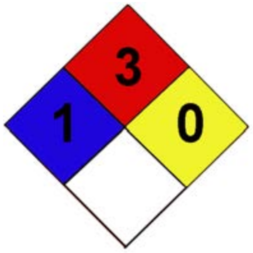
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible substances may include butyl rubber, chlorinated polyethylene, polyurethane, polyvinyl alcohol, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (10,000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1173

ETHYL ACETATE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, or skin; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective but may be used in large amounts to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering servers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl acetate may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the appreciable volatility and flammability of ethyl acetate into account while planning the response. Note that oil spill containment and cleanup methods may be useful in early response stages before ethyl acetate dissolves in water.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl acetate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

MONITOR THE SITUATION . . . Ethyl acetate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of ethyl acetate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb ethyl acetate vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethyl acetate from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of ethyl acetate vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid ethyl acetate may slow the release of vapors into the atmosphere. (Note: All ethyl acetate must be dissolved in water.)

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethyl acetate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ethyl acetate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ETHYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid, with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ETHYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards if the spilled product has had time to hydrolyze to acetic acid and ethyl alcohol.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

ETHYL ACRYLATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl acrylate is a colorless liquid with a sharp acrid slightly nauseating odor that may resemble hot plastic. It is used as the raw material for acrylic resins used in paints, plastic films, adhesives, textiles, and paper. Slightly soluble in water and lighter, it may be expected to form a floating surface slick that slowly dissolves. Its lowest reported flash point of 44°F indicates that it can easily be ignited under a wide range of ambient temperature conditions. Vapors are slightly heavier than air at warm temperatures and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 7.7 pounds per gallon.

Ethyl acrylate does not react with water or many other common materials. Although it is stable in normal transportation when shipped with an inhibitor, exposure to moisture, light, high temperatures, or certain chemicals such as peroxides may initiate self-polymerization in a reaction that may cause violent rupture of its container. The product is generally considered to be moderately toxic by the various routes of exposure. Products of combustion may be toxic and irritating.

Downwind evacuation should be considered if ethyl acrylate is leaking from its container but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 1.5 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, chloroform, and ether.

Specific Gravity (Liquid): 0.923 at 68°F (20°C)

Boiling Point: 211.3°F (99.6°C) at 1 atm.

Melting Point: –98°F (–72°C)

Freezing Point: –98°F (–72°C)

Molecular Weight: 100.12

Heat of Combustion: –6600 cal/g

Vapor Pressure: 29.5 mm Hg (0.570 psia) at 68°F (20°C)

Flash Point: 47°F (8.3°C), closed cup; 44–67°F (6.7–19.4°C), open cup.

Autoignition Temperature: 721°F (382.8°C)

Burning Rate: 4.3 mm/minute

Stability: Stable (stored in presence of air) but may polymerize under conditions described above.

Corrosiveness: Not corrosive to usual materials of construction.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with peroxides, other initiators of polymerization, strong alkalis, atmospheric moisture, oxidizing agents, and oxides.

IDENTIFICATION

Shipping Names: Ethyl acrylate, inhibited (USDOT); ethyl acrylate (IMO).

Synonyms and Tradenames: 2-Propenoic acid, ethyl ester; acrylic acid, ethyl ester; ethyl propenoate; ethyl 2-propenoate.

Chemical Formula: $CH_2{=}CHCOOCH_2CH_3$

Constituent Components (% each): 98.5–99.5% pure with 13–17 ppm methyl ether of hydroquinone as polymerization inhibitor.

49 STCC: 49 072 15

UN/NA Designation: UN1917

IMO Designation: 3.2, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sharp, acrid, slightly nauseating; pungent, like hot plastic.

Common Uses: Raw material for acrylic resins used in paints, plastic films, adhesives, textiles, paper, and denture materials.

ETHYL ACRYLATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Less 1 ppm
Unusual Hazards: Flammable liquid of moderate toxicity. Vapors may be heavier than air. Excessive heat, chemical contamination, light, or moisture may cause self-polymerization resulting in violent container rupture.
Short Term Exposure Limits (STEL): (Skin) 25 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): (Skin) 5 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; light, or moisture in containers; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Ethyl acrylate is moderately toxic by all potential routes of exposure. Major hazard is from inhalation of the high vapor concentrations that may be present in the immediate spill area and directly downwind.
Hazards of Skin or Eye Contact: Prolonged contact of the skin with liquid ethyl acrylate may cause moderate to severe damage involving marked local irritation, redness, edema, thickening, and vascular damage. Skin sensitization may occur and toxic amounts may be absorbed through the skin. Prolonged contact with the eyes may cause severe corneal injury.
Hazards of Inhalation: Vapors of ethyl acrylate are irritating to the eyes and upper respiratory tract and will cause tearing. High concentrations in air may cause shortness of breath, drowsiness, nausea, headache, convulsions, pulmonary edema, and possibly death. Exposure to 2000 ppm for 4 hours was fatal to rats in laboratory experiments.
Hazards of Ingestion: Ingestion may cause severe irritation of the mouth and digestive tract, dizziness, difficult breathing, cyanosis, convulsions, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 1.8%
Upper Flammable Limit: 6.3–12.1%; reported values vary
Behavior in Fire: Flammable liquid. May generate quantities of flammable vapor upon release. Vapor may be heavier than air and may travel to a source of ignition and flash back. Containers may rupture violently in fire.
Hazardous Combustion Products: Considered toxic and irritating, may include unburned ethyl acrylate.

EXPLOSION HAZARDS

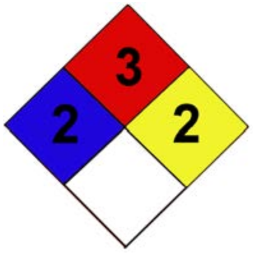
Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat or light may cause spontaneous violent polymerization resulting in violent container rupture. Violent polymerization may also occur in the presence of certain chemical contaminants.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (1000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1917

ETHYL ACRYLATE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if there is skin irritation.

First Aid for **Ingestion:** If victim is conscious, administer two glasses of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting not be induced if immediate medical attention is available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl acrylate may result in damage, rupture, or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment where possible that is not corroded or otherwise damaged by the spilled product. Take the toxic and flammable nature of ethyl acrylate into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl acrylate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl acrylate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain. a small amount (if any) of ethyl acrylate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ETHYL ACRYLATE
Class 3 (Flammable Liquid)

TECHNIQUE '

FOAM . . . There is an unconfirmed possibility that firefighting foam applied to the surface of liquid pools may slow the release of ethyl acrylate vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative techniques if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethyl acrylate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ethyl acrylate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ETHYL ACRYLATE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating ethyl acrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

ETHYL ACRYLATE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with ethyl acrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ETHYL ALCOHOL

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl alcohol is a colorless liquid with a characteristic, sweet, ethereal odor like wine or whiskey. It is essentially fully soluble in water. It is the alcohol present in all alcoholic beverages, but quantities being transported may contain chemical denaturants such as methyl isobutyl ketone, ethyl acetate, methanol, heptane, gasoline, or kerosene that render the product unfit for human consumption. Industry uses ethyl alcohol as a solvent and for making dyes, pharmaceuticals, elastomers, detergents, cosmetics, antifreeze, explosives, chemicals, and a wide variety of other products. The pure alcohol has a flash point of 55°F, but this can vary up or down depending on the type and quantity of denaturant present and whether the alcohol is mixed with water. In most cases, ethyl alcohol or its solutions can be easily ignited under warm ambient temperature conditions. Vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers have some potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.6 pounds per gallon when relatively pure.

Ethyl alcohol does not react with water and many common materials and is stable in normal transportation. It reacts with numerous chemicals, however, and reactions with hydrogen peroxide, bromine pentafluoride, calcium hypochlorite, mercuric nitrate, nitric acid, metal perchlorates, perchloric acid, certain permanganates sodium, potassium, silver nitrate, sodium hydrazide, or similar substances may be explosive. The product is generally considered to be of low toxicity. Products of combustion may include carbon monoxide. (Note: Properties given below mostly for the anhydrous alcohol.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Fully soluble

Solubility in Other Chemicals: Soluble in acetone, benzene, chloroform, ether, methyl alcohol, and most other organic solvents.

Specific Gravity (Liquid): 0.79 at 68°F (20°C)

Boiling Point: 172.9-173.3°F (78.3-78.5°C) at 1 atm.

Melting Point: -169.6 To -179.1°F (-112 to -117.3°C)

Freezing Point: -173.2°F (-114°C)

Molecular Weight: 46.07

Heat of Combustion: -6425 cal/g

Vapor Pressure: 40 mm Hg (0.773 psia) at 66.2°F (19°C)

Flash Point: 55°F (12.8°C), closed cup; 60-64°F (15.6-17.8°C), open cup.

Autoignition Temperature: 685-793°F (353-423°C)

Burning Rate: 3.9 mm/minute

Stability: Stable

Corrosiveness: May react with hot aluminum

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with strong oxidizers, hydrogen peroxide, acetyl chloride, bromine pentafluoride, calcium hypochlorite, chlorine oxides, chromic anhydride, chromyl chloride, mercuric nitrate, silver nitrate, nitric acid, metal perchlorates, perchloric acid, hot aluminum, permanganates treated with sulfuric acid, permanganic acid sodium, potassium, potassium tert-butoxide, and sodium hydrazide.

IDENTIFICATION

Shipping Names: Ethanol or Ethyl alcohol (USDOT and IMO)

Synonyms and Tradenames: Ethanol, ETOH, denatured alcohol, anhydrous ethanol, ethyl hydrate, ethyl hydroxide, fermentation alcohol, methylcarbinol, molasses or potato or grain alcohol; spirits of wine; cologne spirits; Algrain; Anhydrol; Jaysol S; Tescol; Filmcol; Neosol; Padiscol.

Chemical Formula: CH_3CH_2OH

Constituent Components(% each): Anhydrous or various concentrations in water; may contain some amount of denaturant.

UN/NA Designation: UN1170; NA 1986 (USDOT, Denatured alcohol)

IMO Designation: 3.2 or 3.3, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Characteristic; ethereal; like wine or whiskey. Denatured product may be unpleasant.

Common Uses: Used as solvent and for making chemicals, dyes, pharmaceuticals, elastomers, detergents, cleaning preparations, coatings, cosmetics, explosives, antifreeze, beverages, antisepsis, gasohol, plastics, mouthwash, perfumes, inks, paints, lubricants, and other products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYL ALCOHOL

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies widely.

Unusual Hazards: Flammable alcohol of relatively low toxicity. Denatured alcohol is unfit for human consumption.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 1000 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; excessive inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: High concentrations of ethyl alcohol vapors in air may cause eye and nose irritation or symptoms of alcohol intoxication. Special concern must be given to the toxic effects of specific denaturants that may be present in the product.

Hazards of Skin or Eye Contact: Contact of liquid ethyl alcohol with the skin may cause drying and cracking due to the defatting action of the substance. Contact with the eyes may cause irritation and temporary injury.

Hazards of Inhalation: Concentrations of 5000 ppm or more in air may cause transient eye and nose irritation as well as coughing. Very high levels may cause headache, drowsiness, tremors, fatigue, dizziness, and narcosis. Denaturants may produce additional toxic effects.

Hazards of Ingestion: Ingestion of pure ethyl alcohol or its solutions produces the typical effects of alcohol intoxication. Any denaturants present may produce additional toxic effects.

FIRE HAZARDS

Lower Flammable Limit: 3.3%

Upper Flammable Limit: 18.9-19%

Behavior in Fire: Flammable liquid. Vapors may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Carbon monoxide

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire. Contact with various chemicals may result in formation of explosive mixtures. See general information section.

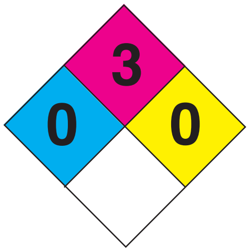
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, polyurethane, Viton, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1170

ETHYL ALCOHOL
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Eye and nose irritation due to vapors; eye irritation or drying of skin due to direct physical contact; symptoms of alcohol intoxication.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious and less than 2 hours have elapsed since ingestion, administer large quantities of water or baking soda solution and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately, particularly if denaturants are present in the alcohol.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog; alcohol foam, carbon dioxide, dry chemical. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Take into account while planning the response that ethyl alcohol is a somewhat volatile flammable liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Ethyl alcohol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the spill is small or in cold weather.

CONSEQUENCE

Hazardous levels of ethyl alcohol in air may be found in the local spill area and some distance downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to ethyl alcohol vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethyl alcohol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ETHYL ALCOHOL

Class 3 (Flammable Liquid)

TECHNIQUE

ALCOHOL FOAM ... Alcohol or AFFF foam applied to the surface of liquid pools may slow the release of ethyl alcohol vapors into the atmosphere.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid ethyl alcohol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Ethyl alcohol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethyl alcohol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

ETHYL ALCOHOL
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the over all volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users. Contaminated water body may require testing to determine when it is safe to use again, particularly with respect to any denaturants present in ethyl alcohol.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

ETHYLAMINE
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Ethylamine anhydrous is a colorless, flammable, and highly volatile gas with an odor resembling ammonia. It is fully soluble in water and will mix freely.

Any spilled liquid will boil or otherwise rapidly vaporize under most ambient temperature conditions, thus potentially generating large amounts of vapor that may be heavier than air, persist for a time in low areas, or travel a considerable distance to source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. The anhydrous liquid weighs approximately 5.7 pounds per gallon; 70% solutions weigh about 6.6 pounds per gallon.

It does not react with water or many other common materials and is stable in normal transportation. It can be corrosive to a variety of metals, however, and may attack many forms of plastics, rubber, and coatings. Additionally, it is reactive with numerous other chemicals, including strong oxidizing agents and strong acids. The substance and its vapors are highly corrosive to bodily tissues and their toxic hazard must be considered high by all possible routes of exposure. Products of combustion are reported to include irritating, corrosive, and/or toxic substances such as ammonia, carbon monoxide, carbon dioxide, very highly toxic oxides of nitrogen, and possibly other harmful substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if ethylamine is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in acetone, dimethyl sulfoxide, ether, ethyl alcohol, and many other organic solvents.

Specific Gravity (Liquid): 0.683 for anhydrous; 0.797 for 70% aqueous solution; both at 68°F (20°C).

Boiling Point: 61.7 - 62.6°F (16.5 - 17°C) for anhydrous; 100 – 107.6°F (37.8 - 42°C) for 70% aqueous solution; both at 1 atm.

Melting Point: -114.2 to - 112°F (- 81.2 to - 80°C) for anhydrous; values for 70% solution vary widely from - 76°F (- 60°C) to less than - 130°F (- 90°C).

Freezing Point: See melting point.

Molecular Weight: 45.08 for ethylamine.

Heat of Combustion: - 8,990 cal/g.

Vapor Pressure: 873 - 912 mm Hg (16.87 - 17.63 psia) at 68°F (20°C); and 1520 mm Hg (29.38 psia) at 96.3°F (35.7°C) for anhydrous. Reported values vary widely for 70% solutions at 68°F (20°C).

Flash Point: At or below 0°F (- 17.8°C), for anhydrous product or 70% aqueous solution.

Autoignition Temperature: 723 - 725°F (384 - 385°C) for anhydrous.

Burning Rate: 5.0 mm/minute for anhydrous.

Stability: Stable.

Corrosiveness: Anhydrous reported as not compatible with aluminum, copper, and silver; will strip and dissolve paint, dissolve most plastics, and cause swelling of rubber. Aluminum, copper, tin, lead, zinc and many of their alloys (such as brass, galvanized metals, etc) are attacked by moist ethylamine; 70% solution is reported as not compatible with aluminum, brass, bronze, copper, galvanized iron, polyethylene, rubber, and zinc. Iron, steel, stainless steel, steel reinforced neoprene lines, and fittings with lead or asbestos composition gaskets are reported compatible with anhydrous. Mild steel, stainless steel, and tinned iron reported suitable for 70% solutions.

Reactivity with Water: No reaction; anhydrous ethylamine dissolves (possibly with some generation of heat) to form a strongly alkaline solution.

Reactivity with Other Chemicals: Contact of ethylamine with cellulose nitrate of high surface area may lead to charring. Contact with mercury may result in an explosion. Violent reactions may occur with strong acids or oxidizers. Chlorine or hypochlorites react in a highly exothermic fashion and may form toxic and explosive chloramines. Contact of the similar diethylamine with nitrites or other nitrosating agents can form potent carcinogens and may explode or form explosive compounds in reactions with dicyanofurazan, dicyanofuroxan or 4-chloroacetophenone. Aliphatic amines such as ethylamine generally evolve heat in reactions with aldehydes, non-oxidizing mineral acids, or organic acids; generate heat and toxic gases in reactions with oxidizing mineral acids, halogenated organics, or organic peroxides or hydroperoxides; evolve heat and flammable gases in reactions with alkali or alkaline earth elemental metals or strong reducing agents; generate heat, toxic gases, and fire in reactions with strong oxidizing agents; generate heat and cause violent polymerization of epoxides or isocyanates; and may possibly react in a hazardous fashion with dithiocarbamates.

IDENTIFICATION

Shipping Names: Ethylamine

Synonyms and Tradenames: Aminoethane; 1-aminoethane; EA; ethanamine; 1-ethanamine; ETN; n-ethylamine; and MEA.

Chemical Formula: $CH_3CH_2NH_2$

Constituent Components (% each): Anhydrous (i.e., water-free) product is generally 98.5% or more pure. Solutions commonly contain 33 - 72% ethylamine by wgt.

UN/NA Designation: UN1036 (anhydrous); UN2270 (aqueous solution).

IMO Designation: 2.1, flammable gas, for anhydrous ethylamine.

Physical State As Shipped: Liquid

Physical State As Released: Liquid, boiling liquid, gas, or mixture of gas and aerosols.

Color of the Shipped Material: Colorless liquid or gas

Odor Characteristics: Sharp, pungent, like ammonia.

Common Uses: Making dyes, pharmaceuticals, synthetic resins, detergents, pesticides, and other chemicals; stabilizer for rubber latex; solvent; plasticizer; curing agent for epoxy resins.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

ETHYLAMINE
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Lowest reported odor threshold is 0.026 ppm. The sense of smell may become fatigued with time such that odor may not remain a reliable warning property.

Unusual Hazards: Highly flammable material, vapors are heavier than air and may travel to a source of ignition and/or persist in low areas.

Short Term Exposure Limit (STEL): *15* ppm for *15* minutes has been proposed by the ACGIH and may be adopted sometime after 1993. (ACGIH, 1992 - 93).

Time Weighted Average (TWA) Limit: *10* ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989). ACGIH has proposed a 5 ppm TWA that may be adopted sometime after 1993.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the extremely high concentrations of ethylamine vapors that may be present in air at the spill site and over considerable downwind distances. Direct contact and ingestion should also be strictly avoided.

Hazards of Shin or Eye Contact: By analogy to similar amines, prolonged or repeated exposure of the eyes to ethylamine vapor concentrations in air too low to cause other effects may possibly cause blue hazy vision and the appearance of halos around lights due to eventual swelling of eye tissues. The eyes usually return to normal the next day in such cases but intense exposures may require several days for recovery and entail discomfort and sensitivity to light. Contact of the eyes with liquid ethylamine, mists, or concentrated vapors may rapidly result in redness, intense pain, corneal opacities, chemical burns, and possibly permanent blindness. Aqueous solutions containing as little as 1% of the similar diethylamine by weight are known to have caused corneal opacities in animal experiments. Brief contact of the skin with liquid ethylamine or its concentrated vapors may cause various degrees of skin irritation, pain, inflammation, and/or burns. Prolonged contact, especially if covered as with wet clothing, may result in blisters, extensive burns, tissue destruction, and/or deep scarring. Prolonged or repeated contact with similar amines is reported capable of resulting in allergic sensitization of the skin. Prolonged or widespread contact may result in the absorption of harmful amounts of ethylamine through the skin. All exposures should be treated on an emergency basis without delay. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Mists or vapors of ethylamine are reported as irritating and corrosive to the eyes, nose, throat, and lungs at levels as low as 50 ppm. More severe exposures are reported to cause headache, inflammation of the nose and throat, sneezing, laryngeal edema, coughing, chest pain, shortness of breath, difficult breathing, faintness, anxiety, bronchitis, nausea, lung injury, liver and/or heart injury, and possibly death. Severe exposures that are initially survived may result in pulmonary edema and chemical pneumonitis that may be delayed in onset and which may have severe consequences. Exposure to 3000 ppm in air for 4 hours was lethal to at least some rats in one laboratory experiment. In another, 2 of 6 rats died after exposure to 8000 ppm for 4 hours. The NIOSH IDLH (1990) for ethylamine vapors is 4000 ppm. Concentrations of ethylamine vapors directly over a pool of the relatively pure liquid are approximately 526,315 ppm at 35.6°F (2°C). At or above its boiling point, the liquid evolves vapors consisting of 100% ethylamine. Concentrations of ethylamine vapors above a 70% solution may range from 427,630 to 592,100 ppm at 68°F (20°C).

Hazards of Ingestion: Ingestion of liquid ethylamine is reported to result in severe burns of the mouth, throat, stomach and digestive tract, possible hemorrhages in the stomach wall, severe abdominal pain, collapse, and possibly death. Single oral dosages of 290 to 560 milligrams of ethylamine per kilogram of body weight are reported as being fatal to 50% of mice and rats in laboratory experiments.

FIRE HAZARDS

Lower Flammable Limit: 3.5%.

Upper Flammable Limit: 13.9 -14%.

Behavior in Fire: Flammable gas. May generate large quantity of flammable and toxic/corrosive vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently and possibly rocket in a fire.

Hazardous Combustion Products: Not well-defined; may include toxic and/or irritating gases and fumes such as ammonia, carbon monoxide, carbon dioxide, very highly toxic oxides of nitrogen, and possibly other harmful substances.

EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently and possibly rocket in a fire. Explosion may occur if vapors or gases are ignited in a confined area. Contact with certain other chemicals may result in an explosion.

1036

ETHYLAMINE
Division 2.1 (Flammable Gas)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product or its solutions. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high gas or vapor concentrations in air. Clothing providing thermal protection may be required where very cold product or equipment may be contacted. Chemically compatible materials may include butyl rubber, Teflon, and nitrile rubber (not as good as other choices). Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: For unknown concentrations, fire fighting, general use, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister (500 ppm or less) or a chemical cartridge respirator with a full facepiece (500 ppm or less) may be adequate within the use limitations of these devices when equipped with canisters or cartridges providing appropriate protection against ethylamine.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, shortness of breath, pain, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If the nose and throat are irritated due to inhalation and the victim is conscious, flush them with water for 15 minutes. If conscious and able to swallow, encourage victim to drink large quantities of 0.5% citric acid solution or lemonade to further treat the throat. Do not administer alcoholic stimulants.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes (a period of 30 - 60 minutes may be more appropriate), occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing. A major maker of the product says not to apply eye pads or pressure since this may cause "gluing" of the eyelids to the eyeball; 2 - 3 drops of a 0.5% pontocaine solution is permitted to relieve pain, after the relief of which the eyes should be flushed with water or a 0.9% sodium chloride solution. The same source suggests rinsing the skin with vinegar or a 1 to 2% acetic acid solution after washing with water. The use of ointments or coverage of the injured area with clothing or a dry dressing is discouraged during the first 24 hour period. Instead, it is reported that the area may be covered with a dressing kept moist with a 0.9% sodium chloride solution. Where and if necessary, thaw any clothing frozen to the skin before its removal.

First Aid for Ingestion: Get medical attention immediately. If conscious, have victim wash out mouth with water (which should not be swallowed). If medical attention is not immediately available and victim is conscious, administer large quantities of water. Do not attempt to make the victim vomit. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs and repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol foam, water spray. Water may be ineffective but application of large quantities may dilute spills to nonflammable mixtures.

Extinguishing Techniques: Unusual corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk at high ambient temperature. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire. Note that ethylamine cylinders do not have safety pressure relief devices so extra precautions are needed to prevent cylinder explosions due to overexposure to heat or fire. A major maker of ethylamine recommends that water not be applied to leak areas.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent

ETHYLAMINE
Division 2.1 (Flammable Gas)

SPILL RESPONSES (CONTINUED)

substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use. Take the corrosiveness, high flammability, high volatility, and toxic characteristics of ethylamine into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Ethylamine discharges may expose downwind areas to toxic and flammable concentrations over very considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethylamine vapors or aerosols may absorb vapors, knockdown aerosols, and/or accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethylamine from contact with its vapors or aerosols.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of ethylamine vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam application until spilled liquid is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid ethylamine and its solutions may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Neutralize and/or remove liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Neutralize and/or remove liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ETHYLAMINE
Division 2.1 (Flammable Gas)

LAND SPILL *(CONTINUED)*

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Any remaining ethylamine on the ground will vaporize fairly quickly at most temperatures.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Due to its relatively low boiling point, high pressures may develop very rapidly in recovery equipment at moderate to high ambient temperatures if anhydrous ethylamine is being recovered.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as carbon dioxide or nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates when equipment temperatures exceed the boiling point of the liquid to be recovered. Consult qualified experts as necessary for assistance.

TECHNIQUE

ABSORPTION . . . Where ambient temperature conditions permit and/or require, spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe and appropriate storage containers by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Where necessary, contaminated soil and/or product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors *present in* the area may be ignited by motorized equipment.

MITIGATION

Decontaminate all equipment after use as necessary, keeping the volatility of ethylamine in mind. Use equipment compatible with spilled product. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Any spilled ethylamine will quickly dissolve in water and form a strongly alkaline solution. Be advised that potentially toxic and flammable vapors may evolve from the water surface for a time and travel in the downwind direction as the contaminated water moves downstream.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ETHYLAMINE
Division 2.1 (Flammable Gas)

WATER SPILL *(CONTINUED)*

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Cation exchangers may be effective for use on sufficiently diluted neutral or acidic solutions.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance-in obtaining and deploying necessary equipment. Apply alternative techniques where sir emissions may pose a downwind hazard.

January 1990

ETHYL BENZENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl benzene is a clear, colorless liquid hydrocarbon of relatively low volatility and with an aromatic, pungent, and sweet odor resembling gasoline. It is used for making styrene, synthetic rubber, and other chemical substances and as a component of paint, agricultural sprays, gasoline, and asphalt. Practically insoluble in water and lighter, ethyl benzene will form a floating surface slick. Its flash point of 59°F indicates that the product is easily ignited under many ambient temperature conditions. Vapors may be slightly heavier than air in hot weather and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.2 pounds per gallon.

Ethyl benzene does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials, however, and may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low to moderate. Products of combustion may include toxic constituents.

If ethyl benzene is leaking (not on fire), downwind evacuation should be considered on a case by case basis until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.015 to 0.020 g/100 g water (150–200 ppm) in range of 68–86°F (20–25°C).

Solubility in Other Chemicals: Soluble in alcohol, benzene, ether, and carbon tetrachloride.

Specific Gravity (Liquid): 0.867 at 68°F (20°C)

Boiling Point: 277.2°F (136.2°C) at 1 atm.

Melting Point: –139°F (–95°C)

Freezing Point: See melting point

Molecular Weight: 106.17

Heat of Combustion: –9877 cal/g

Vapor Pressure: 7 mm Hg (0.1353 psia) at 68°F (20°C)

Flash Point: 59°F (15°G`), closed cup; 80°F (26.7°C), open *cup*

Autoignition Temperature: 810°F (432°C)

Burning Rate: 5.8 mm/minute

Stability: Stable

Corrosiveness: Specific data unavailable; not expected to be corrosive to common metals in short-term service; may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react or ignite in contact with strong oxidizing agents.

IDENTIFICATION

Shipping Names: Ethyl benzene (USDOT); ethylbenzene (IMO)

Synonyms and Tradenames: Ethyl benzol; phenylethane; EB

Chemical Formula: $C_6H_5\text{-}CH_2CH_3$

Constituent Components (% each): Various grades of 99% or more purity with remainder consisting of other hydrocarbons, including traces of toluene, xylenes, cumene, and diethylbenzene.

49 STCC: 49 091 63

UN/NA Designation: UN1175

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sweet; like gasoline; aromatic;. pungent

Common Uses: Mfg. styrene, cellulose acetate, synthetic rubber, and other chemicals; component or solvent in paint, agricultural sprays, gasoline, and asphalt.

ETHYL BENZENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

***Threshold Odor* Concentration:** 0.25–2.3 ppm in air; reported values vary.
Unusual Hazards: Flammable liquid of relatively low volatility that may evolve slightly heavier than air vapors at higher ambient temperatures.
Short Term Exposure Limits (STEL): 125 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 100 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct-physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the vapor concentrations that may be present in the immediate spill area and over some distances downwind. Ingestion and direct physical contact are also to be avoided.
Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid ethyl benzene may result in drying and cracking of the skin due to the defatting action of the product and also cause moderate redness, swelling, blistering, and chapping. Some small amounts may be absorbed through the skin. Contact of liquid ethyl benzene with the eyes may cause slight irritation and possibly slight (and reversible) corneal injury. Do not wear contact lenses when working with ethyl benzene.
Hazards of Inhalation: Exposure to ethyl benzene vapors in air may cause irritation of the eyes, nose, throat, and respiratory tract that is strong at 1000 ppm in air and intolerable at 2000 ppm. Inhalation of higher concentrations in air may cause narcosis and central nervous system depression with symptoms including weakness, dizziness, drowsiness, headache, cramps, sense of chest constriction, incoordination, unconsciousness, tremors, and possibly death due to respiratory system paralysis in severe cases. Exposure to 4000 ppm for four hours was lethal to 50% of rats, while 9150 ppm was lethal to mice after two hours in laboratory experiments. Guinea pigs who died when exposed to 5000 to 10,000 ppm for eight hours were found to have lung edema and congestion, intense cerebral congestion, and cyanotic blood. (Note: The saturated vapor concentration of ethyl benzene in air is about 9210 ppm at 68°F and 15,790 ppm at 86°F. Vapors will be diluted with air fairly rapidly as they move away from the spill site.)
***Hazards of* Ingestion:** Ethyl benzene is of relatively low oral toxicity. Symptoms of ingesting significant amounts resemble those of inhalation but also include gastrointestinal irritation. Aspiration into the lungs during vomiting, as is the case with many other hydrocarbons, may cause pulmonary edema, chemical pneumonia, lung hemorrhage, and respiratory paralysis with possibly severe consequences. Some effects may be delayed in onset.

FIRE HAZARDS

Lower Flammable Limit: 1.0%
Upper Flammable Limit: 6.7–6.8% according to most; one source gives 5.3%
Behavior in Fire: Flammable liquid. May generate flammable vapors upon release. Vapors may be somewhat heavier than air when the spilled liquid is warm or hot and may travel some distance to a source of ignition and flash back. Containers have some limited potential to rupture violently in fires.
Hazardous Combustion Products: Not well-defined; said to be acrid and irritating and to contain carbon monoxide and carbon dioxide. Likely to contain various hydrocarbons that may be toxic.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. There is a limited potential that containers may rupture violently in fire.

1175

ETHYL BENZENE
Class 3 (Flammable Liquid)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include Viton/nitrile rubber and Teflon according to one noted authority. Another source reports that polypropylene, Viton, neoprene, and Teflon are resistant materials.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (2000 ppm or less) or a chemical cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, respiratory tract or skin; symptoms of narcosis and central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, Halon, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl benzene may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that ethyl benzene is a flammable liquid.

ETHYL BENZENE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl benzene spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm or hot weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Ethyl benzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cool or cold weather.

CONSEQUENCE

Hazardous levels of ethyl benzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl benzene vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of ethyl benzene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of ethyl benzene vapors into the atmosphere.

CONSEQUENCE ,

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethyl benzene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethyl benzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ETHYL BENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, vermiculite, fly ash, cement powder, perlite, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Even very low concentrations of ethyl benzene in water can be harmful to aquatic life.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

ETHYL BENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating ethyl benzene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with ethyl benzene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ETHYL CHLORIDE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Ethyl chloride is a clear colorless highly volatile liquid that boils at the relatively low temperature of 54°F and has a pungent odor resembling ether. It is used as an anesthetic, solvent, refrigerant, insecticide, and feedstock for making various other chemicals and products. It is slightly soluble in water and lighter, so may be expected to form a floating surface slick that boils in warm weather or otherwise evaporates rapidly while slowly dissolving in water. Its lowest reported flash point of -45°F indicates that it may be easily ignited under all ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions, if ignited, and there is also some known potential for explosions involving unconfined vapor clouds. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.5 pounds per gallons.

Ethyl chloride does not react with water or many other common materials and is stable in normal transportation. It is reactive with various chemicals, however, and may attack some forms of plastics, rubber, and coatings. It is of low to moderate toxicity by the various routes of exposure but may be present in air in high concentrations. Products of combustion may include toxic gases such as hydrogen chloride, phosgene, and carbon monoxide.

Downwind evacuation should be considered if ethyl chloride is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.57 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol and ether.

Specific Gravity (Liquid): 0.904 at 59°F (15°C)

Boiling Point: 54°F (12.2°C) at 1 atm.

Melting Point: -217.7°F (-138.7°C)

Freezing Point: -217.7°F (-138.7°C)

Molecular Weight: 64.52

Heat of Combustion: -4500 cal/g

Vapor Pressure: 1.4 atm (20.6 psia) at 68°F (20°C)

Flash Point: -58°F (-50°C), closed cup; -45°F (-42.8°C), open cup.

Autoignition Temperature: 966°F (518.9°C)

Burning Rate: 3.8 mm/minute

Stability: Stable but may hydrolyze slowly in water.

Corrosiveness: May attack some forms of plastics, rubber, and coatings; may react with powdered aluminum, zinc, and magnesium.

Reactivity with Water: No reaction normally. May react with very hot water or steam to produce toxic fumes.

Reactivity with Other Chemicals: Reacts with oxidizing materials and chemically active metals like sodium, potassium, calcium, powdered aluminum, zinc, and magnesium.

IDENTIFICATION

Shipping Names: Ethyl chloride (USDOT and IMO)

Synonyms and Tradenames: Chloroethane; monochloroethane; hydrochloric ether; muriatic ether; monochlorethane; aethylis; aethylis chloridum; anodynon; chelen; chlorene; chlorethyl; chloridum; chloryl; chloryl anesthetic; cloretilo; dublofix; ether chloratus; kelene; nar cotile.

Chemical Formula: C_2H_5Cl

Constituent Components(% each): 98-100% pure

UN/NA Designation: UN1037

IMO Designation: 2.1, flammable gas

Physical State as Shipped: Liquid

Physical State as Released: Liquid (boils at 54°F)

Color of the Shipped Material: Colorless

Odor Characteristics: Sweet, pungent, like ether

Common Uses: Anesthetic; solvent; refrigerant; insecticide; aerosol propellant; mfg. of dye, drugs, perfumes, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYL CHLORIDE
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Extremely volatile flammable liquid with heavier than air vapors. May boil at 54°F and above. Vapors may persist in pits, hollows, and depressions.

Short Term Exposure Limits(STEL): 1250 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 1000 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air. Direct contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with liquid ethyl chloride may result in frostbite due to rapid evaporation of the product, and some amount of liquid may be absorbed through the skin. Contact with the eyes or skin may also cause mild irritation.

Hazards of Inhalation: Ethyl chloride vapors are narcotic and cause central nervous system depression at high concentrations. Symptoms include dizziness, eye irritation, abdominal cramps, talkativeness, incoordination, inebriation, headache, and eventual loss of consciousness with possible injury to the lungs, liver, and kidneys. Sudden deaths have occurred, probably due to respiratory or cardiac arrest. A concentration of 13,000 ppm causes slight symptoms of inebriation in 12 minutes.

Hazards of Ingestion: Ingestion of ethyl chloride is considered unlikely but symptoms may include those described above.

FIRE HAZARDS

Lower Flammable Limit: 3.6-3.8%

Upper Flammable Limit: 12-15.4%

Behavior in Fire: Flammable liquid. Will generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. There is a known potential for unconfined vapor clouds to explode if ignited.

Hazardous Combustion Products: May include toxic hydrogen chloride, phosgene, and carbon monoxide gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

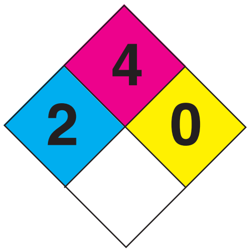
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1037

ETHYL CHLORIDE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Frostbite, eye or skin irritation; symptoms of central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation is present after washing. Do not use hot water for flushing.

First Aid for Ingestion: If victim is conscious, induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Stop flow if possible or let large fires burn while cooling surroundings.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl chloride may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile and flammable nature of ethyl chloride into account when planning the response. Note that accumulations of heavy gas may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl chloride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYL CHLORIDE

Division 2.1 (Flammable Gas)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to ethyl chloride vapors or fumes may accelerate their dispersal in the atmosphere. If water is warm, apply it at a point downwind and do not allow it to contact liquid ethyl chloride as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of ethyl chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM ... Firefighting foam applied to the surface of liquid pools may slow the release of ethyl chloride vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Ethyl chloride may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethyl chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

ETHYL CHLORIDE
Division 2.1 (Flammable Gas)

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: Floating ethyl chloride will rapidly evaporate from the water surface under most conditions. Oil spill containment and cleanup methods may be necessary and useful in cold weather.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ETHYL CHLORIDE

Division 2.1 (Flammable Gas)

TECHNIQUE

ADSORPTION ... Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ETHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Ethyl chloroformate is a colorless to light yellow flammable liquid with an irritating, pungent, and sharp odor resembling hydrochloric (muriatic) acid. It is used for making pharmaceuticals, herbicides, plastics, and a variety of other chemical products. The substance is slightly heavier than water, slightly soluble, and slowly reactive, so may be expected to sink slowly while simultaneously reacting to form ethyl alcohol and hydrochloric acid. Its flash point indicates it may be easily ignited under a wide range of ambient temperature conditions. Vapors may travel some distance to a source of ignition and flash back, particularly at warmer temperatures. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 9.5 pounds per gallon.

Ethyl chloroformate is relatively stable in normal transportation except for a tendency to decompose slowly to hydrogen chloride and ethyl alcohol. It is reactive with a variety of other chemicals, certain types of metals and rubber, and certain metallic rusts and salts. Any hydrochloric acid formed will be corrosive to most metals and may cause evolution of flammable and potentially explosive hydrogen gas during the corrosion process. The corrosivity of ethyl chloroformate itself to bodily tissues is high and requires that all contact with the product be strictly avoided. Products of combustion are both toxic and corrosive and may include chlorine, phosgene, hydrochloric acid, chloroformate fumes, and carbon monoxide.

If ethyl chloroformate is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL PHYSICAL DATA

Solubility in Water: Practically insoluble; reacts slowly (see below).

Solubility in Other Chemicals: Soluble in benzene, chloroform, and ether.

Specific Gravity (Liquid): 1.135 – 1.139 at 68°F (20°C)

Boiling Point: 199.4 – 203°F (93 – 95°C) at 1 atm.

Melting Point: –113.1°F (– 80.6°C)

Freezing Point: See melting point

Molecular Weight: 108.5

Heat of Combustion: – 3800 cal/g (est.)

Vapor Pressure: 32 or 53 mm Hg at 68°F (20°C); reported values vary.

Flash Point: Most give 61°F (16.1°C), closed cup; 82°F (27.8°C), open cup. Some say 36°F (2.2°C).

Autoignition Temperature: 932°F (500°C)

Burning Rate: 2.6 mm minute

Stability: Stable in normal transportation except for possible slow decomposition to hydrogen chloride and ethyl alcohol.

Corrosiveness: Any hydrochloric acid formed will be corrosive to most metals, particularly iron and aluminum, with evolution of hydrogen gas. Best handled in glass, lead, porcelain, tantalum, high density polyethylene, furans, polypropylene, or teflon. Related products are known to attack certain types of rubber.

Reactivity with Water: Reacts slowly to produce flammable ethyl alcohol and corrosive hydrochloric acid (also known as muriatic acid) or hydrogen chloride while generating heat.

Reactivity with Other Chemicals: Incompatible with oxidizing agents, alkali or caustics, acids, alcohols, amines, certain types of rubber, certain metals, and rust. Iron, zinc, and aluminum salts may catalyze decomposition, possibly explosively.

IDENTIFICATION

Shipping Names: Ethyl chloroformate (USDOT and IMO)

Synonyms and Tradenames: Chloroformic acid, ethyl ester; ethyl chlorocarbonate; carbonochloridic acid, ethyl ester.

Chemical Formula: $ClCOOCH_2CH_3$

Constituent Components (% each): 94% or more pure; remainder may include small amounts of hydrochloric acid, ethyl alcohol, and diethyl carbonate.

UN/NA Designation: UN1182

IMO Designation: 6.1 Poisonous Substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless to light yellow

Odor Characteristics: Irritating; sharp; like muriatic acid; pungent

Common Uses: Making of flotation agents, isocyanates, pharmaceuticals, herbicides, plastics, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ETHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly flammable and corrosive liquid. Reacts with water to form ethyl alcohol and hydrogen chloride or hydrochloric acid.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the relatively high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Ethyl chloroformate is considered to be corrosive and destructive to living tissue. Contact with the skin or eyes may cause severe acid-type burns. Vapors of the product are irritating to the eyes and cause tears at low concentrations in air.

Hazards of Inhalation: Vapors of ethyl chloroformate are highly irritating to the respiratory tract. Inhalation may cause burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting, choking, chest pain, edema of the larynx and bronchi, chemical pneumonitis, pulmonary edema (which may be delayed in onset), and possibly death. Exposure to 145 ppm in air for one hour was fatal to 50% of rats in laboratory experiments. A level of 510 ppm was the lowest concentration causing fatalities in mice within 10 minutes.

Hazards of Ingestion: Moderately toxic when ingested and may cause severe burns of the mouth, throat, and stomach leading to death. Similar materials cause stomach pain, nausea, vomiting, and esophageal or gastric necrosis.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquid. Vapors may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire due to overheating and or product decomposition. Will generate large quantities of flammable and corrosive gas or vapor upon release.

Hazardous Combustion Products: Toxic and corrosive; may include chlorine, phosgene, carbon monoxide, hydrochloric acid, and chloroformate fumes.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Note that some chloroformates may explode due to pressure or catalysis.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with ethyl chloroformate. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1182

ETHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

FIRST AID

Nonspecifc Symptoms: Irritation or burns of any bodily tissues; choking, coughing, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, halon, foam. Note that ethyl chloroformate may react with water. Water or foam should be applied with caution at first.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the corrosive, flammable, reactive, and volatile nature of the product into account when planning the response. Note that sealed containers may contain some pressure due to product decomposition.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl chloroformate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities of fumes and vapors are being generated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl chloroformate vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain ethyl chloroformate, hydrochloric acid, and ethyl alcohol from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of hazardous vapors or fumes into the atmosphere. (Note: Since foam is recommended for firefighting, it may also be beneficial for this purpose. Due to the potential reactivity of the product, apply foam with caution at first. Be advised that various authorities disagree on whether alcohol or regular foam should be used.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to contained liquid ethyl chloroformate may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid ethyl chloroformate and its products of reaction with water may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ETHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

TECNNIQUE

PUMPING /VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of liquids may be controlled by absorbing liquid with dry sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ETHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

ETHYLENE
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Ethylene is a colorless gas shipped as a compressed or liquefied gas and having a faint, slightly sweet, ethereal odor. It is used for welding and cutting metal, ripening fruits and vegetables, as an anesthetic, and for making plastics and organic chemicals. It is practically insoluble in water. With a flash point of about – 213°F and a boiling point of –154.7°F, large amounts of flammable gas will be evolved from spills. The cold gas evolved will initially be heavier than air and may travel very considerable distances to a source of ignition and flash back. Accumulations of gas in confined spaces such as buildings or sewers may result in explosions if ignited, and there is also some known potential for explosions involving unconfined vapor clouds. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 4.7 pounds per gallon at its boiling point.

Ethylene does not react with water or many common materials and is stable in normal transportation. It is, however, reactive with a variety of other chemicals. The gas is not significantly toxic by inhalation, but high concentrations may be anesthetic or may cause asphyxiation via displacement of air. Liquid ethylene and concentrated cold gas also pose a frostbite hazard. Products of combustion may include toxic constituents such as carbon monoxide.

If bulk container is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius one half (½) mile. If cylinder is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of one third (⅓) mile.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble.
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.569 at –154.7°F (–103.8°C)
Boiling Point: –154.7°F (–103.7°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: – 272.4°F (–169.1°C)
Molecular Weight: 28.05
Heat of Combustion: –11272 cal/g
Vapor Pressure: 40 atm (587.6 psia) at 29.3°F (–1.5°C)
Flash Point: –213°F (–136°C), closed cup (approx.)
Autoignition Temperature: 842°F (450°C)
Burning Rate: 7.4 mm/minute
Stability: Stable
Corrosiveness: Noncorrosive
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with chlorine, oxidizing materials, aluminum chloride, benzoyl peroxide and carbon tetrachloride, carbon tetrachloride, nitrogen dioxide, nitromethane and aluminum chloride, ozone, sulfuric acid, and nitric acid.

IDENTIFICATION

Shipping Names: Ethylene (USDOT and IMO); ethylene, compressed (USDOT); ethylene, refrigerated liquid (USDOT)
Synonyms and Tradenames: Ethene; acetene; bicarburretted hydrogen; elayl; olefiant gas; etherin.
Chemical Formula: $H_2C = CH_2$
Constituent Components(% each): 99–100% pure
49 STCC: 49 057 34 (compressed); 49 057 35 (refrigerated liquid)
UNINA Designation: UN1962 (compressed); UN1038 (refrigerated liquid)
IMO Designation: 2.1, flammable gas
Physical State as Shipped: Compressed or liquefied gas
Physical State as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless (gas may appear white at first)
Odor Characteristics: Faint, slightly sweet, pungent, like ether
Common Uses: Welding and cutting metal; ripening fruits and vegetables; anesthetic; mfg. plastics and organic chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYLENE
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 400 ppm

Unusual Hazards: Large amounts of flammable gas may be released during spills and may travel to a source of ignition and flash back. Vapors are heavier than air at first and may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable (simple asphyxiant)

Time Weighted Average (TLV-TWA): Unavailable (simple asphyxiant)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry to sewers or confined spaces; inhalation; contact with cold product or equipment.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high gas concentrations that are likely to be present in the spill area and some distance downwind.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with venting gas or liquid ethylene may result in frostbite.

Hazards of Inhalation: Ethylene gas is a simple nonirritating asphyxiant that may cause death by displacement of air at very high concentrations in air. Moderate concentrations may cause headache, drowsiness, muscular weakness, dizziness, and unconsciousness.

Hazards of Ingestion: Ingestion of ethylene is unlikely. Contact of the liquid with the mouth or throat might cause frostbite.

FIRE HAZARDS

Lower Flammable Limit: 2.75–3.02%

Upper Flammable Limit: 28.6–34%

Behavior in Fire: Flammable compressed or liquefied gas. Will generate large quantities of flammable gas upon release. Gas may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: May include toxic constituents such as carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if gas is ignited in a confined area. There is also some known potential for explosions of unconfined gas clouds. Containers may rupture violently in fire. Product is spontaneously explosive in sunlight with chlorine.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with very cold ethylene or containers. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific symptoms: Frostbite from contact; headache, dizziness, or other symptoms of excessive inhalation.

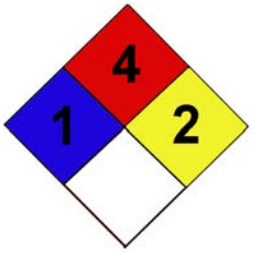
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least *15* minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: Do not use hot water or rub frozen area. Treat for frostbite.)

First Aid for Ingestion: Drink warm water to relieve frostbite. Get medical attention immediately.

1038

ETHYLENE
Division 2.1 (Flammable Gas)



FIRE RESPONSE

Extinguishing Materials: Stop flow of gas if possible. Use carbon dioxide, dry chemical, water fog. High expansion foam may be effective on liquid pools.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with cold product. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to liquid pools of ethylene may increase gas evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent product from entering sewers and confined spaces. Note that intake of ethylene may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Take into account while planning the response that ethylene is extremely volatile and flammable. Pools of liquid will be at –154.7°F. Accumulations of cold heavy gas may persist for a time in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethylene spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethylene vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact pools of liquid ethylene on the ground as this may increase gas evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of ethylene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . High expansion foam applied to the surface of liquid pools may slow the release of ethylene vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations.

ETHYLENE
Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid ethylene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ethylene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Residues will rapidly evaporate.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination where large quantities of liquid ethylene have spilled onto water. Only a very small fraction of the ethylene will dissolve in water. Most will boil off, so this and following responses may only be needed where critical water supplies are impacted.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ETHYLENE
Division 2.1 (Flammable Gas)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTIONN. . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July, 1994

ETHYLENEDIAMINE*
Class 8 (Corrosive Material)

GENERAL INFORMATION

Ethylenediamine is a thick, colorless to yellowish liquid with a strong ammonia-like odor. Vapors are irritating to the respiratory mucous membranes and eyes. It has a freezing point of between 8.5 and 11°C (47.3 to 51.8°F). On reaching temperatures below that point, solutions will tend to solidify. Ethylenediamine's fairly low vapor pressure coupled with its relatively high flash point indicate that the threat of ignition will be largely confined to the vicinity of the actual release. Factors such as increased pool size and increased temperature will promote the generation of vapors. Likewise, the risks of inhalation exposures are likely to be confined to the immediate vicinity of the spill or due to the buildup of vapors in confined spaces. Vapors are heavier than air.

Ethylenediamine is corrosive (owing to its high pH) to skin and is toxic by all routes of exposure. Exposures to vapors, mists and liquids can result in severe burns to the exposed tissues. Repeated skin or inhalation exposures can result in sensitizing the exposed individual. Severe or prolonged exposures may result in systemic toxic effects and effects may be delayed in onset. Ethylenediamine is corrosive to copper and copper alloys. It is completely soluble in water, and weighs approximately 7.5 pounds per gallon.

Ethylenediamine is used in a variety of commercial/industrial processes as a textile lubricant, emulsifying agent, antifreeze inhibitor, and in fungicides. It is also used in the manufacture of chelating agents, dimethyloethylene-urea resins, as a solvent for casein, albumin, and shellac. It is also used as a stabilizer in pharmaceuticals such as injectable aminophylline.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble.

Solubility in Other Chemicals: Soluble in alcohol; slightly soluble in ether.

Specific Gravity (Liquid): 0.899

Vapor Density (Air= 1): 2.1

Boiling Point: 116 to 117°C (240.8 to 242.6°F)

Melting Point: 8.5 to 11°C (47.3 to 51.8°F)

Freezing Point: 8.5 to 11°C (47.3 to 51.8°F)

Molecular Weight: 60.10

Heat of Combustion: – 6830 cal/gm

Vapor Pressure: 10 mmHg @ 21.5°C (70.7°F)

Flash Point: 33.9°C (93.2°F) to 43°C (110°F) CC

Autoignition Temperature: 379.4°C (715°F)

Burning Rate: 2.2 mm/min

Stability: Stable unless mixed with incompatible materials. Not subject to violent polymerization.

Corrosiveness: Corrosive to skin, alkaline, pH of 25% solution = 11.9 @ 25°C (77°F); readily corrodes copper and copper containing alloys.

Reactivity with Water: Not reactive, completely soluble.

Reactivity with Other Chemicals: Reacts violently with acids owing to its high pH. Reacts with aldehydes, ketones and acrylates to generate heat and /or pressure. As with most organics, reacts violently and may ignite in the presence of strong oxidizing agents.

IDENTIFICATION

Shipping Names: Ethylenediamine.

Synonyms and Tradenames: 1,2-diaminoethane; CAS 107-15-3.

Chemical Formula: $NH_2CH_2CH_2NH_2$

Constituent Components (% each): Range from 40 - 60% water/ethylenediamine to 100% ethylenediamine (anhydrous).

UN/NA Designation: UN1604

IMO Designation: 8, corrosive material.

Physical State as Shipped: Thick, viscous liquid.

Physical State as Released: Thick, viscous liquid.

Color of the Shipped Material: Clear, colorless.

Odor Characteristics: Ammonia odor.

Common Uses: Used as a textile lubricant, emulsifying agent, antifreeze inhibitor, and fungicide. It is also used in the manufacture of chelating agents and dimethyloethylene-urea resins. It is a solvent for casein, albumin, and shellac and is an inhibitor in antifreezes. It is also used as a stabilizer in pharmaceuticals such as aminophylline injection.

---

[*] Reportable Quantity (RQ) established. Refer to appendix 1.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

ETHYLENEDIAMINE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 11.2 ppm (28 mg/m^3)

Unusual Hazards: Ethylenediamine is toxic by all routes of exposure but direct contact is the most likely route. It is a strong irritant and a sensitizing agent. It may act as a contact allergen in sensitive individuals.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): 10 ppm (25 mg/m^3) air, OSHA PEL - TWA

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Toxic by inhalation and skin absorption. Direct contact with ethylenediamine or direct contact with contaminated materials is the most likely route of exposure. It is a strong irritant and a strong sensitizing agent. It may act as a contact allergen in sensitive individuals. There is an increased risk to persons with pre-existing conditions such as asthma and allergies or a known sensitivity to ethylenediamine. It is a moderate fire risk due to its relatively high flash point. Increasing temperatures of liquid will increase fire risk.

Hazards of Skin and Eye Contact: Extremely corrosive to eye tissues. Exposure to vapors may be severely irritating. Exposure to liquid or mists can cause severe corneal damage and corneal edema. Severe exposures may result in permanent eye damage or blindness. May cause severe burns to the skin. It can be absorbed through intact skin on repeated or prolonged exposures. Ethylenediamine is a potent skin sensitizer.

Hazards of Inhalation: May cause irritation to respiratory mucous membranes, coughing, wheezing, nausea, vomiting and dizziness. May aggravate pre-existing respiratory conditions such as asthma or allergies. In sensitized individuals, may elicit an allergic response, such as development of a skin rash or respiratory responses such as wheezing and asthma. Allergic responses will vary depending on the sensitivity of the individual exposed but could become life threatening. Exposure to extremely high concentrations may result in permanent lung damage.

Hazards of Ingestion: May result in severe alkali burns to the throat and mouth depending on the concentration. Gastrointestinal distress, nausea, and vomiting are likely to occur depending on the severity of the exposure.

FIRE HAZARDS

Lower Flammable Limit: 4.2%

Upper Flammable Limit: 14.4%

Behavior in Fire: A moderate ignition risk. Vapor generation is likely to be localized in the vicinity of the spill. Vapors are heavier than air and may ignite and flashback to the source. Vapors may collect in low lying areas and enclosed buildings. Temperature and spill surface area will affect the generation of flammable vapors.

Hazardous Combustion Products: May include ammonia, oxides of nitrogen, oxides of carbon, and unburned product.

EXPLOSION HAZARDS

Explosiveness: *No* specific explosive behaviors identified. Ethylenediamine is not subject to violent polymerization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with ethylenediamine liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully covering or encapsulating suits, made of compatible material are appropriate for most large spill situations. Butyl rubber is an appropriate material of construction.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

1604

ETHYLENEDIAMINE
Class 8 (CORROSIVE MATERIAL)

FIRST AID

Nonspecific Symptoms: Irritation to eyes, localized and transient irritation to skin. Abdominal distress on ingestion and anesthetic effects such as headache and dizziness. On prolonged respiratory exposure symptoms may be accompanied by coughing or wheezing, depending on exposure duration.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with clean water for at least 30 minutes, occasionally lifting the eyelid. Seek medical assistance immediately. Risk of permanent eye damage. Prompt medical evaluation is essential. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists.

First Aid for Ingestion: *Do* not induce vomiting. If victim is conscious, give large amounts of water or milk by mouth. Never give anything by mouth to an unconscious person. Provide supportive care and seek medical assistance immediately. Ethylenediamine is highly (alkali) corrosive to mucous membranes. The decision to empty the stomach contents should be made by a physician considering the relative risks from corrosive nature of ethylenediamine. There is no specific antidote.

FIRE RESPONSE

Extinguishing Materials: Water fog, foam, alcohol foam, carbon dioxide, dry chemical.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with ethylenediamine. Wear self contained breathing apparatus and appropriate personal protective clothing. Move intact container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam or the application of water fog is appropriate for fires involving ethylenediamine.

SPILL RESPONSES

General Information: Ethylenediamine is corrosive and flammable. Response strategies should account for the fact that vapors are heavier than air and may collect locally in enclosed spaces or low lying areas. Ethylenediamine may solidify at temperatures below the freezing point. When spilled in water, ethylenediamine is completely soluble and will tend to disperse in the water column. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Ethylenediamine may not evolve large amounts of hazardous airborne contaminants in many outdoor situations. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ethylenediamine vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

ETHYLENEDIAMINE
Class 8 (CORROSIVE MATERIAL)

AIR SPILL *(CONTINUED)*

MITIGATION

Remove spilled ethylenediamine as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for ethylenediamine vapor concentrations.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog applied to ethylenediamine vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain a small amount of ethylenediamine from contact with airborne vapors or fumes. Water spray will add to the volume of the spilled material.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of ethylenediamine vapors into the atmosphere. Vapor generation may not be sufficient to warrant foam applications.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with ethylenediamine.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of ethylenediamine liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids or solids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Ethylenediamine solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking product.

ETHYLENEDIAMINE
Class 8 (CORROSIVE MATERIAL)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Ethylenediamine solutions may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools or dry solids may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed. Avoid equipment constructed with copper or copper alloys.

TECHNIQUE

ABSORPTION . . . Spilled liquids can be absorbed and immobilized with inert materials such as sand, earth, saw dust, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with ethylenediamine solution and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL. . . Ethylenediamine contaminated soil and solidified ethylenediamine may be removed by shovels, motorized graders, scrapers, loaders, buldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Avoid equipment constructed with copper or copper alloys. Store contaminated materials in a safe and secure location.

ETHYLENEDIAMINE
Class 8 (CORROSIVE MATERIAL)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

March 1995

ETHYLENE DIBROMIDE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Ethylene dibromide is a colorless nonflammable solid or liquid with a melting point of 48.2 – 50°F and a sweetish faintly nauseating odor like chloroform. It is used in gasoline and in waterproofing preparations, as a solvent, in fire extinguishers and gauge fluids, and in making other chemicals. It is slightly soluble in water and heavier so may be expected to sink and dissolve slowly. The liquid product weighs approximately 18.2 pounds per gallon.

Ethylene dibromide does not react with water or many other common materials. It is stable in normal transportation but may decompose at high temperatures or in the presence of light. The product reacts, possibly vigorously or violently, with strong oxidizing agents, strong alkalies, active metals, or liquid ammonia. Toxicity of the substance is moderate to high by the various routes of exposure and it is a suspected human carcinogen. At high temperatures, or in contact with hot metal, ethylene dibromide may decompose to highly toxic and or irritating gases such as hydrogen bromide, bromine, and carbon monoxide.

Downwind evacuation should be considered on a case by case basis if ethylene dibromide is leaking from its container until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.4 – 0.43g/l00g water at 86°F (30°C)
Solubility in Other Chemicals: Soluble in alcohol, ether, and most other solvents and thinners.
Specific Gravity (Liquid): 2.17 – 2.18 at 68°F (20°C)
Boiling Point: 267.8 – 269.6°F (131–132°C) at 1 atm.
Melting Point: 48.2 – 50°F (9 –10°C)
Freezing Point: See melting point
Molecular Weight: 187.88
Heat of Combustion: Not flammable
Vapor Pressure: Approximately 8.6 – 9.0 mm Hg (0.166 – 0.174 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable in normal transportation; slowly decomposes in presence of light.
Corrosiveness: May attack some forms of plastics, rubber, greases, and coatings. No appreciable attack on steel.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts vigorously or explosively with strong oxidizing agents; strong alkalies; metals such as powdered aluminum, magnesium, zinc, sodium, potassium, and calcium; or liquid ammonia.

IDENTIFICATION

Shipping Names: Ethylene dibromide (USDOT and IMO)
Synonyms and Tradenames: 1,2-Dibromoethane; sym-dibromoethane; bromofume; glycol dibromide; glycolbromide; EDB; DBE; Dowfume; E-D-Bee; Fumo-gas; Iscobrome D; Kopfume; Nephis; Pestmaster; Soilbrom; Soilfume; Unifume.
Chemical Formula: $BrCH_2CH_2Br$
Constituent Components (% each): Relatively pure (close to 100%)
UN/NA Designation: UN1605
IMO Designation 6.1, poisonous substance
Physical State As Shipped: Liquid
Physical State As Released: Liquid or solid
Color of the Shipped Material: Colorless
Odor Characteristics: Like chloroform; sweetish; faintly nauseating
Common Uses: Lead scavenger in gasoline; general solvent; in waterproofing preparations; in organic synthesis; in fire extinguishers and gauge fluids; formerly used as fumigant.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ETHYLENE DIBROMIDE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at about 10 ppm in air.

Unusual Hazards: Suspected human carcinogen.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable. Listed as suspected human carcinogen by ACGIH. NIOSH recommends 0.13 ppm for 15 minute ceiling limit.

Conditions to Avoid: High heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the relatively high vapor concentrations that may be present in the air in the immediate spill area and downwind. Prolonged contact and ingestion should also be strictly avoided. Note that ethylene dibromide is a suspected human carcinogen and known to cause adverse reproductive effects in animals.

Hazards of Skin or Eye Contact: Prolonged contact of the skin with ethylene dibromide may cause redness, inflammation, blisters, pain, and skin ulcers that may be delayed in appearance. The product may be absorbed through the skin in toxic amounts and may also sensitize the skin. Contact of the eyes with the product may result in pain, irritation, and temporary corneal injury. Do not wear contact lenses when working with ethylene dibromide.

Hazards of Inhalation: Vapors of ethylene dibromide are irritating to the eyes, nose, throat, and lungs. Inhalation of high concentrations in air may cause coughing, difficult breathing, nausea, vomiting, dizziness, faintness, headache, diarrhea, liver and kidney injury, pulmonary edema (which may be delayed in onset), cardiac failure, and possibly death. Exposures to 3000 ppm in air for 6 minutes, 400 ppm for 30 minutes, or 200 ppm for 2 hours were fatal to rats in laboratory experiments.

Hazards of Ingestion: Ethylene dibromide is of moderate to high toxicity via ingestion. Most effects are similar to those of inhalation.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Nonflammable liquid or solid.

Hazardous Combustion Products: Not itself flammable but toxic and irritating gases and fumes are formed upon exposure to high heat or hot metals. These include hydrogen bromide, bromine, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Contact with incompatible powdered metals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

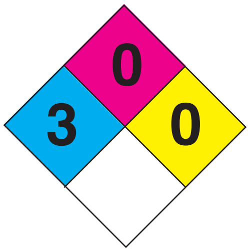
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 400 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (400 ppm or less) or a chemical cartridge respirator with an organic vapor cartridge and full facepiece (400 ppm or less) within the use limitations of these devices.

1605

ETHYLENE DIBROMIDE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues; headache, dizziness, nausea, vomiting, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH recommends that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Ethylene dibromide is not itself combustible. Use water, dry chemical, carbon dioxide, or foam as necessary on surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical-protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethylene dibromide spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large quantities have spilled in a populated area and or have been exposed to heat.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Ethylene dibromide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly when smaller amounts have been discharged or the spill occurs in cold weather.

CONSEQUENCE

Hazardous levels of ethylene dibromide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access of unprotected personnel from the local spill area and areas immediately downwind.

ETHYLENE DIBROMIDE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethylene dibromide vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of ethylene dibromide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that an appropriate firefighting foam applied to the surface of liquid pools may slow the release of ethylene dibromide vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER APPLICATION . . . Application of cold water spray to the surface of contained liquid pools may reduce emissions of vapors or fumes. Since ethylene dibromide is only slightly soluble and heavier than water, cold water will float on the product and possibly cause its solidification.

CONSEQUENCE

Addition of water will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

TECHNIQUE

BURIAL . . . In cool weather, the solidified spilled product may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of vapors or fumes.

CONSEQUENCE

An additional quantity of sand, earth, or similar material will become contaminated. Vapor or fume emissions may continue when the cover material is removed.

MITIGATION

Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethylene dibromide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ethylene dibromide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ETHYLENE DIBROMIDE

Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Solidification of product in cool weather may clog lines or pumps.

MITIGATION

Use equipment compatible with the spilled product. Keep product warm if necessary.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, fly ash, cement powder,commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

ETHYLENE DIBROMIDE
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water and dissolve slowly. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

October 1991

ETHYLENE DICHLORIDE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethylene dichloride is a clear, colorless, oily liquid with a pleasant and sweet odor resembling chloroform or ether. It is used as a fumigant, solvent extractant and raw material for making a wide variety of other chemicals and products. Only slightly soluble in water and heavier, liquid ethylene dichloride may be expected to sink to the bottom of a water body and dissolve at a relatively slow rate. A closed-cup flash point of approximately 55 F indicates that it can be easily ignited under many ambient temperature conditions. At warmer temperatures, vapors may be heavier than air and in any case may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some limited potential for containers of liquid to rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 10.5 pounds per gallon.

Ethylene dichloride does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizers and caustics, chemically active metals and a variety of other chemicals, however, and may attack some forms of plastics, rubber, and coatings. Some of its reactions with other materials may be violent or explosive in nature. Available Information about the corrosivity of ethylene dichloride is not entirely consistent, but it appears that the product may corrode iron and certain other unspecified metals in the presence of water and may react explosively or violently with aluminum, magnesium, or other active metals under appropriate circumstances. Toxicity of the product by all potential routes of exposure is moderate to high. Products of combustion or thermal decomposition are reported to include a number of highly irritating or toxic substances including phosgene.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if ethylene dichloride is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.81 or 0.869g/100g water at 68°F (20°C); reported values vary

Solubility in Other Chemicals: Soluble in alcohol, acetone, benzene, chloroform, ether, and most other common chemical solvents.

Specific Gravity (Liquid): 1.253–1.257 at 68°F (20°C)

Boiling Point: 182.1–182.7°F (83.4–83.7°C) at 1 atm.

Melting Point: –32.3 to –31.5°F (–35.7 to –35.3°C)

Freezing Point: See melting point

Molecular Weight: 98.96

Heat of Combustion: 1887 cal/g (est.)

Vapor Pressure: 60–68 mm Hg (1.16–1.31 psia) at 68°F (20°C); reported values vary in this range

Flash Point: 55–56°F (12.8–13.3°C), closed cup; 59–70°F (15–21°C), open cup

Autoignition Temperature: 775°F (413°C)

Burning Rate: 1.6 mm/minute

Stability: Stable

Corrosiveness: Some authorities state that ethylene dichloride is not corrosive to metals (except aluminum-see below) when dry but corrodes iron, zinc, and aluminum in the presence of water. One adds that it corrodes iron and certain other metals "at elevated temperatures" when in contact with water. Another states it is corrosive to iron and other metals unless stabilized with alkylamines (which appears questionable given the reactivity of the product with alkylamines-see below). Several authorities agree that ethylene dichloride attacks some forms of plastics, rubber and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Incompatible and may react vigorously with strong oxidizers, strong caustics, or chemically active metals such as aluminum or magnesium powder, sodium, or potassium. Reactions with active metals (including solid aluminum), liquid ammonia, dimethylaminopropylamine (when water is present), nitrogen tetroxide, nitrogen dioxide, organic peroxides, reducing agents, nitric acid, or similar materials may e violent or explosive under appropriate conditions. Similar chemicals react with varying results with cyanides, mercaptans or other organic sulfides, azo compounds, hydrazines, nitrides mineral acids, amines, and possibly other substances. (Note: It is known that mixtures with nitric acid are easily detonated by heat, impact or friction.)

IDENTIFICATION

Shipping Names: Ethylene dichloride (USDOT and IMO)

Synonyms and Tradenames: 1,2-dichloroethane; sym-dichloroethane; ethane dichloride; ethylene chloride; glycol dichloride; Brocide; 1,2-DCE; Dutch liquid; Dutch oil; EDC

Chemical Formula: $Cl\text{-}CH\text{-}CH_2\text{-}CI$

Constituent Components (% each): Commercial grades are typically 99% or more pure

49 STCC: 49 091 66

UN/NA Designation: UN1184 (USDOT and IMO)

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant; sweet; like chloroform and ether

Common Uses: Fumigant; insecticide; used in making several other chemicals, plastics and rubber compounds; solvent and extractant for many products; degreasing, pickling, and dry cleaning agent; used m ore flotation, photography, xerography water softening, and in making adhesives, antiknock compounds, cosmetics, finish removers, pharmaceuticals soaps and scouring compounds, wetting and penetrating agents, and varnishes.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYLENE DICHLORIDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Reported values vary from approximately 5 to 100 ppm by volume in air

Unusual Hazards: Flammable, moderately volatile, chlorinated hydrocarbon. Vapors may be heavier than air at higher ambient temperatures and may travel some distance to a source of ignition and flash back.

Short Term Exposure Limit (STEL): 2 ppm for 15 minutes (OSHA, 1989)

Time Weighted Average (TWA) Limits: 10 ppm over each 8 hours of a 40–hour work week (ACGIH TLV, 1990/91); 1 ppm (OSHA PEL, 1989) under similar circumstances.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate vicinity and directly downwind of a spill. Direct contact and ingestion should also be avoided. Ethylene dichloride is regarded as a potential human carcinogen based on the results of chronic exposure studies involving laboratory animals. (Note: No single reference source appeared to provide a complete and consistent overview of the effects of exposure to ethylene dichloride via all potential routes of exposure. The following discussions were pieced together from an unusually large number of references and may not be absolutely accurate in each and every detail.)

Hazards of Skin or Eye Contact: When the skin is exposed to air, repeated contact with liquid ethylene dichloride may result in drying and cracking of the skin as well as roughness and redness due to the defatting action of the substance. When the skin exposure is prolonged, as may occur from contact with wet clothing, quite severe irritation and moderate edema and necrosis may result. Ethylene dichloride is absorbed through the skin but requires quite a large dose to cause serious acute systemic poisoning via this route; such doses are likely to require substantial and prolonged skin exposure. When splashed in the eyes, liquid ethylene dichloride may cause pain, irritation, and lachrymation. No significant or lasting injury is expected if the product is immediately washed from the eyes. There is a possibility of more serious injury, however, if removal is delayed. Although some authorities report that corneal opacity may result from direct contact with the eyes, NIOSH has found that there is no evidence of such effects. Any corneal burns resulting from splashes are expected to heal relatively quickly and without scarring. Contact lenses should not be worn when working with this chemical.

Hazards of Inhalation: Inhalation of ethylene dichloride vapors may result in irritation of the eyes, nose, throat and respiratory tract, central nervous system depression, and gastrointestinal upset with symptoms possibly including drowsiness, dizziness, headache, mental confusion, incoordination, weakness, jaundice, anemia, vomiting, diarrhea, increased urination, hypertension, cyanosis (causing bluish discoloration of the skin and mucous membranes and indicating a lack of oxygen in the blood), pulmonary edema (which may be delayed in onset), increase in myocardial (heart) irritability, unconsciousness, and even death in extreme cases from respiratory and circulatory system failure. Liver, kidney, and adrenal gland damage may result. In the death of an individual exposed to concentrated vapors for 30 minutes, coma developed 20 hours after the initial exposure. Multiple organ failures occurred and the victim died of cardiac arrhythmia on the fifth day. Autopsy revealed severely congested and edematous lungs and degenerative changes of the heart, liver, and kidneys. According to one authority, alcohol consumed before and/or after exposure may increase injury. In laboratory experiments, the maximum concentrations survived by all rats were 20,000 ppm for 12 minutes, 3000 ppm for one hour, or 300 ppm for seven hours. Fifty percent of rats died from exposure to 12,000 ppm for 32 minutes, 3000 ppm for 2.75 hours, or 1000 ppm for 7.2 hours. Note that the saturated vapor concentration of ethylene dichloride, the concentration directly over liquid pools, is at least 78,950 at a temperature of 68°F.

Hazards of Ingestion: Ethylene dichloride is moderately toxic by ingestion. Ingestion of the product is reported to result in burning of the throat and mouth and gastrointestinal distress with an overall response that is not unlike that observed from acute vapor exposures. Additional effects reported in the literature include hemorrhaging of the outer walls of the heart, lungs, interior walls of the chest cavity, and mucous membranes of the stomach and duodenum. The heart beat may be weak and there may be ulceration or bleeding from the stomach. Excessive exposures may result in death. Aspiration into the lungs during vomiting may result in delayed pulmonary edema and chemical pneumonia with possibly severe consequences.

1184

ETHYLENE DICHLORIDE
Class 3 (Flammable Liquid)

FIRE HAZARDS

Lower Flammable Limit: 6–6.2%
Upper Flammable Limit: 15.9–16%
Behavior in Fire: Flammable liquid. May generate flammable vapors upon release, particularly at warmer temperatures (see flash point). Vapors may be somewhat heavier than air and in any case may travel some distance to a source of ignition and flash back. There is some limited potential for containers to rupture violently and possibly rocket in fires. Ethylene dichloride is reported to burn with a smoky flame.
Hazardous Combustion Products: Toxic, irritating, and/or corrosive substances such as carbon dioxide, carbon monoxide, chlorine, hydrogen chloride, hydrochloric acid, phosgene, and vinyl chloride are reported by various authorities as products of combustion and/or thermal decomposition of ethylene dichloride. Other potentially hazardous substances may also be generated.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if flammable vapors are ignited in a confined area. There is some limited potential for containers to rupture violently and possibly rocket in fires. Contact with certain other chemicals or active metals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye or skin contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials for ethylene dichloride may include Viton/neoprene, Viton, and Silvershield. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high concentrations of irritating or corrosive gases generated by burning ethylene dichloride. Note that such suits may require acid-resistant materials of construction.
Respiratory Protection: For unknown concentrations, fire fighting, or any detectable concentration, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, respiratory tract, or skin. Other symptoms of central nervous system depression or gastrointestinal upset.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. At least one authority reports that administration of epinephrine may not be prudent and is contraindicated.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least *15* minutes, occasionally lifting the eyelids. Remove all clothing penetrated by ethylene dichloride immediately. Wash any affected body areas with large amounts of soap and water. Get prompt medical attention if eye contact has occurred or if skin irritation persists after washing.
***First Aid for* Ingestion:** Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately. If vomiting occurs naturally or otherwise, have victim lean forward and keep head below hips to reduce risk of aspiration of liquid ethylene dichloride into the lungs. (Note: Some authorities recommend that the victim be given large amounts of salt water, water, or milk and that vomiting be induced. There is clearly a tradeoff in risk here between the hazards of leaving ethylene dichloride in the body and the hazards associated with the possibility of aspiration of the product into the lungs if vomiting is induced. Seek expert medical advice on this topic immediately if possible. Take into account how long it may require to obtain professional medical treatment for the victim if vomiting is not induced. The recommendation above is deemed best for general purposes but may not be the best choice in all cases.)

ETHYLENE DICHLORIDE
Class 3 (Flammable Liquid)

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective. Authorities disagree on whether alcohol-resistant or regular foam should be used; it is possible that both types may be effective to some degree.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Consider wearing a fully-encapsulating vapor protective suit where contact with dense smoke containing irritating or corrosive gases generated by burning ethylene dichloride may be encountered. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility (albeit limited) that the container may rupture violently, possibly rocket, and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take into account while planning the response that ethylene dichloride is a fairly volatile flammable liquid with toxic vapors. Do not expose equipment made of aluminum, magnesium, or similar active metals to the product.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Ethylene dichloride discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethylene dichloride vapors in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain some small amounts of ethylene dichloride from contact with its vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam (regular or alcohol-resistant; authorities appear to disagree on which is best) applied to the surface of liquid pools may slow the release of ethylene dichloride vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The water content of the foam may render the ethylene dichloride more corrosive to certain metals than the dry product.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Give due consideration to the possibility of increased corrosivity to certain metals on the part of contained liquids.

ETHYLENE DICHLORIDE

Class 3 (Flammable Liquid)

TECHNIQUE

COVERAGE WITH WATER . . . Ethylene dichloride is heavier than water and only slightly soluble. Where pools of the liquid have been fully contained, there is a possibility that the application of a very light water spray to the surface of the pool for a time will build up a layer of water that will float on the ethylene dichloride and reduce its emissions of vapors.

CONSEQUENCE

Addition of water will increase the volume of contained liquid. Wet ethylene dichloride may be more corrosive to certain metals than the dry product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments. Give due consideration to the possibility of increased corrosivity to certain metals on the part of contained liquids.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethylene dichloride may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained ethylene dichloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged, develop leaks, or even possibly react with the substance. Contact with certain metals may be unusually hazardous.

MITIGATION

Use equipment compatible with the spilled product. Keep the product dry to reduce the possibility of increased corrosivity to certain metals.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, fly ash, cement powder, saw dust, straw, vermiculite, perlite, commercial sorbents or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Contact with certain metals may be unusually hazardous. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ETHYLENE DICHLORIDE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid ethylene dichloride is somewhat heavier than water and may be expected to sink to the bottom of a body of water and slowly dissolve. Note that even very small quantities of the product in water may prove highly toxic to anaerobic digestion in water or sewage treatment processing facilities.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic or flammable vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance. Use equipment compatible with the spilled product.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of sorbents may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary. Use equipment compatible with the spilled product.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1996

ETHYLENE GLYCOL*

Class 9 (Miscellaneous Hazardous Materials)

GENERAL INFORMATION

Ethylene glycol is a colorless syrupy liquid with little or no odor. Best known as a major ingredient of antifreeze and deicing solutions (which may also contain large quantities of water and other substances), it has numerous other important uses in industry and consumer products. It is ranked among the top 30 chemicals produced in the United States.It is fully soluble in water and slightly heavier, so can be expected to sink and mix freely. A melting point range of 7.7 to 9.3°F for the relatively pure product indicates that it may solidify at low ambient temperatures. A flash point range of 232 to 250°F indicates that considerable preheating is necessary to ignite the pure material or to reach temperatures at which it will evolve flammable vapors. The relatively pure liquid weighs approximately 9.3 pounds per gallon.

Ethylene glycol does not react with water or many other common materials. There is an increased risk of vigorous reaction, fire and/or explosion in the presence of strong oxidizing agents and the substance is otherwise reactive with a variety of other chemicals substances. It is not corrosive to common metals (except to aluminum at elevated temperatures) but may attack some forms of plastics, rubber, and coatings. The toxic hazard of the product at room temperatures is generally low by all routes in acute exposures. Ethylene glycol is reported to emit acrid smoke and irritating fumes when heated to decomposition.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in other Chemicals: Soluble in acetic acid, acetone and similar ketones, aldehydes, lower aliphatic alcohols, glycerol, glycol ethers, and pyridine and similar coal tar bases.

Specific Gravity (Liquid): 1.11-1.13 at 68°F (20°C)

Boiling Point: 387°F (197.6°C)at 1 atm.

Melting Point: 7.7 to 9.3°F (13.5 to 12 6°C)

Molecular Weight: 62.07

Heat of Combustion: -4033 cal/g

Vapor Pressure: 0.06 mm Hg (0.00116 psia) at 68°F (20°); about 0.20 mm Hg (0.00387 psia) at 86°F (30°C).

Flash Point: 232-250°F (111.1 -121.1°C), closed-cup; 240°F (115.6°C), open cup.

Autoignition Temperature: 748 to 775°F (397.8 to 412.8°C);

Burning Rate: 1.0 mm/minute

Stability: Stable

Corrosiveness: Not corrosive to most metals under normal conditions. May be corrosive to aluminum at temperatures above 212°F. May attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No chemical reaction.

Reactivity with other Chemicals: Increased risk of vigorous reaction, fire and/or explosion in presence of strong oxidizing agents, either immediately or when mixture is heated depending on specific oxidizer. May violently decompose in presence of perchloric acid. Mixture with acids such as oleum, 96% sulfuric acid, or chlorosulfonic acid causes temperature and pressure to rise in closed containers.

IDENTIFICATION

Shipping Name: Environmentally Hazardous Materials, Liquid, n.o.s. (Ethylene Glycol) or Other Regulated Materials, Liquid, n.o.s. (Ethylene Glycol)

Synonym and Tradenames: 1,2-Dihydroxyethane; EG; 1,2-ethanediol; ethane - 1,2-diol; ethanediol; ethylene alcohol; ethylene dihydrate; glycol; glycol alcohol; 2-hydroxyethanol; MEG; monoethylene glycol

Chemical Formula: HOCH2CH2OH

Constituent Component* (% each): Typically 99% pure even for the industrial, commercial or technical grades, but there appear to be exceptions to this rule.

UN/NA Designation: UN3082 or NA3082

IMO Designation: Class 9

Physical State As Shipped:Liquid

Physical State As Released: Liquid (solidifies at 7.7 to 9.3°F)

Color of the Shipped Material: Ethylene glycol itself is a colorless syrupy liquid but commercial products containing the substance may be any of a variety of colors.

Odor Characteristics: Odorless or with a slight odor

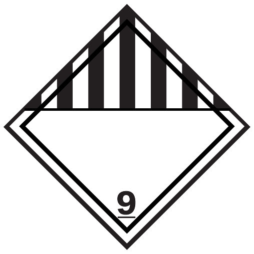
Common Uses: Coolant and antifreeze; extractant and solvent for various purposes; ingredient in hydraulic brake fluids, cosmetics, lacquers, alkyd resins, asphalt emulsion paints, printing inks, wood stains, adhesives, deicing fluids used at airports, ball-point pen inks, heat transfer fluids, and electrolytic condensers.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ETHYLENE GLYCOL
Class 9 (Miscellaneous Hazardous Materials)



POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold odor Concentration: Ethylene glycol is reported by many authorities as being odorless or having a slight odor.

Unusual Hazards: Capable of causing human injury and environmental damage under appropriate spill conditions.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Ceiling (C) Limit:: 50 ppm 1127 mg/m3, absolute ceiling limit (ACGIH, 1991-92; OSHA,1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact

HEALTH HAZARDS

Public Health Hazards: The major threat from ethylene glycol has been associated with ingestion.

Hazards of Skin or Eye Contact: Contact of the eyes with liquid ethylene glycol may cause mild or moderate discomfort, redness, and irritation but no significant corneal injury unless the product is sufficiently hot to cause a thermal burn. Long-term exposure to vapors and mists may cause temporary eye irritation according to some authorities. Contact of the skin with liquid ethylene glycol should cause no more than mild irritation though thermal burns are possible if the product is hot. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Due to its low vapor pressure, toxic concentrations of ethylene glycol in air are unlikely to occur at normal room temperatures and below. Nevertheless, vapors generated at moderate to high ambient temperatures may be irritating. In experiments, humans could not tolerate levels above 56 ppm or greater for long due to throat irritation that produced a burning sensation and coughing. Inhalation of vapors from hot liquid or of mists of ethylene glycol generated at any temperature are variously reported to cause headache, nausea, vomiting, dizziness, giddiness, rapid and involuntary eye movements, eye lacrimation, coughing, general anesthesia, respiratory system stimulation, unspecified effects on the lungs, and possible kidney and liver injury.

Hazards of Ingestion: The toxicity of ethylene glycol by ingestion is comparatively low but the product is easily and widely available and has been the cause of many cases of fatal or near-fatal poisonings. Symptoms of ingestion are reported to include nausea, vomiting, abdominal pain or discomfort, dizziness, drowsiness, malaise, blurring of vision, rapid and involuntary eye movements, irritability, lumbar pain, intoxication, stupor, reduced urination and resultant fluid retention, weakness in facial muscles, diminished hearing, difficulty in swallowing, unconsciousness, coma, and convulsions.

FIRE HAZARDS

Lower Flammable Limit: 3.2%

Upper Flammable Limit: 15.3%

Behavior in Fire: High flash point liquid. Will burn but may be difficult to ignite unless substantially preheated. Water or foam directed onto the hot burning liquid may cause frothing.

Hazardous Combustion Products: Not well-defined. When heated to decomposition, the product may is said by one authority to emit acrid smoke and irritating fumes.

EXPLOSION HAZARDS

Explosiveness: The risk of violent container rupture due to prolonged exposure to heat is very low when relatively pure ethylene glycol is involved due to the high boiling point and very low vapor pressure of the product. Be advised, however, that mixtures with some other substances including water may be more prone to container rupture.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, butyl rubber/neoprene, chlorinated polyethylene, natural rubber, neoprene, neoprene/natural rubber, nitrile rubber, nitrile rubber + polyvinyl chloride, polyethylene, polyurethane, polyvinyl alcohol, styrene-butadiene rubber (SBR), SBR neoprene, Teflon, Viton, and Viton neoprene. Clothing providing thermal protection may be required where hot liquid ethylene glycol is to be handled.

Respiratory Protection: For fire fighting or when vapors or mists are being generated from hot ethylene glycol, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For situations in which vapor pressures will be low (e.g., when the pure product is at a low to moderate ambient temperature), a gas mask with chin-style or front or back mounted organic vapor canister or a chemical cartridge respirator with a full facepiece and organic vapor cartridge(s) may be adequate within the use limitations of these devices.

3082

ETHYLENE GLYCOL
Class 9 (Miscellaneous
Hazardous Materials)

FIRST AID

Nonspecific Symptoms: Eye, skin, or throat irritation; headache, coughing, nausea, vomiting, dizziness, giddiness, drowsiness, abdominal discomfort, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: This is the most common recommendation found in the literature but at least one authority believes that vomiting should not be induced after water is administered. Seek qualified medical advice on this issue if possible.) If vomiting is induced or occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs and then repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Water spray, alcohol foam, carbon dioxide, or dry chemical. Note that direct application of water or foam to burning ethylene glycol may cause frothing. Apply these materials cautiously and carefully at first. Water works by diluting the ethylene glycol to a noncombustible mixture.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility (although highly limited when relatively pure ethylene glycol is involved) that the container may tear or rupture and suddenly release massive amounts of product when exposed to prolonged high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance if deemed necessary to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, consider using an unmanned hose holder or monitor nozzles. If this is impossible, consider withdrawing and letting the fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSE

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources as necessary. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take the temperature of the ethylene glycol into account when planning the response and take action accordingly. The toxic hazard and flammability of the product increases with temperature and this product is frequently used at high temperatures in certain types of equipment. There is a possibility that the discharge of a carbon dioxide fire extinguisher at the point of leakage of pure liquid ethylene glycol has the potential to solidify the product and stop the leak in some cases, at least temporarily. Other means attempting to solidify the leaking liquid via cooling may also work. Whether or not the "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the container and its temperature. It may become necessary to repeat the procedure several times until the leak can be patched or to ultimately abandon the effort. Use professional judgement in attempting this type of response action.

ETHYLENE GLYCOL
Class 9 (Miscellaneous Hazardous Materials)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION…Ethylene glycol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations, particularly and especially if the spill is small and/or the product is at low to moderate ambient temperatures. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ethylene glycol may be found in the air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

EVACUATION…Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Ethylene glycol discharges may expose certain downwind areas to toxic and possibly flammable concentrations in some cases if large quantities of the very hot pure liquid have been released.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY…Where deemed necessary, water fog or spray applied to ethylene glycol vapors or mists in air may absorb vapors, knock down mists, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethylene glycol from contact with its vapors or mists. Water applied to very hot pools of liquid ethylene glycol may cause frothing.

MITIGATION

Apply water at a point downwind if potential frothing of hot liquid is of concern. Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM…Where deemed necessary, alcohol foam applied to the surface of liquid pools may slow the release of ethylene glycol vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. Direct application of foam to very hot pools of liquid ethylene glycol may cause frothing.

MITIGATION

Apply foam with caution at first if it is being applied to a very hot pool of liquid ethylene glycol. Continue foam applications until spilled product is removed. Contain increased volume.

ETHYLENE GLYCOL
Class 9 (Miscellaneous Hazardous Materials)

TECHNIQUE

DILUTION…Where deemed necessary, the addition of a relatively large amount of water to liquid ethylene glycol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Direct application of water to very hot pools of liquid ethylene glycol may cause frothing.

MITIGATION

Apply water as a spray with caution at first if it is being applied to a very hot pool of liquid ethylene glycol. Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES…Liquid ethylene glycol and contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION…A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION…Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION…Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

ETHYLENE GLYCOL

Class 9 (Miscellaneous Hazardous Materials)

TECHNIQUE

MECHANICAL REMOVAL…Contaminated soil or spilled product or its residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. If the ethylene glycol is very hot, any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres; wait till the ethylene glycol has cooled. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE…Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES…Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION…Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Activated carbon is not highly effective for capturing ethylene glycol in water.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment. Activated carbon use may not prove sufficiently effective or efficient. Very large amounts of the carbon may be required.

MITIGATION

Consult qualified experts for safe carbon adsorption techniques (if this recovery technique is attempted) or other methods of treating contaminated water. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION…Water containing dissolved ethylene glycol may potentially be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body. (Note: The low vapor pressure of ethylene glycol indicates that this response technique may not be highly effective. The technique has been suggested by various authorities, however, for materials with similarly low vapor pressures.)

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment and in deciding whether the technique should be attempted under the specific spill conditions of interest. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2003

ETHYLENE GLYCOL MONOBUTYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Ethylene glycol monobutyl ether (EGBE) is a clear, flammable liquid with a mild, ether-like odor. It is also commonly known as 2-Butoxyethanol and is toxic by all routes of exposure. It has many different applications from being used in all-purpose and household solvents to making pesticides and rust removers. It has a flash point of 144°F and therefore flammable, but it can be identified as a flammable or combustible liquid when in transportation. It is reactive with strong acids, bases, caustics and some metals. On exposure to light or air, EGBE may form peroxides. It is completely soluble in water and most organic solvents. The product weighs approximately 7.5 pounds per gallon.

Ethylene glycol monobutyl ether is regarded as the most toxic glycol ether used as a solvent. Symptoms of exposure may include headaches, drowsiness, weakness, slurred speech, tremor and blurred vision. EGBE has an evaporation rate of .08 and is therefore considered a slow evaporator; nevertheless, vapors are heavier than air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of ethylene glycol monobutyl ether is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Complete

Solubility in Other Chemicals: Soluble in ethanol, acetone, mineral oil, ether and most organic solvents.

Specific Gravity (Liquid): 0.9

Vapor Density: 4.07

Boiling Point: 340°F (171°C)

Melting Point: See freezing point.

Freezing Point: -107°F (-77°C)

Molecular Weight: 118.2

Heat of Combustion: 30 kJ/g

Evaporation Rate (butyl acetate=1): .08

Vapor Pressure: 0.8 mm Hg at 68°F (20°C); 300 mm Hg at 284°F (140°C)

Flash Point: 144°F (62°C) closed cup; 158°F (70°C) open cup

Autoignition Temperature: 460°F (238°C)

Burning Rate: Unavailable

Flammable Limits: 1.1% (LFL) - 12.7% (UFL)

Stability: Stable under normal conditions, however, is sensitive to light and air.

Polymerization Potential: Will not occur

pH: 10.5 - 11.5 (reported by one source)

Reactivity with Water: None

Reactivity and Incompatibility: Strong oxidizers, strong caustics, strong bases and zinc. Incompatible with reactive metals such as aluminum and magnesium. May form peroxides on exposure to light and air. It attacks some forms of plastics, rubber and coatings.

IDENTIFICATION

Shipping Name(s): Flammable liquid, n.o.s. (Ethylene glycol monobutyl ether) (USDOT & IMO); Combustible liquid, n.o.s. (Ethylene glycol monobutyl ether) (USDOT)

Synonyms and Tradenames: 2-Butoxyethanol; 2-butoxy-1-ethanol; Butyl Cellosolve®; Butyl oxitol; Dowanol® EB; EGBE; Ektasolve EB®; Jeffersol EB

CAS Registry No.: 111-76-2

Chemical Formula: $C_4H_9OCH_2CH_2OH$ or $C_6H_{14}O_2$

Constituent Components (% each): 99% to 100% pure

UN/NA Designation: UN1993 (Flammable liquid); NA1993 (Combustible liquid)

IMO Designation: 3, Flammable liquids

RTECS Number: KJ8575000

NFPA 704 Hazard Rating: 2 (Health): 2 (Flammability): 0 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Clear colorless liquid

Odor Characteristics: Mild, ether-like odor.

Common Uses: All-purpose solvent often used in water-base paint formulations and hard surface cleaners. Solvent for nitrocellulose, natural and synthetic resins, soluble oils, lacquers, varnish and enamels. Used in textile dyeing and printing, in the treatment of leather, as a stabilizer in metal and household cleaners, in hydraulic fluids, insecticides, herbicides and rust removers.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ETHYLENE GLYCOL MONOBUTYL ETHER

Class 3 (Flammable Liquid) or
Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Approximately 4 ppm

Unusual Hazards: Product is toxic. Fumes and vapors are heavier than air. May form peroxides on exposure to light and air.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 5 ppm (24 mg/m^3) (NIOSH); 50 ppm (240 mg/m^3) (OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 700 ppm

Conditions to Avoid: Heat or sources of ignition; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Ethylene glycol monobutyl ether is regarded as the most toxic of all glycol ethers. Major hazard to public is inhalation of fumes or vapors in air but ingestion and direct physical contact is also to be strictly avoided. Chemical is usually detected by its objectionable odor prior to high levels.

Hazards of Skin or Eye Contact: May cause headache, dizziness, incoordination, nausea, vomiting, diarrhea and general weakness. Brief contact may cause slight irritation with itching and local redness. Prolonged contact may cause more severe irritation, with discomfort or pain, local redness and swelling and possible tissue destruction.

Hazards of Inhalation: High concentrations of vapor cause irritation of the respiratory tract, experienced as nasal discomfort and discharge, with chest pain and coughing. Headache, nausea, vomiting, dizziness and drowsiness may occur.

Hazards of Ingestion: May cause headache, dizziness, incoordination, nausea, vomiting, diarrhea and general weakness. Ingestion of significant quantities may result in red blood cell hemolysis.

FIRE HAZARDS

Lower Flammable Limit: 1.1%

Upper Flammable Limit: 12.7%

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas, and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable and toxic vapors upon release.

Hazardous Combustion Products: May include carbon monoxide, carbon dioxide and irritating and toxic fumes and gases.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Peroxidizable compounds can form and accumulate peroxides, which may explode when subjected to heat or shock.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

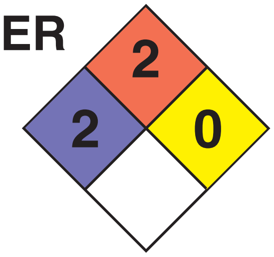
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include Viton®, butyl rubber, nitrile and neoprene (reported to have a greater than 8 hour breakthrough time). Natural rubber has a reported breakthrough time of 67 minutes and is, therefore, not recommended.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

ETHYLENE GLYCOL MONOBUTYL ETHER

1993

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Seek medical advice on whether or not to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, regular foam, water spray or carbon dioxide.

Extinguishing Techniques: Toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Do not use a solid stream of water, since the stream will scatter and spread the fire. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: Ethylene glycol monobutyl ether is a highly toxic and flammable liquid that may cause environmental contamination. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

ETHYLENE GLYCOL MONOBUTYL ETHER
Class 3 (Flammable Liquid) or Combustible Liquid

AIR RELEASE

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Ethylene glycol monobutyl ether may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ETHYLENE GLYCOL MONOBUTYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ETHYLENE GLYCOL MONOBUTYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ETHYLENE GLYCOL MONOETHYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Ethylene glycol monoethyl ether, also commonly known as 2-ethoxyethanol, is a colorless liquid with a mildly pleasant and sweetish odor. It is used as a solvent for resins in lacquers, for dyeing leathers and textiles, and in formulating cleaners and varnish removers. It is fully soluble in water. Its flash point of 110-120°F indicates that very high ambient temperatures or some amount of heating is required before the product can be ignited easily. Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions if ignited under such conditions. There is some limited potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.8 pounds per gallon.

Ethylene glycol monoethyl ether does not react with water and is stable in normal transportation. It is incompatible with oxidizing materials, should not be used with aluminum, zinc, magnesium or galvanized metals, and is known to attack some forms of plastics, rubber, and coatings. Toxic hazard of the product is relatively low to moderate in acute exposures, but some studies with animals have indicated the possibility of adverse reproductive effects due to chronic occupational exposures. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in acetone, diethyl ether, and ethyl alcohol.
Specific Gravity (Liquid): 0.931 at 68°F (20°C)
Boiling Point: 275.2°F (135.1°C) at 1 atm.
Melting Point: -94°F (-70°C) (pour point)
Freezing Point:-94°F (-70°C) (pour point)
Molecular Weight: 90.12
Heat of Combustion: -7400 cal/g (est.)
Vapor Pressure: 4 mm Hg (0.0773 psia) at 68°F (20°C)
Flash Point: 110-120°F (43.3-48.9°C), closed cup; 118°F (47.8°C), open cup.
Autoignition Temperature: 455°F (235°C)
Burning Rate: 2.4 mm/minute
Stability: Stable
Corrosiveness: May attack some forms of plastics, rubber, and coatings. Avoid contact with aluminum, zinc, magnesium, and galvanized metals.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizing materials.

IDENTIFICATION

Shipping Names: Ethylene glycol monoethyl ether (USDOT and IMO)
Synonyms and Tradenames: 2-Ethoxyethanol; ethylene glycol ethyl ether; glycol monoethyl ether; Poly-Solv EE; Dowanol EE; Cellosolve; ethyl cellosolve; Ektasolve EE; emkanol; hydroxyether; Oxitol; Plastiazan 60.
Chemical Formula: $HOCH_2CH_2OCH_2CH_3$
Constituent Components(% each): 95% pure
UN/NA Designation: UN1171
IMO Designation: 3.3, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sweetish, mild, pleasant, ethereal
Common Uses: Solvent for resins in lacquers; used for dyeing leathers and textiles and formulating cleaners and varnish removers.

ETHYLENE GLYCOL MONOETHYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 25 ppm

Unusual Hazards: None

Short Term Exposure Limits(STEL): (Skin) 100 ppm for 15 minutes. (ACGIH) (Note: Deletion of STEL proposed.)

Time Weighted Average(TLV-TWA): (Skin) 50 ppm over each 8 hours of a 40 hour work week.(ACGIH) (Note: 5 ppm proposed.)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the relatively high vapor concentrations that may be present in the immediate spill area and immediately downwind. Ingestion and direct contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact of liquid ethylene glycol monoethyl ether with the skin only causes a mild irritation, but toxic amounts may possibly be absorbed through the skin. Contact with the eyes may result in immediate discomfort, some conjunctival irritation, and temporary irritation of the cornea.

Hazards of Inhalation: Vapors of ethylene glycol monoethyl ether are somewhat irritating to the eyes and nose. High concentrations in air may result in headache, nausea, injury to the lungs, kidneys and blood, and pulmonary edema with possibly severe consequences. Exposure to 1820 ppm in air for seven hours was fatal to 50% of mice in laboratory experiments.

Hazards of Ingestion: Data unavailable. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 1.7-1.8%

Upper Flammable Limit: 14-15.6%

Behavior in Fire: Combustible liquid. Will burn but may be somewhat difficult to ignite. May generate some amounts of flammable vapors upon release if heated. There is some limited potential that containers may rupture violently in fire.

Hazardous combustion products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of warmed liquid are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, or skin; headache or nausea.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

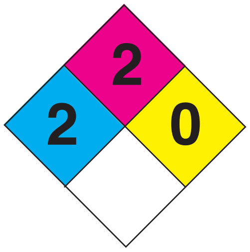
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

1171

ETHYLENE GLYCOL MONOETHYL ETHER

Class 3 (Flammable Liquid) or Combustible Liquid



FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam. Water spray may be used to dilute spills to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that the spilled product is a combustible liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... The spilled product may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of the chemical in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray may absorb chemical vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of chemical from contact with vapors in the atmosphere.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to the spilled product may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ETHYLENE GLYCOL MONOETHYL ETHER
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ALCOHOL FOAM ... There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Ethylene glycol monoethyl ether may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethylene glycol monoethyl ether may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the over all volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ETHYLENE GLYCOL MONOETHYL ETHER
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Carbon is of relatively low effectiveness.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

ETHYLENE GLYCOL MONOETHYL ETHER ACETATE

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Ethylene glycol monoethylether acetate is a colorless liquid with a pleasant, sweet, musty odor. It is used as a solvent or ingredient for lacquers, stains, adhesives, paints, coatings, and other products. Moderately stable in water and slightly lighter, it can be expected to form a floating surface or near-surface slick that rapidly dissolves. Its flash point of 124-130°F indicates that the product must be moderately heated or exposed to high ambient temperatures before it can be ignited easily. Accumulations of vapors in confined spaces such as sewers or buildings may result in explosions if ignited under such conditions. Containers have some potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.1 pounds per gallon.

Ethylene glycol monoethylether acetate does not react with water or many other common materials but is incompatible with strong oxidizers and strong alkalies. It is stable in normal transportation and should be of low to moderate toxicity under spill conditions likely to be encountered. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 23.9% at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, acetone, aromatic hydrocarbons, and ether.
Specific Gravity (Liquid): 0.975 at 68°F (20°C)
Boiling Point: 313-313.5°F (156.1-156.4°C) at 1 atm.
Melting Point: -79.1°F (-61.7°C)
Freezing Point: -79.1°F (-61.7°C)
Molecular Weight: 132.16
Heat of Combustion: -6000 cal/g (est.)
Vapor Pressure: 1.2-2.0 mm Hg (0.023-0.039 psia) at 68°F (20°C)
Flash Point: 124-130°F (52-54°C), closed cup; 117-135°F (47.2-57.2°C), open cup.
Autoignition Temperature: 715°F (379°C)
Burning Rate: Unavailable
Stability: Stable
Corrosiveness: Unavailable; shipped in steel containers.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizers and strong alkalies including nitrates and strong acids.

IDENTIFICATION

Shipping Names: Ethylene glycol monoethylether acetate (USDOT and IMO); 2-ethoxyethyl acetate (IMO).
Synonyms and Tradenames: Acetic acid, 2-ethoxyethyl ester; beta-or 2-ethoxyethyl acetate; cellosolve acetate; 2-ethoxyethanol acetate; ethoxy acetate; ethoxyethyl acetate; oxytol acetate; ethyl glycol acetate; glycol monoethyl ether acetate; Ektasolve EE acetate; glycol ether EE acetate; Poly-solv EE acetate.
Chemical Formula: $CH_3CO_2CH_2CH_2OC_2H_5$
Constituent Components(% each): 99% or more pure with traces of water and ethylene glycol monoethyl ether.
UN/NA Designation: UN1172
IMO Designation: 3.3, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pleasant, sweet, pungent, musty; like ester or ether.
Common Uses: Solvent or ingredient for nitrocellulose, oils, resins, lacquers, paints, coatings, stains, adhesives, varnish removers, and other products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYLENE GLYCOL MONOETHYL ETHER ACETATE

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Recognized at 0.25 ppm or less in air.

Unusual Hazards: Combustible hydrocarbon. There are some indications that it may cause adverse reproductive system effects in the occupational environment.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): (Skin) 50 ppm over each 8 hours of a 40 hour work week.(ACGIH) A 5 ppm TLV is being proposed.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of concentrated vapors. There are indications that the product may injure male reproductive systems and pregnant females, however, so it is wise to minimize any unnecessary exposures.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with the liquid product may cause moderate irritations, defatting, and dermatitis. The product is absorbed through the skin slowly. Contact with the eyes may cause severe irritation, redness, tearing and blurred vision, but only slight and reversible injury.

Hazards of Inhalation: High vapor concentrations in air may cause irritation of the eyes, nose, and respiratory tract. Very high levels (near saturation) in air may cause depression of the central nervous system with symptoms including dizziness, weakness, fatigue, nausea, headache, possible unconsciousness and even death. Blood changes and lung or kidney injury are also possible.

Hazards of Ingestion: Single oral doses are not considered very toxic but may cause gastrointestinal irritation, nausea, vomiting, and diarrhea. Significant ingestion may result in death.

FIRE HAZARDS

Lower Flammable Limit: 1.7%

Upper Flammable Limit: 6.7%

Behavior in Fire: Combustible liquid. Will burn but difficult to ignite unless heated. There is some potential that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: 1.8%; 1.24% at 199°F (93°C)

Upper Explosive Limit: 12.7% at 275°F (135°C)

Explosiveness: Explosion may result if vapors of warm liquid are ignited in a confined area. There is some potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

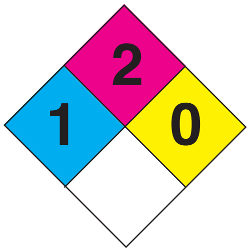
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (2500 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use of limitations these devices.

1172

ETHYLENE GLYCOL MONOETHYL ETHER ACETATE

Class 3 (Flammable Liquid) or Combustible Liquid



FIRST AID

Nonspecific Symptoms: Eye, nose, respiratory tract, or gastrointestinal irritation; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if there is skin irritation.

First Aid for Ingestion: If victim is conscious, administer two glasses of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting not be induced if immediate medical attention is available.)

FIRE RESPONSE

Extinguishing Materials: Water spray, alcohol foam, carbon dioxide, dry chemical.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spill product. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... This product may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of the chemical in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to chemical vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of chemical from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ETHYLENE GLYCOL
MONOETHYL ETHER ACETATE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of chemical vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if the response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... The product may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

ETHYLENE GLYCOL MONOETHYL ETHER ACETATE

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other substances compatible with the chemical.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Ethyleneimine is a highly toxic, colorless and flammable liquid that is fully soluble in water and has a strong pungent fishy odor resembling ammonia. The toxicity of the product is extremely high by all routes of exposure and is also a potential carcinogen. It has a wide flammable range. It is used for oil refining, textile treatment, ion exchange, and making protective coatings, pharmaceuticals, adhesives, surfactants, polymer stabilizers, and other products and chemicals. Its low flash point indicates it may be easily ignited under most ambient temperature conditions. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below). The product weighs approximately 6.9 pounds per gallon.

Ethyleneimine reacts with water in a non-hazardous fashion. Excessive heat or the presence of silver, aluminum, other catalytically active metals, acids, acid-forming materials, chloride ions, oxidizers (possibly), or carbon dioxide (possibly) may result in self-polymerization with violent rupture of its container. The liquid usually contains inhibitors to prevent polymerization. Reactions with silver, chlorine, or sodium hypochlorite may form explosive compounds, and ethyleneimine is also reactive with a variety of other chemicals. It is a corrosive substance but is compatible with a number of materials of construction described below. Products of combustion include toxic oxides of nitrogen, carbon monoxide, and other toxic constituents.

If ethyleneimine is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. (Note: Large discharges may require evacuation over considerable downwind distances.) If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in alcohol, ether, acetone, benzene, and most other organic solvents.

Specific Gravity (Liquid): 0.832 at 68ºF (20ºC)

Vapor Density: 1.5

Boiling Point: 131 - 134.6ºF (55 - 57ºC) at 1 atm.

Melting Point: -108.4ºF (-78ºC) or -96.7 to -95.8ºF (-71.5 to -71ºC); reported values vary.

Freezing Point: See melting point

Molecular Weight: 43.07

Heat of Combustion: -8850 cal/g

Evaporation Rate: Unavailable

Vapor Pressure: 160 mmHg (3.093 psia) at 68ºF (20ºC)

Flash Point: 12ºF (-11.1ºC), closed cup; -4 to 1ºF (-20 to -17.2ºC); open cup

Autoignition Temperature: 608 - 612ºF (320 - 322ºC)

Burning Rate: Unavailable

Flammable Limits: 3.3% (LEL) - 46-54.8% (UEL)

Stability: Stable in normal transportation but may polymerize violently upon excessive heating or if contaminated by certain materials.

Polymerization Potential: May polymerize violently in contact with acids, acid-forming materials, carbon dioxide, possibly oxidizers, silver, aluminum, other catalytically active metals, or chloride ions.

Corrosiveness: Corrosive; may be stored and handled in tin, lead, low carbon steel, polyethylene, kel-f, and teflon. Avoid any and all contact with silver or aluminum.

Reactivity with Water: Mild non-hazardous reaction with some generation of heat.

Reactivity and Incompatibility: Forms explosive compounds with silver (including silver solder), chlorine, or sodium hypochlorite. Also reactive with acrolein, allyl chloride, carbon disulfide, epichlorohydrin, glyoxal, vinyl acetate, oxidizing agents, beta-propiolactone, and other materials.

IDENTIFICATION

Shipping Name(s): Ethyleneimine, inhibited (USDOT & IMO)

Synonyms and Tradenames: Ethylenimine; Aziridine; Azacyclopropane; Dimethyleneimine; Dimethylenimine; Dihydroazirene; Dihydroazirine; Aminoethylene; Azirane; Aziran; Vinylamine; Ethirydine; Dihydro-1h-azirine

CAS Registry No.: 151-56-4

Chemical Formula: C_2H_5N (ring structure)

Constituent Components (% each): Approximately 99% pure; contains pellets or lumps of sodium hydroxide to inhibit polymerization.

UN/NA Designation: UN1185

IMO Designation: 6.1, Toxic substances

RTECS Number: KX5075000

NFPA 704 Hazard Rating: 4(Health): 3(Flammability): 3(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Like ammonia or amine; intense; fishy; pungent.

Reportable Quantity: See appendix I.

Common Uses: Fuel oil and lubricant refining; ion exchange; making coatings, pharmaceuticals, adhesives, surfactants, polymer stabilizers, and other chemicals. Several applications for treating textiles.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Approximately 2 ppm.

Unusual Hazards: Potential carcinogen. Wide range of flammability. Highly toxic, flammable, reactive, and relatively volatile liquid. May polymerize violently if exposed to excessive heat or contaminated by various materials. Vapors are not inhibited and may form polymers in vents or flame arresters resulting in stoppage.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.5 ppm (ACGIH)

Ceiling (C) Limit: Unavailable

IDLH: 100 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Ethyleneimine is an extremely toxic substance that attacks the body in many ways, is a suspected human carcinogen, and may also have mutagenic and teratogenic effects. All exposures to this substance should be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid ethyleneimine may result in severe blisters and slow healing burns. The product can be absorbed through the skin extremely rapidly in toxic amounts causing various effects of ingestion or inhalation and may on occasion cause sensitization of the skin. Burns may be painless (at least initially). Some effects may be delayed. Contact with the eyes may cause burns, corneal necrosis, conjunctival scarring, permanent eye damage, and even death.

Hazards of Inhalation: Vapors of ethyleneimine are extremely irritating to the eyes (effects may get worse over several hours after exposure), mucous membranes, nose, throat, and upper respiratory tract. Inhalation may result in sore throat, swelling of the face, persistent coughing, nausea, vomiting, headache, dizziness, difficult breathing, laryngeal edema, delayed lung injury and congestion, bronchitis, hemorrhage, effects on blood constituents, kidney damage, pulmonary edema, bronchial pneumonia, convulsions, and death. Several effects may be delayed in onset. A concentration of 5 ppm in air causes severe discomfort and irritation in 30 minutes. A 10-minute exposure to 2236 ppm was lethal to 50% of mice in laboratory experiments. Levels ranging from 50 to 1500 ppm were lethal to 50% of a variety of animals exposed for 30 minutes.

Hazards of Ingestion: Ethyleneimine is highly toxic if ingested. Effects may include burns of the mouth and throat, scarring of the esophagus, kidney and liver injury, damage to the rods and cones of the retina leading to blindness, other symptoms associated with inhalation, and death.

FIRE HAZARDS

Lower Flammable Limit: 3.3% (or possibly 3.6%); reported values vary.

Upper Flammable Limit: 46% (or possibly 54.8%); reported values vary.

Behavior in Fire: Flammable liquid. May generate large quantities of flammable and highly toxic vapors upon release. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in explosive polymerization.

Hazardous Combustion Products: Not well defined; may include toxic oxides of nitrogen, carbon monoxide, and other toxic substances.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat may cause spontaneous violent polymerization resulting in explosion. Explosive polymerization may also occur in presence of acids, acid-forming materials, possibly carbon dioxide, possibly oxidizers, silver, aluminum, other catalytically active metals, or chloride ions. Contact with other chemicals such as silver, chlorine, or sodium hypochlorite may result in formation of explosive mixtures.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

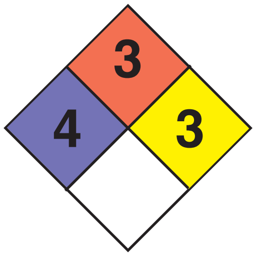
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas-tight safety goggles, and other impervious and resistant clothing. Tychem® 10,000 is reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece.

1185

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, headache, dizziness, nausea, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Authorities disagree on whether or not vomiting should be induced, probably due to the possibility that aspiration into the lungs during vomiting may lead to pulmonary edema or other injury. Seek immediate medical advice on this issue where possible.)

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, alcohol resistant foam. There are indications that carbon dioxide should not be used but this is uncertain. Water may be ineffective but may be used to dilute spill to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear self-contained breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Take into consideration the highly toxic nature of ethyleneimine while planning the response. Downwind evacuation should be considered. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Take the volatile, flammable, reactive, and highly toxic nature of ethyleneimine into account when planning the response.

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyleneimine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of ethyleneimine from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid ethyleneimine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL RESISTANT FOAM . . . There is a possibility that alcohol resistant foam applied to the surface of liquid pools may slow the release of ethyleneimine vapors into the atmosphere. The fact that alcohol resistant foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Ethyleneimine may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined ethyleneimine may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, soda mix (90-10), commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

ETHYLENEIMINE, INHIBITED

Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. Cationic exchangers may be used for neutral or acidic solutions.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 1992

ETHYLENE OXIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Ethylene oxide is a gas or extremely volatile colorless liquid with the relatively low boiling point of 51.1°F. It has a sweet ether-like odor and is used as a fumigant, fungicide, sterilization agent, and intermediate for making drugs, pesticides, antifreeze, plastics, and other chemicals. It is fully soluble in water. Its flash point of well below 0°F indicates that this product may easily be ignited under all ambient temperature conditions. Its low boiling point suggests that the liquid will boil or otherwise rapidly evaporate when spilled, thus evolving large amounts of vapor. The vapors are irritating to the eyes, skin and respiratory system. Prolonged contact with the skin may result in delayed burns. These vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, or depressions. Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions if ignited and there is also some known potential for explosions involving unconfined vapor clouds. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The liquid weighs approximately 7.2 pounds per gallon.

Ethylene Oxide reacts slowly with water in a nonhazardous fashion. Excessive heat or the presence of highly active catalytic surfaces, acidic or alkaline materials, or metal oxides or chlorides may result in self-polymerization with violent rupture of its container, however, and the product is otherwise reactive with a variety of chemicals. It is not considered to be highly corrosive but copper, silver, mercury, or magnesium and their alloys should not be used. The product is of moderate to high toxicity and is suspected of being a carcinogen. Products of combustion are hazardous and irritating.

If material is leaking (not on fire), evacuate for a radius of 2500 feet. If a fire is prolonged or uncontrollable, or if a container is exposed to direct flame, evacuate for a radius of 5000 feet for protection from flying debris if the container should rupture violently.

Note: the material has to be diluted on the order of 24 to 1 with water before the liquid loses its flammability. If contaminated, it may polymerize violently with evolution of heat and rupture of its container. The vapors may burn inside a container.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.881 at 50°F (10°C)
Boiling Point: 51.1°F (10.6°C) at 1 atm.
Melting Point: –167.8°F (–111°C)
Freezing Point: 170.7°F (–112.6°C)
Molecular Weight: 44.05
Heat of Combustion: –6380 cal/g
Vapor Pressure: 1.43 atm (21.1 psia) at 68°F (20°C)
Flash Point: Less than 0°F (–17.8°C)
Autoignition Temperature: 804°F (428.9°C) in air; 1060°F (571.1°C) without air.
Burning Rate: 3.5 mm/minute
Stability: Stable, but may polymerize under conditions described above.
Corrosiveness: Noncorrosive, but do not use copper, silver, mercury, or magnesium or their alloys. Do not use neoprene, natural rubber, or asbestos gasket materials to seal containers.
Reactivity with Water: *Slow,* nonhazardous
Reactivity with Other Chemicals: Reacts with acids; bases; alcohols; magnesium perchlorate; mercaptans; potassium; highly active catalytic surfaces such as anhydrous iron, tin and aluminum chlorides, pure iron and aluminum oxides and alkali metal hydroxides; and other metal oxides and chlorides.

IDENTIFICATION

Shipping Names: Ethylene oxide (USDOT and IMO)
Synonyms and Tradenames: 1,2-Epoxyethane; oxirane; dihydrooxirene; dimethylene oxide; epoxyethane; ethneoxide; ethyloxide; oxyacyclopropane; oxane; oxidoethane; oxyfume 12; anprolene; T-gas; EO; EtO.
Chemical Formula: $-CH_2CH_2-O$
Constituent Components (% each): 99.9 –100% pure with trace of nitrogen
49 STCC: 49 201 08
UN/NA Designation: UN1040
IMO Designation: 2.3, Poison Gas
Physical State as Shipped: Gas or Liquid.
Physical State as Released: Liquid or gas (boils at 51.°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, pungent, ether-like
Common Uses: Fumigant for foods and textiles; agricultural fungicide; sterilization of surgical equipment; mfg. of drugs, pesticides, plastics, antifreeze, and other chemicals

ETHYLENE OXIDE
Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** 0.8–700 ppm; reported values vary widely.

Unusual Hazards: Extremely volatile flammable liquid with heavier than air vapors that may travel considerable distance to a source of ignition. May polymerize violently in container if exposed to heat, acidic or alkaline materials, metal oxides or chlorides, or highly active catalytic surfaces. Vapors may persist in pits, hollows, or depressions. Liquid may burn in closed containers if ignited. Some mixtures of ethylene oxide and water will burn.

Short Term Exposure Limits (STEL): unavailable

Time Weighted Average (TLV-TWA): *10* ppm over each *8* hours of a 40 hour work week. (ACGIH) (Note: 1 ppm has been proposed.)

Conditions to Avoid: Heat, fire and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air, but direct contact and ingestion should also be strictly avoided. Ethylene oxide is suspected to be a human carcinogen in occupational exposures.

Hazards of* Skin *and Eye Contact: Contact of liquid ethylene oxide or contaminated leather or rubber with the skin may cause irritation, sensitization and characteristic burns (after a latent period of 1–5 hours) as well as the possibility of frostbite. The undiluted liquid or solutions may cause severe eye irritation or damage.

Hazards of Inhalation: Vapors of ethylene oxide irritate the eyes and respiratory tract and may cause a peculiar taste. High concentrations in air cause central nervous system depression with effects including headache, nausea, vomiting, difficult breathing, cyanosis, drowsiness, weakness, incoordination, unconsciousness, and possibly death. Many of these effects and resulting pulmonary edema may be delayed up to days. Exposure to 835 ppm for 4 hours was deadly to 50% of mice in laboratory experiments.

Hazards of Ingestion: Moderately toxic (see effects of inhalation); may cause sensitization.

FIRE HAZARDS

Lower Flammable Limit: 3%

Upper Flammable Limit: 100%

Behavior in Fire: Flammable liquid. Will generate large quantities of flammable vapors upon release. Vapors are heavier than air, may accumulate and persist in low areas, and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in explosive polymerization. Material can burn in sealed containers if ignited.

Hazardous Combustion Products: Unknown, but considered hazardous and irritating.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. There is some known potential for explosions involving unconfined vapor clouds. Excessive heat or chemical contamination may cause spontaneous polymerization resulting in violent container rupture (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact and any possibility of skin contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, nitrile rubber, and chlorinated polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1040

ETHYLENE OXIDE
Division 2.3 (Poison Gas)

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or respiratory tract; symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: Do not use hot water if frostbite has occurred.)

***First Aid for* Ingestion:** If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of warm water to pools of liquid ethylene oxide may increase vapor evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile, flammable, and heavier than air nature of ethylene oxide into account while planning the response. Avoid use of materials listed in the Corrosiveness section.

AIR SPILL

TECHNIQUE

EVACUATION. . .Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethylene oxide spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYLENE OXIDE
Division 2.3 (Poison Gas)

TECHNIQUE

WATER FOG OR SPRAY. . .Water fog or spray applied to ethylene oxide vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. If water is warm and pools of pure liquid ethylene oxide are on the ground, apply water at a point downwind and do not allow it to contact such pools as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of ethylene oxide from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM... Alcohol foam applied to the surface of liquid pools may slow the release of ethylene oxide vapors into the atmosphere. (Note: AFFF is not very effective; fluoroprotein is fairly effective. Alcohol foams are best.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION... The rapid addition of flooding quantities of water to liquid ethylene oxide may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time, particularly if the water is warmer than the ethylene oxide.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethylene oxide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ethylene oxide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ETHYLENE OXIDE
Division 2.3 (Poison Gas)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques when air emissions may pose a downwind hazard.

October 1993

2-ETHYLHEXYL ACRYLATE
Combustible Liquid

GENERAL INFORMATION

2-Ethylhexyl acrylate, is a colorless, and only slightly volatile liquid with an odor variably described as pleasant, sweet, inoffensive, strong, acrid, musty, sharp, and objectionable. The liquid is very slightly soluble in water and lighter, so may be expected to form a floating surface slick that dissolves into water and evaporates into air at very slow rates. This substance must be preheated before it can be easily ignited. Vapors evolved from liquid 2-ethylhexyl acrylate heated above its flash point may travel some distance to a source of ignition and flash back. Similarly, accumulations of such vapors may explode if ignited in confined spaces such as buildings or sewers. The product weighs approximately 7.4 pounds per gallon.

2-Ethylhexyl acrylate does not react with water or many other common materials and is stable in normal transportation, provided it is inhibited to prevent self-polymerization which may result in violent or explosive rupture of closed containers. Such polymerization can occur if the product is exposed to excessive heat, excessive sunlight or x-rays, or various contaminants; has an insufficient concentration of inhibitor present; or is stored in the absence of air. It may attack many forms of plastics, rubber, and coatings. Toxicity of the material is low to moderate by direct contact and ingestion; its toxicity by inhalation has not been studied sufficiently to permit full characterization but generally appears low. Products of combustion are reported to include acrid smoke and irritating fumes.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if 2-ethylhexyl acrylate is leaking or otherwise venting from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble.

Solubility in Other Chemicals: Not available.

Specific Gravity (Liquid): 0.885 - 0.887 at 68°F (20°C).

Boiling Point: 416.3 - 424.4°F (213.5 - 218°C) at 1 atm.

Melting Point: - 130°F (- 90°C).

Freezing Point: See melting point.

Molecular Weight: 184.3.

Heat of Combustion: - 8,600 cal/g.

Vapor Pressure: 0.10 - 0.14 mm Hg (0.0019 - 0.0027 psia) at 68°F (20°C); 1.0 mm Hg (0.0193 psia) at 122°F (50°C).

Flash Point: 175 -189°F (79.4 - 87.2°C); closed-cup; 180 - 200°F (82.2 - 93.3°C); open-cup.

Autoignition Temperature: 485 or 496°F (252 or 258°C).

Burning Rate: 4.6 mm/minute.

Stability: Stable in normal transportation when properly inhibited. Excessive heat, exposure to sunlight (ultraviolet light) or x-rays, or contamination by certain chemical substances may result in an exothermic and potentially violent self-polymerization reaction that may result in violent or explosive rupture of a closed container.

Corrosiveness: Suitable materials are reported to include aluminum, steel, and stainless steel by one maker of the product. May attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: The oxygen found in air helps to inhibit polymerization but 2-ethylhexyl acrylate is not compatible with pure oxygen. Contaminants that initiate violent polymerization reactions include free radical initiators, organic and other peroxides, oxidizers and other polymerization initiators. The substance is also said to be incompatible with reducing agents, strong acids, bases (alkalis), or halogens.

IDENTIFICATION

Shipping Names: Combustible liquid, n.o.s. (2-ethy1hexyl acrylate).

Synonyms and Tradenames: Acrylic acid, 2-ethylhexyl ester; EHA; 2-ethylhexyl acrylate; 2-ethylhexyl-2-propenoate; 1-hexanol, 2-ethyl-, acrylate; octyl acrylate; and 2-propenoic acid, 2-thylhexyl ester.

Chemical Formula: $CH_2{=}CHCOOCH_2CH(CH_2H_5)C_4H_9$.

Constituent Components (% each): Apparently 99% or more pure with remainder consisting of other ester adducts and possibly other substances.

UN/NA Designation: NA1993.

IMO Designation: Not regulated.

Physical State As Shipped: Liquid.

Physical State As Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Variably described as pleasant; sweet; inoffensive; strong, acrid, and musty; sharp; and objectionable.

Common Uses: Used for paper treatment and to make plastics, protective coatings, and water-based paints.

2-ETHYLHEXYL ACRYLATE
Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.05 to 0.2 ppm

Unusual Hazards: Various conditions may initiate an exothermic self-polymerization reaction that may result in violent or explosive rupture of a closed container, potentially releasing large amounts of hot unpolymerized vapors and mists into the atmosphere if a source of ignition is not encountered. Vapors may possibly be uninhibited and form polymers in vents or flame arresters, resulting in stoppage of flow. Use of water or foam on fires must be undertaken carefully to avoid frothing, spattering, and potential tank boilover hazards.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established by a recognized authority. Two major manufacturers recommend a TWA of 5 ppm over each 8 hours of a 40 hour work week in their respective MSDS documents.

Ceiling (C) Limit: Not established

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; oxygen-free atmospheres in containers; long-term storage; and other conditions that may result in self-polymerization.

HEALTH HAZARDS

Public Health Hazards: Unless this material undergoes an exothermic reaction (polymerization) there appears to be little risk to anyone not in the immediate spill area. The odor of the chemical may be detected far further downwind than it is harmful in short-term exposures. There will be a risk downwind if an uncontrolled exothermic reaction takes place which result in container rupture & the release of massive amounts of hot vapors & mists.

Hazards of Skin or Eye Contact: Although information in the literature is inconsistent, contact of liquid 2-ethylhexyl acrylate with the eyes appears to have the potential to cause severe irritation and possible injury which is likely to be temporary. Vapors of the liquid are likely to be irritating. Brief contact of the skin with liquid 2-ethylhexyl acrylate may cause minimal irritation, if any, but prolonged contact may result in smarting, irritation (possibly severe), inflammation, and/or swelling. The skin of some susceptible people may become sensitized, particularly upon repeated exposure, such that they become allergic. Liquid 2-ethylhexyl acrylate can be absorbed through intact skin but at such a slow rate that a single exposure, unless massive and prolonged, is not likely to result in significant intoxication. Contact lenses should not be worn when working with this material.

Hazards of Inhalation: Vapors and mists of 2-ethylhexyl acrylate appear to be irritating to the nose, throat, upper respiratory tract, and lungs; prolonged and/or repeated overexposure may result in damage to these organs. Symptoms of excessive exposure are reported to include drowsiness, headache, convulsions, incoordination, coughing, difficult breathing, increased rate of respiration, and pulmonary edema which may be delayed in onset and have severe consequences. The saturated vapor concentration directly over a pool of liquid 2-ethylhexyl acrylate is about 131 - 184 ppm at 68°F (20°C) and 1315 ppm at 122°F (50°C). Much greater concentrations and downwind hazards may be experienced, however, if a container in which an exothermic self-polymerization reaction is taking place ruptures or otherwise vents large amounts of hot vapors and mists into the atmosphere and these contaminants do not encounter a source of ignition.

Hazards of Ingestion: 2-Ethylhexyl acrylate is considered to be of low toxicity by ingestion. Excessive intake of the liquid may cause many of the effects of inhalation overexposure according to some authorities, as well as and including severe irritation of the mouth, throat and stomach, stimulation of the central nervous system, dizziness, nausea, vomiting, diarrhea, difficulty in breathing, nervousness, convulsions, collapse, paralysis, and/or death in extreme cases. The lowest single oral dose required to kill 50% of rats is 5.6 grams of liquid 2-ethylhexyl acrylate per kilogram of an animal's body weight.

FIRE HAZARDS

Lower Flammable Limit: 0.7 - 0.8%.

Upper Flammable Limit: 6.4 to 8.2%.

Behavior in Fire: Combustible liquid. Requires preheating to be easily ignited. May generate flammable vapors upon release when at a temperature at or above its flash point. Such vapors may travel to a source of ignition and flash back. Heat can cause a violent self-polymerization reaction with rapid release of energy, causing sealed containers to rupture violently or explosively and to possibly rocket.

Hazardous Combustion Products: Not well-defined; reported to produce acrid smoke and irritating fumes including but not limited to carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

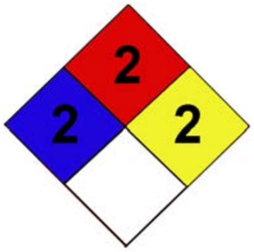
Explosiveness: Explosion may result if vapors from liquid 2-ethylhexyl acrylate at or above its flash point are ignited in a confined area. Containers may rupture violently or explosively and possibly rocket in a fire. There is a possibility that contact with certain other chemicals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, vapor-tight safety goggles, and other impervious and resistant clothing for normal operations. Several authorities recommend use of fully encapsulating suits with self-contained breathing

1993

2-ETHYLHEXYL ACRYLATE
Combustible Liquid



PROTECTIVE CLOTHING AND EQUIPMENT *(CONTINUED)*

apparatus (SCBA) for protection during fire fighting or in emergency spill situations. Compatible materials for 2-ethylhexyl acrylate itself may possibly include butyl rubber, polyvinyl chloride (PVC), neoprene, and Teflon according to various information sources. Many factors affect the suitability of a material for any given application.

Respiratory Protection: For unknown concentrations, fire fighting, or general use, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). A gas mask with chin-style or front or back mounted organic vapor canister or a chemical cartridge respirator with a full facepiece and organic vapor cartridges) may be adequate for "normal" operations at times within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues; drowsiness, dizziness, headache, coughing, nausea, vomiting, diarrhea, difficult breathing, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing. At least one authority recommends that contaminated leather clothing be discarded.

First Aid for Ingestion: Advice in the literature is inconsistent. If victim is conscious and not convulsing, administer large quantities of water. Get medical attention immediately or advice of physician as to whether vomiting should be induced. (Note: The oral toxicity of 2-ethylhexyl acrylate has to weighed against the risk of pulmonary edema and other effects if aspiration into the lungs takes place during induction of vomiting. Since oral toxicity is low, the amount of liquid ingested will be an important deciding factor on how promptly action to empty the stomach should be taken) If vomiting is induced or occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective. Regular or alcohol foam may be effective to some degree. Application of water or foam as a direct stream onto burning 2-ethylhexyl acrylate may possibly result in potentially violent frothing or spattering; entry into burning tanks of the product may possibly result in violent frothing or boilover that may hazardous to nearby personnel. Apply water or foam as a spray with caution and from a distance at first.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to heat. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after the fire is out but do not direct water streams into burning containers. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines as necessary prior to use. Be advised that: 1) Adequate inhibitor is necessary to prevent an exothermic reaction; 2) inhibitors in 2-ethylhexyl acrylate monomer are more effective in the presence of oxygen in air; 3) it is necessary to maintain a space filled with air over liquid surfaces in all containers.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Since sufficient information indicating otherwise is not available, it is prudent to assume that 2-ethylhexyl

2-ETHYLHEXYL ACRYLATE
Combustible Liquid

AIR SPILL *(CONTINUED)*

acrylate discharges may expose downwind areas to toxic concentrations in certain cases, particularly if relatively large amounts have spilled in warm weather. Of greatest concern is a situation in which an uncontrolled exothermic self-polymerization reaction takes place in a container not exposed to fire or another source of ignition and the container either ruptures suddenly or otherwise spews out massive amounts of hot unpolymerized vapors and mists into the atmosphere, in which case evacuation distances may possibly have to be considerable.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION . . . Liquid 2-ethylhexyl acrylate may not evolve hazardous levels of airborne contaminants in some outdoor spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed, particularly if relatively small amounts have spilled and there is no danger of a polymerization reaction taking place in a large container of the substance.

CONSEQUENCE

Hazardous levels of 2-ethylhexyl acrylate may possibly be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to 2-ethylhexyl acrylate vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of 2-ethylhexyl acrylate from contact with its airborne vapors.

MITIGATION

Where deemed necessary, contain contaminated water and remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam (either regular or alcohol type) applied to the surface of liquid pools may slow the release of 2-ethylhexyl acrylate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid 2-ethylhexyl acrylate may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

2-ETHYLHEXYL ACRYLATE
Combustible Liquid

LAND SPILL *(CONTINUED)*

TECHNIQUE

PUMPINGNACUUM SUCTION. . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Improperly designed or contaminated equipment could contribute to the risk of a dangerous self-polymerization reaction taking place within the recovery equipment.

MITIGATION

Use equipment compatible with the spilled product. Ensure it is suitable for recovery and storage of 2-ethylhexyl acrylate.

TECHNIQUE .

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid 2-ethylhexyl acrylate will float on the surface of the water while very slowly evaporating into the atmosphere and dissolving into the water. Some vapors may evolve from the water surface and travel in the downwind direction as the contaminated water moves downstream. The substance is toxic to aquatic life and not very biodegradable.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of bypass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

2-ETHYLHEXYL ACRYLATE
Combustible Liquid

WATER SPILL *(CONTINUED)*

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, or small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating liquid 2-ethylhexyl acrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose a hazard to future users.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with 2-ethylhexyl acrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources. Note that noncombustible sorbents are preferred when available in order to reduce hazards in the event of afire.

TECHNIQUE

CONTAINMENT DIKES. . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

January 1990

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl mercaptan is a colorless to yellow flammable liquid that is highly volatile and has a strong offensive odor resembling skunk, decayed cabbage, and/or garlic at extremely low concentrations in air. It is used as an odorant in LPG and natural gas to provide a warning in the event of leaks and also has uses as an adhesive stabilizer and in making plastics, insecticides, pharmaceuticals, and antioxidants. Slightly soluble in water and lighter, ethyl mercaptan will form a floating surface slick on water that dissolves at a relatively slow rate while rapidly evaporating. Its flash point of approximately – 38°F indicates that the product is easily ignited under all ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7 pounds per gallon.

Ethyl mercaptan does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials, however; may evolve toxic fumes of sulfur oxides in contact with acids or acid fumes; and may be incompatible with a variety of other chemical substances. Toxicity by all potential routes of exposure is generally moderate but the volatility of the product indicates that high concentrations of ethyl mercaptan vapors may be present in air. Products of combustion may include highly toxic fumes of sulfur oxides such as sulfur dioxide as well as other toxic constituents.

If ethyl mercaptan is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.68–1.5 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, ether, acetone, and petroleum naphtha.
SpeciFic Gravity (Liquid): 0.839 at 68°F (20°C)
Boiling Point: 93.9–97.2°F (34.4–36.2°C) at 1 atm.
Melting Point: –234 to –227.9°F (–148 to –144.4°C)
Freezing Point: See melting point
Molecular Weight: 62.13
Heat of Combustion: –8300 cal/g
Vapor Pressure: 442 mm Hg (8.543 psia) at 68°F (20°C)
Flash Point: –38°F (–38.9°C), closed cup
Autoignition Temperature: 570–572°F (299–300°C)
Burning Rate: 5.7 mm/minute
Stability: Stable
Corrosiveness: Unavailable
Reactivity with Water: No reaction
Reactivity with Other Chemicals: May react violently or vigorously and possibly ignite in contact with calcium hypochlorite or other strong oxidizing materials; contact with acid or acid fumes may evolve highly toxic fumes of sulfur oxides; mercaptans in general are also usually reactive with alkaline earth metals, nitrides, peroxides, epoxides, strong reducing agents, and various other chemical substances.

IDENTIFICATION

Shipping Names: Ethyl mercaptan (USDOT and IMO)
Synonyms and Tradenames: Ethanethiol; ethyl sulfhydrate; ethylhydrosulfide; ethylthioalcohol; mercaptoethane; thioethyl alcohol; thioethanol
Chemical Formula: CH_3CH_2SH
Constituent Components (% each): 98.5% or more pure with remainder likely to contain other mercaptans and sulfides
49 STCC: 49 081 69
UN/NA Designation: UN2363
IMO Designation: 3.1, flammable liquid
Physical State As Shipped: Liquid
Physical State As Released: Liquid (boils at approx. 94–97°F)
Color of the Shipped Material: Colorless to yellow
Odor Characteristics: Like skunk, decayed cabbage, and/or garlic; very penetrating and persistent.
Common Uses: Leak warning odorant in LPG and natural gas; adhesive stabilizer; raw material or intermediate in making plastics, insecticides, pharmaceuticals, and antioxidants.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Extremely low; 100% odor recognition is as low as 1–2 parts per billion (ppb) in air for some unadapted persons.

Unusual Hazards: Highly volatile flammable liquid with heavier than air vapors that may persist in pits, hollows, and depressions. Offensive odor may travel very considerable distance from spill site.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.5 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in the immediate spill area and over some distances downwind. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid ethyl mercaptan may result in irritation. Contact of the eyes with liquid ethyl mercaptan may cause slight to moderate irritation.

Hazards of Inhalation: Exposure to ethyl mercaptan vapors in air may cause irritation of the eyes, nose, throat, and respiratory tract. Inhalation of higher concentrations may cause narcosis and central nervous system depression with symptoms including headache, nausea, increased respiration, weakness, incoordination, staggering gait, partial skeletal muscular paralysis, light to severe cyanosis, mild to heavy sedation, tremors, unconsciousness, respiratory paralysis, and possibly death. Exposures to near lethal levels in air may result in pulmonary edema that may be delayed in onset and that may also have severe consequences. Exposure of mice to 2770 ppm and rats to 4420 ppm in air for four hours resulted in death of 50% of the animals in laboratory experiments.

Hazards of Ingestion: Ethyl mercaptan is of relatively moderate oral toxicity. Effects of ingestion may resemble some of those of inhalation but also include the possibility of liver or kidney damage. Some effects may be delayed in onset. There is a possibility that aspiration into the lungs during vomiting may result in delayed in pulmonary edema and chemical pneumonitis with potentially severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 2.8%

Upper Flammable Limit: 18–18.2%

Behavior in Fire: Volatile flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fires.

Hazardous Combustion Products: Not well-defined but likely to include highly toxic sulfur oxides such as sulfur dioxide as well as carbon monoxide, carbon dioxide, and possibly other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

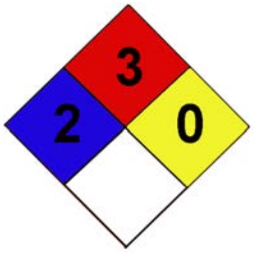
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. A maker of ethyl mercaptan lists PVC, neoprene, and butyl rubber as potentially compatible materials.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 25 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (25 ppm or less) or a chemical cartridge respirator with a full facepiece (25 ppm or less) within the use limitations of these devices.

2363

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, respiratory tract or skin; symptoms of central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Sources disagree on the proper response. Although one major authority makes the above recommendation, a maker of the product indicates that vomiting should not be induced. Seek immediate medical advice on this issue if possible, realizing that both courses of action pose various risks to the victim.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, Halon, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl mercaptan may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that ethyl mercaptan is a highly volatile flammable liquid that will boil at high ambient temperatures and that has heavier than air vapors. Note that tomato juice is reported to deodorize materials contaminated with this product.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl mercaptan spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Be advised, however, that ethyl mercaptan has an offensive odor at extremely low concentrations in air and that strong odors may be experienced at far downwind locations at concentrations that are well below those that cause significant toxic effects.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl mercaptan vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethyl mercaptan from contact with its airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of ethyl mercaptan vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethyl mercaptan may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethyl mercaptan may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, perlite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Even very low concentrations of ethyl mercaptan in water can cause taste or odor problems. Some or all of the oil spill type response measures that follow may not be effective where the product quickly leaves the water surface via evaporation and/or dissolution.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, or small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating ethyl mercaptan.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Commercial sorbent materials compatible with ethyl mercaptan may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1990

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl mercaptan is a colorless to yellow flammable liquid that is highly volatile and has a strong offensive odor resembling skunk, decayed cabbage, and/or garlic at extremely low concentrations in air. It is used as an odorant in LPG and natural gas to provide a warning in the event of leaks and also has uses as an adhesive stabilizer and in making plastics, insecticides, pharmaceuticals, and antioxidants. Slightly soluble in water and lighter, ethyl mercaptan will form a floating surface slick on water that dissolves at a relatively slow rate while rapidly evaporating. Its flash point of approximately – 38°F indicates that the product is easily ignited under all ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7 pounds per gallon.

Ethyl mercaptan does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials, however; may evolve toxic fumes of sulfur oxides in contact with acids or acid fumes; and may be incompatible with a variety of other chemical substances. Toxicity by all potential routes of exposure is generally moderate but the volatility of the product indicates that high concentrations of ethyl mercaptan vapors may be present in air. Products of combustion may include highly toxic fumes of sulfur oxides such as sulfur dioxide as well as other toxic constituents.

If ethyl mercaptan is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.68–1.5 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, acetone, and petroleum naphtha.

SpeciFic Gravity (Liquid): 0.839 at 68°F (20°C)

Boiling Point: 93.9–97.2°F (34.4–36.2°C) at 1 atm.

Melting Point: –234 to –227.9°F (–148 to –144.4°C)

Freezing Point: See melting point

Molecular Weight: 62.13

Heat of Combustion: –8300 cal/g

Vapor Pressure: 442 mm Hg (8.543 psia) at 68°F (20°C)

Flash Point: –38°F (–38.9°C), closed cup

Autoignition Temperature: 570–572°F (299–300°C)

Burning Rate: 5.7 mm/minute

Stability: Stable

Corrosiveness: Unavailable

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react violently or vigorously and possibly ignite in contact with calcium hypochlorite or other strong oxidizing materials; contact with acid or acid fumes may evolve highly toxic fumes of sulfur oxides; mercaptans in general are also usually reactive with alkaline earth metals, nitrides, peroxides, epoxides, strong reducing agents, and various other chemical substances.

IDENTIFICATION

Shipping Names: Ethyl mercaptan (USDOT and IMO)

Synonyms and Tradenames: Ethanethiol; ethyl sulfhydrate; ethylhydrosulfide; ethylthioalcohol; mercaptoethane; thioethyl alcohol; thioethanol

Chemical Formula: CH_3CH_2SH

Constituent Components (% each): 98.5% or more pure with remainder likely to contain other mercaptans and sulfides

49 STCC: 49 081 69

UN/NA Designation: UN2363

IMO Designation: 3.1, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid (boils at approx. 94–97°F)

Color of the Shipped Material: Colorless to yellow

Odor Characteristics: Like skunk, decayed cabbage, and/or garlic; very penetrating and persistent.

Common Uses: Leak warning odorant in LPG and natural gas; adhesive stabilizer; raw material or intermediate in making plastics, insecticides, pharmaceuticals, and antioxidants.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Extremely low; 100% odor recognition is as low as 1–2 parts per billion (ppb) in air for some unadapted persons.

Unusual Hazards: Highly volatile flammable liquid with heavier than air vapors that may persist in pits, hollows, and depressions. Offensive odor may travel very considerable distance from spill site.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.5 ppm over each *8* hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in the immediate spill area and over some distances downwind. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid ethyl mercaptan may result in irritation. Contact of the eyes with liquid ethyl mercaptan may cause slight to moderate irritation.

Hazards of Inhalation: Exposure to ethyl mercaptan vapors in air may cause irritation of the eyes, nose, throat, and respiratory tract. Inhalation of higher concentrations may cause narcosis and central nervous system depression with symptoms including headache, nausea, increased respiration, weakness, incoordination, staggering gait, partial skeletal muscular paralysis, light to severe cyanosis, mild to heavy sedation, tremors, unconsciousness, respiratory paralysis, and possibly death. Exposures to near lethal levels in air may result in pulmonary edema that may be delayed in onset and that may also have severe consequences. Exposure of mice to 2770 ppm and rats to 4420 ppm in air for four hours resulted in death of 50% of the animals in laboratory experiments.

Hazards of Ingestion: Ethyl mercaptan is of relatively moderate oral toxicity. Effects of ingestion may resemble some of those of inhalation but also include the possibility of liver or kidney damage. Some effects may be delayed in onset. There is a possibility that aspiration into the lungs during vomiting may result in delayed in pulmonary edema and chemical pneumonitis with potentially severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 2.8%

Upper Flammable Limit: 18–18.2%

Behavior in Fire: Volatile flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fires.

Hazardous Combustion Products: Not well-defined but likely to include highly toxic sulfur oxides such as sulfur dioxide as well as carbon monoxide, carbon dioxide, and possibly other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

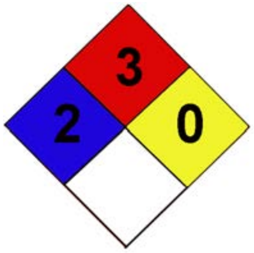
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. A maker of ethyl mercaptan lists PVC, neoprene, and butyl rubber as potentially compatible materials.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above *25* ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (25 ppm or less) or a chemical cartridge respirator with a full facepiece (25 ppm or less) within the use limitations of these devices.

2363

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, respiratory tract or skin; symptoms of central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Sources disagree on the proper response. Although one major authority makes the above recommendation, a maker of the product indicates that vomiting should not be induced. Seek immediate medical advice on this issue if possible, realizing that both courses of action pose various risks to the victim.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, Halon, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of ethyl mercaptan may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that ethyl mercaptan is a highly volatile flammable liquid that will boil at high ambient temperatures and that has heavier than air vapors. Note that tomato juice is reported to deodorize materials contaminated with this product.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ethyl mercaptan spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Be advised, however, that ethyl mercaptan has an offensive odor at extremely low concentrations in air and that strong odors may be experienced at far downwind locations at concentrations that are well below those that cause significant toxic effects.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl mercaptan vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethyl mercaptan from contact with its airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of ethyl mercaptan vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ethyl mercaptan may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained ethyl mercaptan may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, perlite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Even very low concentrations of ethyl mercaptan in water can cause taste or odor problems. Some or all of the oil spill type response measures that follow may not be effective where the product quickly leaves the water surface via evaporation and/or dissolution.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, or small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

ETHYL MERCAPTAN
Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating ethyl mercaptan.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Commercial sorbent materials compatible with ethyl mercaptan may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

ETHYL METHACRYLATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Ethyl methacrylate is a colorless flammable liquid with a sharp, unpleasant, acrid and fruity odor. It is slightly soluble in water and somewhat lighter, so it may form a floating surface slick that slowly dissolves in water while evaporating. It can be easily ignited under moderate to high ambient temperature conditions. At or above its flash point, vapors of ethyl methacrylate may be heavier than air, may persist for a time in low areas, and may travel some distance to a source of distance and flash back. Accumulation of such vapors in confined spaces such as buildings or sewers may explode if ignited. The product weighs approximately 7.63 pounds per gallon.

Ethyl methacrylate does not react with water or many other common materials and is stable in normal transportation, provided it is inhibited to prevent self-polymerization which may result in violent or explosive rupture of closed containers. Such polymerization can occur if the product is exposed to excessive heat, excessive light, or various contaminants; has an insufficient concentration of inhibitor present; or is stored in the absence of air. The substance is reported to be incompatible with strong oxidizing agents (including pure oxygen), strong acids, and strong bases. It is also likely to be incompatible in some fashion with members of many other major families of chemicals and may attack many forms of plastics, rubber, and coatings. Toxicity of the substance is low to moderate by all routes of exposure. Products of combustion are reported to include acrid smoke and irritating fumes.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if ethyl methacrylate is leaking or otherwise venting from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble.

Solubility in Other Chemicals: Soluble in acetone, ether, and ethyl alcohol.

Specific Gravity (Liquid): 0.9135 - 0.9151 at 68°F *(20°C).*

Boiling Point: 242.6 - 246.2°F (117 - 119°C) at 1 atm.

Melting Point: Below - 58°F (- 50°C).

Freezing Point: See melting point.

Molecular Weight: 114.14.

Heat of Combustion: - 7,040 cal/g.

Vapor Pressure: 15 mm Hg (0.2899 psia) at 68°F (20°C).

Flash Point: 60 - 80°F (15.6 - 26.7°C), closed-cup; 68 - 85°F (20 - 29.4°C), open-cup.

Autoignition Temperature: 740 or 771°F (393 or 411°C).

Burning Rate: 4.6 mm/minute.

Stability: Stable in normal transportation when inhibited. Excessive heat, excessive exposure to sunlight (ultraviolet light) or x-rays, or contamination by certain chemical substances may cause a potentially violent self-polymerization reaction that may result in violent or explosive rupture of a closed container.

Corrosiveness: Suitable materials are reported to include aluminum, glass, and types 304 and 316 stainless steel. It may be corrosive to mild steel. It may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: The oxygen found in air helps to inhibit polymerization but ethyl methacrylate is not compatible with pure oxygen. Contaminants that initiate violent polymerization reactions include azoisobutyronitrile, dibenzoyl peroxide, di-tert-butylperoxide, and potentially a wide variety of other substances including oxidizers, free radical initiators, and other organic peroxides. It is said to be otherwise incompatible with strong acids and strong bases.

IDENTIFICATION

Shipping Names: Ethyl methacrylate.

Synonyms and Tradenames: Ethyl alpha-methyl acrylate; ethyl 2-methacrylate; ethyl methacrylate monomer; ethyl methyl acrylate; ethyl 2-methyl-2-propenoate; methacrylic acid, ethyl ester; 2-methyl-2-propen-oic acid, ethyl ester; and 2-propenoic acid, 2-methyl-, ethyl ester.

Chemical Formula: $CH_2{=}C(CH_3)COOCH_2CH_3$.

Constituent Components (% each): Typically 98% or more pure with the remainder consisting of methacrylic acid, methyl methacrylate, other ester adducts, and/or traces of water.

UN/NA Designation: UN2277.

IMO Designation: 3, flammable.

Physical State As Shipped: Liquid.

Physical State As Released: Usually liquid; some products may solidify at very cold ambient temperatures.

Color of the Shipped Material: Colorless.

Odor Characteristics: Sharp, unpleasant, acrid, and fruity.

Common Uses: Used to make polymers and plastics (including Plexiglass); used to make paints, coatings, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

ETHYL METHACRYLATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Data not available. Thresholds in the range of 0.19 to 0.21 ppm have been reported for the similar methyl methacrylate.

Unusual Hazards: Various conditions may initiate an exothermic self-polymerization reaction that may result in violent or explosive rupture of a closed container, potentially releasing large amounts of hot unpolymerized vapors and mists into the atmosphere if a source of ignition is not encountered. Vapors may possibly be uninhibited and form polymers in vents or flame arresters, resulting in stoppage of flow.

Short Term Exposure Limit (STEL): Not established by a recognized authority. One manufacturer recommends a STEL of 75 ppm for 15 minutes in its MSDS.

Time Weighted Average (TWA) Limit: Not established by a recognized authority. One major manufacturer recommends a TWA of 25 ppm in its MSDS while another suggests a TWA of 50 ppm; both over each 8 hours of a 40 hour work week.

Ceiling (C) Limit: Not established

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; oxygen-free atmospheres in containers; exposure of the product to light or x-rays; contamination; long-term storage.

HEALTH HAZARDS

Public Health Hazards: The odor of this chemical may be smelled far further downwind than it is harmful in short-term exposures. One hazard is from inhalation of the vapor concentrations that may be present in air in the spill area and over some distance downwind due to a discharge. Of great concern would be a situation in which an uncontrolled exothermic self-polymerization reaction takes place in a container not exposed to fire or another source of ignition and the container either ruptures violently or otherwise spews out massive amounts of hot vapors and mists into the atmosphere. Be advised that this material is a suspected teratogen and mutagen.

Hazards of Skin or Eye Contact: Contact of the eyes with liquid ethyl methacrylate may result in moderate irritation, discomfort, lacrimation, and blurring of vision. Vapors of this substance are also irritating to the eyes. Contact of the skin with the liquid may result in slight irritation, discomfort and a possible rash. Analogy with other acrylic monomers indicates the possibility that severe irritation, inflammation, and possibly even severe tissue damage may occur if the liquid is confined against the skin such as by clothing for a prolonged period of time. The skin of some susceptible people may become sensitized to ethyl methacrylate such that they become allergic. Liquid ethyl methacrylate can be absorbed through intact skin but at such a slow rate that a single exposure, unless massive and prolonged, is not likely to result in significant intoxication. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Vapors and mists of ethyl methacrylate irritate the nose, throat, and upper respiratory passages. Excessive exposures may cause symptoms which variably include coughing, wheezing, laryngitis, dizziness, headache, confusion, lightheadedness, incoordination, weakness, drowsiness, nausea, vomiting, shortness of breath, rapid respiration, possibly lowered blood pressure possibly decreased heart rate, unconsciousness, and possibly death in very extreme cases (as a result of respiratory failure). Repeated exposures may cause slightly increased red blood cell counts. Be advised that other acrylic monomers have been known to cause pronounced lung irritation or pulmonary edema upon overexposure, the latter of which is often delayed in onset. The lowest concentration of ethyl methacrylate vapors that resulted in the death of rats from 3 hour exposures was 15,000 ppm; 50% of rats died when exposed to 8300 ppm for 4 hours. The saturated vapor concentration directly over a pool of liquid ethyl methacrylate is about 19,735 ppm at 68°F (20°C). Much greater concentrations and downwind hazards may be experienced, however, if a container in which a self-polymerization reaction is taking place ruptures or otherwise vents large amounts of hot vapors and mists into the atmosphere and these do not encounter a source of ignition.

Hazards of Ingestion: Ethyl methacrylate is of low to moderate toxicity by ingestion. Excessive intake of the liquid may cause many of the effects of overexposure by inhalation as well as and including irritation of the mouth and stomach, corrosion of the walls of the stomach, weakness, labored and irregular respiration, a drop in blood pressure, unconsciousness and possibly death as a possible result of respiratory failure when large amounts have been ingested. The single oral doses required to kill 50% of rats are in the range of 13.3 to 14.8 grams of ethyl methacrylate per kilogram of an animal's body weight. One authority estimates a human fatal dose of 5.4 g/kg.

FIRE HAZARDS

Lower Flammable Limit: 1.8%.

Upper Flammable Limit: Saturated vapor concentration; temperature unspecified.

Behavior in Fire: Flammable liquid. May possibly generate large amounts of flammable vapors upon release. Such vapors may travel some distance to a source of ignition and flash back. Heat can cause a violent self-polymerization reaction with rapid release of energy, causing sealed containers to rupture violently or explosively and to possibly rocket.

Hazardous Combustion Products: Not well-defined; simply reported to produce acrid smoke and irritating fumes including but not limited to carbon monoxide and carbon dioxide.

2277

ETHYL METHACRYLATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS *(CONTINUED)*
EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors from liquid ethyl methacrylate at or above its flash point are ignited in a confined area. Containers may rupture violently or explosively and possibly rocket in a fire. There is a possibility that contact with certain other chemicals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, vapor-tight safety goggles, and other impervious and resistant clothing. Various authorities recommend use of fully encapsulating suits with self-contained breathing apparatus (SCBA) for protection during fire fighting. Compatible materials for ethyl methacrylate itself may include butyl rubber and polyvinyl alcohol. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: For unknown concentrations, fire fighting, or general use, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). A gas mask with chin-style or front or back mounted organic vapor canister or a chemical cartridge respirator with a full facepiece and organic vapor cartridges) may be adequate for "normal" operations at times within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues; coughing, drowsiness, headache, incoordination, weakness, nausea, vomiting, unusual breathing, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Limited data are available. Get medical attention immediately or advice from physician as to whether water should be administered and/or vomiting induced. If vomiting is induced or occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective. Regular or alcohol foam may be effective to some degree.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to heat. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Ethyl methacrylate discharges may expose downwind areas to toxic and possibly flammable

ETHYL METHACRYLATE
Class 3 (Flammable Liquid)

AIR SPILL *(CONTINUED)*

concentrations over considerable distances in some cases, particularly if relatively large amounts have spilled in warm weather. Of the highest concern is a situation in which an uncontrolled self-polymerization reaction takes place in a container not exposed to fire or another source of ignition and the container ruptures suddenly or otherwise spews out massive amounts of hot vapors and mists into the atmosphere, in which case evacuation distances may possibly have to be very considerable.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION . . . Liquid ethyl methacrylate may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in certain cases to simply monitor the situation until the spilled product is removed, particularly if relatively small amounts have spilled in cool weather and there is no danger of a polymerization reaction taking place in a large container of the substance.

CONSEQUENCE

Hazardous levels of ethyl methacrylate may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately d***ownwind.***

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethyl methacrylate vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of ethyl methacrylate from contact with its airborne vapors.

MITIGATION

Where deemed necessary, contain contaminated water and remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam (either regular or alcohol type) applied to the surface of liquid pools may slow the release of ethyl methacrylate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid ethyl methacrylate may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fare-hose runoff' or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

LAND SPILL *(CONTINUED)*

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Improperly designed or contaminated equipment could contribute to the risk of a dangerous self-polymerization reaction taking place within the recovery equipment.

MITIGATION

Use equipment compatible with the spilled product. Ensure it is suitable for recovery and storage of ethyl methacrylate.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL. . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors present in the area may be ignited by motorized equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid ethyl methacrylate will float on the surface of the water while simultaneously evaporating at some slow rate into the atmosphere and dissolving at a fairly slow rate into the water. Note that potentially flammable and toxic vapors may evolve from the water surface for a time and travel in the downwind direction as the contaminated water moves downstream.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

ETHYL METHACRYLATE
Class 3 (Flammable Liquid)

WATER SPILL *(CONTINUED)*

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating liquid ethyl methacrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose a hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with ethyl methacrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources. Note that noncombustible sorbents are preferred when available to reduce hazards in the event of a fire.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

FERRIC CHLORIDE SOLUTION
Class 8 (Corrosive Material)

GENERAL INFORMATION

Ferric chloride is a greenish black, yellow orange, or brown solid that may be shipped as a brownish orange acidic solution in water. The solution has a faint odor of hydrochloric (muriatic) acid and is used as a flocculant, catalyst, pigment, etching agent, feed additive, and mordant. It is fully soluble in water and is not flammable. It weighs approximately 11.6 pounds per gallon, but this may vary with the amount of ferric chloride in solution, as may other properties given in this guide (given for greater than 50% solutions.)

Ferric chloride solutions do not react with water and are stable in normal transportation. They are corrosive to most metals and violently reactive with certain chemicals. They are also irritating and possibly corrosive to bodily tissues. Toxic chlorides may be evolved when solutions are heated.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol
Specific Gravity (Liquid): 1.396 at 86°F (30°C)
Boiling Point: 599°F (315°C)
Melting Point: below –58°F (–50°C)
Freezing Point: below –58°F (–50°C)
Molecular Weight: 162.21 (ferric chloride)
Heat of Combustion: Not flammable
Vapor Pressure: Unavailable
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: Corrosive to most metals
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts violently with allyl chloride, sodium, potassium, and ethylene oxide; also reacts with acids, sulfur, and oxidizable materials.

IDENTIFICATION

Shipping Names: Ferric chloride solution (USDOT and *IMO)*
Synonyms and Tradenames: Iron trichloride; iron (III) chloride; iron chloride; iron muriate.
Chemical Formula: $FeC1_3$ (ferric chloride)
Constituent Components(% each): Ferric chloride in water
49 STCC: 49 323 42; 49 323 43
UN/NA Designation: UN2582
IMO Designation: 8, corrosive
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Orange-brown solution
Odor Characteristics: Faint odor of hydrochloric acid; sharp, pungent, irritating.
Common Uses: Flocculant for sewage and industrial waste; catalyst; pigment; etching agent for engraving, photography, electronics; feed additive; oxidizing agent; mordant.

FERRIC CHLORIDE SOLUTION
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** Unavailable
Unusual Hazards: Somewhat corrosive nonflammable liquid.
Short Term Exposure Limits (STEL): Unavailable
Time Weighted Average (TLV-TWA): Unavailable
Conditions to Avoid: Excessive heat; contact with incompatible materials; runoff to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Ferric chloride solutions are irritating and somewhat corrosive to bodily tissues via all routes of exposure.
Hazards of Skin or Eye Contact: Contact with ferric chloride solutions may result in irritation or possibly burns of the skin or eyes.
Hazards of Inhalation: Breathing ferric chloride dust (and presumably vapors or mists from solutions) may cause irritation of the nose and throat and coughing or difficult breathing.
Hazards of Ingestion: Ingestion may result in irritation of the mouth and stomach.

FIRE HAZARDS

Lower Flammable Limit: Not flammable
Upper Flammable Limit: Not flammable
Behavior in Fire: May evolve toxic chlorides. Some chance that containers may rupture due to steam pressure.
Hazardous Combustion Products: May evolve toxic chlorides such as hydrogen chloride fumes when heated.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable
Upper Explosive Limit: Not flammable
Explosiveness: Some chance that containers may rupture due to steam pressure.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Mist respirators may be adequate for normal circumstances within the use limitations of these devices.

FIRST AID

Nonspecific symptoms: Irritation of bodily tissues.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists.
***First Aid for* Ingestion:** If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

2582

FERRIC CHLORIDE SOLUTION
Class 8 (Corrosive Material)

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in adverse impacts on industrial processes.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Ferric chloride solution, usually, will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ferric chloride solution in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ferric chloride solution vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain ferric chloride solution from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid ferric chloride solution may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

FERRIC CHLORIDE SOLUTION
Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ferric chloride solution may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained ferric chloride solution may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

FERRIC CHLORIDE SOLUTION
Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

August 1997

FERROUS CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

GENERAL INFORMATION

Ferrous chloride solution is a green solution with a slight acrid odor used in dyeing, metallurgy, pharmaceutical preparations, manufacture of ferric chloride, and sewage treatment. It is easily soluble in water and methanol. It has a high boiling point of 104.4-121.1°C (220-250°F). This material is normally stable, however it is incompatible with materials such as oxidizing agents, alkali materials, metals, sodium, potassium and ethylene oxide and in conditions of extreme heat, air, light and moisture.

Ferrous chloride solution is corrosive and toxic to tissues and mucous membranes. It is corrosive and irritating to the skin and can cause inflammation and blistering. It is also corrosive and irritating to the eyes and can cause corneal damage or blindness. Inhalation is toxic to the lungs, can cause irritation to the respiratory tract and can result in unconsciousness and possibly death. Ingestion can cause irritation to the gastrointestinal tract and possible metabolic acidosis, coma and eventually death.

Ferrous chloride is not flammable. Although when heated it can emit fumes of hydrochloric acid. In situations where a fire exists, it is recommended to use extinguishing agents appropriate for the source of the surrounding fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Easily soluble
Solubility in Other Chemicals: Soluble in methanol.
Specific Gravity (Water=1): 1.24-1.40
Vapor Density(Air=1): 4.4
Boiling Point: 104.4-121.1°C (220-250°F)
Melting Point: <0°C (32°F)
Freezing Point: See Melting Point
Molecular Weight: 126.75
Evaporation Rate (Ether=1): >1
Vapor Pressure: Low
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable Limits: Not flammable
Stability: Stable.
Polymerization Potential: May not occur
pH: .1-1.5
Corrosiveness: Non-corrosive in presence of glass.
Reactivity and Incompatibility: Incompatible with oxidizing agents, alkali materials, metals, sodium, potassium and ethylene oxide. Will react with extreme heat, air, light and moisture.
Reactivity with Water: Will absorb water.

IDENTIFICATION

Shipping Name(s): Ferrous chloride, solution (USDOT); Corrosive liquid, acidic, inorganic, n.o.s. (IMO)
Synonyms and Tradenames: Ferrous chloride; Iron chloride; Iron (II) chloride; Iron (2+) chloride; Iron dichloride
CAS Registry No: 7758-94-3.
Chemical Formula: $FeCl_2$ in H_2O
Constituent Components (% each): 27-35% ferrous chloride; 0.2-2.5% hydrochloric acid; 65-73% water.
UN/NA Designation: NA1760 (USDOT); UN3264 (IMO)
IMO Designation: 8
RTECS Number: NO5400000
NFPA 704 Hazard Rating: 2 (Health): 0 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Green solution
Odor Characteristics: Slight acrid odor
Reportable Quantity: See appendix I
Common Uses: Mordant in dyeing; metallurgy; pharmaceutical preparations; manufacture of ferric chloride; sewage treatment.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

FERROUS CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

*Also 3264

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Material is corrosive and toxic to tissues and mucous membranes. It is irritating to the eyes, skin, respiratory tract and gastrointestinal tract. Contact can cause severe skin reactions, corneal damage, blindness, lung damage and death.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1mg/m^3

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Avoid oxidizing agents, sodium, potassium, ethylene oxide and extreme heat, air and moisture.

HEALTH HAZARDS

Potential Health Hazards: Ferrous chloride is corrosive and toxic to tissues and mucous membranes. Eye contact can produce corneal damage and blindness. Material can cause irritation to the skin, eyes, respiratory tract and gastrointestinal tract. In cases of severe over exposure, lung damage and death can result.

Hazards of Skin or Eye Contact: Material is corrosive and irritating to the skin and can cause inflammation and blistering. Contact with eyes can be corrosive and irritating and can result in corneal damage or blindness. Damage to skin or eyes is function of length of tissue contact.

Hazards of Inhalation: Inhalation of vapors from this material can produce irritation to the respiratory tract. Symptoms include burning, sneezing and coughing. Material is toxic to lungs and mucous membranes and in severe over exposure can cause lung damage, choking, unconsciousness and even death.

Hazards of Ingestion: Ingestion can cause irritation to the gastrointestinal tract and possible delayed metabolic acidosis, coma and eventual liver damage.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Does not burn.

Hazardous Decomposition Products: When heated emits fumes of hydrochloric acid.

EXPLOSION HAZARDS

Explosive Potential: Ferrous chloride is non combustible.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels of their use. Protection by air purifying resperators is limited.

FIRST AID

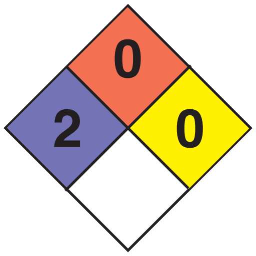
Nonspecific Symptoms: Ferrous chloride is corrosive to tissue and mucous membrane and can cause burns or blistering. Material is toxic to lungs and can cause coughing or wheezing and in severe cases can cause lung damage and death. If exposed to the eyes it can cause abnormal vision and could result in blindness. If ingested it can cause gastrointestinal irritation which can result in metabolic acidosis, coma or liver damage.

1760 *

*Also 3264

FERROUS CHLORIDE, SOLUTION

Class 8 (Corrosive Material)



First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, wash with large amounts of soap and water for 15 minutes. Remove contaminated clothing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large quantities of water if patient is conscious. Do not induce vomiting without medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Since ferrous chloride solution does not burn, use extinguishing agents appropriate for surrounding fire.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water to protect exposures or prevent containers from failing. Do not flood spill material with water since it does not significantly reduce the pH. Fight fire from maximum distance to disperse vapors and protect personnel. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain toxic material.

SPILL RESPONSES

General Information: Ferrous chloride is a highly toxic and corrosive solid that may cause environmental contamination. Confine and contain runoff. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Prevent substance from entering sewers, waterways and confined spaces. Underflow dams are not an effective means to dike material since it is soluble with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic and corrosive. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

FERROUS CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the immediate area in all directions if a bulk container of the liquid is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind if there is a large spill or the material is involved in a fire.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if concentrations exist and when conditions are safe to reenter the area. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted.

TECHNIQUE

MONITOR THE SITUATION . . . Usually ferrous chloride, solution will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

FERROUS CHLORIDE, SOLUTION
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

FERROUS CHLORIDE, SOLUTION
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

July, 1994

FLUORINE, COMPRESSED*
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Fluorine is an extremely reactive gas and is a member of the chemical group known as halogens. It is pale yellow in color and has a sharp, penetrating odor. It is extremely corrosive to most living tissues and is a potent oxidizer. Fluorine will react with virtually any organic material, most metals and silica compounds. While fluorine is not flammable, it will support and accelerate the combustion of fuels. Fluorine reacts violently with water to form hydrogen fluoride and hydrofluoric acid. Because of fluorine's reactivity and pressure characteristics, stopping fluorine leaks is difficult. Only materials inert to the effects of fluorine such as thread sealing tapes and plugging devices can be used. Because fluorine exists as a gas, there is a significant risk to downwind exposures. The gas is heavier than air and may accumulate in low lying areas or confined spaces. Handling fires where fluorine is involved is also difficult. Most fire fighting agents such as carbon dioxide and foam, including alcohol and protein, are oxidized in the presence of fluorine and may simply add fuel to the fire.

Fluorine reacts very quickly with tissues and will cause severe burns on exposure. On contact with skin tissues, fluorine will quickly hydrolyze to hydrofluoric acid. Burns to the skin will typically take a yellowish stain. Residual fluorine on the skin will continue to cause damage until washed with copious amounts of water and/or neutralized. Fluorine gas may contaminate water used in fire suppression or vapor control activities. In the event that a fluorine gas container is submerged and leaking, the gas will react with water, principally forming hydrofluoric acid. To address these concerns, refer to the **Hydrofluoric acid,** *Emergency Action Guide.*

Fluorine is an important element in the manufacture of a wide variety of commonly used chemicals. It is used in the manufacture of pharmaceuticals and plastics, including teflon. It is also used in the production of refrigerant gasses such as R-12 and R-22 found in air conditioners, and in the manufacture of halon, used in fire suppression systems.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts violently, potentially explosively.
Solubility in Other Chemicals: Reacts with standard solvents.
Specific Gravity (Liquid): Gas.
Vapor Density (Air=1): 1.31
Boiling Point: - 188°C (- 306.4°F)
Melting Point: - 220°C (- 364°F)
Freezing Point: - 220°C (- 364°F)
Molecular Weight: 37.99
Heat of Combustion: Non-flammable.
Vapor Pressure: Gas. Flash Point: Non-flammable.
Autoignition Temperature: Non-flammable.
Burning Rate: Non-flammable, accelerates and supports combustion of fuel materials.
Stability: Normally stable, will not polymerize.
Corrosiveness: Highly corrosive to living tissues and most metals.
Reactivity with Water: Violent reaction, evolving heat. Products include hydrofluoric acid and hydrogen fluoride.
Reactivity with Other Chemicals: Extremely strong oxidizer, probably the most potent oxidizer known. Reacts with most organic materials, silicon materials (glass) and metals. Reactions can be violent and/or explosive. May oxidize fire fighting agents such as CO_2, and foams.

IDENTIFICATION

Shipping Names: Fluorine, compressed.
Synonyms and Tradenames: Fluorine; CAS 7782-41-4.
Chemical Formula: F_2
Constituent Components (% each): 99% fluorine
UN/NA Designation: UN1045
IMO Designation: 2.3, poisonous gas.
Physical State as Shipped: Compressed gas.
Physical State as Released: Gas.
Color of the Shipped Material: Yellowish gas.
Odor Characteristics: Sharp, pungent, irritating, highly corrosive.
Common Uses: The manufacture of pharmaceuticals, plastics including teflon, refrigerant gasses such as R-12 and R-22, halon, water treatment chemicals and a variety of other materials.

---

*Reportable Quantity (RQ) established. Refer to appendix 1.

CHEMTREC (800) 424-9300 OR (202) 483-7616**

FLUORINE, COMPRESSED
Division 2.3 (Poison Gas)

Square background
applicable to rail cards.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 3 ppm (6 mg/m^3)

Unusual Hazards: Extremely corrosive to living tissue, oxidizes most organic material, supports combustion, may react with carbon dioxide or foam fire suppression agents.

Short Term Exposure Limits (STEL): 2 ppm (4 mg/m^3) (ACGIH)

Time Weighted Average (TLV-TWA): 0.1 ppm (0.2 mg/m^3) OSHA PEL - TWA.

Conditions to Avoid: Contact with water and other fire fighting chemicals, incompatible materials (includes most organics and metals); runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Extremely corrosive to tissues. Contact with vapors may result in severe burns to skin and respiratory system. Acts quickly to produce damage.

Hazards of Skin and Eye Contact: Due to the highly reactive nature of fluorine gas, any direct contact with skin and eye tissue will probably produce some degree of injury. Eye exposure can result in severe burns to eye tissue. Extent and duration of exposure will determine the severity of the injury which could result in permanent blindness. Severe acid bums to the skin are likely to result from direct fluorine exposures. Burns may be deep, penetrating below the skin depending on the nature of the exposure. Fluorine burns will typically discolor skin providing a yellowish stain around the contact areas.

Hazards of Inhalation: Severe respiratory irritant. In high concentrations, respiratory exposures may quickly become incapacitating. Corrosive to respiratory mucous membranes. Symptoms include coughing, wheezing, excessive salivation and mucous formation. May progress to acute pulmonary edema and chemical pneumonia. Inhalation exposures may be fatal depending on the concentration and duration of exposure. Burns may progress even after removal from exposures due to the formation of acid fluorine residuals.

Hazards of Ingestion: Ingestion of fluorine is highly unlikely given the fact that fluorine exists in gas form only.

FIRE HAZARDS

Lower Flammable Limit: Non-flammable.
Upper Flammable Limit: Non-flammable.

Behavior in Fire: Potent oxidizer, may react with most organics and cause ignition. Fluorine atmospheres will support combustion. Containers may rupture violently in afire due to over-pressurization. Will generate large quantities of gas upon release.

Hazardous Combustion Products: Non-flammable, related to fuel involved. Fluoride formation with fuel is likely and such products are generally toxic. Formation of hydrogen fluoride and oxygen difluoride likely in fire situations.

EXPLOSION HAZARDS

Explosiveness: Fluorine is non-flammable and non-explosive. As a strong oxidizer, it may ignite or react violently with most organic materials. Explosive properties will depend on the nature of the fuel involved. May react explosively on contact with a variety of materials such as: ammonium hydroxide, carbon tetrachloride, cellulose, chlorine dioxide, hydrogen and water. Containers may rupture violently in a fire due to over-pressurization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Full chemical protective equipment is necessary when dealing with fluorine releases. Equipment should protect from all direct contact with fluorine gas. Fully encapsulating suits made of compatible material are appropriate for most spill situations. Fluorine will attack glass. Neoprene, butyl rubber, and polyvinyl chloride (PVC) have been reported as suitable materials of construction.

Respiratory Protection: Full respiratory protection. Positive pressure self contained breathing apparatus or supplied air systems with full facepiece (or equivalent) are recommended for handling spills and fires involving fluorine.

1045

FLUORINE, COMPRESSED
Division 2.3 (Poison Gas)

FIRST AID

Nonspecific Symptoms: Severe burns to any tissues involved. Eye contact may result in permanent damage or blindness. Severe corrosion of respiratory tissues, coughing, wheezing, choking, pulmonary edema, and chemical pneumonia. Symptoms may progress after removal from exposure due to residual contamination. Pulmonary symptoms may continue to develop after removal from exposure and victims should be observed for development/progression of pulmonary edema and delayed chemical pneumonia.

First Aid For Inhalation: Remove victim to fresh air. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure resulting in increased respiratory distress with time. Symptoms of pulmonary edema and chemical pneumonia may continue to develop for some time (1-2 days) after exposure. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Severe exposures may result in permanent eye damage or blindness. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance immediately. To neutralize fluorine residues on exposed skin, calcium gluconate, gel or slurry, in glycerin or water will bind active fluoride on skin limiting the extent of the burn. A preparation of 20% magnesium sulfate, 6% magnesium oxide, 18% glycerol, 55% water, and 1 - 2% procaine hydrochloride applied to skin as a paste has also been suggested. Finally, a simple preparation of 20% magnesium oxide in glycerin applied to the burned skin area has been reported as effective.

First Aid for Ingestion: Material is a gas and ingestion is highly unlikely.

FIRE RESPONSE

Extinguishing Materials: Non-flammable.

Extinguishing Techniques: Fluorine is non-flammable. Extinguishing techniques will be based on the fuel involved. Caution should be exercised as fluorine is reactive with water and extinguishing agents. Carbon dioxide and foams, may be oxidized by fluorine gas. Intact containers containing fluorine may rupture if exposed to fire due to increased gas pressure or thermal failure of container material. If intact containers are involved in fire, cool with water, from a safe distance and from the side of the container.

SPILL RESPONSES

General Information: Seek expert assistance. Spills involving fluorine will be in the form of leaking, compressed gas. Its highly reactive nature dictates that extreme caution be used when dealing with fluorine releases. Compatible materials must be used when dealing with fluorine. Fluorine is corrosive to most metals. Containers, transfer lines or other product handling equipment must be passivated prior to being used in fluorine service. Passivation is a special treatment process which protects metals from the effects of fluorine.

The principal health threat is from direct exposure to fluorine gas. Spills contaminating land surfaces will likely result from fluorine contaminated runoff from fire fighting activities. Water spills are likely from contaminated runoff or the release of fluorine gas from a submerged container. Once incorporated in runoff or water, fluorine will react to form hydrofluoric acid. Contaminated water will become acidic and the pH will depend on the amount of contaminant. Fluorine gas is denser than air and vapors may accumulate in low lying areas and confined spaces. Vapors may be controlled with water fog or mist spray. Do not spray water directly on the leak as this may help accelerate the release rate.

FLUORINE, COMPRESSED
Division 2.3 (Poison Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Fluorine releases may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Seek expert assistance. Working with fluorine and fluorine handling equipment requires specialized training. Stop leak if without risk and if proper equipment and trained personnel are available. Allow vapors and gas to dissipate completely before reentering spill area without special protective gear.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog applied to fluorine gas may accelerate its dispersal in the atmosphere. Fluorine gas will likely react with water to form hydrofluoric acid and hydrogen fluoride.

CONSEQUENCE

Water runoff may contain levels of hydrofluoric acid from contact with fluorine gas. Water will become acidic and the pH will depend on the levels of acid generated. High levels of hydrofluoric acid in solution will pose a significant hazard. Refer to the **Hydrofluoric acid, *Emergency Action Guide***, for further information.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Refer to the **Hydrofluoric acid, *Emergency Action Guide***, for further information.

LAND SPILL

Fluorine is a gas and will not form spills on land. Water runoff from fire fighting or air spill response may be contaminated with hydrofluoric acid depending on the level of exposure. If runoff is contaminated, refer to the **Hydrofluoric acid, *Emergency Action Guide***, for safety and response information. 1

WATER SPILL

Fluorine is a gas and will not form spills in water unless gas is release from submerged tank. Fluorine will react with water to form hydrofluoric acid and hydrogen fluoride. Reaction is likely to be violent. Hydrofluoric acid contaminated water may require further response. Refer to the **Hydrofluoric acid, *Emergency Action Guide***, for safety and response information.

March 1995

FORMALDEHYDE SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid or Class 9 (Miscellaneous Hazardous Material)

GENERAL INFORMATION

Formaldehyde is a colorless gas with a pungent irritating odor similar to odors from hay or straw. It is normally shipped as a 30-50% solution in water (also called formalin) with 0-15% methyl alcohol and is used in making disinfectants, embalming fluids, synthetic resins, artificial silk and textiles, dyes and inks, and a wide variety of other products and chemicals. Its flash point will vary with the specific composition of the solution but is typically in excess of 100°F. Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions if ignited. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The solution weighs approximately 9.2 pounds per gallon.

Formaldehyde does not react with water or many common materials and is stable in normal transportation. It is reactive with various chemicals and may be corrosive to steel, copper, and copper alloys. Although pure formaldehyde readily polymerizes with various organic materials, commercially available solutions contain methanol to inhibit such reactions. The product is highly irritating by the various routes of potential exposure and is suspected as being a human carcinogen in chronic exposures. Products of combustion may include unburned formaldehyde as well as other toxic products of organic substances. The properties described below are for commercial solutions unless noted otherwise.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, chloroform, and ether

Specific Gravity (Liquid): Approx 1.1 at 77°F (25°C)

Boiling Point: Approx 206-214°F (96.7-101.1°C) at 1 atm.

Melting Point: Unavailable

Freezing Point: Unavailable

Molecular Weight: 30.03 for formaldehyde

Heat of Combustion: -4543 cal/g at 77°F (25°C)

Vapor Pressure: 1-1.3 mm Hg (0.019-0.025 psia) at 68°F (20°C)

Flash Point for 37% Solution: 122°F (50°C), closed cup (15% methyl alcohol); 182°F (83.3°C), closed cup (alcohol free).

Autoignition Temperature: Approx 806°F (430°C)

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Corrosive to steel, copper, and copper alloys

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with strong oxidizers; strong alkalies; phenols; urea; perchloric acid; aniline; ammonia; tannin; iron preparations; gelatin; bisulfites; salts of copper, iron, and silver; hydrogen peroxide; iodine; potassium permanganate; caustics; isocyanates; anhydrides; oxides; and inorganic acids.

IDENTIFICATION

Shipping Names: Formaldehyde, solutions flammable (USDOT & IMO).

Synonyms and Tradenames: Methanal; formalin; oxomethane; methylene oxide; methylaldehyde; formic aldehyde; oxymethylene; fannoform; formalith; fyde; ivalon; lysoform; moricid; paraform; superlysoform.

Chemical Formula: HCHO

Constituent Components(% each): 30-50% W formaldehyde and 0-15% W methyl alcohol in water. Formalin is a 37% solution of formaldehyde.

UN/NA Designation: UN1198; UN2209 (flash point above 141°F., (61°C.))

IMO Designation: 3.3, flammable liquid; 9, misc. dangerous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless or cloudy

Odor Characteristics: Pungent, irritating, like hay or straw odors

Common Uses: Mfg. fungicide, germicide, disinfectants, embalming fluids, artificial silk and textiles, latex, synthetic resins, dyes, inks, mirrors, explosives, pesticides, drugs, and other chemicals; also used in paper, photographic, furniture, and tanning industries.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

FORMALDEHYDE SOLUTION

Class 3 (Flammable Liquid) or
Combustible Liquid or
Class 9 (Miscellaneous Hazardous

See "UN/NA Designation" for
other ID numbers

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1 ppm

Unusual Hazards: Combustible liquid. Suspected of being a human carcinogen. Some people may develop an allergy to formaldehyde.

Short Term Exposure Limits(STEL): 2 ppm for 15 minutes has been proposed (ACGIH).

Time Weighted Average(TLV-TWA): 2 ppm absolute ceiling limit; 1 ppm 8-hr TWA has been proposed (ACGIH).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of high gas concentrations in air as may occur in local and immediately downwind areas. Direct contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin with formaldehyde solution may be very irritating and may cause inflammation and sensitization. Eye contact may result in severe injury and corneal damage.

Hazards of Inhalation: Formaldehyde gas is very irritating to the eyes and respiratory tract. High concentrations in air may cause coughing, difficulty in breathing, pulmonary edema, pneumonitis, and possibly death. Discomfort is quite pronounced after 10-30 minutes exposure to only 4-5 ppm in air.

Hazards of Ingestion: Ingestion may cause severe irritation of the gastrointestinal tract, violent vomiting, diarrhea, severe stomach pains, dizziness, loss of consciousness, general collapse, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 7%

Upper Flammable Limit: 73%

Behavior in Fire: Combustible liquid. Will burn but difficult to ignite unless heated. There is some limited possibility that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include unburned formaldehyde and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosions may result if vapors of warm or hot liquid are ignited in a confined area. There is some limited possibility that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash- proof safety goggles, and other impervious and resistant clothing. Compatible materials include butyl rubber, natural rubber, neoprene, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, chlorinated polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, and nitrile-butadiene rubber.

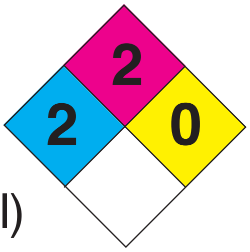
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (50 ppm or less) or an organic vapor cartridge respirator with a full face piece (50 ppm or less) within the use limitations of these devices.

2209

See "UN/NA Designation" for other ID numbers

FORMALDEHYDE SOLUTION

Class 3 (Flammable Liquid) or
Combustible Liquid or
Class 9 (Miscellaneous Hazardous Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, dry chemical, carbon dioxide, water spray. Water may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Formaldehyde spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION ... Formaldehyde may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled in cold weather.

CONSEQUENCE

Hazardous levels of formaldehyde in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

FORMALDEHYDE SOLUTION
Class 3 (Flammable Liquid) or Combustible Liquid or Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to formaldehyde vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of formaldehyde from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid formaldehyde may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of formaldehyde vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Formaldehyde may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained formaldehyde may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

FORMALDEHYDE SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid or Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

FORMALDEHYDE SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid or Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause over flow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Carbon may not be highly effective.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 2000

FORMIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Formic acid is a colorless liquid with a pungent, penetrating odor. It is used mainly as a chemical intermediate and is completely soluble in water. The flash point of 122ºF indicates the product must be heated before ignition may occur. It has a low pH and is therefore strongly acidic, values reported range from below 1 to 2.2. Formic acid is reactive with a wide range of materials, see below, but reacts violently with furfuryl alcohol, hydrogen peroxide, hydrated thallium nitrate and permanganates. Contact with concentrated sulfuric acid results in the formation of toxic and flammable carbon monoxide gas. Accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. Vapors are heavier than air and may travel some distance to a source of ignition and flash back at any temperature above the flash point. There is some potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration especially if the stored product has decomposed. Formic acid, particularly at 98% will decompose slowly during storage liberating carbon monoxide which can rupture sealed containers. Certain salts and mineral acids will catalyze the reaction and temperature will increase the rate of decomposition. The product weighs approximately 10.2 pounds per gallon.

Formic acid does not react with water. It is generally stable in normal transportation but slowly decomposes during storage. Combustion may produce carbon monoxide and carbon dioxide; formaldehyde may be formed at temperatures greater than 572-752ºF. Toxicity hazards of the product are considerable by all routes of exposure and primarily derive from the highly irritating nature of the substance.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Complete
Solubility in Other Chemicals: Soluble in alcohol and ether.
Specific Gravity (Liquid): 1.22
Vapor Density: 1.6
Boiling Point: 224.6ºF (107ºC)
Melting Point: See freezing point
Freezing Point: 10.4ºF (-12ºC) (25% solution)
Molecular Weight: 46
Heat of Combustion: 63 kcal/mol
Evaporation Rate (butyl acetate=1): 2.1
Vapor Pressure: 35 mmHg
Flash Point: 122ºF (50ºC) closed cup
Autoignition Temperature: 1112ºF (600ºC)
Burning Rate: Unavailable
Flammable Limits: 18% (LEL) - 57% (UEL)
pH: 2.2 (85% solution) others sources report <1
Stability: Stable under ordinary conditions of use and storage.
Polymerization Potential: Will not occur.
Corrosiveness: Corrosive to metals.
Reactivity with Water: No reaction
Reactivity and Incompatibility: Reacts violently with furfuryl alcohol, hydrogen peroxide, hydrated thallium nitrate, permanganates. Contact with concentrated sulfuric acid results in the formation of toxic and flammable carbon monoxide gas. Avoid strong oxidizing agents, strong bases and finely powdered metals. Protect from moisture.

IDENTIFICATION

Shipping Name(s):Formic acid (USDOT & IMO)
Synonyms and Tradenames: Hydrogen carboxylic acid; Methanoic acid; Aminic acid; Formylic acid.
CAS Registry No.: 64-18-6
Chemical Formula: HCOOH
Constituent Components (% each): Most sources report somewhere between 85 - 95%.
UN/NA Designation: UN1779
IMO Designation: 8, Corrosives
RTECS Number: LQ4900000
NFPA 704 Hazard Rating: 3(Health): 2(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Fuming liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent, penetrating odor.
Reportable Quantity: See appendix I.
Common Uses: Chemical intermediate; textile dyeing; acidifying agent; cotton finishing; leather processing; rubber making; catalyst in hydrocarbon-formaldeyde resins; controlling particle size and thickness of electroplating in electroplating industry; antiseptic in wine and beer brewing; preservative in animal feed.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

FORMIC ACID

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.024 ppm - 5 ppm (Reports vary)

Unusual Hazards: Formic acid, particularly at 98% will decompose slowly during storage liberating carbon monoxide which can rupture sealed container. Reacts explosively with oxidizing agents.

Short Term Exposure Limit (STEL): 12 ppm (19 mg/m^3); 10 ppm (16 mg/m^3) (ACGIH)

Time Weighted Average (TLV-TWA): 5 ppm (8 mg/m^3)

Ceiling (C) Limit: Unavailable

IDLH: 30 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and downwind and from direct physical contact. Ingestion is also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid may cause severe irritation or burns and possibly result in absorption of toxic amounts of this product through the skin if the exposure is excessive. Even high concentrations of vapors in air may cause a burning skin irritation. Contact of the liquid with eyes has the potential to cause severe injury and burns. Eye discomfort includes irritation and tearing. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Inhalation of vapors can cause severe irritation of nose, throat, and upper respiratory tract. Inhalation of higher concentrations may cause central nervous system effects and lung damage.

Hazards of Ingestion: Ingestion may cause serious burns and corrosion of the mouth, throat, and esophagus, with immediate pain and difficult swallowing. Other symptoms of abdominal pain, nausea, diarrhea and vomiting can occur, leading to shortness of breath and death.

FIRE HAZARDS

Lower Flammable Limit: 18%

Upper Flammable Limit: 57%

Behavior in Fire: Exposure of containers to fire or heat may result in accelerated decomposition of product and possible container rupture. Vapors are heavier than air and may travel some distance to a source of ignition and flash back.

Hazardous Combustion Products: Combustion may produce carbon monoxide and carbon dioxide; formaldehyde may be formed at temperatures greater than 572-752ºF. Formic acid, particularly at 98% will decompose slowly during storage liberating carbon monoxide which can rupture sealed containers. Certain salts and mineral acids will catalyze the reaction and temperature will increase the rate of decomposition.

EXPLOSION HAZARDS

Explosive Potential: Reacts explosively with oxidizing agents.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

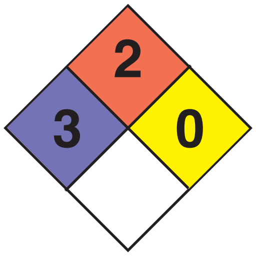
Protective Clothing Required: Equipment should prevent any possibility of skin contact and eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas tight safety goggles, and other impervious and resistant clothing. Saranex® and butyl rubber are reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases according to some authorities to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices.

1779

FORMIC ACID

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues, excessive tears in the eyes, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, halon, alcohol resistant foam. Do not use water jet.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

FORMIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to formic acid vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of formic acid from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere. The fact that foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Formic acid may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined liquid may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

FORMIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, lime or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

FORMIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

FUEL OIL

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Fuel oils (No. 2, 4, 5 and 6; see kerosene for fuel oil No. 1) are light brown liquids which have an odor like kerosene. Common uses are as a general purpose domestic or commercial fuel, particularly for home heating (fuel oil No.2), commercial or industrial heating (fuel oil No.4), and for furnaces and boilers of utility power plants, ships, locomotives, metallurgical operations and industrial power plants (fuel oil No.5). They are essentially insoluble in water and lighter, so may be expected to form a floating oil slick. Their minimum flash point ranging from about 126°F to 156°F indicates that some degree of preheating is necessary before the product can be ignited easily. Accumulations of vapor from heated liquid in confined spaces may result in explosions if ignited. There is a limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The products weigh approximately 7.3 to 7.8 pounds per gallon.

Fuel oils do not react with water or many other common materials and are stable in normal transportation. They are relatively noncorrosive substances and are primarily incompatible with strong oxidizing materials that may cause its ignition. Toxicity via potential routes of exposure is low to moderate. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Essentially insoluble.
Solubility in Other Chemicals: Soluble in other hydrocarbons.
Specific Gravity (Liquid): 0.87 - 1.05
Vapor Density: 4.7 - 8
Boiling Point: 214 - 1092ºF (101 - 589ºC)
Melting Point: See freezing point.
Freezing Point: -20 to 0ºF (-29 to -18ºC)
Molecular Weight: Mixture
Heat of Combustion: -9,700 to -10,800 cal/g
Evaporation Rate (butyl acetate=1): Very slow
Vapor Pressure: 1 - 2 mmHg (0.04psia) at 68ºF (20ºC)
Flash Point: 126 - 336°F (52 - 169ºC)
Autoignition Temperature: 494 - 763ºF (257 - 407°C)
Burning Rate: 4 mm/minute
Flammable Limits: 0.6% (LEL) - 20% (UEL)
Stability: Under normal conditions, the material is stable. Avoid sources of ignition such as flames, hot surfaces, sparks, and electrical equipment.
Polymerization Potential: Material is not known to polymerize.
pH: Essentially neutral.
Corrosiveness: Noncorrosive
Reactivity with Water: No reaction
Reactivity and Incompatibility: Avoid contact with strong oxidizers such as chlorine, fluorine, nitrogen tetraoxide, concentrated oxygen, and sodium hypochlorite or other hypochlorites.

IDENTIFICATION

Shipping Name(s): Fuel oil (USDOT) Diesel fuel or Kerosene (IMO)
Synonyms and Tradenames: Fuel oil no. 2; Fuel oil no. 4; Fuel oil no. 5; Fuel oil no. 6; Home heating oil; Diesel oil; Residual fuel oil no.4; Residual fuel oil no.5; Cat cracker feedstock; NSFO; Navy special fuel; Heavy residual fuel; Middle distillate; and Bunker C.
CAS Registry No.: 68476-30-2 (fuel oil no.2); 68476-31-3 (fuel oil no.4); 68476-33-5 (fuel oil no.6)
Chemical Formula: Mixture of Petroleum Hydrocarbons
Constituent Components (% each): Complex mixture.
UN/NA Designation: NA1993 (Fuel oil); UN1202 (Diesel fuel); UN1223 (Kerosene)
IMO Designation: 3.3 Flammable liquids
RTECS Number: NH1000314 (fuel oil no.2); FO1008628 (fuel oil no. 6)
NFPA 704 Hazard Rating: 1(Health): 2(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Reports vary; some reported to be clear, yellow, brown or black. Some sources report that they might be dyed purple or red for taxation purposes.
Odor Characteristics: Like kerosene or fuel oil.
Reportable Quantity: See appendix I.
Common Uses: General-purpose fuel for domestic, commercial, industrial burners, power plants, ships, locomotives, and metallurgical operations.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

FUEL OIL

Class 3 (Flammable Liquid) or Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.11 ppm

Unusual Hazards: None

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable but kerosene is listed as 100 mg/m^3

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, fire, and sparks, contact with incompatible materials, runoff to sewers or water bodies, inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Health hazards are generally low unless the product is ingested in significant quantities. Nevertheless, all major exposures should be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with fuel oils may cause drying and cracking of the skin due to the defatting action of these products, as well as the possibility of blisters and allergic reactions. Contact with the eyes results in mild or negligible irritation in most cases. Direct contact may cause irritation, redness, tearing and blurred vision.

Hazards of Inhalation: Prolonged exposure to high vapor concentrations in air may cause headache, drowsiness, irritation of the eyes and nose, and lung irritation. Such concentrations are generally unlikely outdoors, however, except in the immediate vicinity of the spilled product. Other symptoms may include fatigue, tremors, convulsions, loss of consciousness, coma, respiratory arrest and death, depending on the concentration and duration of the exposure.

Hazards of Ingestion: Ingestion may cause irritation of the gastrointestinal tract, nausea, vomiting, cramping, and possible central nervous system depression with symptoms ranging from headache to anesthesia, coma, and death. Aspiration into the lungs during vomiting may result in coughing, gagging, difficult breathing, substernal distress, rapidly developing pulmonary edema, and delayed bronchopneumonia and pneumonitis with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 0.6%

Upper Flammable Limit: 20%

Behavior in Fire: Flammable liquid. Will burn but may be difficult to ignite unless warmed. There is some limited possibility that containers may rupture violently in fire. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back.

Hazardous Combustion Products: Thermal decomposition products may include carbon monoxide, carbon dioxide, oxides of sulfur and nitrogen, and other toxic gases.

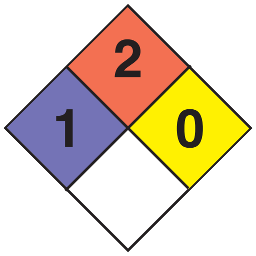
EXPLOSION HAZARDS

Explosive Potential: Forms explosive mixtures with air. Explosions may result if vapors of warm liquid are ignited in a confined area. There is some limited possibility that containers may rupture violently in fire.

1993

FUEL OIL

Class 3 (Flammable Liquid) or
Combustible Liquid



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, polyurethane, polyvinyl alcohol, Viton® , and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge may suffice.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physician: Gastric lavage may be indicated if ingested. If spontaneous vomiting has occurred after ingestion, the patient should be monitored for difficulty in breathing, as adverse effects of aspiration into the lungs may be delayed for up to 48 hours.

FIRE RESPONSE

Extinguishing Agents: Foam, dry chemical, carbon dioxide, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of fuel oil may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment.

FUEL OIL

Class 3 (Flammable Liquid) or Combustible Liquid

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of fuel oil in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to fuel oil vapors or fumes may accelerate their dispersal in the atmosphere and will accumulate in low lying areas.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

FOAM . . . Foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications and monitor the area until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

FUEL OIL
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

FUEL OIL

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating fuel oil.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with fuel oil may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

January 1989

FURAN
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Furan is a highly volatile and usually colorless flammable liquid with an odor that resembles ether and a boiling point of 88.3 – 88.5°F. It is used as a solvent and for making a variety of other chemicals. Slightly soluble in water and lighter, it may be expected to form a floating surface slick that simultaneously evaporates and dissolves. Its flash point of –32°F indicates it can be easily ignited under all ambient temperature conditions. Vapors of furan are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.8 pounds per gallon.

Furan does not react with water and is generally considered stable in normal transportation. It turns to a solid resin upon evaporation or in contact with mineral acids and may turn brown upon standing when not containing a small amount of water. The product is usually shipped containing a stabilizer to prevent formation of unstable (explosive) peroxides upon exposure to air and is incompatible with oxidizing agents that may cause its ignition and with acids. Toxicity of the product ranges from low to moderate depending upon the route of exposure. Products of combustion are not well defined and may include toxic constituents.

Downwind evacuation should be considered if furan is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 1% wt at 77°F (25°C)
Solubility in Other Chemicals: Soluble in alcohol, ether, acetone, and benzene.
Specific Gravity (Liquid): 0.937 at 68°F (20°C)
Boiling Point: 88.3 – 88.5°F (31.3 – 31.4°C) at 1 atm.
Melting Point: –122.1°F (–85.6°C)
Freezing Point: See melting point
Molecular Weight: 68.07
Heat of Combustion: –7347 cal/g
Vapor Pressure: 493 mm Hg (9.53 psia) at 68°F (20°C)
Flash Point: – 32°F (– 35.6°C), closed cup
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Stable in normal transportation when stabilized. Resinifies upon evaporation or in contact with mineral acids. If unstabilized, very slowly forms unstable (explosive) peroxides upon exposure to air.
Corrosiveness: Data unavailable. Unlikely to be corrosive to metals. Likely to attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Incompatible with oxidizing agents. Contact with acids causes violent exothermic reaction.

IDENTIFICATION

Shipping Names: Furan (USDOT and IMO)
Synonyms and Tradenames: Furfuran; oxole; tetrole; divinylene oxide; oxacyclopentadiene
Chemical Formula: -CHCHCHCHO-
Constituent Components (% each): 99% or more pure. Usually stabilized with butylatated hydroxytoluene (BHT) to inhibit formation of peroxides.
49 STCC: 49 091 75
UN/NA Designation: UN2389
IMO Designation: 3.1, flammable liquid
Physical State As Shipped: Liquid
Physical State As Released: Liquid or gas (boils at 88.3 –88.5°F)
Color of the Shipped Material: Colorless liquid; turns brown on standing. Color change retarded by small amount of water.
Odor Characteristics: Like ether
Common Uses: Organic synthesis; solvent for resins and in formation of lacquers; making of pharmaceuticals, insecticides, and fine chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

FURAN
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly volatile flammable liquid. If unstabilized, it may very slowly form unstable (explosive) peroxides upon exposure to air.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable. Manufacturer suggests 1 ppm limit for chronic occupational exposures.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; prolonged exposure to air; distillation to dryness.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and downwind. Ingestion and direct physical contact are also to be avoided. Note that the toxicity of furan has not been thoroughly studied and that available information is very limited.

Hazards of Skin or Eye Contact: Limited experimentation with animals suggests that contact of the skin or eyes with liquid furan is not irritating because the chemical quickly evaporates. Nevertheless, repeated or prolonged contact may lead to absorption of toxic amounts through the skin and might be expected to cause defatting and irritation or cracking of the skin. Do not wear contact lenses when working with furan.

Hazards of Inhalation: Furan is reported to be a central nervous system depressant. Reported symptoms of acute overexposure include headache, fatigue, nausea, vomiting, unconsciousness, respiratory system paralysis, and possibly death. A concentration of 3464 ppm in air for one hour was fatal to 50% of rats in laboratory experiments. Note that a much lower widely published figure for mice is in error according to the major producer of furan.

Hazards of **Ingestion:** Furan is moderately toxic by ingestion. Symptoms are likely to resemble those of inhalation to a large extent. Known effects include congestion of the gastrointestinal tract and possible liver injury.

FIRE HAZARDS

Lower Flammable Limit (LFL): 2.3%

Upper Flammable Limit (UFL): 14.3%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable gas or vapor upon release.

Hazardous Combustion Products: Not well-defined; likely to include carbon monoxide and gaseous hydrocarbons.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Formation of unstable peroxides upon very prolonged exposure to air may lead to an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. A manufacturer of furan lists butyl rubber, natural rubber, and neoprene as compatible materials.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2389

FURAN
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific Symptoms: Headache, fatigue, nausea, or other symptoms of overexposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff: Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Electrically ground and bond all lines and equipment. Take the highly volatile, flammable, and toxic nature of furan into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Furan spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to furan vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of furan from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

FURAN
Class 3 (Flammable Liquid)

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of furan vapors into the atmosphere. The fact that alcohol foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Furan may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained furan may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCES

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment in hot weather.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, activated carbon, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accummulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines. (Note: Most furan will vaporize rapidly in warm weather.)

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable gases or vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store containinated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

FURAN
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Most furan will rapidly evaporate from water surface in warm weather while some amount dissolves from the floating slick that will form. In cold weather, the rate of exporation will be reduced and time may permit application of oil spill type containment and/or cleanup techniques if the flammability hazards of furan can be safely controlled. The first three techniques below apply to the dissolved portion. The others that follow are generally applicable to hydrocarbons that float on water.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as need until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Mineral acids promote resinification of furan. Solids that form may require removal from the water body.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air striping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

FURAN
Class 3 (Flammable Liquid)

TECHNIQUES

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of bypass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating furan.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with furan may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

March 1995

FURFURYL ALCOHOL

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Furfuryl alcohol is a colorless or pale yellow or amber liquid that may slowly become brown to dark red or black upon exposure to light and air and has a mildly irritating odor. It is used as a solvent, as a liquid propellant, for treating sand in foundries and oil wells, and for making furan resins, polymers, and other products. It is fully soluble in water and slightly heavier. Its flash point of 149°F indicates that it must be moderately heated before ignition may occur easily. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 9.4 pounds per gallon.

Furfuryl alcohol does not react with water or many other common materials. It will darken and form water-insoluble material during transport if exposed to air or acids, particularly when hot. Reactions with cyanoacetic acid, formic acid, and strong mineral or organic acids may be explosive and may involve violent self-polymerization. The alcohol dissolves lacquers, varnishes, or epoxy resins. Toxicity varies with route of exposure. Products of combustion are not well-defined and may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Fully soluble

Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform and most organic solvents with the exception of petroleum hydrocarbons and most oils.

Specific Gravity (Liquid): 1.129 at 68°F (20°C)

Boiling Point: 338°F (170°C) at 1 atm.

Melting Point: -20.2°F (-29°C) or -25.9°F (-14.6°C) depending on form.

Freezing Point: 5°F (-15°C)

Molecular Weight: 98.1

Heat of Combustion: -6200 cal/g

Vapor Pressure: 1 mm Hg (0.019 psia) at 89.2°F (31.8°C)

Flash Point: 149°F (65°C), closed cup; 167°F (75°C), open cup.

Autoignition Temperature: min. 736°F (391°C); max. 915°F (490°C); reported values vary.

Burning Rate: 2.3 mm/minute

Stability: Stable, but may polymerize under conditions described above.

Corrosiveness: Dissolves lacquers, varnishes, or epoxy resins. Can be stored in ordinary steel tanks (up to 6 months) and in tanks lined with baked phenolic coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with cyanoacetic acid, formic acid, strong mineral acids, nitric acid, hydrogen peroxide or nitrogen tetroxide, strong organic acids, Lewis acids, and acyl halides.

IDENTIFICATION

Shipping Names: Furfuryl alcohol (USDOT & IMO).

Synonyms and Tradenames: 2-hydroxymethyl furan; furfural alcohol; furfuralcohol; furyl alcohol; 2-furancarbinol; 2-furanmethanol; alpha- or 2-furylcarbinol; FA.

Chemical Formula: $C_4H_3OCH_2OH$

Constituent Components(% each): Rather pure with small amounts of water and furfural.

UN/NA Designation: UN2874

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless, pale yellow or amber but may become brown to dark red or black in light and air.

Odor Characteristics: Mildly irritating.

Common Uses: Wetting agent, penetrant, and solvent; liquid propellant; used in foundry cores and in oil well treating; mfg. Of furan resins, polymers, sealants, cements, and tetrahydrofurfuryl alcohol; flavoring.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

FURFURYL ALCOHOL

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 8 ppm

Unusual Hazards: Violent polymerization may be initiated by mineral acids or organic acids. Otherwise, a combustible alcohol of relatively low volatility and moderate toxic hazard.

Short Term Exposure Limits(STEL): (Skin) 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 10 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of concentrated vapors in air, but the hazard is limited due to the relatively low volatility of the substance. Eye contact with the liquid and ingestion should clearly be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with liquid furfuryl alcohol may result in moderate irritation, defatting, dermatitis, and absorption via the skin. Contact with the eyes may cause severe inflammation and possible corneal opacity.

Hazards of Inhalation: Vapors may cause eye, nasal, and respiratory tract irritation. High concentrations in air may result in narcosis with symptoms including headache and nausea. Exposure to 233 ppm in air for 4 hours is lethal to 50% of laboratory rats. A level of 700 ppm was lethal to some mice in 10 minutes.

Hazards of Ingestion: Ingestion of furfuryl alcohol may cause gastrointestinal irritation, nausea, headache, diarrhea, and vomiting. Less than one-third ounce may be fatal based on animal studies.

FIRE HAZARDS

Lower Flammable Limit: 1.8% at 162°F (72.5°C)

Upper Flammable Limit: 16.3% at 252°F (122°C)

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite. There is some limited potential that containers may rupture violently in fire.

Hazardous combustion products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: There is some limited potential that containers may rupture violently in fire. Violent polymerization may occur in the presence of organic or mineral acids. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Explosion may result if vapors of heated liquid are ignited in a confined area.

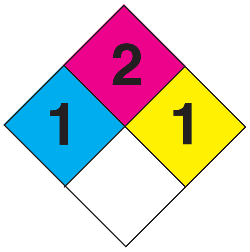
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

2874

FURFURYL ALCOHOL
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, skin, or gastrointestinal tract.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water spray for dilution to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. See the General Information section for the reactivity hazards of furfuryl alcohol.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Furfuryl alcohol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of furfuryl alcohol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to furfuryl alcohol vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of furfuryl alcohol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

FURFURYL ALCOHOL
Division 6.1 (Poisonous Material)

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid furfuryl alcohol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... Alcohol foam applied to the surface of liquid pools may slow the release of furfuryl alcohol vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent to liquid furfuryl alcohol may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Furfuryl alcohol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained furfuryl alcohol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

FURFURYL ALCOHOL
Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other incompatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAl ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2006

GASOLINE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Gasoline is a volatile colorless to amber or pale brown liquid hydrocarbon that may also be dyed various colors. It is most commonly used as fuel but also has uses as a diluent and solvent in industry. Essentially insoluble in water and lighter, gasoline will float to form a surface slick. Its flash point may be as low as –50°F and indicates that the product is easily ignited under most ambient temperature conditions. Vapors of gasoline are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.9–6.1 pounds per gallon.

The chemical and physical properties, as well as the composition, of gasoline can vary greatly depending on the specific product and the origin of the crude oil. Due to differences in composition, there may be components that are themselves, hazardous and may require the use of additional guides. Gasoline does not react with water or many other common materials and is stable in normal transportation. It is a relatively noncorrosive substance and is primarily incompatible with oxidizing materials that may cause its ignition. Toxicity of the product ranges from low to high depending on the route of exposure. Products of combustion may include toxic products from lead compounds and other additives, as well as other toxic constituents.

If gasoline is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration. (Note: Data given below are for automotive gasoline but are also mostly applicable to other types not containing alcohols.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 100–600 ppm

Solubility in Other Chemicals: Soluble in ether, chloroform, ethanol and other hydrocarbons.

Specific Gravity (Liquid): 0.73 at 68°F (20°C)

Vapor Density: 2.5 – 4.0

Boiling Point: 140 – 390°F (60 – 199°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: –131 to –140°F (–90.6 to –95.6°C)

Molecular Weight: Mixture, 72 – 142 (est.)

Heat of Combustion: –10,400 cal/g

Evaporation Rate (butyl acetate=1): One source reports 4–10, others report >10

Vapor Pressure: 190 mmHg (3.67 psia) at 68°F (20°C), some mixtures may be as low as 38 mmHg

Flash Point: –38 to –50°F (–38.9 to –45.6°C), cc

Autoignition Temperature: 495 – 853°F (257 – 456°C), varies with grade.

Burning Rate: 4 mm/minute

Flammable (Explosive) Limits: 0.6–1.4% (LEL) – 7.1–7.6% (UEL)

Stability: Stable

Polymerization Potential: Will not occur

pH: Not applicable

Corrosiveness: Noncorrosive, but may attack some forms of plastics, rubbers or coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with oxidizing materials, such as peroxides, nitric acid and perchlorates.

IDENTIFICATION

Shipping Names: Gasoline, Petrol, or Motor spirit (USDOT & IMO)

Synonyms and Tradenames: Light gasoline; Natural gasoline; Petrol; Motor spirit; Motor fuel; Casing head gasoline; Blended gasoline; Automotive or aviation gasoline; Benzin

CAS Registry No.: 8006-61-9; 86290-81-5 (refinery blend motor gasoline)

Chemical Formula: C_5–C_{10} hydrocarbon mixture

Constituent Components (% each): Complex hydrocarbon mixture; may contain small amounts of lead compounds, paraffins, cycloparaffins, benzene, naphthalene, ethanol, aromatics and other additives.

UN/NA Designation: UN1203

IMO Designation: 3, flammable liquids

RTECS Number: LX3300000

NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Instability)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless to amber or brown; may be dyed other colors

Odor Characteristics: Like typical gasoline

Common Uses: Solvent or diluent; finishing agent for artificial leather; motor fuel; portable stove and lantern fuel.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

GASOLINE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reports vary as low as 0.025; others report 0.12 – 0.15 ppm (recognition) 0.06 – 0.08 ppm (threshold)

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back or persist in low areas. May contain lead compounds or other toxic additives. Flowing product may be ignited by self-generated static electricity.

Short Term Exposure Limits (STEL): Potential occupational carcinogen (NIOSH); 500 ppm (ACGIH) Note: Gasoline is a mixture of compounds, some of which are very toxic and may have a lower exposure limits.

Time Weighted Average (TLV-TWA): Potential occupational carcinogen (NIOSH); 300 ppm (ACGIH)

Ceiling (C) Limit: Potential occupational carcinogen (NIOSH)

IDLH: Potential occupational carcinogen (NIOSH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard to public is from prolonged exposure to the significant vapor concentrations that may be present in air after major spills. Ingestion and physical contact should also be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with gasoline may cause drying and cracking of the skin due to the defatting action of the product (and possible blistering or lesion formation). Certain individuals may develop hypersensitivity. Contact with the eyes may result in smarting and pain, but only slight and temporary injury.

Hazards of Inhalation: Vapors act as a central nervous system depressant and may be irritating. Low concentrations in air may cause flushing of the face, staggering gait, headache, dizziness, slurred speech and mental confusion. High levels may cause convulsions, unconsciousness, coma, pulmonary edema, and possibly death from respiratory failure or asphyxiation. There may also be damage to the pancreas, liver, kidneys and spleen.

Hazards of Ingestion: Ingestion may result in irritation of the mouth, throat and stomach; irregular heartbeat; stimulation and later depression of the central nervous system (see above). Aspiration into the lungs during vomiting may result in severe lung irritation with coughing, gagging, difficult breathing, substernal distress, rapidly developing pulmonary edema, and possibly delayed bronchopneumonia and pneumonitis with severe consequences.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 0.6–1.4%

Upper Flammable (Explosive) Limit: 7.1–7.6%

Behavior in Fire: Extremely flammable liquid and will readily ignite at room temperature. Will generate large quantities of flammable or explosive vapors upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Product may float on water and may travel to distant locations or spread fire.

Hazardous Decomposition Products: Not well-defined, may include toxic products from additives like lead compounds as well as other toxic constituents, hydrocarbons, aromatics, oxides of nitrogen and phenols. One source reports that contact with nitric and sulfuric acid may form nitrocresols that can decompose violently.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

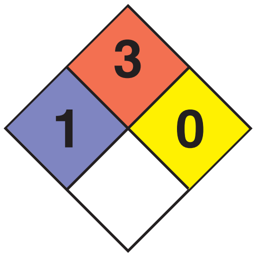
PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: **For emergency response situations, structural firefighting clothing for firefighting or fire retardant coveralls, such as Nomex or PBI are required.** Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include nitrite rubber, nitrile latex gloves, chlorinated polyethylene, polyurethane, polyvinyl alcohol, Viton® and nitrite-butadiene rubber. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 3 (mixed gasoline); Tychem® (BR; LV; Responder®; Responder® CSM; TK; Reflector®) (leaded gasoline); Nitrile; Viton®; Barricade®; Nitri Solve 727® gloves; Viton 892® gloves; Neop. N5 or N8® gloves; Viton 890® gloves. The following materials are reported to have a greater than 4 hour breakthrough time: polyvinyl alcohol gloves; 4H® and Silver Shield® brand gloves; Responder® suits. The following materials are **not** recommended for use: neoprene rubber, latex, natural rubber or butyl rubber.

1203

GASOLINE

Class 3 (Flammable Liquid)



Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations: any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Regular foam, carbon dioxide, dry chemical, water spray. Water may be ineffective as it may not cool gasoline below its flash point.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Gasoline will float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases. Note that gasoline has a flash point of –38 to –50°F.

SPILL RESPONSES

General Information: Gasoline is a highly flammable and volatile liquid that may cause environmental contamination. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of gasoline may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that gasoline is a highly volatile and highly flammable substance and will float on top of water.

GASOLINE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Gasoline may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed.

CONSEQUENCE

Hazardous levels of gasoline in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to gasoline vapors or fumes may accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Water runoff may contain a small amount (if any) of gasoline from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of gasoline vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Gasoline may be contained by building dikes or barriers using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained gasoline may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

GASOLINE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

GASOLINE

Class 3 (Flammable Liquid)

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present, or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating gasoline.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with gasoline may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

January 1989

HELIUM
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Helium is a colorless, odorless, nonflammable and nontoxic element of nature that is handled as a compressed gas under high pressure or as a refrigerated cryogenic liquid at extremely low temperatures. It has a variety of uses in research, for filling balloons and blimps (being the gas normally used to fill floating balloons), and in gas supplies for divers, space vehicles, luminous signs, welding, and chromatography. Due to its slight solubility in water and boiling point of –452.1°F, spills of liquid on land or water may quickly generate relatively large amounts of gas that may appear white at first due to condensation of water vapor in the air. Initially, the gas may be much heavier than air, but it becomes substantially lighter than air as it warms. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The refrigerated liquid weighs approximately 1.23 pounds per gallon near its boiling point temperature.

Due to the fact that the compressed gas is shipped at temperatures far in excess of its very low critical temperature, the pressure within containers of compressed gas is a function of the temperature of the container and the amount of helium it contains (such that the term "vapor pressure" no longer has meaning). These pressures can vary, but are typically on the order of 170 – 140 atmospheres (2500 – 3500 psig) at room temperature within gas cylinders.

Helium is an inert substance that does not react with other materials and is stable in transportation. Although it is completely nontoxic, the large volumes of gas that may be generated in a major accident may cause suffocation by displacing oxygen in the air. 'the extremely low temperatures that may occur under certain conditions of release (primarily but not exclusively from discharges of liquid) may cause tissue damage and burns due to frostbite.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very slightly soluble; 0.97 ml (gas)/ 100 ml water at 32°F (0°C); 0.861% by volume at 68°F (20°C).
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 0.147 at –455.8°F (–271°C)
Boiling Point: –452.1°F (–268.9°C) at 1 atm.
Melting Point: Cannot be frozen at ordinary pressure
Freezing Point: –457.6°F (–272°C) at 25.2 atm
Molecular Weight: 4.0
Heat of Combustion: Not flammable
Vapor Pressure: See General Information section above.
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: Noncorrosive; requires no special materials of construction so long as temperatures and pressures are tolerated.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: None; not known to combine with any other element; considered inert.

IDENTIFICATION

Shipping Names: Helium (USDOT and IMO); helium, refrigerated liquid (USDOT and IMO); helium, compressed (USDOT).
Synonyms and Tradenames: None, helium is one of the natural elements.
Chemical Formula: He_2
Constituent Components (% each): More than 99.99% pure
49 STCC: 49 045 40 (helium or compressed helium); 49 045 39 (refrigerated or compressed helium).
UN/NA Designation: UN1046 (helium, compressed helium); UN1963 (refrigerated, cryogenic liquid).
IMO Designation: 2.2, nonflammable gas
Physical State As Shipped: Compressed or liquefied (refrigerated) gas
Physical State As Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless
Common Uses: Rocket research; nucleonics; lasers; filling balloons and blimps; producing low temperatures or inert atmospheres; leak detection; diving and space vehicle breathing equipment; luminous signs; welding; chromatography; etc.

HELIUM
Division 2.2 (Nonflammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor **Concentration:** Odorless

Unusual Hazards: Large volumes of nontoxic and nonflammable gas generated upon release may cause suffocation via displacement of oxygen in air at high concentrations. Extreme cold of liquid or vapors may cause tissue damage or burns due to frostbite. Temperatures involved may be low enough to liquefy air on the surface of cold equipment.

Short Term Exposure Limits (STEL): Unavailable; see below

Time Weighted Average (TLV-TWA): Unavailable; listed as simple asphyxiant.

Conditions to Avoid: Entry into any area in which oxygen levels may be reduced unless a self-contained breathing apparatus is worn. Contact with cold liquid, gas, or containment equipment. Use of equipment not suitable for the temperatures and pressures that may be encountered.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the high gas concentrations that may be present in air in the immediate spill area. Contact should be avoided with cold liquid, gas, or containment equipment to prevent tissue damage and burns due to frostbite.

Hazards of **Skin** ***or Eye Contact:*** Contact with liquid helium or cold helium gas may cause extensive tissue damage or burns due to the extremely cold temperatures involved. Blistering and deep tissue freezing may occur from excessive contact.

Hazards of Inhalation: High concentrations of helium gas in air may cause suffocation by diluting the concentration of oxygen in air below levels necessary to support life. Lack of oxygen may produce dizziness, nausea, errors in judgment, fatigue, accelerated pulse, gasping, confusion, vomiting, loss of consciousness and death, possibly in seconds and without warning.

Hazards of Ingestion: Ingestion of liquid helium is highly unlikely.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable compressed gas or refrigerated liquid. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of gas upon release.

Hazardous Combustion Products: Not flammable; will not decompose.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Not flammable but containers may rupture violently in fire due to overpressurization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with excessively cold liquid helium, gas, or containment equipment. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Note that respirators will not function in oxygen depleted environments and may lead to suffocation.

FIRST AID

Nonspecific Symptoms: Symptoms of oxygen deficiency or frostbite.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration and get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of water. Get medical attention immediately. Do not use hot water or rub frostbitten areas.

1046

HELIUM
Division 2.2 (Nonflammable Gas)

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid bodily contact with cold liquid or gas. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential due to overpressurization. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers Cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent entrapment of liquid in dosed systems, Use oxygen monitoring equipment to test for oxygen deficient atmospheres where necessary. Vent helium to atmosphere slowly in well ventilated outdoor location if this method of disposal is selected. Note that liquid helium in exposed piping can actually cause air to condense and liquefy. The nitrogen in this liquid air can evaporate more rapidly, leaving behind an oxygen enriched liquid. Consequently, any insulating materials used should be compatible with oxygen. Only metals and materials compatible with extremely low temperatures and/or high pressures should be used, thus excluding use of carbon steel and other metals that become brittle when used at low temperatures.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Helium discharges may not generate hazardous airborne contaminant concentrations over significant distances in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the product is removed or depleted, particularly if less than large amounts have been released in outdoor locations.

CONSEQUENCE

Hazardous levels of helium in air may be found in the local spill area and immediately downwind.

MITIGATION

Restrict access to the local spill area and areas immediately downwind of unprotected personnel until flow is stopped or the container empties. Check for oxygen levels in air.

TECHNIQUE

EVACUATION . . . Where necessary due to the possibility of massive releases in populated areas, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HELIUM
Division 2.2 (Nonflammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid helium, where necessary due to vulnerable surroundings, may be contained by building dikes or barriers using soil, sand or other materials. Note that any spilled liquid will boil vigorously at first and continue to vaporize rapidly.

TECHNIQUE

EXCAVATION . . . Where necessary, a trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Where necessary and possible, accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks due to the high pressures and low temperatures that may be encountered.

MITIGATION

Use suitable equipment. Consider allowing liquid helium to evaporate until depleted or use a light water spray to accelerate boil-off.

WATER SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Any liquid helium contacting a water body will rapidly boil off. Traces of helium remaining in the water (if any) should be completely harmless.

January 1990

HEPTANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Heptane is a clear, colorless, and somewhat volatile liquid hydrocarbon with a mild odor similar to gasoline. It is used as a general solvent and extractant in industry, for organic synthesis and preparation of laboratory reagents, and as a standard in testing knock in gasoline engines. Practically insoluble in water and lighter, heptane will form a floating surface slick. Its flash point of 25°F for the pure liquid indicates that the product is easily ignited under most ambient temperature conditions. Vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flash back, particularly in warm weather. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.7 pounds per gallon.

Heptane does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials, however, and may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low to moderate. Products of combustion may include toxic constituents.

If heptane is leaking (not on fire), downwind evacuation should be considered on a case by case basis until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.005 g/100 g water (50 ppm) at 59°F (15°C); 3 ppm in fresh water and 10.5 ppm in salt water at 68°F (20°C).

Solubility in Other Chemicals: Soluble in alcohol, chloroform, ether, acetone, and hydrocarbons.

Specific Gravity (Liquid): 0.684 at 68°F (20°C)

Boiling Point: 209.1°F (98.4°C) at 1 atm.

Melting Point: –131°F (– 90.6°C)

Freezing Point: See melting point

Molecular Weight: 100.2

Heat of Combustion: –10,650 cal/g

Vapor Pressure: 35 – 40 mm Hg (0.677 – 0.773 psia) at 68°F (20°C); reported values vary

Flash Point: 25°F (–3.9°C), closed cup; 30°F (–1.1°C), open cup

Autoignition Temperature: 399 – 433°F (204 – 222°C)

Burning Rate: 6.8 mm/minute

Stability: Stable

Corrosiveness: Noncorrosive to metals but may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react or ignite in contact with strong oxidizing agents or materials.

IDENTIFICATION

Shipping Names: Heptane (USDOT and IMO)

Synonyms and Tradenames: n-Heptane; normal heptane; heptyl hydride; dipropylmethane; Skellysolve C; Gettysolve C

Chemical Formula: $CH_3(CH_2)_5CH_3$

Constituent Components (% each): Various grades are mostly heptane with remainder consisting of petroleum hydrocarbons such as dimethyl pentanes and cyclopentanes, methyl hexanes, toluene, cyclohexane, and others.

49 STCC**:** 49 091 90

UNINA Designation: UN1206

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Like mild gasoline

Common Uses: Standard in testing knock in gasoline engines; anesthetic; used in organic synthesis and preparation of laboratory reagents; general solvent and extractant.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HEPTANE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 200 ppm for 100% odor recognition; other reported values vary from *2* to 2000 ppm.
Unusual Hazards: Somewhat volatile flammable liquid with slightly heavier than air vapors at ambient temperatures.
Short Term Exposure Limits (STEL): 500 ppm for *15* minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 400 ppm over each 8 hours of a *40* hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS.

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided. Note that heptane may cause some degree of sensitization of the heart to epinephrine.
Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid heptane may result in drying and cracking of the skin due to the defatting action of the product and also lead to pain, redness, swelling, itching, and burning. Some amounts may be absorbed through the skin. Contact of liquid heptane with the eyes may cause slight irritation including redness and swelling of the mucous membranes. Do not wear contact lenses when working with heptane.
Hazards of Inhalation: Exposure to heptane vapors in air may cause some irritation of the eyes, nose, and/or respiratory tract in some but not all individuals. Inhalation of higher concentrations may cause narcosis and central nervous system depression with symptoms including lightheadedness, rapid breathing, dizziness, hilarity, nausea, loss of appetite, vertigo, incoordination, stupor, convulsions, tremors, unconsciousness, and possibly death in severe cases. Humans exposed to 1000 ppm for six minutes or 2000 ppm for four minutes reported slight vertigo. A level of 5000 ppm for 15 minutes produced stupor lasting 30 minutes with a prolonged aftertaste of gasoline. Mice exposed to 15,000 to 20,000 ppm for 30 to 60 minutes convulsed and died in laboratory experiments.
Hazards of **Ingestion:** Detailed information on the effects of heptane ingestion are not available but the product is expected to be of relatively low oral toxicity with symptoms resembling those of inhalation but also including gastrointestinal irritation, vomiting, and diarrhea. Aspiration into the lungs during vomiting may cause pulmonary edema, chemical pneumonia, hemorrhage, respiratory paralysis, asphyxia, and/or cardiac arrest with possibly severe consequences. Some effects may be delayed in onset.

FIRE HAZARDS

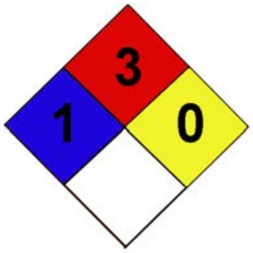
Lower Flammable Limit: 1.0 – 1.2%
Upper Flammable Limit: 6.7 – 7.0%
Behavior in Fire: Flammable liquid. May generate flammable vapors upon release. Vapors may be somewhat heavier than air and travel some distance to a source of ignition and flash back. Containers have some limited potential to rupture violently in fires.
Hazardous Combustion Products: Not well-defined; said to be acrid and to contain carbon monoxide, carbon dioxide, and various hydrocarbons which may be toxic.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. There is a limited potential that containers may rupture violently in fire.

1206

HEPTANE
Class 3 (Flammable Liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 4250 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (4250 ppm or less) or a chemical cartridge respirator with a full facepiece (850 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; symptoms of narcosis and central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to ,area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of heptane may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that heptane is a flammable liquid.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Heptane spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm or hot weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HEPTANE
Class 3 (Flammable Liquid)

TECHNIQUE

MONITOR THE SITUATION . . . Heptane may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cool or cold weather.

CONSEQUENCE

Hazardous levels of heptane in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product a$ soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to heptane vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of heptane from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination: Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of heptane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Heptane may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained heptane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

HEPTANE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, vermiculite, perlite, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal, equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Heptane spills will float on water while evaporating at a relatively slow rate and dissolving in the water at an extremely slow rate.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 – 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

HEPTANE
Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating heptane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with heptane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: This and the following potential spill responses should be considered only where critical water resources have been impacted and it is desired to remove all traces of the spilled product. Consult qualified experts for advice where necessary.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

HEXACHLOROCYCLOPENTADIENE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Hexachlorocyclopentadiene, called "HCCPD" in this Guide for short, is a yellowish, amber, or greenish yellow noncombustible substance with an odor described as pungent, harsh, and/or unpleasant. With a melting point in the range of 48.2 - 52.4°F (9 - 11.3°C), the product may be either a solid or liquid at ambient temperatures. Used to make plastics, dyes, pesticides, fungicides, pharmaceuticals and other chemical substances,

HCCPD is heavier than water and practically insoluble therein, so may be expected to sink and dissolve very slowly. It will also react slowly with water to form hydrochloric acid which corrodes many metals while producing flammable and potentially explosive hydrogen gas. HCCPD weighs about 14.3 pounds per gallon as a liquid. HCCPD is stable under normal conditions of storage, but besides its reactivity with water, is reported as incompatible with various chemicals and explosive in contact with sodium. The product is corrosive to bodily tissues, and most importantly (and despite its low vapor pressure), generates vapors which are extremely toxic to humans even at very low concentrations in air. Exposure to fire causes thermal decomposition of HCCPD and is reported to result in generation of corrosive and/or poisonous gases such as hydrogen chloride, chlorine, phosgene, carbon monoxide, and possibly other harmful substances.

Downwind evacuation or an alternative protective action must be considered based on the amount of material released, location, weather conditions, and whether or not the product is thermally decomposing in a fire or exposed to high heat if HCCPD is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, that a large amount of noncombustible but extremely toxic vapors may be released into the atmosphere if the container ruptures.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.805 ppm (805 ppb) at 77°F (25°C).

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, hexane, and certain other organic solvents.

Specific Gravity (Liquid): 1.71 at 68°F (20°C).

Boiling Point: 462°F (239°C) at 1 atm.

Melting Point: 48.2 - 52.4°F (9 - 11.3°C).

Freezing Point: See melting point.

Molecular Weight: 272.77.

Heat of Combustion: Not combustible.

Vapor Pressure: 0.08 mm Hg (0.001546 psia) at 77°F (25°C); 1 mm Hg (0.019329 psia) at 140°F (60°C).

Flash Point: Not combustible.

Autoignition Temperature: Not combustible.

Burning Rate: Not combustible.

Stability: Stable under normal conditions of storage.

Corrosiveness: Hydrochloric acid formed in slow reaction of HCCPD with water or moisture will corrode most metals, particularly iron and aluminum, with evolution of flammable and potentially explosive hydrogen gas that may accumulate in enclosed spaces. A maker of the product suggests the product be stored in nickel clad or phenolic lined containers and implies that HCCPD may react slowly with common metals even in the absence of water.

Reactivity with Water: Reacts very slowly and in a non-hazardous fashion to form hydrochloric acid and less chlorinated forms of hexachlorocyclopentadiene.

Reactivity with Other Chemicals: Available data are limited. Reported to be incompatible with strong acids, strong bases, or oxidizing agents; said to react slowly with many substances including common metals. May explode in contact with sodium. Any hydrochloric acid formed in reactions with water may be reactive with a wide variety of substances.

IDENTIFICATION

Shipping Names: Hexachlorocyclopentadiene.

Synonyms and Tradenames: 1,3-Cyclopentadiene, 1,2,3,4,5,5-hexachloro-; hexachloro-1,3-cyclopentadiene; 1,2,3,4,5,5-hexachloro-1,3-cyclopentadiene; HCCPD; PCL; perchlorocyclopentadiene; and various tradenames including C-56; Graphlox; and HRS 1655.

Chemical Formula: Molecular formula is C_5Cl_6; structural formula is $-(CCl)_4-CCl_2-$; the material has a five-sided ring structure.

Constituent Components (% each): Limited data available. Apparently 97% or more pure; some products may be close to 100% pure.

UN/NA Designation: UN2646.

IMO Designation: *6.1, poisonous* material.

Physical State As Shipped: Liquid or solid.

Physical State As Released: Liquid or solid; solidifies at 48.2 - 52.4°F (9 - 11.3°C).

Color of the Shipped Material: Variably described as pale yellow, yellow, amber, and greenish yellow.

Odor Characteristics: Described as pungent, harsh, and/or unpleasant.

Common Uses: Used to make resins, plastics, dyes, pesticides, fungicides, pharmaceuticals, and various other chemical substances.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

HEXACHLOROCYCLOPENTADIENE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.15 ppm; pronounced pungent odor at 0.33 ppm in air.
Unusual Hazards: Despite a low vapor pressure at normal ambient temperatures, HCCPD vapors are extremely toxic at even very low concentrations in air. Hydrochloric acid is formed when HCCPD reacts with water or moisture.
Short Term Exposure Limit (STEL): Not established
Time Weighted Average (TWA) Limit: *0.01* ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93).
Ceiling (C) Limit: Not established
Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the extremely toxic vapors of HCCPD that may present in air in the spill area and over considerable downwind distances. Direct contact and ingestion should also be strictly avoided. Of greatest concern would be situations in which the spilled product is exposed to heat which increases its vaporization rate and/or a bulk container exposed to extereme fire or excessive heat ruptures and suddenly releases large amounts of hot noncombustible liquid and extremely toxic vapors.
Hazards of Skin or Eye Contact: The vapors of HCCPD are severely irritating to the eyes and cause lacrimation. Contact of the liquid or solid product with the eyes is reported to result in burns, which indicates the possibility of permanent impairment of sight or blindness. Contact of the skin with HCCPD may result in severe irritation, blisters, burns, and/or destruction of tissue. Prolonged contact may result in harmful amounts being absorbed through the skin. Indeed, even contact of "high" concentrations of vapors with the skin is considered hazardous. Any HCCPD which contacts the skin should be removed as soon as possible. Contact lenses should not be worn when working with this chemical.
Hazards of Inhalation: Vapors or mists of HCCPD are extremely toxic to humans. Symptoms of exposure are variably reported to include severe irritation of the nose, throat and lungs, sneezing, coughing, headache, nausea, excessive salivation, chest discomfort, abdominal cramps, difficult breathing, gasping respiration, bronchitis, tremors, pulmonary hyperemia and pulmonary edema (which is likely to be delayed in onset), pneumonia, and possibly death. Autopsies have revealed degenerative and necrotic changes in the brain, heart and adrenal glands as well as necrosis of liver and kidney tubules. Ingestion of alcohol before or after an exposure may greatly aggravate injurious effects on the liver. Exposures not causing the more severe effects listed above may result in symptoms such as fatigue, respiratory tract irritation, headaches, and eye irritation that persist for weeks (and which may include excess serum proteins in the urine and elevated serum lactic dehydrogenase levels). Exposure to only 1.6 ppm in air for 4 hours was lethal to 50% of male rats in laboratory experiments. The saturated vapor concentration directly over a pool of HCCPD at 77°F (25°C) is about 105 ppm. Such concentrations can rise to about 1315 ppm at 140°F (60°C), 12,250 ppm at 220°F (104°C) and 71,600 ppm at 300°F (149°C) if HCCPD warms up when exposed to a source of heat in a spill situation.
Hazards of Ingestion: One authority lists nausea, vomiting, diarrhea, and depression (probably of the respiratory system) as symptoms of ingestion while another repeats several severe effects associated with inhalation including those involving the brain, heart, liver, adrenal glands, kidneys, and lungs. The lowest single oral dose reported as lethal to 50% of rats in laboratory experiments is 584 milligrams of HCCPD per kilogram of an animal's body weight. It is expected that consumption of alcohol before or after an exposure may greatly increase liver damage.

FIRE HAZARDS

Lower Flammable Limit: Not combustible.
Upper Flammable Limit: Not combustible.
Behavior in Fire: Some authorities warn that bulk containers of the product may explode in a fire but that probability of this in transportation appears to be quite low except possibly under extreme conditions (though small containers may rupture due to expansion of the liquid upon heating). Not combustible, exposure to heat will increase its vapor pressure and the rate at which it will generate extremely toxic vapors.
Hazardous Combustion Products: Exposure to fire or very high tempertures may cause thermal decomposition of HCCPD and generation of poisonous and/or corrosive gases such as hydrogen chloride, chlorine, carbon monoxide, and phosgene.

EXPLOSION HAZARDS

Explosiveness: See "Behavior in Fire" section above for discussion of container explosion possibility. Contact with certain other chemicals or materials may result in an explosion. Any accumulations of hydrogen gas produced by the action of hydrochloric acid on metals may explode if ignited in a confined space; see "Corrosiveness" section for further details.

2646

HEXACHLOROCYCLOPENTADIENE
Division 6.1 (Poisonous Material)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and vapor-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with "high" vapor concentrations in air or the products of thermal decomposition of HCCPD in a fire. Several authorities agree that compatible materials for HCCPD itself may include butyl rubber, nitrile rubber, polyvinyl alcohol, and Viton. Be advised that many factors affect the suitability of a material for any given application. Ensure that the specific protective clothing and devices chosen will provide adequate protection under actual conditions to be encountered.

Respiratory Protection: Whenever or wherever the concentration of HCCPD may exceed 0.01 ppm in air, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, headache, salivation, chest discomfort, abdominal cramps, difficult breathing, tremors, nausea, vomiting, diarrhea, fatigue, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Do not permit consumption of alcohol after any exposure.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if irritation or other effects persist after washing.

First Aid for Ingestion: If conscious, have victim wash out mouth with water (which should not be swallowed); then administer several glasses of water or milk. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Do not permit consumption of alcohol after any exposure.

FIRE RESPONSE

Extinguishing Materials: HCCPD is not combustible. Use agent suitable for surrounding fire but do not permit water to enter containers of HCCPD.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with "high" vapor concentrations in air or products of thermal decomposition of HCCPD is anticipated. Move container from fire area if no risk. Be alert to the warning that the container may explode and suddenly release massive amounts of HCCPD and various gases when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out but do not permit water to enter containers. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with extreme caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines as necessary. Be advised there is a possibility that discharge of a carbon dioxide fire extinguisher at the point of leakage of liquid HCCPD has the potential to solidify the product and stop the leak in some cases, at least temporarily. Other means of attempting to solidify the leaking liquid and/or reducing its vapor pressure via cooling may also work. Whether or not a "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the container and its temperature. Use professional judgment in attempting this type of response action. Take the reactivity and extremely toxic nature of HCCPD into account while planning the response.

HEXACHLOROCYCLOPENTADIENE
Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. HCCPD discharges may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to HCCPD vapors may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact the HCCPD if this is not desirable under the circumstances. Conversely, if the HCCPD is being warmed by a nearby source of high heat, the water may help keep the HCCPD cool and thereby reduce its rate of toxic vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of hydrochloric acid, HCCPD, and possibly similar hazardous substances.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible and as necessary to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of confined liquid pools or solidified liquid pools of HCCPD may slow the release of HCCPD vapors into the atmosphere.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors may increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . HCCPD is practically insoluble in water, heavier than water, and reported to react slowly with water in a non-hazardous fashion. There is an unconfirmed possibility that coverage of confined liquid pools, particularly with cold water, and using a gentle water spray, may form a layer or blanket of water over the HCCPD which reduces toxic vapor emissions.

CONSEQUENCE

Addition of water will increase the volume of contained liquids. Hydrochloric acid and possibly other hazardous substances may be formed by the slow reaction of HCCPD with water.

MITIGATION

Contain spilled liquids and neutralize and/or remove them as soon as possible and as necessary. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid HCCPD or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained liquids and spread of contamination.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible and as necessary to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

LAND SPILL *(CONTINUED)*

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product or contaminated water runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible and as necessary to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Any hydrochloric acid present may generate flammable and potentially explosive hydrogen gas within incompatible equipment. At or below the melting point temperature of HCCPD, the product may solidify and clog or plug various items of equipment.

MITIGATION

Use dry equipment compatible with the spilled product and/or any hydrochloric acid that may be present. Do not undertake this recovery method where liquid HCCPD may solidify during the recovery process unless the product may be maintained as a liquid by some safe means.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product or contaminated runoff may be controlled by absorbing liquids with dry sand, earth, clay, fly ash, cement powder, vermiculite, dicalite, celite, diatomaceous earth, commercial sorbents, or other compatible substances according to various authorities. This response is not applicable for solid HCCPD.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance, particularly in the case of liquids containing or generating hydrochloric acid.

CONSEQUENCE

Application and removal of chemical agents entail additional risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

PROTECTION FROM WIND . . . If deemed necessary due to conditions at the spill site, cover solid HCCPD with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product or its residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable gases present in the area, such as may be generated by the action of hydrochloric acid on many metals, may be ignited by motorized removal equipment.

MITIGATION

Use compatible equipment. Decontaminate all equipment after use. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

HEXACHLOROCYCLOPENTADIENE
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE.. . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. HCCPD will sink to the bottom of water bodies, dissolve at a very slow rate, and react slowly to form hydrochloric acid and possibly other hazardous pollutants. Note that HCCPD is toxic to aquatic life at very low concentrations in water; certain breakdown products may accumulate in the food chain.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air. Wet HCCPD will slowly react with water to form hydrochloric acid that will corrode may metals while generating hydrogen gas.

MITIGATION

Consult qualified experts for guidance. Use compatible equipment or take other precautions if hydrogen gas may pose a fire or explosion hazard.

TECHNIQUE

CONTAINMENT DIKES . . . Water with any dissolved chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to water contaminated by HCCPD, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards, particularly those caused by any hydrochloric acid that may be present or which may be generated.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 1992

HEXAFLUOROACETONE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Hexafluoroacetone is a highly toxic, noncombustible, colorless gas that fumes upon exposure to moist air, that has a musty pungent odor that may be acrid at times, and that is shipped and stored as a liquid under pressure. It is used for making other chemicals and substances used in adhesive, pharmaceutical, solvent, and water-repellent coating formulations. Liquid hexafluoroacetone has a low boiling point and will react vigorously with water or moisture to form an extremely acidic hydrate of the product while generating considerable amounts of heat. All discharges on water or land have the potential to generate relatively large quantities of heavier than air gases and fumes that may be hazardous over considerable downwind distances and that may persist in low areas. The liquid product weighs about 11.1 pounds per gallon under its own vapor pressure at a temperature of 77°F (25°C).

Hexafluoroacetone is stable in normal transportation but containers of the product may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. Information about its reactivity with substances other than water is limited but hexafluoroacetone is generally reported to be a highly reactive substance and is at the very least incompatible with reducing agents, nitrates, and nitric acid. Toxicity of the substance must be considered high by all routes of exposure. Some of its toxic effects are quite unusual and hazardous, especially to pregnant women. When heated to decomposition, hexafluoroacetone is reported to generate fluoride fumes which may possibly include highly corrosive hydrogen fluoride and/or hydrofluoric acid as well as other hazardous substances.

Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, and weather conditions if hexafluoroacetone is leaking from its container. Be advised that the U.S. DOT's 1990 Emergency Response Guidebook recommends immediate initial isolation of the leak area for at least 1500 feet in all directions and then evacuation of a far greater downwind distance in the event of a release from any size container. If a container is exposed to direct flame or a fire becomes uncontrollable, note that it may rupture violently and suddenly release all of its contents into the atmosphere in the form of highly toxic and/or corrosive gases and fumes.

Due to various factors, the available data and information available for this substance were comparatively limited in detail and contained shortcomings. It should not be expected that each and every item of information and recommendation presented below is completely accurate.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts vigorously
Solubility in Other Chemicals: Not available
Specific Gravity (Liquid): 1.32–1.33 at 77°F (25°C) as a liquid under its own vapor pressure.
Boiling Point: –18.4 to –16.6°F (– 28 to – 27°C) at 1 atm.
Melting Point: –187.6°F (–122°C) or – 200.2°F –129°C); reported values vary.
Freezing Point: See melting point
Molecular Weight: 166.02
Heat of Combustion: Not combustible
Vapor Pressure: 5.95 atm (87.5 psia) at 70°F (21.1°C)
Flash Point: Not combustible
Autoignition Temperature: Not combustible
Burning Rate: Not combustible
Stability: Stable in normal transportation
Corrosiveness: Available data are for compatible rather than incompatible materials. All equipment used for hexafluoroacetone should be clean and dry to avoid development of acidic conditions. Monel, nickel, Inconel, stainless steel, copper, and glass or Hastellory C-lined equipment are considered satisfactory for use.
Corrosiveness (continued): Copper tubing can be used for transfer of liquid or gaseous product that is dry. Polyethylene and some types of rubber tubing have been successfully used at times for flexible connections at atmospheric pressure.
Reactivity with Water: Hexafluoroacetone is hygroscopic (i.e., absorbs moisture from the air), will fume when exposed to moist air, and will react vigorously with water or moisture while evolving a considerable amount of heat. The reaction forms highly acidic hexafluoroacetone sesquihydrate with a pH of less than 1.
Reactivity with Other Chemicals: Available data are highly limited. One authority simply reports the product is highly reactive; another reports it also reacts vigorously with substances other than water while releasing considerable heat; and a third recommends the product be kept away from direct sunlight, water, heat, reducing agents, nitrates, and nitric acid. It is best to consider the substance highly reactive and dangerous under these circumstances pending the availability of additional information.

IDENTIFICATION

Shipping Names: Hexafluoroacetone
Synonyms and Tradenames: 1,1,1,3,3,3-Hexafluoro-2-propanone; perfluoroacetone; perfluoro - 2-propanone; GC 7887; HFA; and 6FK.
Chemical Formula: CF_3COCF_3 or $(CF_3)_2C0$
Constituent Components % each): 95% minimum purity; commercial products are more commonly 99.5% or more pure and may exceed 99.9%.
49 STCC: 49 205 28
UN/NA Designation: UN2420
IMO Designation: 2.3, poison gas
Physical State As Shipped: Compressed liquefied gas
Physical State As Released: Fuming and/or boiling liquid, gas, or mixture of gas and aerosols (small liquid droplets); the boiling point of the product is in the range of –18.4 to –16.6°F (– 28 to –27°C) at 1 atm.
Color of the Shipped Material: Colorless gas that fumes when exposed to moist air. Color not available for liquid.
Odor Characteristics: Musty, pungent; becomes acrid in presence of acidic impurities.
Common Uses: Making other chemicals and hexafluoroacetone derivatives used in adhesives, pharmaceutical products, and water repellent coatings for textiles; also used as solvents for resins and polymers

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HEXAFLUOROACETONE
Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available

Unusual Hazards: Extremely volatile substance with poisonous vapors and fumes that are heavier than air and may persist in low areas. Reacts vigorously with water to form highly acidic hydrates while generating considerable heat. Suckback of the product into a container may cause a violent reaction and lead to extremely corrosive conditions.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: (Skin) 0.1 ppm (0.68 mg/m^3) over each 8 hours of a 40 hour work week (ACGIH, 1991– 92; OSHA, 1989).

Conditions to Avoid: Heat or fire; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the high gas, vapor, and fume concentrations that may be present in the spill area and over very considerable distances downwind, but any and all exposures to hexafluoroacetone should be minimized or avoided. Pregnant females appear to be particularly at risk of suffering malformations of fetuses. Males may suffer testicular damage.

Hazards of Skin or Eye Contact: Data are limited. Hexafluoroacetone is simply reported to be severely irritating to the eyes and skin and capable of causing burns. The high acidity of the product in the presence of moisture or water suggests that burns have the potential to be severe and may result in permanent damage to the eyes. Aqueous solutions of hexafluoroacetone and/or its hydrates have been reported to cause the malformation of fetuses in pregnant rats via absorption through the skin when applied daily in repeated doses as low as 1 mg/kg of body weight or in a single application as low as 11 mg/kg. The skin of animals in some of these tests became red and scaly, with burns causing dead skin to be shed in some animals. Absorption through the skin may also cause toxic effects (including effects on the testes of males) and even death in non-pregnant animals, though at higher dosages. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Vapors or fumes of hexafluoroacetone are severely irritating to the eyes, nose, throat, and respiratory tract. Symptoms of exposure are variably reported to include central nervous system depression (with symptoms presumed to include drowsiness, fatigue, incoordination, dizziness, etc.), respiratory system impairment, decreased blood pressure, hemorrhages involving the eyes, pigmented secretions around the eyes and nose, damage to blood cells, injury to the kidneys and liver, damage to the reproductive glands of males (affecting level of sperm production), and irritation of the lungs leading to gross hemorrhages, pulmonary edema (which may be delayed in onset), and death. Exposure of rats to 900 ppm of hexafluoroacetone vapors in air for 30 minutes, to 275 ppm for 3 hours, or to 300 ppm for 4 hours, killed 50% of the animals in laboratory experiments. Exposure to 200 ppm for 4 hours provided evidence of damage to the liver, kidneys, testes, and thymus but was not lethal. Damage to the testes of male rats was reported after a single 4 hour exposure to 60 ppm. There is evidence that exposures can cause malformations in the fetuses of pregnant mammals and subsequent birth defects. Repeated exposures to 12 ppm in air over 90 days caused effects on bone marrow. Repeated exposures have also demonstrated effects on lymph nodes and the spleen in rats and dogs. Some effects, such as reversible kidney injury in rats and increased lung weight in dogs, have been observed after repeated exposures to even 1 ppm in air. Odor is not a reliable warning property of dangerous concentrations of this substance. There is an unconfirmed possibility based on experience with other chemicals that people who have ingested alcohol may be at greater risk of kidney and/or liver damage when exposed to hexafluoroacetone.

Hazards of Ingestion: Data are limited. Due to its low boiling point, ingestion of liquid hexafluoroacetone itself is not considered likely. Nevertheless, experiments with presumably aqueous solutions of the substance have indicated that ingestion of comparatively moderate amounts can cause injury and/or death. The lowest dosage reported to kill rats in laboratory experiments is 191 mg/kg of body weight. The acidity of strong aqueous solutions may be expected to cause burns of the mouth, throat, and gastrointestinal tract with possibly severe consequences.

2420

HEXAFLUOROACETONE
Division 2.3 (Poison Gas)

FIRE HAZARDS

Lower Flammable Limit: Not combustible

Upper Flammable Limit: Not combustible

Behavior in Fire: Liquefied compressed gas. Containers may rupture violently in a fire due to overpressurization and suddenly release all of their contents into the atmosphere in the form of highly toxic and/or corrosive gases and fumes.

Hazardous Combustion Products: Not well-defined. Although the substance is not flammable, various authorities indicate it generates toxic "fluoride" fumes when heated to decomposition. These fumes may possibly contain hydrogen fluoride, hydrofluoric acid, and other hazardous substances such as carbon monoxide and carbon dioxide among others.

EXPLOSION HAZARDS

Lower Explosive Limit: Not combustible

Upper Explosive Limit: Not combustible

Explosiveness: Containers may rupture violently in a fire due to overpressurization. Information on explosions due to reactions with other chemicals is not available.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with hexafluoroacetone and its products of reaction with water or moisture. This may include rubber boots, gloves, face shields, splash-proof and/or gas-tight safety goggles, and other impervious and resistant clothing depending on working conditions. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air under emergency conditions.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full face-piece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, skin, nose, throat, respiratory tract, or other bodily tissues; impaired respiration and/or various other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get immediate medical attention.

First Aid for Ingestion: Ingestion of hexafluoroacetone itself is unlikely due to its low boiling point and is therefore not discussed in reference sources. If an aqueous solution of the product is ingested and the victim is conscious, it appears most prudent to administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to avoid aspiration of fluids into the lungs.

FIRE RESPONSE

Extinguishing Materials: Hexafluoroacetone is not combustible. Use agent suitable for surrounding type of fire but note that liquid hexafluoroacetone reacts vigorously with water with the evolution of considerable heat. The resulting solution may be highly acidic and corrosive.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out, but avoid inadvertently getting water inside containers of

FIRE RESPONSE (continued)

Extinguishing Techniques (continued): hexafluoroacetone or onto any pools of liquid. Do not apply water at point of leak if hexafluoroacetone is discharging from its container. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid all contact with spilled product. Stop leak if safe to do so. Prevent liquid hexafluoroacetone or its solutions from entering sewers. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or other adverse impacts on boilers or industrial process equipment due to the corrosivity and reactivity of the substance and its aqueous solutions. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the high volatility, unusual toxicological characteristics, and reactivity of hexafluoroacetone into account while planning the response. Note that suckback of the product into a container may cause a violent reaction and may lead to the formation of extremely corrosive conditions. To prevent suckback, it is advisable to install a check valve, vacuum break, or trap in transfer lines connected to the container.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Hexafluoroacetone discharges may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hexafluoroacetone vapors or fumes may react with vapors, knockdown vapors and fumes, and/or accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact any pools of liquid hexafluoroacetone itself that may be present. Do not apply water directly on point of leakage.

CONSEQUENCE

Water runoff may contain highly acidic hydrates of hexafluoroacetone from contact with the vapors or fumes of hexafluoroacetone.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid hexafluoroacetone may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Hexafluoroacetone reacts vigorously with water with considerable evolution of heat.

TECHNIQUE *(continued)*

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts for advice as necessary.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid hexafluoroacetone, its solutions, and contaminated runoff may be contained by building dikes or barriers using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate means.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained substances and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible and as appropriate to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment used in attempts to recover liquid hexafluoroacetone itself. Any moisture or water present may result in highly corrosive conditions.

MITIGATION

Use dry, clean equipment compatible with the spilled product and of sufficient pressure capacity. Where necessary, consider using a cold gas such as dry nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of hexafluoroacetone into the equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solutions or contaminated runoff may be controlled by absorbing the liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances. Deposit used sorbents in sealed containers.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

HEXAFLUOROACETONE
Division 2.3 (Poison Gas)

TECHNIQUE (continued)

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify aqueous solutions of hexafluoroacetone to less hazardous substances.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and residues of liquid solutions of hexafluoroacetone may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with contaminant. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid hexafluoroacetone will sink in water while simultaneously boiling and reacting vigorously. The portion that reacts with water will form a highly acidic and toxic solution. The remainder will enter the atmosphere as highly toxic and/or corrosive gases, vapors, and fumes.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1989

HEXAMETHYLENE DIAMINE SOLUTION
Class 8 (Corrosive Materials)

GENERAL INFORMATION

The product solution discussed in this guide is 70% hexamethylene diamine dissolved in water. It is a clear colorless liquid with a weak fishy odor and is used in the making of high polymers such as nylon. A flash point of 160°F for the pure chemical indicates that its solution must be moderately heated before ignition may occur. The solution weighs approximately 7.8 pounds per gallon.

Hexamethylene diamine solution does not react with water or many other common materials and is stable in normal transportation. It is corrosive to aluminum and copper and their alloys, and reacts with oxidizing materials. It is also an irritant via the various routes of exposure and may cause burns of bodily tissues. Toxic vapors are emitted when the materials is heated to decomposition.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol and benzene
Specific Gravity (Liquid): 0.933 at 68°F (20°C)
Boiling Point: 401°F (205°C) at 1 atm. for pure chemical
Melting Point: 28°F (–2°C)
Freezing Point: 28°F (–2°C)
Molecular Weight: 116.21
Heat of Combustion: –6790 cal/g (est.)
Vapor Pressure: Approx 31 mm Hg (0.6 psia) at 230°F (110°C) for pure chemical.
Flash Point: 160°F (71.1°C), open cup for pure chemical.
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Stable
Corrosiveness: Corrosive to aluminum and copper and their alloys.
Reactivity with Water: No reaction; forms alkaline and caustic solution.
Reactivity with Other Chemicals: Reacts with oxidizing materials.

IDENTIFICATION

Shipping Names: Hexamethylene diamine, solution (USDOT); hexamethylenediamine, solution (IMO).
Synonyms and Tradenames: 1,6-Hexanediamine; 1,6-diaminohexane; HMDA.
Chemical Formula: $NH_2(CH2_2)_6NH_2$
Constituent Components (% each): 70% hexamethylene diamine by weight in water.
49 STCC: 49 356 45
UN/NA Designation: UN1783
IMO Designation: 8, corrosive (basic)
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Weak, fishy; like piperidine
Common Uses: Formation of high polymers, especially nylon.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HEXAMETHYLENE DIAMINE SOLUTION
Class 8 (Corrosive Materials)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 0.0009 ppm
Unusual Hazards: Relatively corrosive and combustible liquid.
Short Term Exposure Limits (STEL): Unavailable
Time Weighted Average (TLV-TWA): Unavailable
Conditions to Avoid: Fire or excessive heat; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may possibly be present in the immediate vicinity of the spill. Contact and ingestion are also to be avoided.
Hazards of Skin or Eye Contact: Hexamethylene diamine solution is irritating to the skin and may cause inflammation or burns upon prolonged exposure. Contact with the eyes may cause strong irritation and possibly burns.
Hazards of Inhalation: Vapors of hexamethylene diamine are irritating to the eyes and respiratory tract and are toxic. Exposure to only 158 ppm in air for 10 minutes was fatal to some mice in laboratory experiments.
Hazards of Ingestion: Moderately toxic; may cause burns of the mouth, esophagus, and stomach.

FIRE HAZARDS

Lower Flammable Limit: 0.7%
Upper Flammable Limit: 6.3%
Behavior in Fire: Will burn but may be difficult to ignite unless heated.
Hazardous Combustion Products: Decomposition products are considered toxic and may include oxides of nitrogen.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors from hot liquid are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.
Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.
First Aid for Ingestion: Do not induce vomiting, give large quantities of water. Never give anything by mouth to an unconscious person. Get medical attention immediately.

1783

HEXAMETHYLENE DIAMINE SOLUTION

Class 8 (Corrosive Materials)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water spray. Water may possibly be used to dilute solution to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Hexamethylene diamine solution, usually, will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of hexamethylene diamine solution in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access of unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hexamethylene diamine solution vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain hexamethylene diamine solution from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of hexamethylene diamine solution vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

HEXAMETHYLENE DIAMINE SOLUTION
Class 8 (Corrosive Materials)

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid hexamethylene diamine solution may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as firehose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hexamethylene diamine solution may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as firehose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

HEXAMETHYLENE DIAMINE SOLUTION
Class 8 (Corrosive Materials)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Carbon may be effective on alkaline solutions. Cation exchangers can be used on acid or neutral solutions.)

CONSEQUENCE

Recovery of adsorbents may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

HEXANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Hexane is a clear colorless and fairly volatile liquid hydrocarbon with an odor similar to gasoline. It is used as a general solvent and medium for chemical reactions. Only barely soluble in water and lighter, hexane will form a floating surface slick. Its flash point of – 7°F indicates that the product is easily ignited under most ambient temperature conditions. Vapors are somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.5 pound per gallon.

Hexane does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials, however, and may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low to moderate, but the volatility of hexane indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents. Downwind evacuation should be considered on a case by case basis if hexane is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.014 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, chloroform, and diethyl ether.
Specific Gravity (Liquid): 0.659 at 68°F (20°C)
Boiling Point: 155.7°F (68.7°C) at 1 atm.
Melting Point: –139°F (–95°C)
Freezing Point: –139°F (–95°C)
Molecular Weight: 86.17
Heat of Combustion: –10,692 cal/g
Vapor Pressure: 124 mm Hg (2.4 psia) at 68°F (20°C)
Flash Point: – 7°F (– 21.7°C), closed cup.
Autoignition Temperature: 437°F (225°C)
Burning Rate: 7.3 mm/minute
Stability: Stable
Corrosiveness: Noncorrosive to metals but may attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizing materials.

IDENTIFICATION

Shipping Names: Hexane (USDOT and IMO)
Synonyms and Tradenames: Hexyl hydride; normal hexane; n-hexane; Skellysolve B.
Chemical Formula: $CH_3(CH_2)_4CH_3$
Constituent Components(% each): Various grades that are mostly hexane with remainder being petroleum hydrocarbons like cyclopentanes, isohexane, and possibly benzene.
49 STCC: 49 081 83
UN/NA Designation: UN1208
IMO Designation: 3.1, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless *Odor*
Characteristics: Like gasoline
Common Uses: General solvent and extractant; chemical reaction medium for pharmaceuticals; mfg. plastics, adhesives, inks, lacquers, stains, and low temperature thermometers; food additive.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HEXANE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Fairly volatile flammable liquid with somewhat heavier than air vapors. May contain some amounts of toxic benzene.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 50 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in the spill area and some distance downwind. Ingestion and direct contact are also to be avoided. Note that hexane may be a sensitizer of the heart to epinephrine. Any benzene present may increase the acute and chronic health risks of the product.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid hexane may result in drying and cracking of the skin due to the defatting action of the product. Contact of liquid hexane with the eyes may cause irritation.

Hazards of Inhalation: Exposure to appreciable vapor concentrations of hexane in air may cause irritation of the eyes, nose, and respiratory tract. Higher concentrations may cause narcosis and central nervous system depression with symptoms including lightheadedness, giddiness, nausea, headache, dizziness, unconsciousness, and possibly death. Exposure to 5000 ppm in air for only 10 minutes may be sufficient to cause dizziness and the sensation of giddiness.

Hazards of Ingestion: Ingestion may result in nausea, vomiting, swelling of the abdomen, headache, and other signs of central nervous system depression. Aspiration into the lungs during vomiting may cause delayed pulmonary edema or chemical pneumonia with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 1.1–1.2%

Upper Flammable Limit: 7.5–7.7%

Behavior in Fire: Flammable liquid. May generate significant quantities of flammable vapors upon release. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

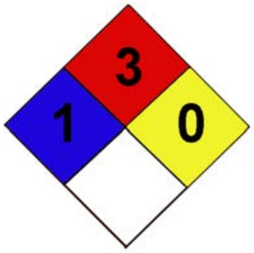
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, chlorinated polyethylene, polyurethane, polyvinyl alcohol, Viton, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (5000 ppm or less) or an organic vapor cartridge respirator (1000 ppm or less) within the uselimitations of these devices.

1208

HEXANE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, respiratory tract, or skin; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Avoid contact with spilled product. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of hexane may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that hexane is a highly flammable substance.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hexane spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Hexane may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of hexane in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

HEXANE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hexane vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of hexane from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of hexane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hexane may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained hexane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material..

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

HEXANE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION .

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

HEXANE
Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating hexane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with hexane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

1-HEXENE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

1-Hexene is a clear liquid with a faint, pleasant odor used as a laboratory reagent. It is typically reported to be 100% pure. Although it's solubility in water is negligible, it is very soluble in benzene, ethyl ether, ethyl alcohol and petroleum ether. It is reported to be stable although it can react violently with heat and strong oxidizing agents. The flash point is very low in the range of -18°C (-0.4°F) to -28°C (-18.4°F), with a lower explosive limit of 1.2% and an upper explosive limit of 6.9% with one source reporting approximately 8.9% as an UEL.

1-Hexene is hazardous through skin or eye contact, inhalation and ingestion. Eye contact with vapor can cause irritation including excessive tearing, blinking and redness, however contact with liquid can be more severe causing possible corneal damage. Skin contact can cause local redness and swelling. Inhalation of vapors can cause irritation to the respiratory tract with possible symptoms including dizziness, drowsiness, headaches, nausea, vomiting, diarrhea, weakness, euphoria, loss of coordination and disorientation. In cases of severe over exposure, unconsciousness or asphyxiation may occur. Ingestion can cause irritation to the gastrointestinal tract including possible symptoms such as abdominal and chest discomfort, nausea, vomiting, diarrhea and weakness. Lung damage may result if aspiration occurs during swallowing or vomiting.

Material is extremely flammable. Explosive mixtures of air and vapor may form, further complicated by the ability of vapors to travel to distant sources of ignition, ignite and flash back. Combustion of 1-Hexene can generate toxic levels of carbon monoxide, carbon dioxide, irritating aldehydes and ketones, while heating to decomposition can cause toxic levels of carbon monoxide, carbon dioxide, acrid smoke and fumes to be produced. Runoff from 1-Hexene may be toxic and/or flammable and must be contained for proper disposal.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible, < .1%
Solubility in Other Chemicals: Very soluble in benzene, ethyl ether, ethyl alcohol, and petroleum ether.
Specific Gravity (Liquid): .673
Vapor Density (Air=1): 3.0
Boiling Point: 63.4°C (146.1°F)
Melting Point: -139.7°C (-219.5°F)
Freezing Point: Not available
Molecular Weight: 84.158
Heat of Combustion: -72.34 ± 1.2 kj/mol
Evaporation Rate (Butyl Acetate=1): 9.6
Vapor Pressure: 7.68 kPa at 0°C (32°F); 24.8 kPa at 25°C (77°F); 64.7 kPa at 50°C(122°F)
Flash Point: -18°C (-0.4°F) to -28°C (-18.4°F)
Autoignition Temperature: 252°C (485.6°F)
Burning Rate: Not available
Flammable Limits: 1.2% (LEL) - 6.9% (UEL) (~8.9% also reported as UEL)
Stability: Stable
Polymerization Potential: Will not occur.
pH: 7
Reactivity and Incompatibility: Can react violently with heat, strong oxidizing agents and acids.
Other Characteristics: Can generate toxic levels of carbon monoxide, carbon dioxide, irritating aldehydes and ketones during combustion or decomposition.

IDENTIFICATION

Shipping Name(s): 1-Hexene (USDOT & IMO)
Synonyms and Tradenames: Butyl Ethylene; Hexene; Hex-1-ene; Hexylene.
CAS Registry No: 592-41-6
Chemical Formula: $CH_2{=}CHCH_2CH_2CH_2CH_3$
Constituent Components (% each): 100% 1-Hexene
UN/NA Designation: UN2370
IMO Designation: 3.1
RTECS Number: MP6600100
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear
Odor Characteristics: Faint, pleasant odor, also described as having a hydrocarbon odor.
Reportable Quantity: See appendix I
Common Uses: Laboratory reagent. Also used in synthesis of flavors, perfumes, dyes and resins.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1-HEXENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Volatile, flammable liquid with a low flash point and heavier than air vapors that can travel to a source of ignition and flash back.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, static, or other sources of ignition and incompatible materials such as strong oxidizing agents and acids.

HEALTH HAZARDS

Potential Health Hazards: 1-Hexene is harmful if absorbed through skin and may cause irritation to eyes and respiratory tract. Aspiration may occur if swallowed. Excessive inhalation may cause central nervous system depression, dizziness, confusion and unconsciousness.

Hazards of Skin or Eye Contact: Vapors from 1-Hexene may cause irritation to the eyes. Symptoms may include excessive tearing, blinking and redness. Liquid 1-Hexene may cause more severe irritation and possible corneal injury. Skin contact may cause irritation or discomfort seen as local redness and possible swelling, as well as other adverse health effects.

Hazards of Inhalation: Vapors or mist may cause irritation to the nose and throat. Symptoms may include dizziness, drowsiness, headaches, nausea, vomiting, diarrhea, weakness, euphoria, loss of coordination, and disorientation. In poorly ventilated areas, confined spaces, or large concentrations, unconsciousness and asphyxiation may occur.

Hazards of Ingestion: Ingestion may cause irritation of mouth, throat, and stomach. Symptoms may include abdominal and chest discomfort, nausea, vomiting, diarrhea, and weakness. Aspiration may occur during swallowing or vomiting, resulting in lung damage.

FIRE HAZARDS

Lower Flammable Limit: 1.2 %

Upper Flammable Limit: 6.9 % (~8.9 % also reported)

Behavior in Fire: Explosive air-vapor mixtures may form. Vapors may travel to distant sources of ignition and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic.

Hazardous Decomposition Products: When heated to decomposition it emits carbon monoxide, carbon dioxide, acrid smoke and fumes.

Hazardous Combustion Products: Toxic levels of carbon monoxide, carbon dioxide and irritating aldehydes and ketones.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Has a relatively low flash point and low autoignition temperature. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas where vapors can accumulate and present an explosive hazard. Containers exposed to prolonged heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

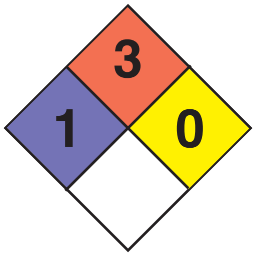
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Full fire retardant structural firefighting clothing meeting NFPA standards is recommended for handling spills when fire is the major concern.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits. Protection provided by air purifying respirators is limited.

2370

1-HEXENE

Class 3 (Flammable Liquid)



FIRST AID

First Aid for Inhalation: In case of inhalation, remove patient to fresh air. If patient is having difficulty breathing, administer oxygen or if patient is not breathing give artificial respiration. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If patient is conscious and can swallow, give 16 ounces of water but do not induce vomiting. If vomiting occurs, give more water. Have a physician determine if condition of patient permits induced vomiting or evacuation of stomach. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Special Medical Treatment for Physicians: Aspiration of this product during emesis may result in severe lung damage. If evacuation of stomach is necessary, use the method least likely to cause aspiration, such as gastric lavage after endotracheal intubation.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical or alcohol foam, or water spray (fog). Water may be ineffective on flames but should be used to cool fire exposed containers.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: 1-Hexene is a highly flammable liquid that may cause environmental contamination. Material floats on the surface of water. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

1-HEXENE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

MONITOR THE SITUATION . . . Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

1-HEXENE
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

1-HEXENE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . If released into water sources, 1-hexene is expected to float on the surface. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION . . . Material is not water soluble and lighter than water. Overflow dams may be used to confine or divert the spill to a limited area.

CONSEQUENCE

Some material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of any vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Booms may be an effective means to recover spilled material since the material is only slightly water soluble and will float on the surface of the water. Barriers of suitable material may be used to confine the spill to a limited area to prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Constantly monitor the integrity of boom/barriers.

TECHNIQUE

SURFACE SKIMMING . . . Surface skimming may be effective since the material is not water soluble and is lighter than water.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Constantly monitor the integrity of boom/barriers.

August 1997

HYDRAZINE

Class 8 (Corrosive Material) or Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Hydrazine is a colorless, oily, fuming, hygroscopic, highly reactive, corrosive and toxic liquid in concentrations greater than 37%wt. In concentrations less than 37% it is primarily toxic. It has a fishy, ammonia-like odor. It is fully soluble in water and will mix freely. Its flash point of 37.8°C (100°F) indicates that it may be easily ignited under high ambient temperature conditions or when preheated to some degree. Pure liquid hydrazine weighs approximately 8.4 lbs./gallon.

Hydrazine does not react with water and is stable in normal transportation at ordinary ambient temperatures. It is a very strong reducing agent, however, that may ignite in contact with porous organic materials with a high surface area such as rags, cotton, sawdust, etc, and even asbestos. There is a severe explosion hazard if hydrazine is allowed to react with any oxidizing agents, and the product is otherwise reactive with a wide variety of other materials. Toxicity of the product is relatively high by all routes of exposure and the material is considered corrosive to bodily tissues. NIOSH lists hydrazine as a potential occupational carcinogen. Combustion of hydrazine may produce nitrogen oxides.

Downwind evacuation should be considered if hydrazine is leaking but not on fire. Vapors may travel to distant sources of ignition and flash back or accumulate in confined spaces and explode if ignited. Unusual flammability characteristics include a wide range of flammability (2.7-98%), and an autoignition temperature that varies according to the type of material that hydrazine is in contact with, and which can be as low as 23.3°C (73.9°F) in the presence of rusty iron.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in alcohol, ether and other polar solvents.

Specific Gravity: 1.008 at 20°C (68°F)

Vapor Density: 1.1

Boiling Point: 113.5°C (236.3°F)

Melting Point: 1.4-2°C (34.5-35.6°F)

Molecular Weight: 32.05

Heat of Combustion: -622.08 kcal/g

Vapor Pressure: 10 mm Hg (1.33 kPa) at 20°C (68°F)

Flash Point: 51°C (124°F) closed cup.

Autoignition Temperature: Varies from 23.3°C (74°F) in contact with iron rust to 132°C (270°F) in contact with black iron to 156°C (313°F) in contact with stainless steel to 270°C (518°F) in contact with glass.

Burning Rate: 1mm/minute (est.)

Flammable Limits: 2.7-4.7% (LEL) - 98% (UEL)

pH: 10-11

Stability: Stable at ordinary temperature. Can ignite spontaneously on contact with oxidizers and porous materials such as wood or cloth and metal oxides. Thermally unstable.

Polymerization Potential: Will not occur

Corrosiveness: Corrosive to stainless steel with more than 0.5% molybdenum, as well as copper, zinc, lead, iron, bronze, brass, nickel and silver. Will attack glass, rubber and cork.

Reactivity and Incompatibility: Reactions with metallic oxides (rusty) surfaces or porous materials such as wood, asbestos or cloth may result in ignition or flaming decomposition of hydrazine. Reactions with oxidizing agents may result in spontaneous ignition or explosion. Hydrazine is a strong reducing agent that reacts with a wide variety of other chemicals. Catalytic metals such as lead, copper, zinc, cadmium, cobalt, molybdenum, gold, silver and their alloys should be avoided.

IDENTIFICATION

Shipping Name(s): Hydrazine, anhydrous; Hydrazine, aqueous solution; Hydrazine hydrate (USDOT & IMO)

Synonyms and Tradenames: Diamide; Diamine; Hydrazine base. Solutions may be referred to as hydrazine hydrate or diamine hydrate.

CAS Registry No: 302-01-2

Chemical Formula: H_2NNH_2 or N_2H_4

Constituent Components (% each): Anhydrous is 98-100% pure with the rest mostly water and some aniline. Solutions usually contain 35-64% hydrazine in water.

UN/NA Designation: UN2029 (anhydrous greater than 64% wt); UN2030 (hydrate and aqueous solutions between 37 and 64% wt);UN3293 (aqueous solutions not more than 37% wt)

IMO and DOT Designation: 8; 6.1 for solutions of not more than 37% wt.

RTECS Number: MU1750000

NFPA 704 Hazard Rating: 3 (Health): 3 (Flammability): 3 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless oily liquid; may fume when anhydrous. White crystals when solidified. Solutions may be slightly yellow.

Odor Characteristics: Like ammonia; fishy

Reportable Quantity: See appendix I

Common Uses: Rocket fuel, mfg. chemicals, pesticides, plastics, medicines, reducing agent, inorganic solvent, mfg. antioxidants, solder fluxes, explosives, corrosion inhibitors, plating metals on glass or plastic, fuel cells, photo developers, oil-well drilling, etc.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

HYDRAZINE

Class 8 (Corrosive Material) or
Division 6.1 (Poisonous Material)

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 3-4 ppm

Unusual Hazards: Fuming, hydroscopic, highly reactive, flammable, corrosive and toxic liquid. Vapors of heated liquid may travel to a source of ignition and flash back. Hydrazine may continue to burn in the absence of air. NIOSH has identified hydrazine as a potential occupational carcinogen.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.04 mg/m^3 (2-hr.)

Ceiling (C) Limit: 0.03 ppm

IDLH: 50 ppm

Conditions to Avoid: Heat, fire and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Potential Health Hazards: Major hazard is from exposure to the high vapor concentrations that may be present in the spill area and downwind. Ingestion and physical contact are also to be strictly avoided. NIOSH has identified hydrazine as a potential workplace carcinogen.

Hazards of Skin or Eye Contact: Hydrazine is a severe skin and mucous membrane irritant. It may cause severe burns of the skin, may be absorbed through the skin in toxic amounts and may lead to allergic sensitization. Contact of liquid hydrazine with the eyes may result in severe injury and permanent damage. Even exposure of the eyes to high vapor concentrations in air can cause temporary blindness lasting up to 24 hours.

Hazards of Inhalation: Hydrazine vapors are immediately irritating to the nose and throat and cause dizziness and nausea, as well as itching, burning and swelling of the eyes over time. Vomiting and excited behavior may follow as the central nervous system is effected. Excessive exposures may result in convulsions, bronchitis, pulmonary edema, liver and kidney damage and possibly death.

Hazards of Ingestion: Ingestion of hydrazine may result in weakness, vomiting, excitement, convulsions, liver and kidney damage, other symptoms reported above and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 4.7% (some reference sources say 2.9%)

Upper Flammable Limit: 98%

Behavior in Fire: Flammable liquid in concentrations greater than 64% will generate large quantities of flammable gas or vapor upon release when hot. Vapors may travel to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Decomposition Products: Nitrogen, ammonia.

Hazardous Combustion Products: May include ammonia and nitrogen oxides.

EXPLOSION HAZARDS

Explosive Potential: Explosive when heated or in contact with oxidizers. Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

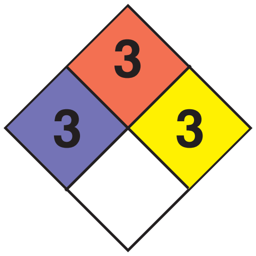
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Compatible materials may include butyl rubber, natural rubber and polyvinyl chloride. For hydrazine Tychem® SL, Tychem®9400, and Barricade® (longer than 8 hours). For

2029*

*Also 2030 or 3293

HYDRAZINE

Class 8 (Corrosive Material) or
Division 6.1 (Poisonous Material)



hydrazine hydrate, 51%, Tychem® 10,000 (longer than 8 hours). Structural firefighting protective clothing does not provide an adequate level of personal protection for this product.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a positive-pressure, self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent) is recommended. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; dizziness, nausea or other symptoms of exposure.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if burning or irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not induce vomiting without advice from a physician. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Foam, carbon dioxide, dry chemical and/or water. Flooding with water is necessary to prevent reignition. Water may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Unusual toxic and corrosive fume hazard. Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. Do not walk through spilled material. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, to protect personnel and dilute to nonflammable limits. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain corrosive and/or toxic gases.

SPILL RESPONSES

General Information: Hydrazine is a highly toxic, flammable and reactive material that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors and delete to nonflammable limit. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Due to the low vapor pressure and high boiling point hazardous vapor concentrations should not occur beyond the immediate spill area. However, continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapor, especially if a large spill and fire is involved.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable, corrosive and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents may be applied to the surface of liquid pools to reduce vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid may slow the release of vapors into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination.

HYDRAZINE

Class 8 (Corrosive Material) or Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product. At low ambient temperatures, the liquid may solidify.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Keep from solidifying to maintain suction or resort to mechanical removal of solid material. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, dry dolomite, dry vermiculite or other similar nonporous noncombustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product.

HYDRAZINE

Class 8 (Corrosive Material) or Division 6.1 (Poisonous Material)

WATER SPILL

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Hydrazine and its solutions are fully soluble in water and will rapidly dissolve. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 2006

HYDROCHLORIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Hydrochloric acid, also known as muriatic acid (in lower concentrations), is a colorless to light yellow volatile, fuming liquid with a sharp pungent, and irritating odor. It is used to make fertilizers, dyes and dyestuffs, artificial silk, pigments, and a variety of other chemicals; it also has uses in electroplating, soap and edible oil refining, leather tanning, ore refining, petroleum extraction, and a wide range of other processes. It is not flammable but contact with many metals produces flammable and potentially explosive hydrogen gas. The product is completely soluble in water and weighs approximately 9.9 pounds per gallon. It is formed by dissolving hydrogen chloride (HCl) gas in water, and solutions may contain as much as 40% hydrogen chloride.

Hydrochloric acid is stable in normal transportation but may react with water, generating heat and corrosive and/or toxic vapors. Vapors are heavier than air and may accumulate in low lying or confined areas, such as basements, ditches, tanks, hopper/tank cars etc. It is highly corrosive to most metals and reacts with a wide variety of other chemicals and substances. Spills of the product may generate gases and vapors which are highly corrosive to bodily tissues. Any contact with the liquid may result in acid burns. Many solutions of hydrogen chloride have a high vapor pressure, thereby releasing high amounts of toxic and corrosive vapors in the air.

If hydrochloric acid is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in alcohol

Specific Gravity (Liquid): 1.19 at 68°F (20°C) for 38% HCl

Vapor Density: Approximately 1.3

Boiling Point: Varies with composition, but at or above 123°F (50.5°C)

Melting Point: Varies with composition. Usually around –87 to –101°F (–66 to –74°C)

Freezing Point: Varies with composition

Molecular Weight: 36.46 (for HCl); may form higher weight hydrates.

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): Reports vary; 1 – 2

Vapor Pressure: Varies with composition. Reports vary from 84 mmHg to 210 mmHg at 68°F (20°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Flammable (Explosive) Limits: Not flammable

Stability: Stable

Polymerization Potential: Will not occur

pH: 0.1 – 2.02

Corrosiveness: Corrosive to most metals, particularly iron and aluminum, with evolution of hydrogen gas.

Reactivity with Water: No reaction, but may generate heat.

Reactivity with Other Chemicals: Reacts with most metals; alkali or active metals and certain of their compounds; acetic anhydride; 2-amino ethanol; ammonium hydroxide; chlorosulfonic acid; oleum; sulfuric acid; ethylene diamine or imine; propylene oxide; vinyl acetate; B propiolactone; $HClO_4$; hydroxides; cyanides; sulfides; strong oxidizers; carbonates; hypochlorites and formaldehyde and a variety of other chemicals.

IDENTIFICATION

Shipping Names: Hydrochloric acid (USDOT & IMO)

Synonyms and Tradenames: Muriatic acid; Aqueous hydrogen chloride

CAS Registry No.: 7647-01-1

Chemical Formula: HCl (dissolved in H_20)

Constituent Components(% each): <10 – 40% HCl in water

UN/NA Designation: UN1789

IMO Designation: 8, corrosive substances

RTECS Number: MW4025000

NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 0 (Instability)

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless to light yellow; spent acid may be dark.

Odor Characteristics: Sharp, pungent, irritating

Reportable Quantity: See Appendix I

Common Uses: Mfg. of fertilizers, dyes, dyestuffs, artificial silk, paint pigments, other chemicals; food industry, scale removal, metal cleaning, pH adjustment, industrial acidizing; refining soap, ore, or edible oils; petroleum extraction; electroplating; leather tanning; pickling of metals; uses in photographic, textile, and rubber industries.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

HYDROCHLORIC ACID

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not well defined, may be 1–5 ppm
Unusual Hazards: Highly corrosive acid that generates heavier than air vapors and gases; may generate hydrogen gas upon contact with metals.
Short Term Exposure Limits (STEL): Unavailable
Time Weighted Average (TLV-TWA): Unavailable
Ceiling (C) Limit: 5 ppm (7 mg/m^3) (NIOSH & OSHA)
IDLH: 50 ppm
Conditions to Avoid: Excessive heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to high vapor or gas concentrations in air but all exposures should be strictly avoided.
Hazards of Skin or Eye Contact: Hydrochloric acid and its vapors and gases may rapidly cause skin inflammation or burns. Effects range from dermatitis, redness, swelling, pain, and permanent scarring, to death. Contact with the eyes may result in eye irritation, severe burns, and permanent damage with possible loss of sight.
Hazards of Inhalation: Vapors or gases evolved from hydrochloric acid may cause irritation of the respiratory tract with burning, choking, and coughing. High concentrations in air may result in ulceration of the nose and throat, severe delayed breathing difficulties involving pulmonary edema, laryngeal edema or spasm, and possibly death.
Hazards of Ingestion: Ingestion of concentrated acid may result in burns of the mouth, throat and stomach, pain, nausea, vomiting, and possibly death due to esophageal or gastric necrosis.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Not flammable
Upper Flammable (Explosive) Limit: Not flammable
Behavior in Fire: There is a limited possibility that containers may rupture in fire due to over-pressurization. May generate large quantities of corrosive gas or vapors upon release.
Hazardous Decomposition Products: May generate flammable, potentially explosive hydrogen gas on contact with most metals. Explosive concentrations of hydrogen may accumulate inside metal equipment. Hydrochloric acid vapors may be released from heating under fire conditions.

EXPLOSION HAZARDS

Explosive Potential: There is a limited potential that containers may rupture in fire due to over-pressurization. Contact with most metals produces hydrogen gas that may explode if ignited in confined spaces.

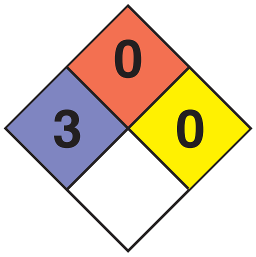
PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor concentrations in air. Compatible materials may include neoprene, latex or rubber, nitrile latex, butyl rubber, natural rubber, nitrite rubber, nitrite rubber/polyvinyl chloride, chlorinated polyethylene, polyvinyl chloride, styrene-butadiene rubber, Viton®, nitrite-butadiene rubber, Saranex®, and polycarbonate. The following materials are reported to have a greater than 8 hour breakthrough time: butyl; Teflon®; Saranex®; Barricade®; Trellchem®; Tychem® CPF 2; Tychem® SL; Tychem® CPF 3; Tychem® CPF 4; Tychem® BR; Tychem® LV; Tychem® TK; Tychem® F; Tychem® Reflector®; Tychem® CPE; Tychem® Butyl and Tychem® ThermoPro; Chem Master gloves; Ultraflex Nitrile 22R gloves; Viton® 890 gloves; Neoprene 6780 gloves; Viton 892® gloves; Nitty Gritty 65NFW gloves; Butyl 878 gloves; Hustler PVC 725R gloves; Butyl 874R gloves; Ultraflex Neoprene 32 gloves; N-DEX 8005 gloves; Chloroflex 723 gloves; Neo. Chloroflex N5/N8 gloves; Nitri Solve 727. The following materials are reported to have a greater than 4 hour breakthrough time: neoprene; PVC; Tychem® Responder®; Tychem® Responder® CSM.

1789

HYDROCHLORIC ACID

Class 8 (Corrosive Material)



Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm): a self-contained breathing apparatus (SCBA) with full facepiece; any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 50 ppm): any air-purifying half-mask respirator equipped with cartridge(s) providing protection against hydrogen chloride; any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against hydrogen chloride; any powered air-purifying respirator with cartridge(s) providing protection against hydrogen chloride; any supplied-air respirator. NOTE: Eye protection may be required in addition to the respirator.

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; choking, coughing and other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of water until all traces of material are gone or for 20 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, vapor suppressant foam, dry sand, carbon dioxide, dry chemical or as necessary for surrounding fire. Note: Most foams may react with the material and release corrosive/toxic gases.

Extinguishing Techniques: Corrosive vapor hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense vapors/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. Do not get water inside containers. Take into account while planning the response that fuming hydrochloric acid is highly corrosive and that contact with metals may produce flammable and potentially explosive hydrogen gas.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers or confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that fuming hydrochloric acid is highly corrosive and that contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. A vapor suppressing foam or water spray may be used to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material.

HYDROCHLORIC ACID

Class 8 (Corrosive Material)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Hydrochloric acid, especially the solid, may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill by checking for pH until the spilled product is removed.

CONSEQUENCE

Hazardous levels of hydrochloric acid in air may be found in the local spill area and immediately downwind, particularly if an acid mist is somehow generated in higher concentration solutions.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrochloric acid vapors or fumes may absorb vapors, knockdown vapors, and accelerate their dispersal in the atmosphere. Do not allow run off to contact spilled pool. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Water runoff may contain hydrochloric acid from contact with its vapors.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

VAPOR SUPPRESSANT FOAM . . . Vapor Suppressant foam may be applied to the surface of liquid pools accumulated in depth, which may slow the release of vapors in the atmosphere. Note: Application of some vapor suppressant foams may initially increase the rate of vaporization until the entire surface of the spill is covered.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid hydrochloric acid may eventually slow the release of vapors into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hydrochloric acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained hydrochloric acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

HYDROCHLORIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. NOTE: Hydrochloric acid is corrosive to many metals and may create flammable gas upon reaction.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent, such as sodium bicarbonate or soda ash, may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

HYDROCHLORIC ACID

Class 8 (Corrosive Materials)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

HYDROCYANIC ACID
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Hydrocyanic acid is a colorless gas (hydrogen cyanide) that is shipped as a pure liquid under pressure or may be dissolved in water to form aqueous solutions of various strengths. This guide is primarily intended for the pure liquefied gas. Although hazards of aqueous solutions are usually less severe and physical properties may differ, much information here is generally applicable to such solutions if properly interpreted. Pure hydrocyanic acid is fully soluble in water, has a sweetish odor like almonds, a boiling point of 78.3°F, and a flash point of 0°F. The pure liquid may boil at high ambient temperatures or otherwise rapidly evaporate, thus producing large amounts of highly toxic and flammable vapors which may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat (see below also). The liquid weighs about 5.7 pounds per gallon.

Hydrocyanic acid dissolves in water with a moderate reaction and may become unstable if stored for extended time or exposed to high temperature and pressure. It is incompatible with alkalis and may attack some forms of plastics, rubber, and coatings, but is considered noncorrosive to most metals. It is a highly toxic substance by all routes of exposure, including absorption through the skin, and is considered a poison. Products of combustion are toxic and may include unburned cyanides and nitrogen oxides. However, if the material is on fire do not extinguish the fire. The combustion products pose a less air pollution hazard than the unburned chemical.

If on fire, do not extinguish unless flow can be stopped. If liquid hydrocyanic acid or its aqueous solutions (classed as Poison A by USDOT) are leaking or are involved in a fire, evacuate for a radius of 2500 feet. If aqueous solutions of hydrocyanic acid (classed as Poison B by USDOT) are leaking, downwind evacuation should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol
Specific Gravity (Liquid): 0.689 at 68°F (20°C)
Boiling Point: 78.3°F (25.7°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: 8.1°F (–13.3°C)
Molecular Weight: 27.03
Heat of Combustion: –5864 cal/g
Vapor Pressure: 620 mm Hg (11.98 psia) at 68°F (20°C)
Flash Point: 0°F (–17.8°C), closed cup
Autoignition Temperature: 1004°F (540°C)
Burning Rate: 1.8 mm/minute
Stability: May become unstable and subject to explosion if stored for extended time or exposed to high temperature and pressure.
Corrosiveness: Noncorrosive to most metals; may attack some plastics, rubber, or coatings.
Reactivity with Water: Dissolves with moderate reaction
Reactivity with Other Chemicals: Reacts with alkalis and bases such as caustics and amines (may polymerize), acetaldehyde, and oxidizers.

IDENTIFICATION

Shipping Names: Hydrogen cyanide, stabilized (USDOT & IMO); Hydrogen cyanide, solution in alcohol (USDOT & IMO); Hydrocyanic acid, liquefied (USDOT & IMO); Hydrocyanic acid solution, less than 5% hydrocyanic acid (USDOT); Hydrogen cyanide, aqueous solution (USDOT & IMO); Hydrocyanic acid, aqueous solutions (USDOT & IMO).
Synonyms and Tradenames: Hydrogen cyanide, prussic acid, HCN, acid liquid HCN, carbon hydride nitride, cyclon, formic anammonide, formonitrile, anhydrous hydrocyanic acid.
Chemical Formula: HCN
Constituent Components(% each): 96% pure with 0.05% phosphoric acid as stabilizer; may also be aqueous solution.
UN/NA Designation: UN1051 (USDOT and IMO); UN1613 (USDOT and IMO); UN1614 (USDOT and IMO); UN3294
IMO Designation: 6.1 poisonous substance.
Physical State as Shipped: Liquid
Physical State as Released: Liquid or gas (boils at 78.3°F)
Color of the Shipped Material: Colorless to bluish white
Odor Characteristics: Sweetish, like bitter almonds, but some people may not smell odor.
Common Uses: Fumigation; mfg. plastics, dyes, pharmaceuticals, insecticides, rodenticides, and other chemicals; used in electroplating, mining, and metallurgy.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

HYDROCYANIC ACID

Division 6.1 (Poisonous Material)

Square background applicable to rail cars.
Also see "UN/NA Designation" for additional numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.2-5 ppm (if evident)

Unusual Hazards: Extremely toxic, flammable substance that may be hazardous over considerable downwind distances. Storage of more than 90 days, excessive heat, or chemical contamination may result in explosive polymerization.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): (Skin) 10 ppm absolute ceiling limit.(ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Vapors may be toxic over considerable downwind distances. All exposures should be strictly avoided.

Hazards of Skin or Eye Contact: Liquid hydrocyanic acid and its concentrated vapors have little or no irritant effect on the skin but may be rapidly absorbed in toxic amounts. Contact with the eyes may cause local irritation and may also result in hazardous absorption.

Hazards of Inhalation: Relatively low concentrations in air may cause weakness, headache, confusion, occasional nausea and vomiting, difficult breathing, cyanosis, and convulsions. Higher levels may cause rapid unconsciousness and death. Opinions vary, but many state that 270 ppm is rapidly fatal while 110 ppm is fatal in one hour; 45-54 ppm may cause symptoms in 30-60 minutes.

Hazards of Ingestion: The ingestion of as little as 50-100 mg (0.0035 ounce or less) may be fatal.

FIRE HAZARDS

Lower Flammable Limit: 5.6-6%

Upper Flammable Limit: 40-41%

Behavior in Fire: Flammable liquefied gas or liquid. May generate large quantities of flammable and toxic vapors upon release. Vapors may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in explosive polymerization.

Hazardous Combustion Products: Toxic, may include unburned cyanides and nitrogen oxides.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of stabilizer or excessive heat may cause polymerization resulting in violent container rupture. Polymerization may also occur in the presence of bases or alkalis.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, neoprene, polyvinyl chloride, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1051

HYDROCYANIC ACID
Division 6.1 (Poisonous Material)

See "UN/NA Designation" for
additional other ID numbers.

FIRST AID

Nonspecfic symptoms: Headache, weakness, other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If available and necessary, administer amyl nitrite pearl in cloth one inch from mouth and nostrils for 15 seconds. Repeat 5 times at 15-second intervals. Use fresh pearl every 5 minutes until 3-4 have been used.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. Administer amyl nitrite if necessary and available.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. Administer amyl nitrite if necessary and available for cyanide poisoning.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective but may be used to dilute spill to nonflammable mixture. Be cautious of possible water reaction.

Extinguishing Techniques: Unusual toxic vapor hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture, or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that hydrocyanic acid is extremely volatile, toxic, and flammable when concentrated. Accumulations of heavy gas may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrocyanic acid spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HYDROCYANIC ACID
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrocyanic acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain hydrocyanic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of hydrocyanic acid vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply alternative technique if response is ineffective. Proceed with caution.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hydrocyanic acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained hydrocyanic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

HYDROCYANIC ACID
Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

HYDROCYANIC ACID
Division 6.1 (Poisonous Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Proceed with caution. Consult qualified experts for safe treatment or neutralizing techniques.

January 1989

HYDROFLUORIC ACID
Class 8 (Corrosive Materials)

GENERAL INFORMATION

Hydrofluoric acid is an extremely corrosive, nonflammable, colorless to slightly yellow fuming liquid that has a penetrating, irritating, pungent, and sharp odor and that consists of hydrogen fluoride (usually 30–70% by weight) dissolved in water. It is used for polishing, etching, and frosting glass; pickling, electropolishing, cleaning, and treating various metals; dissolving ores; and for a wide variety of other purposes. The acid is completely soluble in water and will mix rapidly while generating heat. Although hydrofluoric acid is not itself flammable, contact with some metals may liberate flammable and potentially explosive hydrogen gas. Containers may rupture violently due to overpressurization if exposed to excessive heat or fire for sufficient time duration, especially if the acid is concentrated. The liquid weighs approximately 9.2 to 10.5 pounds per gallon with its specific weight depending on temperature and concentration.

Hydrofluoric acid is stable in normal transportation but is highly reactive with a wide variety of other chemicals and materials. It is among the most corrosive of all acids and will attack natural rubber, leather, many organic materials, glass, concrete, and certain metals, especially those like cast iron that contain silica. It is also extremely corrosive to bodily tissues and may cause severe, painful, deep, and slow healing burns that may be delayed in onset.

If hydrofluoric acid is leaking and generating vapors or fumes, downwind evacuation should be considered until properly equipped responders have evaluated the hazard. Note that the degree of hazard will depend on the amount of acid spilled and the concentration of hydrogen fluoride in solution. Large spills of concentrated acid may require evacuation over considerable downwind distances.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol
Specific Gravity (Liquid): 1.1–1.26; varies with temperature and concentration.
Boiling Point: 150.8 –152.6°F (66 – 67°C) for 70%; 226.4°F (108°C) for 48%; 248°F (120°C) for 35.35% solution at 1 atm.
Melting Point: – 95.8 to – 92.2°F (– 71 to – 69°C) for 70%; –34.6°F (–37°C) for 48%; –31°F (–35°C) for 35.35% solution.
Freezing Point: See melting point
Molecular Weight: 20.01 (for HF); may be higher for associated molecules in air; e.g., 49.08 at 68°F (20°C).
Heat of Combustion: Not flammable
Vapor Pressure: 10 mm Hg (0.1933 psia) for 48%; 110 mm Hg (2.126 psia) for 70%; both at 68°F (20°C).
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: *Will* attack natural rubber, leather, many organic matters, glass, concrete, certain metals (especially those like cast iron that contain silica), and many other substances. Contact with silicon-bearing materials (including sand, glass, and ceramics) may generate silicon tetrafluoride gas.
Reactivity with Water: Dissolves with generation of heat.
Reactivity with Other Chemicals: Reacts (possibly violently) with a wide variety of materials including arsenic trioxide, phosphorus pentoxide, bismuthic acid, nitric acid, fluorine, sodium, cyanides, sulfides, acetic anhydride, 2-amino ethanol, ammonium or sodium hydroxide; calcium oxide, chlorosulfonic acid, ethylenediamine, ethyleneimine, oleum, betapropiolactone, propylene oxide, sulfuric acid, vinyl acetone, strong alkalies, and others. Contact with sulfides may liberate toxic hydrogen sulfide gas. Contact with cyanides may liberate toxic hydrogen cyanide gas.

IDENTIFICATION

Shipping Names: Hydrofluoric acid solution (USDOT and IMO); fluoric acid (USDOT and IMO).
Synonyms and Tradenames: Hyfluoric acid; fluoric acid; fluohydric acid; fluorhydric acid; hydrogen fluoride aqueous solution; aqueous HF.
Chemical Formula: HF (in water)
Constituent Components (% each): Shipped as various strength solutions usually containing 30 – 70% hydrogen fluoride by weight in water but some solutions may be more dilute.
49 STCC: 49 300 22
UN/NA Designation: UN1790
IMO Designation: 8, corrosive
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless to slightly yellow liquid; may fume in air if not too dilute.
Odor Characteristics: Sharp; irritating; pungent; penetrating
Common Uses: Polishing, etching and frosting glass; pickling copper, brass, stainless and other alloy steels; electropolishing metals; cleaning castings; dissolving ores; acidizing oil wells; making fluorinated chemicals and plastics; laundry sour; separating uranium isotopes; treatment of ceramic, iron, and aluminum surfaces; dye chemistry; gasoline refining.

CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HYDROFLUORIC ACID
Class 8 (Corrosive Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.036–0.132 ppm

Unusual Hazards: Extremely corrosive and reactive liquid that may fume in air. Contact with some metals may liberate hydrogen gas.

Short Term Exposure Limits (STEL): Unavailable Time Weighted Average (TLV-C):

Conditions to Avoid: Excessive heat or fire; sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly toxic and corrosive by all possible routes of exposure. Fumes and vapors from the concentrated acid may be hazardous over considerable downwind distances in air. Note that solutions as dilute as 2% or lower by weight may cause burns to bodily tissues. Symptoms may not appear for some time after exposures.

Hazards of Skin or Eye Contact: Contact of the skin with hydrofluoric acid or its fumes may result in severe slow-healing and painful burns and ulcers involving localized death of the skin and deep tissue and possible decalcification of bone. Effects may be delayed up to 24 hours for 20% or less solutions and 1– 8 hours for 20 – 50% solutions. Contact with the eyes may also cause severe irritation and deep burns possibly resulting in blindness or other permanent defects in vision. Do not wear contact lenses when working with this product.

Hazards of Inhalation: Hydrofluoric acid vapors and fumes are severe respiratory system irritants that may cause choking, coughing, difficult breathing, burns of the nose, throat and upper respiratory tract, and bronchitis. Excessive exposures may cause rapid inflammation and congestion of the lungs, severe breathing difficulties, fever, cyanosis, and death from pulmonary edema. Some severe effects may be delayed in onset by hours or even days. Concentrations of 50–250 ppm in air are considered dangerous to humans in even brief exposures. Levels of 456 to 1774 ppm for one hour were fatal to *50%* of various animals in laboratory experiments.

Hazards of Ingestion: Ingestion of hydrofluoric acid may cause severe burns of the mouth, throat and stomach, nausea, vomiting, pain, diarrhea, kidney injury, profound hypocalcemia, circulatory collapse, and death.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization, particularly if acid is concentrated. May generate large quantities of corrosive vapors and fumes upon release.

Hazardous Combustion Products: Not flammable but hydrogen fluoride gas may evolve upon heating.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Containers may rupture violently in fire due to over-pressurization, particularly if acid is concentrated. Contact with some metals may liberate hydrogen gas that may explode if ignited in a confined space. Contact with sodium may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials for 30 – 70% solutions in water may include neoprene, nitrile rubber, Viton, and nitrile butadiene rubber according to an EPA guide. Polyvinyl chloride is listed as compatible by two makers of hydrofluoric acid.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 20 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted hydrogen fluoride canister and filter or a chemical cartridge respirator with a full facepiece and providing protection against hydrogen fluoride within the use limitations of these devices.

1790

HYDROFLUORIC ACID
Class 8 (Corrosive Materials)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; choking, coughing, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. Pay special attention to skin under nails. If available after washing of skin, immerse burned skin area in 0.2% iced aqueous hyamine 1622 or 0.13% iced aqueous zephiran chloride solution. Next best is saturated solution of epsom salts or iced 70% alcohol or iced benzalkonium chloride solutions.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. Give more water if vomiting occurs naturally.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account when planning the response that hydrofluoric acid is an extremely corrosive substance and that contact with some metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof tools and equipment where necessary.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrofluoric acid spills may expose downwind areas to toxic concentrations over considerable distances in some cases if large quantities of corrosive fumes or gas are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HYDROFLUORIC ACID
Class 8 (Corrosive Materials)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrofluoric acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain hydrofluoric acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid hydrofluoric acid may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid hydrofluoric acid may eventually slow the release of vapors or fumes into the atmosphere. (Note: Do not use caustic soda-sodium hydroxide.)

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hydrofluoric acid may be contained by building dikes using soil or other compatible substances. Note that the acid will react with sand and other materials containing silica and release toxic and corrosive silicon tetrafluoride gas.

CONSEQUENCE

Contained hydrofluoric acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

HYDROFLUORIC ACID
Class 8 (Corrosive Materials)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with earth, fly ash, cement powder, commercial sorbents, or other compatible substances. Note that hydrofluoric acid reacts with silicon-bearing materials such as sand.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance. (Note: Do not use caustic soda-sodium hydroxide.)

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Apply technique to remove final traces of spilled product or to remove products of neutralization.

HYDROFLUORIC ACID
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Do not use caustic soda-sodium hydroxide.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

HYDROFLUOROSILICIC ACID
Class 8 (Corrosive Material)

GENERAL INFORMATION

Hydrofluorosilicic acid, also known as hydrofluosilicic acid, is a colorless to straw colored fuming liquid with an acrid, sour, and pungent odor. It is used for electropolishing metals, particularly aluminum. Its sodium salt is used to harden cement and ceramics, as a wood preservative, in paints, for making synthetic cryolite in aluminum production, and in water fluoridation. The acid is fully soluble in water and nonflammable. It weighs approximately 10.8 pounds per gallon.

Hydrofluorosilicic acid dissolves in water with the evolution of heat and is stable in normal transportation. It is reactive with a variety of chemicals and combustible materials, and will corrode most metals while producing flammable and potentially explosive hydrogen gas. The liquid and its vapors are also corrosive to bodily tissues. Corrosive and toxic fumes of hydrogen fluoride may be generated in fires.

Downwind evacuation should be considered on a case by case basis if spills of hydrofluorosilicic acid generate large amounts of fumes or mists into air.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Slightly soluble in alkaline solutions.

Specific Gravity (Liquid): Approx. 1.3 at 77°F (25°C)

Boiling Point: Approx. 212°F (100°C) - decomposes

Melting Point: See freezing point

Freezing Point: –24 to –4°F (–31 to –20°C) (typical)

Molecular Weight: 144.09 (solute only)

Heat of Combustion: Not flammable

Vapor Pressure: Unavailable, may fume

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Corrodes most metals with evolution of hydrogen gas.

Reactivity with Water: No reaction, but evolves heat while mixing.

Reactivity with Other Chemicals: May react with oxidizers, alkali metals, combustible materials, organic peroxides, arsenic trioxide, and phosphorus pentoxide.

IDENTIFICATION

Shipping Names: Fluosilicic acid (USDOT & IMO).

Synonyms and Tradenames: Hydrosilicofluoric acid; hydrofluosilicic acid; fluorosilicic acid; fluosilicic acid; hexafluosilicic acid; hydrogen hexafluorosilicate; sand acid; silicofluoric acid.

Chemical Formula: H_2SiF_6 in H_2O

Constituent Components(% each): 22-30% solutions in water

UN/NA Designation: UN1778

IMO Designation: 8, corrosive

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless to straw colored

Odor Characteristics: Acrid, sour, pungent

Common uses: Electropolishing metals; sodium salt used to harden cement and ceramics, as wood preservative, to make synthetic cryolite, in technical paints, and for water fluoridation.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HYDROFLUOROSILICIC ACID
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Corrosive acid that may fume in air. Evolves hydrogen gas in contact with most metals.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat or fire; sparks or fire where hydrogen may be present, contact with incompatible materials; runoff to sewers or waterbodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact with liquid hydrofluorosilicic acid or its concentrated vapors or fumes in air may cause severe burns of the eyes or skin.

Hazards of Inhalation: Fumes or vapors of hydrofluorosilicic acid are severely corrosive to the mucous membranes and may irritate or injure the respiratory tract if inhaled.

Hazards of Ingestion: Ingestion may result in severe burns of the mouth and stomach.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May generate corrosive fumes or vapors upon release. May decompose in fire to produce toxic and corrosive fumes of hydrogen fluoride.

Hazardous Combustion Products: See behavior in fire.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Contact with most metals produces hydrogen gas that may explode if ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encpasulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air, where such concentrations are evident.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

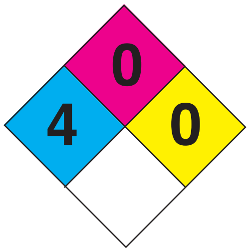
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: Treat as for hydrogen fluoride burns with iced benzalkonium soaks.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

1778

HYDROFLUOROSILICIC ACID

Class 8 (Corrosive Material)



FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may be dangerous. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that hydrofluorosilicic acid is highly corrosive and that contact with most metals evolves hydrogen gas. Use explosion-proof and spark-proof equipment where necessary.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrofluorosilicic acid spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts of fumes are generated from spills.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION ... Hydrofluorosilicic acid may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the acid is not fuming or small amounts have spilled.

CONSEQUENCE

Hazardous levels of hydrofluorosilicic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to hydrofluorosilicic acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain hydrofluorosilicic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

HYDROFLUOROSILICIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid hydrofluorosilicic acid may slow the release of vapors into the atmosphere. Apply water cautiously at first to ensure lack of a hazardous reaction.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent to liquid hydrofluorosilicic acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Hydrofluorosilicic acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained hydrofluorosilicic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for ground water contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread ofcontamination. Use surface dikes or barriers where ground water contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

HYDROFLUOROSILICIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product.Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

Containment dikes ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

HYDROFLUOROSILICIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled withcare. Improper application may lead to increased damage or harm. (Note: Salts formed in neutralization are also toxic.)

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

August 1997

HYDROGEN (Refrigerated Liquid or Compressed)

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Hydrogen is a colorless and odorless gas sometimes transported as a refrigerated liquid. It is commercially produced, although not the only means, by reaction of methane with steam at 830°C (1526°F) in the presence of a nickel catalyst. Hydrogen is the element with the lowest atomic number and forms a bond with another hydrogen molecule to form H_2. It is essentially 100% pure although trace amounts of helium and hydrocarbon gas such as methane may be found. Hydrogen has many uses including the hydrogenation of vegetable and animal oils and fats, prevention of oxidation of metals, welding and cutting, petroleum refining, production of ammonia, methanol, aniline and some inorganic acids and fuel. It is stable, although any source of ignition should be avoided. Incompatible materials include, but may not be limited to, air, oxygen, oxidizing agents, lithium, halides, alkali metals, metal catalysts, nitrogen trifluoride, oxygen difluoride, and halogens. Its solubility in water is negligible and it is slightly soluble in ethanol and ether.

Hydrogen is essentially non-toxic. The primary route of entry is inhalation of the gas, although the liquid form may cause frostbite like burns to the eyes and skin. Inhalation in moderate amounts may cause headaches, drowsiness, dizziness, excitation, excessive salvation, vomiting and unconsciousness. Larger amounts may cause unconsciousness and death due to asphyxia.

The explosive potential for hydrogen is high. It has a low ignition energy and will readily ignite from any source of ignition, including static electricity and friction from escaping gas. Explosive mixtures are formed with air, oxygen and chlorine. A fireball is formed if gas cloud is ignited immediately after release. Vapors may travel to distant sources of ignition and flash back. Hydrogen flame may be pale or invisible.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible (2.1cc/100cc)
Solubility in Other Chemicals: Slightly soluble in ethanol and ether.
Specific Gravity: .071
Vapor Density (Air=1): .0696
Boiling Point: -252.8°C (423°F)
Melting Point: -259.2°C (-434.6°F)
Freezing Point: See melting point.
Molecular Weight: 2.016
Heat of Combustion: 121 kJ/g
Vapor Pressure: High
Flash Point: Burns at all ambient temperatures.
Autoignition Temperature: 571.2°C (1060°F); 500°C (932°F); 520°C (752°F); also reported 400°C (968°F)
Burning Rate: Rapid
Flammable Limits: 4.1% (LEL) - 74.2% (UEL)
Stability: Stable. Avoid sparks or flame source that can cause ignition.
Polymerization Potential: Will not occur.
Corrosiveness: Not corrosive to metals.
Reactivity and Incompatibility: Incompatible with air, oxygen, oxidizing agents, lithium, halides, alkali metals, metal catalysts, nitrogen trifluoride, oxygen difluoride, and halogens.

IDENTIFICATION

Shipping Name(s): Hydrogen, compressed (USDOT & IMO); Hydrogen, refrigerated liquid (USDOT & IMO)
Synonyms and Tradenames: None
CAS Registry No: 1333-74-0
Chemical Formula: H_2
Constituent Components (% each): Essentially 100% Hydrogen, although may contain trace amounts of helium and hydrocarbon gas such as methane.
UN/NA Designation: UN1049 (compressed); UN1966 (refrigerated liquid)
IMO Designation: 2.1
RTECS Number: MW8900000
NFPA 704 Hazard Rating (Gas): 0-gas, 3-liquid (Health): 4 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Compressed gas; liquid.
Physical Form as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless
Reportable Quantity: See appendix I
Common Uses: Used in the hydrogenation of vegetable and animal oils and fats, prevention of oxidation of metals, welding and cutting, petroleum refining, production of ammonia, methanol, aniline and some inorganic acids, fuel, propellant for nuclear powered rockets and space vehicles, etc.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

*

HYDROGEN (Refrigerated liquid or Compressed)

Division 2.1 (Flammable Gas)

*Also 1049

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Highly flammable with broad range of ignition with air. Liquid form of hydrogen can cause frost like burns. Inhalation of large concentration of gas may cause unconsciousness or death due to asphyxiation.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable (Simple asphyxiant)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as air, oxygen, oxidizing agents, lithium, halides, alkali metals, metal catalysts, nitrogen trifluoride, oxygen difluoride, and halogens.

HEALTH HAZARDS

Potential Health Hazards: Hydrogen has practically no toxicity except that it may asphyxiate and cause frost like burns with skin or eye contact.

Hazards of Skin or Eye Contact: Eye or skin contact with liquid can cause frost bite type injury due to rapid cooling from evaporation.

Hazards of Inhalation: In confined areas, vapors can accumulate and cause unconsciousness and death due to displacement of oxygen (simple asphyxia). Moderate concentrations may cause headache, drowsiness, dizziness, excitation, excessive salivation, vomiting and unconsciousness.

Hazards of Ingestion: Ingestion is unlikely due to physical properties of hydrogen. Contact with the extremely cold liquid would, at the very least, cause frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 4.1%

Upper Flammable Limit: 74.2%

Behavior in Fire: Hydrogen is flammable. It will readily ignite if exposed to sources of heat and flame. Vapors may be heavier than air when cold, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable. A hydrogen flame can be pale or invisible. Containers exposed to prolonged fire or heat may violently rupture.

Hazardous Decomposition Products: None.

EXPLOSION HAZARDS

Explosive Potential: High. Severe explosion hazard when exposed to heat, flame or oxidizers. Explosive when mixed with air, oxygen and chlorine. Escaping gas may ignite spontaneously due to friction. Hydrogen has a low ignition energy and broad range of ignition with air. Fireball is formed if gas cloud is ignited immediately after release. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged fire or heat may violently rupture.

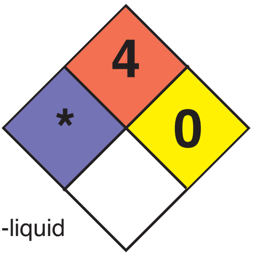
PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Specialized high temperature protective clothing is recommended for working in close proximity to hydrogen fires. Full structural firefighting personal protective equipment may be used by firefighters in support roles or for protecting exposure in perimeter area. Positive-pressure, self-contained breathing apparatus is required.

1966*

HYDROGEN (Refrigerated liquid or Compressed)

Division 2.1 (Flammable Gas)



*Also 1049

*0-gas; 3-liquid

FIRST AID

Nonspecific Symptoms: Hydrogen is relatively inert. Contact of liquid with skin or eyes may cause frost like burns. Inhalation is the major route of exposure and can cause headache, drowsiness, dizziness, excitation, excessive salivation, vomiting and unconsciousness. Higher levels may cause asphyxiation and death.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact with cold liquid, remove contaminated clothing and wash affected body areas with large amounts of warm water. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming such as wrapping effected area gently in blankets if warm water is not available. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Ingestion is unlikely. If liquid is ingested, frostbite like injury can occur. Drink warm water to relieve frostbite, but do not induce vomiting without medical supervision. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

FIRE RESPONSE

Extinguishing Agents: Stop flow. Carbon dioxide, dry chemical, water spray (fog), or foam. A fine water spray or fog can be used on large discharges to control the fire by preventing its spread and absorbing some of its heat. Do not apply water streams directly on a hydrogen pool fire since this may greatly and/or suddenly increase the rate of burning and/or the size of the fire by increasing the vaporization rate of the liquid.

Extinguishing Techniques: Stay upwind. Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid flammable vapors. Hydrogen fires burn at very high temperatures and are almost invisible, especially when wearing self contained breathing apparatus and a proximity hood. A broom should be held in front of advancing firefighters to locate the flame. Wear positive-pressure, self-contained breathing apparatus and appropriate protective clothing. Wear full chemical and/or thermal protective suit as necessary and appropriate. Move container from fire area if no risk. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to prolonged heat, such as from a direct flame. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable gases.

SPILL RESPONSES

General Information: Hydrogen is highly flammable. Eliminate all sources of ignition. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with very cold gas or liquid unless properly equipped for such contact. If transfer operations are anticipated, only use equipment specifically designed for use with the material being transferred and its temperature and pressure at the time of transfer. One method to dispose of excess or undesired hydrogen is to “flare” it under controlled conditions; consult qualified experts for advice on safe flaring techniques if this approach is considered. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows and depressions. Use combustible gas detectors prior to entering any potentially affected confined space or any low area in which cold, heavier-than-air gases or vapors may have accumulated (but keep in mind that the gas or vapor will become lighter than air as it warms and will disperse more easily). Do not direct water at a venting safety device since this may cause icing to occur. Note that the rapid escape of gas under pressure may generate a static electricity charge that could cause gas ignition. Be advised that the very low temperatures associated with hydrogen can cause many materials to become brittle and subject to sudden failure or cracking. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

MONITOR THE SITUATION . . . Hydrogen is expected to exist almost entirely in the vapor phase when released into the atmosphere. Depending on the magnitude of the release, flammable concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

HYDROGEN (Refrigerated liquid or Compressed)
Division 2.1 (Flammable Gas)

TECHNIQUE

FOAM . . . Foam can be applied in large volumes to the surface of confined pools of hydrogen to slow the rate of vapor evolution, particularly after boiling pools have quieted down.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression. Be advised of the possibility of a short-term increase in vapor evolution when the foam (which will be warmer than the hydrogen) is first applied.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to the soil, initially liquid will rapidly boil, generate a large amount of flammable vapors and freeze the ground it is in contact with. Much later, the liquid will reach a less rapid boiling rate thereby evolving less vapors. Containment dikes or barriers using soil, sand or other related materials may be effective to confine the spill to a limited area thereby reducing the surface area and volume of gas generated until liquid evaporates. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material.

CONSEQUENCE

Contained material will take longer to evaporate.

MITIGATION

Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater, which may overfill diked areas.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches. Generally practicable only for small leaks. Reducing the spill surface area will decrease the vapor generation.

CONSEQUENCE

Contained material will take longer to evaporate. Mechanical equipment could ignite material.

MITIGATION

Continually monitor for flammable conditions. Dig a deep pit with small area to reduce vapor generation rate. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill pits.

TECHNIQUE

MECHANICAL REMOVAL . . . Most if not all the hydrogen will rapidly vaporize from soil surfaces once the bulk of the hydrogen liquid has vaporized. Mechanical equipment can be used to grade frozen ground to eliminate any pockets of material.

CONSEQUENCE

Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Continually monitor for flammable conditions.

HYDROGEN (Refrigerated liquid or Compressed)
Division 2.1 (Flammable Gas)

TECHNIQUE

LET BURN . . . If pool not ignited or already ignited it may be safer to burn the hydrogen rather than attempt to recover it or put out fire.

CONSEQUENCE

If pool is not well confined, fire may spread and increase burn area. If large amount of liquid spilled, the time of burn may be too long.

MITIGATION

Ensure pool is well confined and unable to spread. Ensure area is well clear of any population that may be exposed to heat or material that could be ignited by intense heat. Consult qualified personnel regarding safety of flaring the gas.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake and monitor situation.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

MONITOR THE SITUATION . . . Hydrogen will vigorously and rapidly boil off the surface of water bodies.

CONSEQUENCE

Flammable concentrations will exist in the area before time and distance from the area of the spill has diluted the hydrogen gas.

MITIGATION

Evacuate area affected and continually monitor until conditions are safe.

March 1995

HYDROGEN BROMIDE

Poison Gas

(Division 2.3)

GENERAL INFORMATION

Hydrogen bromide is a toxic and corrosive but nonflammable colorless gas that has a sharp, pungent, irritating, acrid, and suffocating odor and that is shipped as a pale yellow liquid under pressure. It is used to make a variety of other chemicals including several pharmaceuticals. The liquid product is highly soluble in water and heavier, so may be expected to sink while simultaneously boiling, forming hydrobromic acid in water, and generating heat. All spills on water or land will result in the generation of relatively large quantities of heavier than air gas and fumes which may be dense and white in appearance at first and which may persist in pits, hollows, and depressions. Contact with most metals may liberate flammable and potentially explosive hydrogen gas in the presence of moisture. Containers may rupture violently due to overpresurization if exposed to fire or excessive heat for sufficient time duration. Liquid hydrogen bromide weighs between 17.9 and 23.1 pounds per gallon near its boiling point temperature according to various authorities.

Hydrogen bromide is stable in normal transportation, is highly corrosive to metals in the presence of moisture, and is reactive with a wide variety of other chemicals and substances. Both the liquid and its vapors and fumes are corrosive to bodily tissues and may rapidly cause severe irritation or burns. Exposure to very high temperatures may cause decomposition of hydrogen bromide into hydrogen and bromine according to one authority.

Downwind evacuation should be considered if hydrogen bromide is leaking until properly equipped responders have evaluated the hazard. Evacuation of a circular region may also be necessary if a container is exposed to direct flame or a fire becomes uncontrollable for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; 198g/100g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol and organic solvents

Specific Gravity (Liquid): 2.14–2.21 or 2.72–2.77 at boiling point; reported values vary.

Boiling Point: –88.2 to –87.5°F (–66.8 to –66.4°C) at 1 atm.

Melting Point: –124.6 to –122.8°F (-87 to -86°C)

Freezing Point: See melting point

Molecular Weight: 80.92

Heat of Combustion: Not flammable

Vapor Pressure: 22.8 atm (334.7 psia) at 70°F (21.1°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Essentially inert to common metals when dry under normal conditions but no galvanized metals or brass or bronze should be used at higher than atmospheric pressure. In presence of moisture will attack most metals except silver, platinum, and tantalum while liberating hydrogen gas according to one authority. Another states that copper-nickel alloys, copper-tin alloys, stainless steel and nickel-chromium alloys offer the best resistance to HBr corrosion with Kel-F and teflon best for gaskets and Buna S, Buna N, and neoprene being unacceptable.

Reactivity with Water: Dissolves with considerable evolution of heat to form hydrobromic acid.

Reactivity with Other Chemicals: Incompatible and may react violently with fluorine (flaming occurs), ammonia, possibly iron oxide, strong oxidizing agents, strong caustics, and unsaturated organic matter. Contact of dry hydrogen bromide with ozone may result in an instantaneous explosion. Contact with strong oxidants may liberate bromine gas.

IDENTIFICATION

Shipping Names: Hydrogen bromide, anhydrous (USDOT & IMO)

Synonyms and Tradenames: Anhydrous hydrobromic acid; anhydrous hydrogen bromide

Chemical Formula: HBr

Constituent Components (% each): 99.8% or more pure with remainder mostly hydrogen chloride

UN/NA Designation: UN1048

IMO Designation: 2.3, poison gas

Physical State as Shipped: Liquefied compressed gas

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Pale yellow liquid that fumes in moist air; colorless gas; white dense fumes.

Odor Characteristics: Pungent; irritating; acrid; sharp; suffocating.

Common Uses: Making of a variety of other chemicals including several pharmaceuticals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HYDROGEN BROMIDE
Poison Gas
(Division 2.3)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at 2 ppm in air

Unusual Hazards: Evolves large amounts of heavier than air, corrosive and toxic gases and fumes upon release. May generate hydrogen gas in contact with metals in presence of moisture. Fumes and gases may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 3 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Excessive heat or fire, sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or waterbodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high gas and fume concentrations that may be present in air in the spill area and over considerable downwind distances. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid hydrogen bromide may result in severe tissue irritation, pain, swelling, tissue destruction, brownish-yellow stains, and deep slow healing burns. Severe exposures may result in shock. Contact with the eyes may cause extreme pain, tearing, irritation and swelling of the eyelids, corneal burns, and either temporary or permanent impairment or loss of vision. Do not wear contact lenses when working with this product. Note that the frostbite is also a possibility due to the very low boiling point of the product.

Hazards of Inhalation: Hydrogen bromide vapors and fumes are highly irritating to the eyes, nose, and upper respiratory tract. High concentrations in air may cause coughing, choking, headache, weakness, dizziness, difficult breathing, laryngeal spasm, tightness in chest, air hunger, frothy sputum, pulmonary edema (which may be delayed in onset), pneumonitis, and possibly death. Concentrations of 3-6 ppm cause nose and throat irritation in humans in several minutes. Exposure of rats to 2858 ppm in air for one hour was sufficient to kill 50% of the animals in laboratory experiments; 814 ppm had similar effects on mice. One authority reports that 1300-2000 ppm would be lethal to humans in a few minutes.

Hazards of Ingestion: Although ingestion of anhydrous hydrogen bromide is unlikely, ingestion of the product or concentrated hydrobromic acid may result in burns of the mouth, throat, and stomach. Similar acids also cause pain, nausea, vomiting, and possibly death due to esophageal or gastric necrosis.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Containers may rupture violently in fire due to over-pressurization. Will generate large quantities of corrosive gas or fumes upon release.

Hazardous Combustion Products: Not flammable but may decompose to hydrogen and bromine at very high temperatures.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

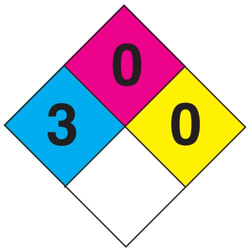
Upper Explosive Limit (UEL): Not flammable

Explosiveness: Containers may rupture violently in fire due to over-pressurization. Contact with most metals in presence of moisture liberates hydrogen gas that may explode if ignited in a confined space. Contact with ozone may result in instantaneous explosion.

1048

HYDROGEN BROMIDE

Poison Gas
(Division 2.3)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid gas canister (50 ppm or less) or a chemical cartridge respirator with an acid gas cartridge and full facepiece (50 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; coughing, choking, or other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but note that contact of water with pools of liquid hydrogen bromide may result in increased vapor evolution.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay up wind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account when planning the response that hydrogen bromide is a corrosive and highly volatile substance. Contact with metals in the presence of moisture may generate hydrogen gas and require use of explosion-proof and spark-proof tools and equipment. Mixtures with water produce hydrobromic acid. Accumulations of heavy gas may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrogen bromide spills may expose downwind areas to toxic concentrations over considerable distances if large quantities of corrosive fumes or gases are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HYDROGEN BROMIDE
Poison Gas (Division 2.3)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to hydrogen bromide vapors or fumes may absorb vapors, knock down fumes, and accelerate their dispersal in the atmosphere. Apply water at a point down wind and do not allow it to contact pools of liquid hydrogen bromide as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain hydrobromic acid from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as firehose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION ... The rapid addition of flooding quantities of water to liquid hydrogen bromide may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent to liquid hydrogen bromide may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid hydrogen bromide may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained hydrogen bromide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

HYDROGEN BROMIDE
Poison Gas (Division 2.3)

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. high pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Although a large fraction of the hydrogen bromide may boil and vaporize, significant amounts may dissolve in water.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

HYDROGEN CHLORIDE
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Hydrogen chloride is a highly toxic and corrosive nonflammable colorless gas that has a sharp, pungent, irritating odor and is shipped as a liquid under pressure. It is used to make drugs, food starch, and other chemicals, and is also used in ore refining, scale removal, and rubber processing. The liquid is substantially soluble in water and somewhat heavier, and may be expected to sink and moderately react with water (to produce hydrochloric acid and heat) while simultaneously boiling. All spills on water or land will result in the generation of relatively large quantities of heavier than air gas and fumes that may be toxic over considerable downwind distances and may persist in pits, hollows, and depressions. Contact with most metals in the presence of moisture may evolve flammable and potentially explosive hydrogen gas. Containers of hydrogen chloride may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. Liquid hydrogen chloride weighs approximately 9.9 pounds per gallon near its boiling point temperature.

Hydrogen chloride is stable in normal transportation. It is highly corrosive to metals, particularly in the presence of moisture, and is reactive with a wide variety of other chemicals. The heat generated in reaction with any alkali or active metal may be sufficient to ignite adjacent combustible materials. Both liquid and gaseous hydrogen chloride are highly corrosive to bodily tissues and may rapidly cause inflammation or burns.

If bulk container is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of 2500 feet. If cylinder is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of 1500 feet. If hydrogen chloride is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 62 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, benzene and ether.

Specific Gravity (Liquid): 1.19 at – 121°F (– 85°C)

Boiling Point: – 121°F (– 85°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: – 175°F (– 115°C)

Molecular Weight: 36.46

Heat of Combustion: Not flammable

Vapor Pressure: 40 atm (587.6 psia) at 64°F (17.8°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Corrosive to most metals with evolution of hydrogen gas, particularly in the presence of moisture, but not corrosive to steel when dry.

Reactivity with Water: Moderate reaction with evolution of heat.

Reactivity with Other Chemicals: Reacts with most metals; alkali or active metals and certain of their compounds; acetic anhydride; 2-amino ethanol; ammonium hydroxide; chlorosulfonic acid; oleum; sulfuric acid; ethylene diamine or imine; propylene oxide; vinyl acetate; B-propiolactone; $HC1O_4$; and a variety of other chemicals.

IDENTIFICATION

Shipping Names: Hydrogen chloride, anhydrous (USDOT, IMO); hydrogen chloride, refrigerated liquid (USDOT).

Synonyms and Tradenames:Hydrochloric acid, anhydrous; anhydrous hydrochloric acid; hydrochloric acid gas; hydrochloride; basilin; chlorohydric acid.

Chemical Formula: HC1

Constituent Components(% each): 97.5-99% pure (technical grade)

UN/NA Designation: UN1050; UN2186 (refrigerated liquid)

IMO Designation: 2.2 nonflammable gas

Physical State as Shipped: Compressed liquefied gas

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless to slightly yellow

Odor Characteristics: Sharp, pungent, irritating

Common Uses: Mfg. of pharmaceuticals and other chemicals; chlorination of rubber; laboratory reagent; hydrolyzing food starch; ore refining; scale remover and cleaner.

other ID numbers

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1-5 ppm

Unusual Hazards: Evolves large amounts of heavier than air, corrosive and toxic fumes and gases upon release. May generate hydrogen gas upon contact with metals. Heat of reaction with any alkali or active metal may ignite nearby combustible material. Fumes and gases may persist in pits, hollows, and depressions.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 5 ppm absolute ceiling limit.(ACGIH)

Conditions to Avoid: Excessive heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to high gas or fume concentrations in air but all exposures should be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid hydrogen chloride or concentrated gas may rapidly result in inflammation or burns. Contact with the eyes may cause irritation, severe burns, and permanent damage with possible loss of sight. Frostbite is also possible.

Hazards of Inhalation: Hydrogen chloride gas or fumes may cause irritation of the respiratory tract with burning, choking, and coughing. High concentrations in air may result in ulceration of the nose and throat, severe delayed breathing difficulties involving pulmonary edema, laryngeal edema or spasm, and possibly death. Concentrations of 1000-2000 ppm may be dangerous even for brief exposures.

Hazards of Ingestion: Ingestion of hydrogen chloride or concentrated acid solutions may result in burns of the mouth, throat and stomach, pain, nausea, vomiting, and possibly death due to esphageal or gastric necrosis.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit:: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. Will generate large quantities of corrosive gas or fumes upon release.

Hazardous Combustion Products: Not flammable

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Cylinders may rupture violently in fire due to overpressurization. Contact with most metals produces hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, natural rubber, neoprene, nitrile rubber, polyethylene, polyvinyl chloride, Viton, and Saranex.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid gas canister (100 ppm or less) or an acid gas cartridge respirator with a full facepiece (100 ppm or less) within the use limitations of these devices.

1050

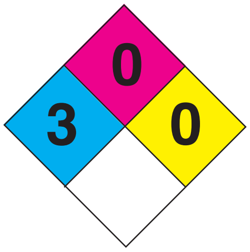
other ID numbers

HYDROGEN CHLORIDE
Poison Gas
(Division 2.3)



FIRST AID

Nonspecific symptoms: Irritation or burns of any bodily tissues; choking, coughing and other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but be cautious in applying water to spilled product.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts moderately with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers or confined spaces. Protect sewers and water-ways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or other-wise damaged by the spilled product. Take into account while planning the response that hydrogen chloride is a corrosive and extremely volatile substance; also, that contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Note that contact with water produces hydrochloric acid. Accumulations of heavy gas may persist in pits, hollows, or depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrogen chloride spills may expose downwind areas to toxic concentrations over considerable distances if large quantities of corrosive fumes or gases are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HYDROGEN CHLORIDE
Poison Gas (Division 2.3)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrogen chloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not let it contact pools of liquid hydrogen chloride as this may increase fume evolution in some cases.

CONSEQUENCE

Water runoff may contain hydrogen chloride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid hydrogen chloride may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid hydrogen chloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Hydrogen chloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained hydrogen chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

HYDROGEN CHLORIDE
Poison Gas (Division 2.3)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vaculm trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply technique to remove final traces of spilled product or to remove products of neutralization.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

HYDROGEN CHLORIDE
Poison Gas (Division 2.3)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

HYDROGEN FLUORIDE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Hydrogen fluoride is an extremely volatile, nonflammable and colorless corrosive liquid that boils at the relatively low temperature of 67°F and has a pungent irritating odor. It is used for a variety of purposes including polishing, etching, and frosting of glass; pickling brass, copper, and steels; electropolishing of metals; cleaning castings; dissolving ores; and making fluorinated chemicals. The liquid dissolves in water with substantial generation of heat to form extremely corrosive hydrofluoric acid. Although hydrogen fluoride is not itself flammable, contact with some metals may evolve flammable and potentially explosive hydrogen gas. Containers of liquid may rupture if exposed to excessive heat or fire for sufficient time duration due to overpressurization. The product's boiling point of about 67°F and its considerable vapor pressure indicate that it will boil in warm weather and will otherwise evaporate rapidly to produce large amounts of gases, vapors, and white fumes that may be hazardous over considerable downwind distances. The liquid weighs approximately 8.3 pounds per gallon.

Hydrogen fluoride is highly reactive with a variety of chemicals and is corrosive to natural rubber, leather, many organic materials, glass, concrete, and certain metals, especially those like cast iron that contain silica. It is also highly corrosive in all forms to bodily tissues and may cause severe and painful burns.

Downwind evacuation should be considered if hydrogen fluoride is leaking. A distance of up to one-half (1/2) mile should be considered depending on the amount of material spilled, location, and local weather conditions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol
Specific Gravity (Liquid): 0.992 at 66.2°F (19°C)
Boiling Point: 67.1°F (19.5°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –134°F (– 92.2°C)
Molecular Weight: 20.01
Heat of Combustion Not flammable
Vapor Pressure: 760 mm Hg (14.7 psia) at 67.1°F (19.5°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: Will attack natural rubber, leather, many organic materials, glass, concrete, and certain metals, especially those like cast iron that contain silica. Lead, wax, polyethylene and platinum are not corroded.
Reactivity with Water: Dissolves with liberation of heat.
Reactivity with Other Chemicals: Reacts with arsenic trioxide, phosphorus pentoxide, bismuthic acid, nitric acid, fluorine, sodium, cyanides, sulfides, acetic anhydride, 2-amino ethanol, ammonium or sodium hydroxide, calcium oxide, chlorosulfonic acid, ethylene diamine or imine, oleum, B-propiolactone, propylene oxide, sulfuric acid, vinyl acetate, and a variety of other chemicals.

IDENTIFICATION

Shipping Names:: Hydrogen fluoride, anhydrous (USDOT and IMO).
Synonyms and Tradenames: Hydrofluoric acid, anhydrous; anhydrous hydrofluoric acid; fluorohydric acid gas; HF; AHF; HF-A
Chemical Formula: HF
Constituent Components(% each): 99-99.97% pure
UN/NA Designation: UN1052, UN1790
IMO Designation: 8, corrosive material
Physical State as Shipped: Liquid
Physical State as Released: Liquid or gas (boiling point is 67.1°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent, irritating
Common Uses: Polishing, etching and frosting glass; pickling copper, brass, stainless and other alloy steels; electropolishing metals; cleaning castings; dissolving ores; acidizing oil wells; making fluorinated chemicals; laundry sour.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Extremely volatile and corrosive substance. Contact with some metals may produce flammable hydrogen gas. May be toxic in air over considerable downwind distances.

Short Term Exposure Limits (STEL): 6 ppm as Fluorine for 15 minutes.(ACGIH)

Time Weighted Average (TLV-TWA): 3 ppm as Fluorine over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Excessive heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Hydrogen fluoride is extremely dangerous by all possible routes of exposure. Toxic concentrations may exist over considerable downwind distances in air.

Hazards of Skin or Eye Contact: Contact with liquid hydrogen fluoride, its water solutions, or high vapor concentrations in air may result in severe burns involving localized death of skin and deep tissue and possible decalcification of bone. These effects may be delayed 1-8 hours if solutions are less than 50% hydrogen fluoride. Contact with the eyes may cause severe irritation and deep-seated burns possibly resulting in blindness or other permanent defects in vision.

Hazards of Inhalation: Hydrogen fluoride is a severe respiratory irritant which may cause burns of the nose, throat and upper respiratory tract, nasal congestion, and bronchitis. High concentrations in air may cause rapid inflammation and congestion of the lungs as well as severe breathing difficulties that may result in death from pulmonary edema. Severe effects may be delayed some hours after the exposure has ceased. Concentrations of only 50-250 ppm are considered dangerous for even brief exposures.

Hazards of Ingestion: Ingestion may result in severe damage to the mouth, throat and stomach. Effects may include nausea, vomiting, pain, and diarrhea.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. Will generate large quantities of corrosive gas or fumes upon release.

Hazardous Combustion Products: Not flammable

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may rupture violently in fire due to overpressurization. Contact with metals may produce hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene, nitrile rubber, Viton, and nitrile butadiene rubber based on data for 30-70% solutions in water.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 20 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted hydrogen fluoride canister and filter or a hydrogen fluoride cartridge respirator with a full facepiece within the use limitations of these devices.

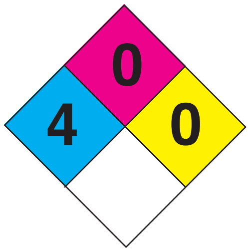
HYDROGEN FLUORIDE
Class 8 (Corrosive Material)



FIRST AID

Nonspecific symptoms: Irritation or burns of any bodily tissues; choking, coughing and other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide or water spray, but be cautious in applying water to pools of spilled product.

Extinguishing Techniques: Corrosive vapor or fume hazard. Dissolves in water with heat evolution. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers or confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that hydrogen fluoride is a corrosive and extremely volatile substance; also, that contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Note that contact with water produces hydrofluoric acid.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrogen fluoride spills may expose downwind areas to toxic concentrations over considerable distances if large quantities of corrosive fumes or gases are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

HYDROGEN FLUORIDE
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrogen fluoride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not let it contact pools of liquid hydrogen fluoride if any increase in fume evolution is observed.

CONSEQUENCE

Water runoff may contain hydrogen fluoride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid hydrogen fluoride may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2003

HYDROGEN PEROXIDE
Division 5.1 (Oxidizer)

GENERAL INFORMATION

Hydrogen peroxide is a colorless liquid that may be shipped as a relatively pure product or as various strength solutions in water. This guide is primarily intended for the relatively pure product. Although hazards of aqueous solutions may be less severe and physical properties may differ, much of the information here is generally applicable to such solutions if properly interpreted. Hydrogen peroxide is fully soluble in water and has a slightly sharp and irritating odor. It is used as a rocket propellant, a bleaching or disinfecting agent and as an ingredient or raw material for various chemicals and products. Although it is not itself flammable, it is a strong oxidizer and may cause fire, violent reactions and possibly explosions upon contact with combustible materials or certain metals. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration, or if contaminated with certain metals or dirt. The product weighs approximately 12 pounds per gallon.

Hydrogen peroxide does not react with water and is quite stable if uncontaminated. It is reactive with various chemicals and ordinary combustibles and may attack or ignite some forms of plastics, rubber or coatings. The concentrated product is irritating and injurious to bodily tissues by all routes of potential exposure. Products of decomposition are oxygen and water.

Initial downwind evacuation should be considered for at least 100 meters (330 feet) in all directions if hydrogen peroxide is leaking but not on fire. If the material is in a mixed load shipment (small packages shipped with other small packages in the same outer packaging, railcar, container or trailer) and exposed to fire or direct flame, evacuate for one-half (1/2) mile in all directions. If bulk container is exposed to direct flame or fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in diethyl ether and ethyl alcohol.

Specific Gravity (Liquid): 1.407 at 77°F (25°C)

Vapor Density: 1.1

Boiling Point: Variable depending on concentration. Ranges from 223°F (106°C) to 302.4°F (150.2°C) (decomposes)

Melting Point: Variable depending on concentration. Ranges from -18°F (-27°C) to 31.3°F (–0.4°C)

Freezing Point: See melting point.

Molecular Weight: 34.01

Vapor Pressure: 1 mm Hg (0.019 psia) at 59.5°F (15.3°C)

Evaporation Rate (butyl acetate=1): >1

pH: Reported values range from less than 3 to 4.

Heat of Combustion: Not flammable

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Pure grades are quite stable, but contamination by metals or dirt or excessive heat can cause rapid or violent decomposition.

Polymerization Potential: Will not occur. However, will catalyze polymerization.

Corrosiveness: Relatively noncorrosive but may react with certain metals (see below) or attack or react with some plastics, rubber or coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Strong oxidizer. Reacts with most organic or readily oxidizable materials, chemicals, or combustibles; iron, copper, brass, bronze, magnesium, chromium, zinc, lead, manganese, silver, platinum, or other catalytic metals or their salts; glycerin, hydrazines, alcohol, oxides and a variety of other substances.

IDENTIFICATION

Shipping Name(s): Hydrogen peroxide, stabilized or hydrogen peroxide, aqueous solutions (UN2015) (USDOT & IMO); Hydrogen peroxide, aqueous solutions (UN2014 &UN2984) (USDOT & IMO)

Synonyms and Tradenames: Hydrogen dioxide; Peroxide; Hydroperoxide; Perhydrol; Dihydrogen dioxide; Hydrogen oxide; Inhibine; Peroxan; Superoxol; T-stuff; Albone; Hioxy.

CAS Registry No.: 7722-84-1

Chemical Formula: $H_2 0_2$

Constituent Components (% each): 3% to almost 100% pure with remainder being water. May contain small amount of stabilizer.

UN/NA Designation: UN2015 (>60%); UN2014 (>20% to 60%); UN2984 (20% to >8%)

IMO Designation: 5.1, Oxidizing substances

RTECS Number: MX0900000 or MX0899000

NFPA 704 Hazard Rating: 2 (Health): 0 (Flammability): 1 (Reactivity): Oxidizing Agent

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Slightly sharp, irritating

Common Uses: Rocket propellant; bleaching agent; disinfectant; mfg. chemicals, buttons, pharmaceuticals, felt hats, plastic foam, sponge rubber, pesticides and dyes; used to artificially age wines and liquors; gasoline additives, plasticizers, dyestuffs, textile finishing agents, germicides, medicinal products and other chemicals and products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

*

HYDROGEN PEROXIDE

Division 5.1 (Oxidizer)

*Also 2014 and 2984

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: May ignite, react violently or even cause explosion of combustible or organic materials upon contact when concentrated. Containers may rupture violently due to rapid product decomposition if heated or contaminated by metals or dirt.

Short Term Exposure Limit (STEL): 2 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 1 ppm (1.4 mg/m^3)

IDLH: 75 ppm (solutions with higher concentrations)

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from breathing high concentrations in the immediate spill area and directly downwind. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid hydrogen peroxide may cause tingling and temporary whitening if the skin is washed promptly. If not removed, redness and blisters may occur. Contact with the eyes may cause severe damage and possible blindness. Damage may appear a week or more after exposure.

Hazards of Inhalation: Vapors of hydrogen peroxide may cause extreme irritation of the eyes, nose and throat. Pulmonary irritation ranging from mild bronchitis to pulmonary edema is also possible. One authority reports the irritation threshold to be 100 ppm in air, presumably in acute exposures.

Hazards of Ingestion: Ingestion may result in injury to the mouth and throat with possible bleeding of the esophagus and stomach. The product may also produce oxygen gas that may distend the esophagus and stomach and possibly cause severe damage.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may explode or rupture violently in fire due to overpressurization.

Hazardous Combustion Products: Decomposition products are water, oxygen, hydrogen gas, heat and steam but any unburned product may be hazardous. Release of oxygen may support combustion.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire due to overpressurization. Contact with combustible materials or some metals may result in formation of explosive mixtures in some cases when the product is concentrated.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with vapor or fume concentrations in air above 75 ppm. Compatible materials may include butyl rubber, neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, polyurethane, polyvinyl chloride, styrene-butadiene rubber, Viton®, natural rubber or polyethylene for 70% or less solutions.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

*Also 2014 and 2984

HYDROGEN PEROXIDE

Division 5.1 (Oxidizer)

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, skin or other tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if skin irritation persists.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not induce vomiting. Get medical attention immediately. Gastric lavage may be necessary if swallowed.

FIRE RESPONSE

Extinguishing Agents: Use water in ample quantities or appropriate foam. Do not use CO_2, dry chemical or organic material.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with concentrated material or dense fumes/smoke anticipated. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or rupture of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that concentrated hydrogen peroxide is a strong oxidizer that may ignite or otherwise react violently with a wide variety of materials. Decomposition produces pure oxygen. High pressures may develop in unvented containers.

HYDROGEN PEROXIDE
Division 5.1 (Oxidizer)

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Hydrogen peroxide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrogen peroxide vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of material from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to hydrogen peroxide may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

HYDROGEN PEROXIDE

Division 5.1 (Oxidizer)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Hydrogen peroxide may be confined by building dikes using soil, sand or other non-combustible materials.

CONSEQUENCE

Confined liquid may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

HYDROGEN PEROXIDE
Division 5.1 (Oxidizer)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels. (There is a possibility that hydrogen peroxide may be held in a diked area until peroxide completely decomposes. Consult with qualified experts on this subject.)

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

HYDROGEN SELENIDE
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Hydrogen selenide is a compressed or liquefied compressed poison gas with an offensive disagreeable odor resembling decayed horseradish. It is used for making selenium compounds and electronic semiconductors. The liquid is heavier than water and slightly soluble so may be expected to sink while boiling rapidly and dissolving slowly. The gas is heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, or depressions. Accumulations of gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 17.1 pounds per gallon at its boiling point temperature.

Hydrogen selenide is stable in normal transportation but may decompose in air to form red selenium precipitate. It does not react with water or many other common materials, but may react vigorously, ignite, or explode in contact with strong oxidizing agents, alkalies, or halogenated hydrocarbons. Toxicity of the product is extremely high via inhalation. Products of combustion include toxic selenium dioxide fumes.

Downwind evacuation should be considered if hydrogen selenide is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 270 ml gas/100 ml water at 72.5°F (22.5°C); 0.73 g/100 g water at 68°F (20°C).

Solubility in Other Chemicals: Soluble in carbonyl chloride, carbondisulfide, and phosgene.

Specific Gravity (Liquid): 2.0–2.1 at boiling point

Boiling Point: – 44 to – 42°F (–42.2 to –41.1°C) at 1 atm.

Melting point: – 86.3 or – 83.2°F (– 65.7 or – 64°C); reported values vary.

Freezing point: See melting point

Molecular Weight: 80.98

Heat of combustion: Unavailable

Vapor Pressure: 9.5 atm (139.56 psia) at 70°F (21.1°C)

Flash Point: Flammable gas

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable in normal transportation; decomposes in air to form red selenium precipitate.

Corrosiveness: Aluminum and stainless steel most resistant. Iron, steel or brass acceptable under many conditions. Unites directly with many metals to form metallic selenides.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Various authorities indicate the possibility of vigorous reaction, fire, and/or explosion upon contact with strong oxidizing agents, alkalies, or halogenated hydrocarbons.

IDENTIFICATION

Shipping Names: Hydrogen selenide, anhydrous (USDOT and IMO)

Synonyms and Tradenames: Selenium hydride; dihydrogen selenide; selenium dihydride; selane; selenium anhydride.

Chemical Formula: H_2Se

Constituent Components (% each): 98% or more pure

UN/NA Designation: UN2202

IMO Designation: 2.3, poison gas

Physical State as Shipped: Compressed or liquefied compressed gas.

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Disagreeable; offensive; like decayed horseradish

Common Uses: Making metallic selenides and organoselenium compounds; in doping gas for making electronic semiconductor materials.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HYDROGEN SELENIDE

Poison Gas (Division 2.3)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at 0.3 ppm but deadens sense of smell rapidly at levels below 1 ppm.

Unusual Hazards: Extremely toxic and flammable compressed or liquefied compressed gas. Vapors are heavier than air and may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.05 ppm as Se over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact with cold liquid, gas, or containers.

HEALTH HAZARDS

Public Health Hazards: Major hazard by far is from inhalation of the high vapor concentrations that may be present in air in the spill area and over considerable downwind distances. Note that hydrogen selenide may deaden the sense of smell and is reported to be an allergen by some authorities. Direct contact and ingestion should also be strictly avoided.

Hazards of Skin or Eye Contact: The hazards of skin or eye contact with liquid hydrogen selenide or its concentrated vapors are not well defined. Various authorities suggest the possibility of irritation, chemical burns, and burns due to frostbite.

Hazards of Inhalation: Vapors of hydrogen selenide are extremely irritating to the eyes, nose, throat, and lungs and are considered intolerable at a level of 1.5 ppm in air. Severe (acute) exposures may result in coughing, nasal secretions, chest pain, dizziness, nausea, vomiting, difficult breathing, cyanosis, pulmonary edema (which may be delayed in onset), bronchitis, liver and spleen injury, pneumonitis, and possibly death. Prolonged exposures may also cause metallic taste in mouth, garlic odor on breath, and extreme fatigue. Other possible symptoms include a possible hemolytic effect, occasional hyperglycemia, and gastrointestinal distress. Note that hydrogen selenide is easily oxidized to red selenium on the surface of membranes of the nose and lungs. Exposure to 0.3 ppm in air for 8 hours was fatal to guinea pigs (after a month) in laboratory experiments. Exposure to 6 ppm for 30 minutes caused deaths as did exposure to 10 ppm for 2 hours and about 85 ppm for 10 minutes.

Hazards of Ingestion: Due to its low boiling point, ingestion of hydrogen selenide is not considered likely and is not discussed in the literature.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable compressed or liquefied compressed gas. Containers may rupture violently in fire. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Burns with blue flame.

Hazardous Combustion Products: Toxic selenium dioxide fumes are produced in fires. Thermal decomposition produces elemental selenium.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with liquid hydrogen selenide, cold gas streams, or very cold containers of this product. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 0.05 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2202

HYDROGEN SELENIDE

Poison Gas (Division 2.3)

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas (including mucous membranes of nose if necessary) with large amounts of water. Get medical attention as necessary. Do not use hot water on frozen tissues or rub them if frostbite has occurred.

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or else let fire burn out while cooling surroundings with water spray or fog. Carbon dioxide may be used for extinguishment when reignition is no longer a possibility.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the extremely toxic, volatile, and flammable nature of hydrogen selenide into account when planning the response. Electrically ground and bond all lines and equipment as necessary to prevent sparks.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrogen selenide discharges may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to hydrogen selenide vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid hydrogen selenide as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of hydrogen selenide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

HYDROGEN SELENIDE
Poison Gas (Division 2.3)

TECHNIQUE

FOAM ...There is a possibility that application of an appropriate firefighting foam to the surface of liquid pools may slow the release of hydrogen selenide vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid hydrogen selenide may be contained by building dikes or barriers using soil, sand or other materials.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable gases or vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

HYDROGEN SELENIDE
Poison Gas (Division 2.3)

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Liquid hydrogen selenide will boil rapidly while sinking in water. Only a small fraction may dissolve in water.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

HYDROGEN SULFIDE
Poison Gas
(Class 2.3)

GENERAL INFORMATION

Hydrogen sulfide is a colorless and poison liquefied compressed gas with a characteristic rotten eggs odor that may rapidly deaden the sense of smell. It has a variety of uses in making other chemicals and in metallurgy, laboratory analysis, and disinfection of agricultural products. Only slightly soluble in water and lighter, and having a very low boiling point, liquid hydrogen sulfide will rapidly boil from the surface of a water body with little dissolution (but even small amounts in water can be harmful to aquatic organisms). Rapidly vaporizing upon any release to the environment, and being heavier than air, its vapors may travel a considerable distance to a source of ignition and flash back, and may also persist in pits, hollows or depressions. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8 pounds per gallon near its boiling point temperature.

Hydrogen sulfide does not react with water and is stable in normal transportation. It is dangerously reactive with a variety of other chemicals, particularly with strong oxidizing agents, however, and attacks various metals and certain forms of plastics, rubber, and coatings. Toxicity of the product is especially high via inhalation and the liquid may cause frostbite as well as inflammation in contact with the skin or eyes. Products of combustion are also highly toxic and include oxides of sulfur.

If hydrogen sulfide is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half ($^{1}/_{2}$) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; approx. 1 g in 242 ml water at 68°F (20°C).

Solubility in Other Chemicals: Somewhat soluble in alcohol, ether, and glycerol.

Specific Gravity (Liquid): 0.95-0.96 at boiling point

Boiling Point: –77.3 to -76.4°F (–60.7 to –60.2°C) at 1 atm.

Melting Point: –122.1 to –118.8°F (–85.6 to –83.8°C)

Freezing Point: See melting point

Molecular Weight: 34.08

Heat of Combustion: –3640 cal/g

Vapor Pressure: 18.15 atm (266.7 psia) at 70°F (21.1°C)

Flash Point: Flammable gas

Autoignition Temperature: Most authorities give 500°F (260°C) but 554°F (290°C) also reported.

Burning Rate: 2.3 mm/minute (liquid)

Stability: Stable

IDENTIFICATION

Shipping Names: Hydrogen sulfide (USDOT); hydrogen sulphide (IMO)

Synonyms and Tradenames: Dihydrogen sulfide; dihydrogen monosulfide; sulfur hydride; sulfuretted hydrogen; hydrosulfuric acid; sewer gas; stink damp.

Chemical Formula: H_2S

Constituent Components (% each): 98.5% or more pure

UN/NA Designation: UN1053

IMO Designation: 2.3, poison gas

Corrosiveness: Attacks many metals to form sulfides and may corrode many metals rapidly when wet. May attack some forms of plastics, rubber, and coatings. Aluminum and 316 stainless among others are acceptable for wet or dry service. Black iron, carbon steel, and brass among others are acceptable for dry product. Avoid hard steels that are highly stressed and which may be subject to hydrogen embrittlement from hydrogen sulfide.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Highly reactive (possibly causing fire or explosions) with acetaldehyde, barium oxide and mercurous or nickel oxide, bromide pentafluoride, chlorine monoxide, chlorine trifluoride, fluorine, lead dioxide, oxygen difluoride, nitrogen trichloride, nitrogen trifluoride, powdered copper, nitric acid, chromic anhydride, soda lime, sodium, sodium peroxide, nitrogen triiodide, phenyl diazonium chloride, and strong oxidizing agents.

Physical State as Shipped: Liquefied gas at 350-400 psi

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Like rotten eggs; offensive; may be odorless at poisonous concentrations.

Common Uses: Source of sulfur; purification of certain acids; laboratory reagent; making other chemicals; metal extraction from ores; agricultural disinfectant.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

HYDROGEN SULFIDE
Poison Gas (Class 2.3)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.13 ppm (but possibly less); faint but readily perceptible at 0.77 ppm.

Unusual Hazards: highly toxic, flammable, heavier than air liquefied compressed gas. May persist in pits, hollows, and depressions. Exposure to hydrogen sulfide gas can deaden the sense of smell such that dangerous concentrations are not noticed after initial exposure.

Short Term Exposure Limits (STEL): 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, ordirect physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high gas concentrations that may be present in air in the spill area and over considerable downwind distances. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid hydrogen sulfide may cause irritation, painful inflammation, and frostbite, with at least one authority describing the product as corrosive to bodily tissues. Similarly, contact with the eyes may at the very least cause painful irritation, watering, and inflammation. Contact lenses should not be worn when working with this chemical.

Hazards of Inhalation: Hydrogen sulfide gas is irritating to the eyes, nose, and throat with some eye effects possibly delayed. Depending on the duration of exposure, inhalation of low to moderate concentrations in air may result in sneezing, headache, dizziness, drowsiness, upset stomach, fatigue, irritability, confusion, excitement, cold sweat, staggering, bronchitis, pulmonary edema (which may be delayed in onset), and bronchial pneumonia. High concentrations may quickly cause unconsciousness, convulsions, and death due to respiratory paralysis. Note that the sense of smell will deaden rapidly upon exposure to hydrogen sulfide. Levels of 1000-2000 ppm in air are sufficient to cause coma and possible death after a single breath. Concentrations between 600 and 1000 ppm may be fatal after 30 minute exposures.

Hazards of Ingestion: Due to its low boiling point, ingestion of hydrogen sulfide is considered unlikely.

FIRE HAZARD

Lower Flammable Limit (LFL): 4.0 or 4.3%; reported values vary.

Upper Flammable Limit (UFL): 44, 45, or 46%; reported values vary.

Behavior in Fire: Flammable liquefied compressed gas. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flashback. Containers may rupture violently in fire. Burns in air with pale blue flame.

Hazardous Combustion Products: Highly toxic oxides of sulfur (primarily sulfur dioxide).

EXPLOSION HAZARD

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with other chemicals such as strong oxidizing agents or certain metal oxides may result in formation of explosive mixtures.

1053

HYDROGEN SULFIDE

Poison Gas (Class 2.3)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent the skin from becoming frozen from contact with liquid hydrogen sulfide, cold gas streams, or cold equipment containing this product. Equipment should also prevent any reasonable probability of eye contact with liquid hydrogen sulfide. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, neoprene, chlorinated polyethylene, polyvinyl chloride, and styrene- butadiene rubber

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, or throat; headache, dizziness, upset stomach, or other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if irritation persists after washing.

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or else let fire burn while cooling surrounding equipment with water. Carbon dioxide, dry chemical, or water spray may be used after possibility of reignition has been eliminated.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Electrically ground and bond all lines and equipment as appropriate. Take the highly volatile, toxic, and flammable nature of hydrogen sulfide into account when planning the response.

HYDROGEN SULFIDE
Poison Gas (Class 2.3)

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Hydrogen sulfide discharges may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to hydrogen sulfide vapors or fumes may accelerate their dispersal in the atmosphere. Do not allow water to contact standing pools of liquid hydrogen sulfide as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of hydrogen sulfide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Note that even low levels of hydrogen sulfide in water can be dangerous to aquatic organisms.

TECHNIQUE

FOAM ... There is a possibility that application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of hydrogen sulfide vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if initial increase in vapor evolution may affect downwind populations. Consult qualified experts for advice where necessary

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid hydrogen sulfide or contaminated runoff may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

HYDROGEN SULFIDE
Poison Gas (Class 2.3)

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

ABSORPTION ... Spreading of contaminated runoff may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances. (Note: This response only applies to contaminated water runoff.)

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance. (Note: This response only applies to contaminated water runoff.)

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders,bulldozers, or draglines. (Note: Most residues will vaporize eventually or degrade to sulfur in the environment.)

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

HYDROGEN SULFIDE
Poison Gas (Class 2.3)

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Most hydrogen sulfide will quickly boil from the water surface. Dissolved oxygen will eventually convert any hydrogen sulfide that dissolves in water to elemental sulfur. However, even low concentrations of hydrogen sulfide can be rapidly toxic to aquatic organisms.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment orstorage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture some spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Anion exchangers may also be effective.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1996

HYDROQUINONE*

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Hydroquinone is an organic colorless to light tan to white solid, found in powder, crystal or liquid form. It is produced from the oxidation of aniline, the reduction of quinone, the hydroxylation of phenol with 70% hydrogen peroxide in the liquid phase with a soluble acid catalyst, or from the alkylation of benzene and cumene. Hydroquinone is used primarily in the manufacture of photographic chemicals such as reducers and developers, however it may also be used as a chemical intermediate for dyes, stabilizers in paints, varnishes, motor fuels and oils, a raw material to produce rubber anti-oxidants, and as a polymerization inhibitor.

Hydroquinone is irritating to the eyes and skin. It is a skin sensitizer and repeated or prolonged exposure may cause allergic rashes, discoloration of the skin, and eye corrosion and ulceration. The most common route of exposure is through skin contact. It is mildly toxic by skin absorption, inhalation and ingestion. May cause irritation of the mouth and throat, nausea and vomiting.

Although the fire potential for hydroquinone is low when exposed to sources of heat and flame, it can react with oxidizing materials. Under severe dusting conditions, the material may form explosive mixtures with air, and explode if ignited in enclosed areas. Polymerization will not occur. When heated to decomposition, the burning material may generate irritating and poisonous gases, such as carbon monoxide. Normal structural fire fighting protective clothing will provide only limited protection for releases where hydroquinone is present. Runoff may be toxic. Hydroquinone is moderately water soluble. This material is normally stable, however it is incompatible with materials such as strong oxidizers, alkalis, oxygen, and sodium hydroxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Moderate (7% @ 25°C [77°F]).
Solubility in Other Chemicals: Freely soluble in alcohol, acetone and ether; very soluble in carbon tetrachloride; slightly soluble in benzene.
Specific Gravity (Liquid): 1.3
Vapor Density (Air=1): 3.81
Boiling Point: 285°C (545°F)
Melting Point: 170°C (338°F)
Freezing Point: Unavailable.
Molecular Weight: 110.11
Heat of Combustion: Unavailable.
Vapor Pressure: 1 mm Hg at 132°C (270°F)
Flash Point: 165°C (329°F)
Autoignition Temperature: 516°C (960°F)
Flammable Limits: Not established.
Stability: Stable.
Polymerization Potential: Will not occur.
Evaporation Rate: 1 (Ether=1.0)
pH: 4.0-4.7 @ 5% aqueous solution
Reactivity and Incompatibility: Incompatible with strong oxidizers, alkalis, oxygen, and sodium hydroxide.
Other Characteristics: When heated to decomposition, material emits irritating and poisonous carbon monoxide.

IDENTIFICATION

Shipping Name(s): Hydroquinone (USDOT & IMO)
Synonyms and Tradenames: Quinol, Hydroquinol, Tecquinol, P-Benzendiol, Hydroxy Phenol, Benzohydroquinone, 1,4-Benzenediol, Dihydroxybenzene, 1,4-Dihydroxybenzene, 4-Hydroxyphenol, Beta-Quinol, Diak 5, Eldoquin, Eldopaque, HE 5, Benzoquinol, Alpha-Hydroquinone, Hydroquinole, NCI-C55834, P-Dioxobenzene, P-Hydroquinone, Phiaquin, and Tenox HQ. CAS Registry No: 123-31-9
Chemical Formula: $C_6H_4(OH)_2$
Molecular Formula: $C_6H_6O_2$
UN/NA Designation: UN2662
IMO Designation: 6.1
RTECS Number: NIOSH/MX3500000
OHMTADS Number: 7217252
NFPA 704 Hazard Rating: 2 (Health): 1 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid/powder/crystals
Physical Form as Released: Liquid/powder/crystals
Color of the Shipped Material: Colorless to light tan to white. Its solution becomes brown in air due to the effects of oxidation.
Odor Characteristics: Odorless; slight odor
Common Uses: Hydroquinone is used primarily in the manufacture of photographic chemicals such as reducers and developers, however it may also be used as a chemical intermediate for dyes, a stabilizer in paints, varnishes, motor fuels and oils, a raw material to produce rubber anti-oxidants, and as a polymerization inhibitor.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

HYDROQUINONE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Material is irritating to the eyes and skin; prolonged exposure can cause skin and eye discoloration.

Time Weighted Average (TLV-TWA): 0.4 ppm

Short Term Exposure Limit (STEL): Not established.

IDLH: 44 ppm

Conditions to Avoid: Heat, sparks, flame, moisture, incompatible materials such as strong oxidizers, alkalis, oxygen, and sodium hydroxide. Material may not be stored near food stuffs.

HEALTH HAZARDS

Potential Health Effects: Hydroquinone is irritating to the eyes, skin and respiratory system. May be mildly toxic by skin absorption or ingestion. Prolonged exposures can cause discoloration of the skin and eyes, and eye corrosion or ulceration. May cause allergic skin rashes. Gross overexposure may cause red blood cell destruction with anemia and central nervous system depression. In some cases, gross overexposure may be fatal. Individuals with preexisting diseases of the cardiovascular system may have increased susceptibility to the toxicity of excessive exposures. Exposure to hydroquinone may induce methemoglobinemia.

Hazards of Skin and Eye Contact: Skin contact may cause skin irritation with rash, redness, itching, burning, swelling and dermatitis. Prolonged exposures may lead to skin sensitization with allergic rashes. Repeated or prolonged exposure may cause discoloration of the skin. Eye contact may cause irritation with tearing, pain or blurred vision. Prolonged contact may cause eye corrosion or ulceration. Potential effects from repeated and/or prolonged exposures to vapor, aerosol or dusts include changes in corneal curvature with eventual stigmatism.

Inhalation Hazards: Inhalation may cause central nervous system (CNS) effects such as nausea, headache, dizziness or general weakness. Irritation of the upper respiratory tract and wheezing may also occur.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by shortness of breath, cyanosis, headache, nausea, and vomiting.

FIRE HAZARDS

Lower Flammable Limit: Not established.

Upper Flammable Limit: Not established.

Behavior in Fire: Although it will not readily ignite, hydroquinone will burn if exposed to sources of heat and flame, and if it comes into contact with oxidizing materials. Dusts may form explosive mixtures with air in enclosed areas and ignite in the presence of sources of ignition, heat and flame.

Hazardous Decomposition Products: When heated to decomposition, toxic and irritating gases such as carbon monoxide may be liberated in fire situations.

EXPLOSION HAZARDS

Explosive Potential: Low, however dusts may explode in enclosed areas.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are natural rubber, nitrile rubber, polyvinyl chloride and neoprene. Structural firefighting protective clothing only provides a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits.

2662

HYDROQUINONE
Division 6.1 (Poisonous Materials)

FIRST AID

Nonspecific Symptoms: Direct skin contact can produce irritation, itching, inflammation, and rashes. Central nervous system (CNS) effects may include nausea, headache, dizziness confusion, fatigue, incoordination, or general weakness.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physicians: If ingested and conscious, administer a slurry of activated charcoal in water if not previously administered. Perform gastric lavage with water. DO NOT USE ALCOHOL for gastric lavage. The use of a stomach tube may be contraindicated if corrosion is evident. Administer milk, egg whites, or olive oil as demulcents. Maintain patient in recumbent position. Apply external heat to keep warm. Give fluids to restore electrolyte balance. Treat shock if indicated and give antibiotics as necessary.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray, or AFFF foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water spray to cool fire-exposed containers, disperse vapors and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be toxic.

SPILL RESPONSES

General Information: Hydroquinone is a poisonous material. Do not walk through spilled material. Ventilate enclosed areas before entering since the solid or crystal form of the material presents a potential dust explosion hazard. Secure potential sources of heat, sparks, flame, impact, friction, electricity and moisture in the immediate spill area and downwind. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent material from entering sewers, waterways, and storm drains. Overflow dams are an effective means to dike material since it is only slightly water soluble and heavier than water. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered. Runoff may be toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

HYDROQUINONE
Division 6.1 (Poisonous Materials)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container of the liquid material is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential ignition sources such as heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

MONITOR THE SITUATION...If released into the atmosphere, hydroquinone is expected to exist primarily in the vapor phase. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Dusts may accumulate in enclosed areas and explode. Extreme caution should be exercised in these areas. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind in enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively in fire situations. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

FOAM...Aqueous Film Forming Foam (AFFF) or compatible hazardous materials foam agents applied to the surface of liquid pools.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

HYDROQUINONE
Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, hydroquinone is expected to degrade. The time frame would depend on the size of the release and atmospheric conditions. Volatilization of hydroquinone from water to the atmosphere is expected to be too slow to be environmentally significant. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is moderately soluble in water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may have limited effectiveness to recover spilled material since the material is moderately water soluble and it is heavier than water. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming may be effective if initiated promptly since the material is moderately water soluble and it is heavier than water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

HYDROQUINONE
Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...If released to soil, hydroquinone is expected to biodegrade under aerobic conditions. Volatilization from either most soil or dry soil is not expected to occur to any significant extent. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Cover solid or crystalline form of material with a plastic sheet or other compatible material. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

September 1992

ISOBUTANE
Class 2.1 (Flammable Gas)

GENERAL INFORMATION

Isobutane is a colorless, flammable, compressed liquefied gas in transportation with a normal boiling point of approximately 10.9°F (–11.7°C). It may be odorless in air at low concentrations, have a mild petroleum, sweet or gasoline like odor, or possibly be treated with a foul skunk-like or other repulsive additive for leakage warning purposes.

Isobutane is practically insoluble in water and lighter. Due to its relatively low boiling point temperature, any spilled liquid will boil or otherwise rapidly vaporize under all but the very coldest environmental conditions. Thus, spills have the potential to generate large amounts of vapor that may be heavier than air, may accumulate and persist in pits, hollows and depressions, and that may travel a considerable distance to a source of ignition and flash back or even explode. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 4.95 pounds per gallon at its boiling point temperature.

Isobutane does not react with water or many other common materials and is primarily known to be incompatible with oxidizing materials that may cause its ignition. It is not corrosive to common metals but may attack some types of plastic and rubber. Toxicity of the product is low by all routes of exposure but contact with very cold liquid or gas may result in frostbite or freeze burns. Products of combustion may include toxic substances.

Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, and weather conditions if isobutane is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire and becomes uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently and possibly rocket. If a cylinder is so threatened, evacuate for a radius of one-third (1/3) mile. (Note: The data and information presented below are for relatively pure isobutane. The properties and hazards of isobutane may be altered if it is shipped or stored as a mixture with other substances.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 49 ppm at 68°F (20°C)

Solubility in Other Chemicals: Soluble to varying degrees in alcohol, chloroform, and ether.

Specific Gravity (Liquid): 0.557 at 68°F (20°C); 0.593 at 10.4°F (–12°C)

Boiling Point: 10.8 to 10.9°F (–11.8 to –11.7°C) at 1 atm.

Melting Point: –255.3°F (–159.6°C); several other values found in the literature appear to be incorrect.

Freezing Point: See melting point

Molecular Weight: 58.12

Heat of Combustion: –10,810 cal/g

Vapor Pressure: 45.27–45.40 psia (3.08–3.09 atm) at 70°F (21.1°C); 72.6 psia (4.94 atm) at 100°F (37.8°C); 90.1 psia (6.13 atm) at 115°F (46.1°C); 110.6 psia (7.53 atm) at 130°F (54.4°C) for high purity isobutane. May differ for mixtures.

Flash Point: –117°F (–82.8°C), closed-cup

Autoignition Temperature: 860–864°F (460–462°C) most commonly reported

Burning Rate: 9.3 mm/minute

Stability: Stable

Corrosiveness: Not corrosive to common metals; may attack some plastics, rubber, and coatings. Polyethylene and polypropylene are specifically cited as vulnerable to attack.

Reactivity with Water: No reaction, but contact of cold liquid isobutane with water (particularly warm or hot water) may result in vigorous or violent boiling of the product and extremely rapid vaporization due to the large temperature differences involved. Pressures may build to dangerous levels if cold liquid isobutane contacts much warmer water in a closed container.

Reactivity with Other Chemicals: May react vigorously, ignite, or explode in contact with strong oxidizing agents or materials. Note that the closely related n-butane has the potential to explode in the presence of nickel carbonyl and oxygen.

IDENTIFICATION

Shipping Names: Isobutane; isobutane mixtures

Synonyms and Tradenames: 1,1-Dimethylethane; 2-methylpropane; iso-methylpropane; trimethylmethane.

Chemical Formula: $(CH_3)_2CHCH_3$

Constituent Components Me each): Shipments of "isobutane" are likely to be 95% to 99.96% pure with the remainder mostly consisting of n-butane and/or propane and no more than 1–2 ppm sulfur.

49 STCC: 49 057 47 (isobutane gas, liquefied); 49 057 50 (isobutane for further refinery processing).

UN/NA Designation: UN1969

IMO Designation: 2.1, flammable gas

Physical State As Shipped: Liquefied compressed gas

Physical State As Released: Boiling liquid, vaporizing liquid, gas, or mixture or gas and aerosols (small liquid droplets), depending on environmental and release conditions; the boiling point of the product is about 10.9°F.

Color of the Shipped Material: Colorless, but very cold may gas appear white at first due to condensation of water vapor in the atmosphere.

Odor Characteristics: Odorless or mild petroleum, sweet, or gasoline odor; some shipments may contain a skunk-like or other repulsive odorant for leakage warning purposes.

Common Uses: General fuel source; organic synthesis of organic chemicals; raw or intermediate material for making synthetic rubber, polyurethane foams and resins.

**FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)**

ISOBUTANE
Class 2.1 (Flammable Gas)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: One authority simultaneously lists a threshold odor concentration of 1.2 ppm in air, a 100% odor recognition concentration of 2 ppm, and a recognition level of 562 ppm at 68°F. A maker of the pure product disagrees and states that isobutane can only be smelled at high concentrations in air.

Unusual Hazards: Extremely flammable heavier than air gas or vapor may travel a considerable distance to a source of ignition and flash back. Vapors and gases may persist in pits, hollows, and depressions. Unconfined as well as confined vapor clouds may explode if ignited. One maker of the product warns that escaping gas may ignite because of friction. Another reports that the material may accumulate static electrical charges which may cause its ignition (presumably upon its release). Also cautioned is that drains may become plugged and valves may become inoperable because of the formation of ice due to expanding vapors or vaporizing liquids.

Short Term Exposure Limit (STEL): Not established.

Time Weighted Average (TWA) Limit: Not established; the limit for closely related n-butane is 800 ppm over each 8 hours of a 40 hour work week (ACGIH TLV, 1990–91; OSHA PEL, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff of liquid to sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the very high concentrations of isobutane gas or vapor that may be present in air at the spill site and directly downwind. Direct contact with the liquid or very cold gas or equipment should also be avoided.

Hazards of Skin or Eye Contact: Contact with very cold liquid isobutane or concentrated cold gas streams may cause frostbite or freeze burns. Frostbite may also occur from contact with the surface of a very cold container of the product. High gas concentrations may cause mild eye irritation; very high gas concentrations may cause mild irritation of mucous membranes (presumably of the nose and throat).

Hazards of Inhalation: Isobutane is of generally low inhalation toxicity. High concentrations of the gas or vapor in air may cause central nervous system depression. Very high concentrations of isobutane gas or vapor in air may cause suffocation by diluting the concentration of oxygen in air below levels necessary to fully support life. Progressively lower levels of available oxygen and higher levels of isobutane may variably cause dizziness, headache, nausea, errors in judgment, disorientation, fatigue, excitation, incoordination, fatigue, accelerated pulse, gasping, confusion, vomiting, anesthesia, prostration, loss of consciousness, coma, convulsions, and eventually death due to respiratory arrest, possibly in seconds and without warning if oxygen levels suddenly drop too low. Isobutane is also reported to be a weak cardiac sensitizer that may cause abnormal heartbeats (i.e., cardiac arrhythmia and ventricular fibrillation) at anesthetic levels in air. An exposure to 57% by volume in air was required to kill 50% of rats within 15 minutes in laboratory experiments; about 42.7% isobutane in air was lethal to 5%of mice exposed for 2 hours. Specific effects at lower levels depend on the duration of the exposure. There are apparently no ill-effects from breathing a concentration as high as 5% (50,000 ppm) isobutane in air for 2 hours according to various authorities, but it should be noted that even this concentration is well above the LFL of the substance.

Hazards of Ingestion: Due to its low boiling point temperature, ingestion of isobutane is unlikely. If it should occur, frostbite of the lips, mouth, and other contacted tissues may possibly be expected.

FIRE HAZARDS

Lower Flammable Limit: Both 1.8% and 1.9% reported

Upper Lower Flammable Limit: Both 8.4% and 8.5% reported

Behavior in Fire: Liquefied flammable gas. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently and possibly rocket in a fire.

Hazardous Combustion Products: Not well-defined; may include carbon monoxide, carbon dioxide, and possibly other toxic constituents. Some authorities report that acrid smoke and irritating fumes are generated upon thermal decomposition of isobutane. One states that reactive hydrocarbons are generated during combustion.

1969

ISOBUTANE
Class 2.1 (Flammable Gas)

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Containers may rupture violently and possibly rocket in a fire. Explosion may result if vapors or gases are ignited in a confined area. There is potential for explosions involving unconfined vapor clouds.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact with the spilled material and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing that preferably does not accumulate static electricity. Although no specific data are available for isobutane, compatible materials for n-butane are reported to possibly include neoprene, neoprene/styrene-butadiene rubber, nitrite rubber/PVC, polyurethane, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Dizziness, drowsiness, or other symptoms of central nervous system depression or oxygen deficiency; frostbite or freeze burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. Isobutane may be a weak cardiac sensitizer; it may not be prudent to administer epinephrine or other sympathomimetic amines to the victim.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.) Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming if warm water is not available.

First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.)

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or liquid or let fire burn if discharge is appreciable. Use carbon dioxide or dry chemical on small fires in the open involving smaller containers that can be safely extinguished and isolated from other flammables. Use water spray or foam on large fires to cool surroundings.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may rupture violently, suddenly release massive amounts of product and possibly rocket when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Note that contact with water may increase the rate of vapor evolution from any exposed pools of liquid isobutane. Direct application of water on pressure relief devices could potentially cause ice to form, thus preventing proper functioning of the devices.

ISOBUTANE
Class 2.1 (Flammable Gas)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the high volatility and flammable nature of isobutane into account while planning the response. Beware of potentially persistent heavy gas accumulations in low areas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Isobutane discharges may expose downwind areas to flammable concentrations over considerable distances in some cases, particularly if the discharge is large. (Note: Since concentrations of isobutane considered toxic are above the LFL of the material, primary hazards are associated with flammable and potentially explosive gas clouds or plumes.)

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isobutane vapors or fumes in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid isobutane pools with water may increase vapor evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid isobutane.

TECHNIQUE

FOAM . . . There is a possibility that application of firefighting foam to the surface of liquid isobutane pools may slow the release of vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if any increases in vapor evolution may affect downwind populations or operational safety.

ISOBUTANE
Class 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid isobutane may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Any remaining traces of isobutane on the ground will vaporize with time.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as nitrogen or carbon dioxide to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of the product into equipment.

WATER SPILL

Liquid isobutane will boil or rapidly vaporize from the water surface with negligible dissolution in the vast majority of cases.

January 1988

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isobutyl acetate is a colorless liquid with a fruity, mild, sweet ester odor that may be disagreeable at higher concentrations in air. It is used as a solvent and in making perfumes, flavoring agents, pharmaceuticals, and other products. Slightly soluble in water and lighter, isobutyl acetate will float to form a surface slick that slowly dissolves. Its flash point is in the range of 64–70°F, thus indicating that it can be easily ignited under many ambient temperature conditions. At warmer temperatures, vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.3 pounds per gallon.

Isobutyl acetate does not react with water and many other common materials but does soften or dissolve various resins and plastics. It is also reactive with a variety of chemicals and contact with explosives may cause an explosion. The toxicity of the substances is generally considered low to moderate via the various potential routes of exposure. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.63–0.7% at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohols, esters, ether, hydrocarbons, and ketones.
Specific Gravity (Liquid): 0.870–0874 at 68°F (20°C)
Boiling Point: 233.6–246.2°F (112–119°C) at 1 atm.
Melting Point: –146 to –145.5°F (– 98.9 to –98.6°C)
Freezing Point: –142.8 to –146°F (– 97.1 to 98.9°C)
Molecular Weight: 116.2 *Heat of Combustion: – 7220* cal/g
Vapor Pressure: 12.5 mm Hg (0.242 psia) at 68°F (20°C)
Flash Point: 64–70°F (17.8–21.1°C), closed cup; 75–83°F (23.9–28.3°C), open cup.
Autoignition Temperature: 790–800°F (421–427°C)
Burning Rate: Unavailable
Stability: Stable, but heat contributes to instability.
Corrosiveness: Brass, bronze, or lead compounds not acceptable from a color or contamination standpoint. Will attack wide variety of resins and plastics. Carbon steel, 304SS, lined carbon steel or aluminum not attacked.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with nitrates, strong oxidizers, strong acids or alkali, strong reducing agents, explosives, alkaline earth elemental metals, nitrides, azo or diazo compounds, hydrazines, and caustics.

IDENTIFICATION

Shipping Names: Isobutyl acetate (USDOT and IMO)
Synonyms and Tradenames: Acetic acid, isobutyl ester; acetic acid 2-methylpropyl ester; 2-methyl-1-propyl acetate; 2-methylpropyl acetate; beta-methylpropyl ethandate.
Chemical Formula: $CH_3COOCH_2CH(CH_3)_2$
Constituent Components(% each): 95–99% or more pure with small amounts of water and isobutyl alcohol.
49 STCC: 49 092 07
UN/NA Designation: UN1213
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless, clear
Odor Characteristics: Mild, fruity, sweet, characteristic ester; may be disagreeable in higher concentrations.
Common Uses: Solvent for nitrocellulose, thinners, and topcoat lacquers; mfg. of perfumes, pharmaceuticals, and flavoring agents.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 4 ppm, but may be 0.35–0.50 ppm or lower according to some authorities.

Unusual Hazards: Flammable, moderately volatile hydrocarbon. Vapors may be heavier than air and may travel to a source of ignition.

Short Term Exposure Limits (STEL): 187 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 150 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air, as may occur in the immediate vicinity and directly downwind of a spill.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid isobutyl acetate may cause mild to moderate irritation and drying of skin. Contact with the eyes may cause moderate irritation.

Hazards of Inhalation: Vapors are irritating to the nose and respiratory tract. High concentrations in air may be narcotic with symptoms including dizziness, weakness, fatigue, nausea, headache, loss of consciousness and possibly death. In laboratory experiments, rats showed no effects from a 3 hour exposure of 3,000 ppm but died from an exposure of 21,000 ppm.

Hazards of Ingestion: Ingestion may cause gastrointestinal irritation, nausea, vomiting, diarrhea, and symptoms of narcosis. The lethal dose for humans is between 1 pint and 1 quart in single doses.

FIRE HAZARDS

Lower Flammable Limit: 1.27% or 2.4%, reported values vary

Upper Flammable Limit: 7.5% or 10.5%, reported values vary

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire.

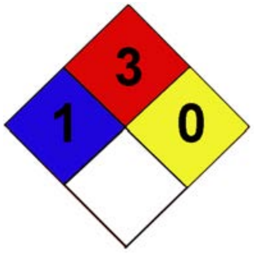
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials are likely to include chlorinated polyethylene, polyurethane, polyvinyl alcohol, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 7500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (7500 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1213

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes and nose or other symptoms of vapor exposure or ingestion. Eye or skin irritation from direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or irritation of skin persists after washing.

First Aid for Ingestion: If victim is conscious, administer two glasses water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Water fog, alcohol foam, dry chemical, carbon dioxide. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of isobutyl acetate may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that isobutyl acetate is a flammable liquid that slowly dissolves in water.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Isobutyl acetate spills may expose downwind areas to toxic or flammable concentrations, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Isobutyl acetate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of isobutyl acetate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isobutyl acetate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of isobutyl acetate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of isobutyl acetate vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Isobutyl acetate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained isobutyl acetate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow. The spilled product may all dissolve in water before the dam is completed.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

ISOBUTYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating isobutyl acetate before it dissolves in water.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with isobutyl acetate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1991

ISOBUTYLENE
Class 2.1 (Flammable Gas)

GENERAL INFORMATION

Isobutylene, which may be also transported in the U.S. with the shipping name "liquefied petroleum gas", or LPG for short, is a colorless and flammable liquefied gas with a boiling point of approximately 19.6 F in the open environment. Its odor as variously been described as mild and sweetish, like gasoline or faint petroleum, and unpleasant like coal gas. Some shipments may be treated with a foul (skunk-like) additive for leakage warning purposes. The product is used for making aviation gasoline, antioxidants, rubber, plastics, and other chemicals.

Isobutylene is practically insoluble in water and lighter. Due to its low boiling point temperature, any spilled liquid will boil or otherwise rapidly vaporize under all but the very coldest environmental conditions. Thus, spills have the potential to generate large amounts of vapor that may be heavier than air, may accumulate and persist in pits, hollows and depressions, and/or may travel a considerable distance to a source of ignition and flash back or even explode. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently and possibly rocket if exposed to fire or exc essive heat for sufficient time duration. The product weighs approximately 5.2 pounds per gallon at its boiling point temperature.

Isobutylene does not react with water or many other common materials. It is not corrosive to common metals but may attack some types of plastic and rubber. It is reported to be incompatible with oxidizing materials that may cause its ignition, however, and may react with varying results with acids, cyanohydrins, halogens, halogenated compounds monomers, molten sulfur, and polymerizable esters. Toxicity of the product is low by all routes of exposure but contact with very cold liquid or gas may result in frostbite or freeze burns. Products of combustion may include toxic constituents.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if isobutylene is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket. If a cylinder is so threatened, evacuate for a radius of one-third (1/3) mile. (Note: The data and information presented below are for relatively pure isobutylene. The properties of isobutylene may be altered if it is shipped or stored as a mixture with other substances.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 263 ppm at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, benzene, ether, and other organic solvents

Specific Gravity (Liquid): Approx 0.626 at 19.4°F (–7°C); 0.59 to 0.60 at 68°F (20°C)

Boiling Point: 19.6°F (–6.9°C) at 1 atm.

Melting Point: –220.6 to –220.5°F (–140.33 to –104.28°C)

Freezing Point: See melting point

Molecular Weight: 56.11

Heat of Combustion: –10,755 cal/g

Vapor Pressure: Approx 2.62–2.65 atm (38.54–39.0 psia) at 70°F (21.1°C)

Flash Point: –112°F (– 80°C), closed cup; –105°F (– 76°C), unspecified method

Autoignition Temperature: 869°F (465°C)

Burning Rate: Not available

Stability: Stable in normal transportation. Polymerization may possibly occur at elevated temperatures and pressures and/or in the presence of a catalyst such as aluminum chloride or boron trifluoride according to some but not all authorities. One isolated reference reports that exposure to air may result in the formation of peroxides. Such reactions, which typically require a prolonged period of exposure to air, are usually considered hazardous if the peroxides formed are shock-sensitive explosives. Whether or not that is the case here is unclear. The possibility is unlikely to pose a significant threat in episodic discharge situations.

Corrosiveness: Not corrosive to common metals; may affect some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react vigorously, ignite, or explode in contact with strong oxidizing agents or materials. Also reported as incompatible with acids, cyanohydrins, halogens, halogenated compounds, monomers, molten sulfur, and polymerizable esters. Similar substances are incompatible with varying results with aldehydes, certain reactive metals, and possibly other substances.

IDENTIFICATION

Shipping Names: Isobutylene (USDOT and IMO); liquefied petroleum gas (USDOT)

Synonyms and Tradenames: 2-Methylpropene; isobutene; gamma-butylene; uns-dimethylethylene

Chemical Formula: $CH_2 (CH_3)_2$

Constituent Components (% each): Shipments of "isobutylene" may be 99% or more pure with the remainder primarily consisting of similar hydrocarbons. It could not be determined whether lower purity grades are commercially. available.

49 STCC: 49 057 48 (isobutylene); 49 057 52 (liquefied petroleum gas)

UN/NA Designation: UN1055 (isobutylene); UN1075 (LPG)

IMO Designation: 2.1, flammable gas

Physical State As Shipped: Liquefied compressed gas

Physical State As Released: Boiling liquid, vaporizing liquid, gas, or mixture or gas and aerosol (small liquid droplets) depending on environmental and release conditions; the boiling point of the product is about 19.6°F.

Color of the Shipped Material: Colorless gas or liquid, but very cold gas may appear white at first due to condensation of water vapor in the atmosphere.

Odor Characteristics: Variously described as mild and sweetish; like gasoline; like faint petroleum odor; and unpleasant like coal gas. One authority reports that some shipments may contain a skunk-like odorant for leakage warning purposes.

Common Uses: Making aviation gasoline, butyl rubber, and antioxidants for foods, packaging materials and food supplements; making plastics, other polymers, and various chemicals.

ISOBUTYLENE
Class 2.1 (Flammable Gas)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Reported values widely differ and include 0.56 ppm, 0.6 ppm, 1.3 ppm, 19.7 ppm, and 2098 ppm for either threshold or recognition levels in air.

Unusual Hazards: Extremely flammable and. volatile heavier than air gas or vapor may travel a considerable distance to a source of ignition and flash back. Vapors and gases may persist in pits, hollows, and depressions. Unconfined as well as confined vapor clouds may explode if ignited. One manufacturer makes the unusual observation that escaping gas may ignite because of friction, which is not implausible if static electricity charges buildup during the venting process. Another reports that drains may become plugged and valves may become inoperable because of the formation of ice during expansion of vapors or vaporization of liquids; this also is plausible.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limits: Unavailable from recognized authority for isobutylene. Both the ACGIH (TLV, 1990–91) and OSHA (PEL, 1989) have adopted a 1000 ppm TWA limit over each 8 hours of a 40 hour work week for LPG. Suppliers recommend exposure limits of 800 to 1000 ppm on the same basis for isobutylene.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff of liquid to sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the very high concentrations of isobutylene gas or vapor that may be present in air at the spill site and directly downwind. Direct contact with the liquid or very cold gas or equipment should also be avoided.

Hazards of Skin or Eye Contact: Contact with very cold liquid isobutylene or concentrated gas streams may cause frostbite or freeze burns. Frostbite may also occur from contact with the surface of a very cold container of the product.

Hazards of Inhalation: Isobutylene is practically nontoxic by inhalation. Nevertheless, it may be mildly irritating to mucous membranes, may act as an anesthetic to some extent, may cause some degree of central nervous system depression, and may cause asphyxiation by diluting the concentration of oxygen in air below levels necessary to fully support life when present in very high concentrations. The effects of progressively higher concentrations of isobutylene in air and resulting lower levels of available oxygen may variously include drowsiness, dizziness, headache, errors in judgment, diminished mental alertness, muscular incoordination, emotional instability, excitation, rapid fatigue, accelerated pulse, gasping, rapid respiration, air hunger, excess salivation, confusion, nausea, vomiting, prostration, loss of consciousness, convulsions, deep coma and death, possibly in seconds and without warning if oxygen levels drop too low. An exposure to about 266,600 ppm for 4 hours was required to kill 50% of rats in laboratory experiments; an exposure to 178,450 ppm for 2 hours was required to obtain the same result in mice. These levels are far above the 18,000 ppm lower flammable limit of the substance. It has been reported by a maker of the product that isobutylene may be a cardiac sensitizer.

Hazards of Ingestion: Due to its low boiling point temperature, ingestion of isobutylene is unlikely. If it should occur, frostbite of the lips, mouth, and other contacted tissues may be expected.

FIRE HAZARDS

Lower Flammable Limit: 1.8%

Upper Flammable Limit: Numerous references report 9.6%; two respected authorities, however, provide an upper limit of 8.8%.

Behavior in Fire: Liquefied flammable gas. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel a a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire and possibly rocket.

Hazardous Combustion Products: Not well-defined; include carbon monoxide and carbon dioxide and possibly other toxic constituents. One authority reports that acrid smoke and fumes are generated upon thermal decomposition of isobutylene.

1055

ISOBUTYLENE

Class 2.1 (Flammable Gas)

See UN/NA Designation for
other ID numbers.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently and possibly rocket in fire. Explosion may result if vapors or gases are ignited in a confined area. There is known potential for explosions involving unconfined vapor clouds.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact with the spilled material and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Dizziness, drowsiness, or other symptoms of central nervous system depression, narcosis, or oxygen deficiency; frostbite or freeze burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. There is a possibility that isobutylene may be a cardiac sensitizer; it may not be prudent to administer epinephrine to the victim.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.)

First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.)

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or liquid or let fire burn if discharge is appreciable. Use carbon dioxide or dry chemical on small fires in the open involving smaller containers that can be safely extinguished and isolated from other flammables. Use water spray or foam on large fires to cool surroundings.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may rupture violently, suddenly release massive amounts of product, and possibly rocket when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Note that contact with water may increase vapor evolution from any pools of liquid isobutylene.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the high volatility and extremely flammable nature of isobutylene into account while planning the response. Beware of possible heavy gas accumulations in low areas.

ISOBUTYLENE
Class 2.1 (Flammable Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Isobutylene discharges may expose downwind areas to flammable concentrations over considerable distances in some cases, particularly if the discharge is large. Distances associated with toxic concentrations are likely to be shorter for this particular material.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isobutylene vapors or fumes in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid isobutylene pools with water may increase vapor evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid isobutylene.

TECHNIQUE

FOAM . . . There is a possibility that application of firefighting foam to the surface of liquid isobutylene pools may slow the release of vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations or operational safety.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid isobutylene may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Any remaining traces of isobutylene on the ground will vaporize with time.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as nitrogen or carbon dioxide to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of the product into equipment.

WATER SPILL

Liquid isobutylene will boil or rapidly vaporize from the water surface with negligible dissolution in the vast majority of cases.

January 1995

ISOBUTYRALDEHYDE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isobutyraldehyde is a colorless liquid with a pungent and sweet odor that may range from pleasant to unpleasant. It is used as a solvent and for making flavors, gas additives, perfumes, brake fluids, plasticizers, and other chemicals and products. It is 6% soluble in water by weight at 77°F and lighter, so may be expected to form a floating surface slick that dissolves fairly rapdily. Its flash point below 0°F indicates that it is easily ignited under most ambient temperature conditions. Its vapor pressure indicates it is a fairly volatile substance that will evaporate at a substantial rate. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.6 pounds per gallon.

Isobutyraldehyde does not react with water or many other common materials and is relatively unstable in normal transportation, being readily oxidized in air to form isobutyric acid. Reactions with non-oxidizing mineral acids or organic acids may initiate violent self-polymerization, and the substance is reactive with a wide variety of other chemicals. It is corrosive to mild steel, and although not of high toxicity, is a strong irritant that may be present in the air in high concentrations. Products of combustion are acrid and may include toxic constituents.

If isobutraldehyde is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 11 g/100 g water at 68°F (20°C); 6.0%W at 77°F (25°C).

Solubility in Other Chemicals: Soluble in acetone, benzene, carbon disulfide, chloroform, ether, ethyl alcohol, and toluene.

Specific Gravity (Liquid): 0.787-0.794 at 68°F (20°C)

Boiling Point: 140.2-149°F (60.1-65°C) at 1 atm.

Melting Point: – 86.6 to – 85°F (– 65.9 to – 65°C)

FreezingPoint: – 86.8°F (– 66°C) or – 112°F (–80°C)

Molecular Weight: 72.11

Heat of Combustion:– 7693 cal/g

Vapor Pressure: 130 mm Hg (2.51 psia) at 68°F (20°C)

Flash Point: – 40 to – 1°F (– 40 to – 1°C), closed cup; –13 to 2°F (– 25 to – 17°C), open cup

Autoignition Temperature: min. 385°F (196°C) max. 490°F (254°C); reported values vary.

Burning Rate: 4.8 mm minute

Stability: Readily oxidizes in air to form isobutyric acid. May polymerize under conditions described above.

Corrosiveness: Attacks mild steel. Tanks should be of aluminum, stainless steel, or glass-lined with blanket of inert gas.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with acids, strong oxidizers, strong reducing agents, dithiocarbamates, alkali and alkaline earth elemental metals, nitrides, possibly epoxides, strong bases, amines, azo and diazo compounds, hydrazines, caustics, organic nitro compounds, peroxides, inorganic sulfides, and unsaturated aliphatic hydrocarbons.

IDENTIFICATION

Shipping Names: Isobutyraldehyde (USDOT and IMO);

Synonyms and Tradenames: Isobutylaldehyde; isobutanal; isobutyric aldehyde; 3-methylpropanal; 2-methyl-1-propanal; alpha-or 2-methylpropionaldehyde; valine aldehyde; isobutanal; isopropyl formaldehyde; 2-methyl propenal.

Chemical Formula: $(CH_3)_2CHCHO$

Constituent Components(% each): 96% or more pure with water, propionaldehyde, butyraldehyde, isobutyl alcohol, and butyl alcohol.

UN/NA Designation: UN2045

IMO Designation: 3.1, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Transparent, colorless

Odor Characteristics: Pungent; pleasant to unpleasant sweet ester.

Common Uses: Solvent; mfg. of rubber antioxidants and accelerators, gas additives, perfumes, plasticizers, brake fluid, resins, flavors, and a variety of other chemicals

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ISOBUTRALDEHYDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Detectable at 0.047-0.336 ppm

Unusual Hazards: Highly flammable volatile liquid with heavier than air and irritating vapors. Product may polymerize violently if contaminated by non-oxidizing mineral acids or organic acids. Fires are easily reignited.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is posed by potentially high vapor concentrations in air, yet ingestion and direct physical contact should also be avoided.

Hazards of Skin or Eye Contact: Contact with liquid isobutyraldehyde may cause mild to severe skin irriation or burns depending upon the extent and duration of exposure. Contact with the eyes may result in severe irritation or burns.

Hazards of Inhalation: Vapors of isobutyraldehye are strongly irritating to the eyes, mucous membranes, and respiratory tract and may cause difficult breathing, coughing, drowsiness, headache and other symptoms. Saturated concentrations in air are fatal to laboratory rats in exposures greater than 15 minutes, yet 1000 ppm can be tolerated repeatedly in 6 hour exposures without fatality.

Hazards of Ingestion: Isobutyraldehyde is a strong irritant and of moderate toxicity in acute oral doses.

FIRE HAZARDS

Lower Flammable Limit: 1.6-2%

Upper Flammable Limit: 10-10.6%

Behavior in Fire: Flammable liquid. May generate quantities of flammable vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Fires are easily reignited.

Hazardous Combustion Products: Acrid fumes and smoke; may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: 1.6-2%

Upper Explosive Limit: 10-10.6%

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Violent polymerization may occur in in presence of non-oxidizing mineral acids or organic acids.

PROTECTIVE CLOTHING AND EQUIPMENT

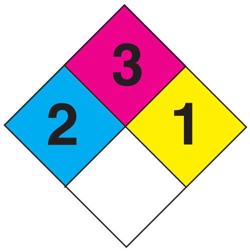
Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic mounted canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

2045

ISOBUTRALDEHYDE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, skin, mucous membrane, or respiratory tract. Other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Get medical attention immediately. (Note: First aid procedures for ingestion are not well documented. Consult a physician as soon as possible.)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water spray. Water may be ineffective except for dilution purposes.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that isobutyraldehyde is highly flammable and evaporates at an appreciable rate. Note that violent polymerization may occur under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Isobutyraldehyde spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ISOBUTRALDEHYDE

Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isobutyraldehyde vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of isobutyraldehyde from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of isobutyraldehyde vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid isobutyraldehyde may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Isobutyraldehyde may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained isobutyraldehyde may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ISOBUTRALDEHYDE

Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances. One manufacturer warns that combustible sorbents should be immersed in water or placed in closed metal containers without delay to prevent spontaneous combustion.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ISOBUTRALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2003

ISOOCTYL ALCOHOL

Combustible Liquid

GENERAL INFORMATION

Isooctyl alcohol is a clear, colorless liquid having a characteristic odor that is recognizable at 0.138 ppm. It consists of a mixture of closely related isomeric primary alcohols with branched chains having the general formula R-CH_2OH. It is used in conjunction with other chemicals for use as plasticizers. It is also used as a raw material for surfactants, as an antifoaming agent, emulsifier, solvent and used in the production of lacquers, enamels, cellulose nitrate, varnishes, ceramics, paper coatings, rubber, latex and textiles. It is combustible, having a flash point of 180°F, and is reactive with strong oxidizers, inorganic acids, aldehydes, alkylene oxides, halogens and acid anhydrides. It is practically insoluble in water but is soluble in other alcohols, ether, acetone and benzene. It is expected to float on water (as it is lighter than water and only negligibly soluble). The product weighs approximately 6.9 pounds per gallon.

Isooctyl alcohol is stable and will not polymerize. Although there are no signs or symptoms of acute or chronic exposure reported in humans, symptoms of exposure may include central nervous system deppression and irritation of the skin, eyes and membranes. Fumes and vapors are heavier than air, may form explosive mixtures with air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of isooctyl alcohol is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.064 g/100 mL at 77°F (25°C)

Solubility in Other Chemicals: Soluble in other alcohols, ether, acetone and benzene

Specific Gravity (Liquid): 0.83

Vapor Density: 4.5

Boiling Point: 181-196°F (83-91°C)

Melting Point: -105°F (-76°C)

Freezing Point: See melting point

Molecular Weight: 130.3

Heat of Combustion: Unavailable

Evaporation Rate (butyl acetate=1): <1 (reported by one source only)

Vapor Pressure: 0.4 mm Hg at 68°F (20°C)

Flash Point:180°F (82°C) open cup

Autoignition Temperature: 531°F (277°C)

Burning Rate: Unavailable

Flammable Limits: 0.9% (LFL) - 5.7% (UFL)

Stability: Stable

Polymerization Potential: Will not occur

pH: Unavailable

Reactivity with Water: None

Reactivity and Incompatibility: Isooctyl alcohol is incompatible with strong oxidizers (such as perchlorates, permanganates, chlorates, nitrates, and peroxides), inorganic acids, aldehydes, alkylene oxides, halogens and acid anhydrides.

IDENTIFICATION

Shipping Name(s): Alcohols, n.o.s. (Isooctyl alcohol) (USDOT & IMO) or Combustible liquid, n.o.s. (Isooctyl alcohol) (USDOT only)

Synonyms and Tradenames: 6-Methyl-1-heptanol; Isooctanol

CAS Registry No.: 26952-21-6

Chemical Formula: $C_7H_{15}CH_2OH$

Constituent Components (% each): 97% to 100% pure

UN/NA Designation: UN1987 (Alcohols, n.o.s.); NA1993 (Combustible liquid, n.o.s.)

IMO Designation: Not regulated

RTECS Number: NS7700000

NFPA 704 Hazard Rating: 0 (Health): 2 (Flammability): 0 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless liquid

Odor Characteristics: Characteristic odor

Common Uses: Used to form phthalate, maleate, adipate and sebacate esters with the corresponding acids for use as plasticizers. Used as a raw material for surfactants and as an antifoaming agent, emulsifier and solvent. Used in the production of lacquers, enamels, cellulose nitrate, varnishes, ceramics, paper coatings, rubber, latex and textiles.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

*Also 1993

ISOOCTYL ALCOHOL

Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.138 ppm

Unusual Hazards: Fumes and vapors are heavier than air. Vapors may form explosive mixtures with air. Vapors may travel to a distant source of ignition and flash back.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 50 ppm (NIOSH)

Ceiling (C) Limit: Unavailable

IDLH: Not determined

Conditions to Avoid: Avoid heat, flames, sparks and other sources of ignition. Containers may rupture or explode if exposed to heat. Keep out of water supplies and sewers. Avoid inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: May cause skin or eye irritation and possibly central nervous system effects.

Hazards of Skin or Eye Contact: Causes skin and eye irritation. Prolonged contact with the skin may lead to absorption of toxic amounts of product.

Hazards of Inhalation: No signs or symptoms of exposure exist for humans, but expected to be irritating to respiratory tract.

Hazards of Ingestion: No signs or symptoms of exposure exist for humans, but caused central nervous depression in laboratory animals.

FIRE HAZARDS

Lower Flammable Limit: 0.9%

Upper Flammable Limit: 5.7%

Behavior in Fire: Combustible liquid. Vapors are heavier than air, may collect in low areas and may travel to a distant source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Combustion may form carbon dioxide and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Butyl rubber, neoprene, polyvinyl alcohol and Viton® are reported to have a greater than 8 hour breakthrough time. Natural rubber is reported to have a less than one hour breakthrough time and is therefore not recommended as it may degrade.

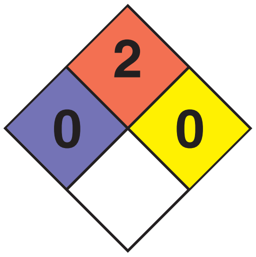
Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1987 *

*Also 1993

ISOOCTYL ALCOHOL

Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if irritation develops or persists. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Seek medical advice on whether or not to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, foam, water spray or carbon dioxide. For large spills use an alcohol type foam concentrate extinguishing agent.

Extinguishing Techniques: Fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Do not use a solid stream of water, since the stream may scatter and spread the fire. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: Isooctyl alcohol is a flammable liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance as needed. Do not use combustible materials, such as sawdust.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited to spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

ISOOCTYL ALCOHOL

Combustible Liquid

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Isooctyl alcohol may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ISOOCTYL ALCOHOL

Combustible Liquid

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ISOOCTYL ALCOHOL

Combustible Liquid

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Sorbent pads or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating product.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Sorbent pads, peat or commercial sorbent materials compatible with product may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

January 1988

ISOPRENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isoprene is a colorless liquid with a mild, aromatic, petroleum-like odor. It is used for making various plastics, rubbers, and other chemicals. The substance is practically insoluble in water and lighter so may be expected to form a floating surface slick. Its flash point of –65°F indicates that it can easily be ignited under all ambient temperature conditions. Its boiling point of 93.4°F indicates that it will boil at high ambient temperatures and will otherwise evaporate rapidly. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, or depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 5.7 pounds per gallon.

Isoprene does not react with water or many other common materials and is considered stable in normal transportation. Although shipped with an inhibitor, excessive heat as in a fire situation may cause self-polymerization resulting in violent rupture of the container. Self-polymerization may also be initiated by rusty iron, acids, azo and diazo compounds, hydrazines, caustics, cyanides, alkali and alkaline earth metals, nitrides, peroxides, phenols, cresols, and inorganic sulfides. Explosions are also possible in the presence of certain metallic elements or alloys. Although toxicity by all routes can be considered low to moderate, the high volatility of isoprene indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

Downwind evacuation should be considered if the product is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble

Solubility in Other Chemicals: Soluble in acetone, alcohol, and ether.

Specific Gravity (Liquid): 0.681 at 68°F (20°C)

Boiling Point: 93.4°F (34.1°C)

Melting Point: –230.8 to –230.0°F (–146 to –146.7°C)

Freezing Point: –230.7°F (–145.9°C)

Molecular Weight: 68.1

Heat of Combustion: –10471 cal/g

Vapor Pressure: 400 mm Hg (7.73 psia) at 59.7°F (15.4°C)

Flash Point: –65°F (–54°C), closed cup

Autoignition Temperature: min. 743°F (395°C); max. 802°F (427°C); reported values vary.

Burning Rate: 8.6 mm/minute

Stability: Stable in normal transportation, but may polymerize under conditions described above.

Corrosiveness: Not available

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reactive with acids, azo and diazo compounds, hydrazines, caustics, cyanides, alkali and alkaline earth metals, certain other metals, nitrides, peroxides, phenols, cresols, inorganic sulfides, dithiocarbamates, explosives, and aldehydes.

IDENTIFICATION

Shipping Names: Isoprene (USDOT and IMO); isoprene, inhibited (IMO)

Synonyms and Tradenames: 2-Methyl-1,3-butadiene; beta-methylbivinyl; 2-methylbutadiene; hemiterpene; 3-methyl-1,3-butadiene; isopentadiene.

Chemical Formula: $CH_2{=}C(CH_3)CH{=}CH_2$

Constituent Components (% each): 99.8% or more pure with small amount of inhibitor in interstate transportation.

49 SPCC: 49 072 30

UN/NA Designation: UN1218

IMO Designation: 3.1, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid; boils at 93.4°F

Color of the Shipped Material: Colorless

Odor Characteristics: Mild, aromatic, like petroleum

Common Uses: Mfg. plastic, rubber, other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ISOPRENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 0.005–3.5 ppm; reported values vary.

Unusual Hazards: Highly volatile, flammable liquid with heavier than air vapors. May boil at high ambient temperatures. Excessive heat or chemical contamination may initiate violent self-polymerization in containers.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, sparks and open flame; incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of potentially high vapor concentrations in air.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with liquid isoprene may cause irritation. Contact with the eyes may cause irritation like gasoline.

Hazards of Inhalation: Vapors of isoprene are irritating to the eyes and upper respiratory tract. High concentrations in air are narcotic and may cause headache, dizziness, nausea, incoordination, loss of consciousness, and possibly death. Very high levels may cause asphyxiation. In mice, a concentration of 5% has been fatal, 2% has caused bronchial irritation.

Hazards of Ingestion: Isoprene is considered moderately toxic by ingestion.

FIRE HAZARDS

Lower Flammable Limit: 1.5–2.0%

Upper Flammable Limit: 8.9–9.0%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat or light may cause spontaneous violent polymerization resulting in container rupture. Polymerization may also occur in the presence of numerous chemicals (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or respiratory tract. Symptoms of excessive vapor inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if irritation persists after washing skin.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

1218

ISOPRENE
Class 3 (Flammable Liquid)

FIRE RESPONSE

Extinguishing Materials: Foam, dry chemical, carbon dioxide, water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of isoprene may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Take into account while planning the response that isoprene is a highly volatile and flammable liquid. It may polymerize violently under conditions described in the General Information section. Heavy vapors may persist in low areas for a time.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Isoprene spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isoprene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff' may contain a small amount (if any) of isoprene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of isoprene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

ISOPRENE
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Isoprene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained isoprene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ISOPRENE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating isoprene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

ISOPRENE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with isoprene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

ISOPROPANOL
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isopropanol, also known as isopropyl alcohol, is a fairly volatile colorless liquid with a sharp musty odor like rubbing alcohol. It is used in making cosmetics, skin and hair preparations, pharmaceuticals, perfumes, lacquer formulations, dye solutions, antifreezes, rubbing alcohols, soaps, window cleaners and other chemicals and products. The substance is fully soluble in water and will mix freely. Its flash point of 53°F indicates that it may be easily ignited under a wide range of ambient temperature conditions. At warmer temperatures, vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.5 pounds per gallon.

Isopropanol does not react with water or many other common materials and is stable in normal transportation. It is a relatively noncorrosive substance, but may attack some forms of plastics, rubber and coatings, may react with metallic aluminum at high temperatures, and is incompatible with oxidizing materials. Toxicity via the various routes of exposure is comparatively low to moderate, but high concentrations may be present in air in the immediate spill vicinity. Products of combustion may include toxic constituents. Downwind evacuation should be considered on a case by case basis if isopropanol is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.
Solubility in Other Chemicals: Soluble in acetone, alcohols, benzene, and ether.
Specific Gravity (Liquid): 0.785 at 68°F (20°C)
Boiling Point: 180.1°F (82.3°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –127.3°F (–88.5°C)
Molecular Weight: 60.10
Heat of Combustion: –7201 cal/g
Vapor Pressure: 33 mm Hg (0.638 psia) at 68°F (20°C)
Flash Point: 53°F (11.7°C), closed cup; 65°F (18.3°C), open cup.
Autoignition Temperature: 750°F (398.9°C)
Burning Rate: 2.3 mm/minute
Stability: Stable
Corrosiveness: Relatively noncorrosive, but may react with metallic aluminum at high temperatures. May attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizers and with aluminum at high temperatures.

IDENTIFICATION

Shipping Names: Isopropanol (USDOT and IMO); isopropyl alcohol (USDOT and IMO).
Synonyms and Tradenames: 2-Propanol; isopropyl alcohol; dimethylcarbinol; sec-propyl alcohol; rubbing alcohol; 1-methylethyl alcohol; IPA; numerous tradenames.
Chemical Formula: $CH_3CH(OH)CH_3$
Constituent Components(% each): 91–100% pure
49 SPCC: 49 092 05
UN/NA Designation: UN1219
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sharp, musty, like rubbing alcohol
Common Uses: Mfg. of liniments, skin and hair preparations, cosmetics, pharmaceuticals, perfumes, lacquer formulations, dye solutions, antifreezes, rubbing alcohols, soaps, window cleaners, other chemicals; preservative; solvent.

ISOPROPANOL
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor: Concentration: 40–45 ppm
Unusual Hazards: Fairly volatile flammable liquid.
Short Term Exposure Limits (STEL): 500 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 400 ppm over each 8 hours of a 40 hour work Average (TLV-TWA):
Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from prolonged exposure to high vapor concentrations in air as may occur in the spill area and immediately downwind, but ingestion and physical contact should also be avoided.
Hazards of Skin or Eye Contact: Prolonged or repeated contact with liquid isopropanol may result in drying and cracking of the skin due to the defatting action of the product, and some amount may be absorbed through the skin. Contact with the eyes may cause discomfort, irritation, and stinging, but only transitory injury in most cases.
Hazards of Inhalation: Isopropanol vapors may cause mild irritation of the eyes, nose, and throat. High concentrations in air may cause narcosis with symptoms including headache, drowsiness, incoordination, and possibly coma. Humans are uncomfortable at 800 ppm in air. A level of 3000 ppm causes narcosis in laboratory mice.
Hazards of Ingestion: Ingestion of sufficient amounts may cause nausea, vomiting, headache, stomach pain, diarrhea, drowsiness, unconsciousness, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 2.3%
Upper Flammable Limit: 12.7%
Behavior in Fire: Flammable liquid. May generate quantities of flammable vapor upon release. Vapors may travel to a source of ignition and flash back. There is some limited potential that containers may rupture violently in fire.
Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

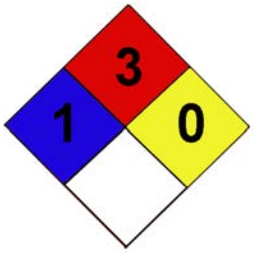
Lower Explosive Limit: 2.5%
Upper Explosive Limit: 12.7%
Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, nitrile rubber, polyethylene, chlorinated polyethylene, polyvinyl chloride, and Viton.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 20,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with front or back mounted organic vapor canister (20,000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1,000 ppm or less) within the use limitations of these devices.

1219

ISOPROPANOL
Class 3 (Flammable Liquid)



FIRST AID

Nonspeciric symptoms: Irritation of the eyes or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if there is skin irritation.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that isopropanol is a fairly volatile flammable liquid.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Isopropanol spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ISOPROPANOL
Class 3 (Flammable Liquid)

TECHNIQUE

MONITOR THE SITUATION . . . Isopropanol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled or in cold weather.

CONSEQUENCE

Hazardous levels of isopropanol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to isopropanol vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of isopropanol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of isopropanol vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid isopropanol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Isopropanol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained isopropanol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ISOPROPANOL

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ISOPROPANOL

Class 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques. (Note: Activated carbon may be ineffective.)

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1997

ISOPROPENYLBENZENE

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Isopropenylbenzene is a colorless liquid with a characteristic sharp, aromatic odor used as a chemical intermediate. It is reported to be over 95% pure. It is virtually insoluble in water, but is soluble in benzene, diethyl ether, chloroform, ethanol, acetone, carbon tetrachloride and is miscible in alcohol and ether. It is generally stable although it can form peroxides, and contact should be avoided with strong oxidizing agents, strong mineral acids, peroxides, halogens, sulfuric acid , mercury, copper, alkaline pesticides, oleum, aluminum iron chloride, and catalysts for vinyl or ionic polymers. Corrosion of ferrous metals and mild steel can occur in the presence of moisture.

Isopropenylbenzene is irritating to the eyes and skin. It can cause stinging, tearing, redness and swelling to the eyes. Pre-existing skin conditions can be aggravated and exposure can cause dryness, redness, burning and cracking. Inhalation can cause irritation to the respiratory tract and CNS depression. Ingestion can cause irritation of the gastrointestinal tract including nausea, vomiting and diarrhea. Primary routes of entry are skin contact and inhalation.

Isopropenylbenzene is classified as a flammable liquid by US DOT and IMO, however when transported in bulk it can be classified as a combustible liquid. It has a relatively high flash point but it can form explosive mixtures with air at or above 38°C (100.4°F). Vapors are heavier than air, may travel along the ground forming explosive mixtures with air to distant sources of ignition and flash back. Decomposition of this product yields carbon dioxide, carbon monoxide, and hydrocarbons. Some products of decomposition may be corrosive. Complete combustion yields carbon dioxide and water. Runoff from fire control may be toxic and/or flammable and cause environmental damage.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble (<1 mg/m^3 at 22°C(71.6°F))
Solubility in Other Chemicals: Soluble in benzene, diethyl ether, chloroform, ethanol, acetone, carbon tetrachloride. Miscible in alcohol and ether.
Specific Gravity (Water=1): 0.9062 - 0. 920
Vapor Density (Air=1): 4.08
Boiling Point: 165.4°C (329.7°F)
Melting Point: -23.2°C (-9.8°F)
Molecular Weight: 118.19
Heat of Combustion: -5041.2 to -5093.2 kJ/mol.
Evaporation Rate: Unavailable
Vapor Pressure: 4.88 kPa at 75°C (167°F); 13.5 pKa at 100°C (212°F); 32.1 pKa at 125°C (257°F)
Flash Point: 38°C (100.4°F) to 54°C (129.2°F); 83.9°C (183°F) closed cup, also reported.
Autoignition Temperature: 574°C (1065.2°F)
Burning Rate: Unavailable
Flammable Limits: .7% - 1.9% (LEL) - 6.1% (UEL)
Stability: Stable, able to form peroxides.
Polymerization Potential: Can occur, avoid exposure to excessive heat, peroxides, and polymerization catalysts.
pH: 7.0
Corrosiveness: May corrode ferrous metals and mild steel in the presence of moisture.
Reactivity and Incompatibility: Strong oxidizing agents, strong mineral acids, peroxides, halogens, sulphuric acid, mercury, copper, alkaline pesticides, oleum, aluminum iron chloride and catalysts for vinyl or ionic polymers.

IDENTIFICATION

Shipping Name(s): Isopropenylbenzene (USDOT & IMO)
Synonyms and Tradenames: AMS; (1-Methylethene) benzene; 1-Methyl-1-phenylethene; alpha-Methyl styrene; Methyl phenylethene; 2-Phenylpropene; beta-Phenylpropene; 2-Phenylpropylene; beta-Phenylpropylene
CAS Registry No: 98-83-9
Chemical Formula: $C_6H_5CCH_3{=}CH_2$
Constituent Components (% each): Greater than 95% pure.
UN/NA Designation: UN2303
IMO Designation: 3.3
RTECS Number: WL5250000
NFPA 704 Hazard Rating: 1 (Health): 2 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid.
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Characteristic sharp, aromatic odor
Reportable Quantity: See appendix I
Common Uses: Chemical intermediate.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ISOPROPENYLBENZENE

Class 3 (Flammable Liquid) or
Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: .052 ppm (detection); .16 ppm (recognition)

Unusual Hazards: Material is irritating to the skin, eyes, respiratory tract and gastrointestinal tract. Repeated exposure to skin can cause dermatitis. Repeated exposure to vapors or mist generated at high temperatures may cause loss of coordination and central nervous system depression.

Short Term Exposure Limit (STEL): 100 ppm

Time Weighted Average (TLV-TWA): 50 ppm

Ceiling (C) Limit: Unavailable

IDLH: 700 ppm

Conditions to Avoid: Avoid contact with incompatible materials such as strong oxidizing agents, strong acids, peroxides, halogens, sulfuric acid, mercury, copper, alkaline pesticides and oleum. Keep away from heat, sparks, and open flames. May corrode ferrous metals and mild steel in presence of moisture.

HEALTH HAZARDS

Potential Health Hazards: Primary routes of entry are skin contact and inhalation. Pre-existing conditions of the skin and respiratory tract can be aggravated. Symptoms of exposure include skin, eye, respiratory and gastrointestinal irritation.

Hazards of Skin or Eye Contact: Exposure of material to eyes can cause irritation including stinging, tearing, redness and swelling. Exposure to skin can cause irritation including dryness, redness, burning and cracking. Pre-existing skin conditions may be aggravated.

Hazards of Inhalation: Exposure to vapor or mist can cause irritation to the nose, throat and respiratory tract. Symptoms may include central nervous system depression, dizziness, drowsiness, weakness, fatigue, nausea, headache, unconsciousness and even death. Pre-existing conditions such as asthma may be aggravated.

Hazards of Ingestion: Ingestion of this material in low dose has a low toxicity but in larger doses is harmful. Symptoms may include gastrointestinal irritation including nausea, vomiting and diarrhea.

FIRE HAZARDS

Lower Flammable Limit: .7 - 1.9 %

Upper Flammable Limit: 6.1%

Behavior in Fire: Isopropylbenzene is a flammable liquid with a fire potential. It will readily ignite and burn if exposed to sources of ignition, heat and flame. It has a relatively low vapor pressure at ambient temperatures, but if heated it can produce sufficient vapors which are heavier than air, can travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may be invisible and may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Runoff from fire control or dilution water may be flammable and/or toxic and cause environmental damage.

Hazardous Decomposition Products: Carbon dioxide, carbon monoxide, and various hydrocarbons. Decomposition products may be corrosive.

Hazardous Combustion Products: Complete combustion yields water and carbon dioxide.

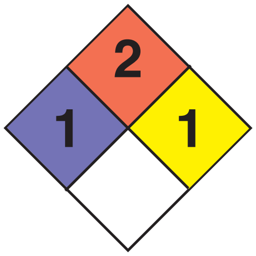
EXPLOSION HAZARDS

Explosive Potential: Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas where vapors can accumulate, since it may present a vapor explosion hazard. Containers exposed to prolonged heat and flame may violently rupture.

2303

ISOPROPENYLBENZENE

Class 3 (Flammable Liquid) or Combustible Liquid



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks <u>with no fire</u>. Suitable materials of construction are Viton® (longer than 8 hours). Butyl rubber, natural rubber, neoprene, nitril rubber and polyvinylalcohol have less than 1 hour resistance to breakthrough and are not recommended for use. Structural firefighting protective clothing will provide only a limited level of chemical personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited

FIRST AID

Nonspecific Symptoms: Primary exposure is from the skin and inhalation. Symptoms include irritation to the eyes, skin, respiratory tract and gastrointestinal tract.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, wash with copious amounts of soap and water for 15 minutes. Remove contaminated clothing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, do not induce vomiting without advice from a physician. This material is an aspiration hazard. If patient is drowsy or unconscious, place patient on left side with the head down. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Alcohol, carbon dioxide, dry chemical, foam, or water spray (fog).

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Do not extinguish fire unless source of leak can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

ISOPROPENYLBENZENE

Class 3 (Flammable Liquid) or Combustible Liquid

SPILL RESPONSES

General Information: Isopropylbenzene is a flammable liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Due to its high boiling point and low vapor pressure at ambient temperatures, isopropenylbenzene is not expected to release much vapor beyond the immediate spill area. However, continuous air monitoring of the immediate area and downwind should be conducted for the presence and/or spread of any hazardous concentrations of flammable and/or toxic vapors especially if the material is involved in a fire or a large spill is involved. The evacuation zone should be expanded as conditions warrant.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind if there is a large spill or the material is involved in a fire.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used effectively to control the production of vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated runoff and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, storm drains and water ways.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents may be applied to the surface of liquid pools to reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, dry dolomite, dry vermiculite or other similar nonporous noncombustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor the situation for the presence of flammable vapor.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

ISOPROPENYLBENZENE

Class 3 (Flammable Liquid) or Combustible Liquid

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . If released into water sources, isopropenylbenzene is expected to float on the surface. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION . . . Material is not water soluble and lighter than water. Overflow dams may be used to confine or divert the spill to a limited area.

CONSEQUENCE

Some material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of any vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Booms may be an effective means to recover spilled material since the material is not water soluble and will float on the surface of the water. Barriers of suitable material may be used to confine the spill to a limited area to prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Continually monitor the integrity of the boom/barriers.

TECHNIQUE

SURFACE SKIMMING . . . Surface skimming may be effective since the material is not water soluble and is lighter than water.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Continually monitor the integrity of the boom/barriers.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat or commercial sorbent materials compatible with isopropenylbenzene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Continually monitor for flammable vapors and eliminate ignition sources.

August 1996

ISOPROPYL ACETATE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isopropyl Acetate is a colorless flammable liquid with a fruity odor used as a solvent for cellulose derivatives, plastics, oils, and fats. It is also used as a solvent for coatings, printing inks, gums and resins, and as a synthetic flavoring ingredient. Isopropyl Acetate is produced from the reaction of propylene and anhydrous acetic acid in the presence of a catalyst. It may also be produced from reacting isopropyl alcohol with acetic acid in the presence of catalysts acid. Isopropyl Acetate vapors and liquid are irritating to the eyes, skin, nose, throat and respiratory tract. The most common routes of exposure are through inhalation and skin contact. It may be poisonous if inhaled or absorbed through the skin for prolonged periods.

The fire potential for isopropyl acetate is high. Vapors may be ignited by heat, sparks, flame, static electricity and other ignition sources in the immediate area and downwind of the release. The material may form explosive mixtures with air. When heated to decomposition, hazardous by-products may include carbon monoxide. Vapors are heavier than air and may settle in low lying areas. Vapors may travel considerable distances to an ignition source and flash back. Normal structural firefighting protective clothing will provide only a limited level of personal protection for working in atmospheres where isopropyl acetate is present. Runoff may be flammable and/or toxic. Isopropyl Acetate is slightly water soluble and floats on the surface of water. This material is incompatible with strong oxidizers. Empty containers containing product residue may be hazardous and proper safety precautions should be followed.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly (3%)
Solubility in Other Chemicals: Acetone, alcohol, ether and most common organic solvents.
Specific Gravity (Liquid): 0.9
Vapor Density (Air=1): 3.5
Boiling Point: 90°C (194°F)
Melting Point: -73°C (-100°F)
Freezing Point: -69°C (-92°F)
Molecular Weight: 102.13
Heat of Combustion: -9,420 BTU/LB. (-5,230 CAL/G.)
Evaporation Rate: Unavailable.
Vapor Pressure: 47 mm Hg at 20°C (68°F)
Flash Point: 2°C (35°F)
Autoignition Temperature: 460°C (860°F)
Flammable Limits: 1.8% (LEL) - 8.0% (UEL)
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with strong oxidizing agents such as hydrogen peroxide, nitric acid, and perchloric acid.
Other Characteristics: Decomposes with heat and produces carbon monoxide.

IDENTIFICATION

Shipping Name(s): Isopropyl Acetate (USDOT & IMO)
Synonyms and Tradenames: 2-Acetooxypropane, 2-Propyl Acetate, 1-Methylethyl Ester, Isopropyl Ester, 2-Propyl Ethanoate, and Paracetat. CAS Registry No: 108-21-4
Chemical Formula: $(CH_3)_2CHOOCCH_3$
Molecular Formula: $C_5H_{10}O_2$
UN/NA Designation: UN1220
IMO Designation: 3.2
RTECS Number: NIOSH/AI4930000
OHMTADS Number: 7216768
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear/colorless
Odor Characteristics: Fruity odor.
Common Uses: Product is used as a solvent for cellulose derivatives, plastics, oils, and fats, coatings, printing inks, gums and resins, and as a synthetic flavoring ingredient.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ISOPROPYL ACETATE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.05 ppm

Unusual Hazards: Exposure to the vapors and liquid may cause severe eye injury requiring several days to heal.

Time Weighted Average (TLV-TWA): 250 ppm

Short Term Exposure Limit (STEL): 310 ppm

IDLH: 16,000 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong oxidizers.

HEALTH HAZARDS

Potential Health Effects: Isopropyl Acetate is irritating to the eyes, skin, nose, throat and upper respiratory tract. It is slightly irritating to mucous membranes and may be poisonous if inhaled or absorbed through the skin. Inhalation can cause chest discomfort, coughing, headache, weakness, drowsiness and unconsciousness. Ingestion may cause headache, nausea, abdominal cramps, and vomiting.

Hazards of Skin Contact: Isopropyl Acetate may be absorbed through the skin in toxic amounts. Skin contact may cause defatting and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, tearing, conjunctivitis, or permanent eye injury requiring several days to heal.

Inhalation Hazards: Inhalation of material may result in nose and throat irritation, respiratory tract irritation, pneumonitis, central nervous system depression, dizziness, suffocation and possibly unconsciousness.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, diarrhea, and abdominal pain.

FIRE HAZARDS

Lower Flammable Limit: 1.8%

Upper Flammable Limit: 8.0%

Behavior in Fire: Isopropyl Acetate is a flammable liquid with high fire potential. It will readily ignite if exposed to sources of heat, sparks, flame and static electricity. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic. Isopropyl Acetate floats on the surface of water and may spread fire beyond the immediate area.

Hazardous Decomposition Products: When heated to decomposition, material releases carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Isopropyl Acetate has a relatively low flash point and ignition temperature. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are polyethylene vinyl alcohol and teflon. Structural firefighting protective clothing will provide a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

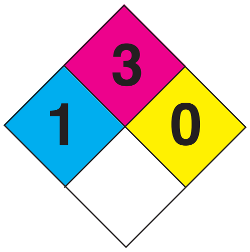
Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are in the range of 250 ppm to 2000 ppm. Protection provided by air purifying respirators is limited.

FIRST AID

Nonspecific Symptoms: Isopropyl Acetate may be absorbed through the skin in toxic amounts. Skin contact may cause defatting and dermatitis. Eye contact with liquid or vapors may cause irritation, redness, tearing, conjunctivitis, or permanent eye injury

1220

ISOPROPYL ACETATE
Class 3 (Flammable Liquid)



requiring several days to heal. Inhalation of material may result in nose and throat irritation, respiratory tract irritation, pneumonitis, central nervous system depression, dizziness, suffocation and possibly unconsciousness. Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, diarrhea, and abdominal pain.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog), or alcohol-resistant foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Isopropyl Acetate is a flammable liquid that may cause environmental contamination. Material floats on the surface of water. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Non-sparking tools and explosion-proof equipment are recommended to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways and storm drains. Underflow dams are an effective means to dike material since it floats on water. As a result, recovery efforts from water borne releases may be effective. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

ISOPROPYL ACETATE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of ignition such as heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...Isopropyl Acetate usually has a short residence time in the atmosphere when released. Since its vapors are heavier than air, the highest concentrations of vapor will be at ground level in low lying and enclosed areas. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

FOAM...Alcohol-resistant foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

ISOPROPYL ACETATE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, isopropyl acetate is expected float on the surface and rapidly volatize into the atmosphere. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is only slightly water soluble. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

Overflow dams may be used to confine the spill to a limited area until appropriate clean-up activities can be initiated. The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may be an effective means to recover spilled material since the material is only slightly water soluble and will float on the surface of the water. Barriers of suitable material may also be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material may travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming may be effective since the material is only slightly water soluble and will float on the surface of the water.

CONSEQUENCE

Material may travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

ISOPROPYL ACETATE
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...If released to soil, isopropyl acetate will display high mobility and has the potential to leach into ground water and potentially contaminate drinking water supplies. Rapid volatilization is expected to occur from both moist and dry soils. Spilled material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

August 1996

ISOPROPYLAMINE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Isopropylamine is a colorless highly flammable, corrosive liquid with an ammonia-like odor used as a solvent and a chemical intermediate in the synthesis of rubber accelerators, pharmaceuticals, dyes, insecticides, bactericides, and textile specialties. Isopropylamine may be produced from the reaction of isopropyl alcohol with ammonia in the presence of a dehydrating catalyst. It may also be produced from acetone and ammonia, and from isopropyl chloride and ammonia under pressure. Isopropylamine is extremely irritating to the eyes, skin and respiratory tract. The most common routes of exposure are through inhalation and skin contact. It may be corrosive upon direct skin contact and poisonous if inhaled or absorbed through the skin for prolonged periods.

The fire potential for isopropylamine is high. Vapors may be ignited by heat, sparks, flame, static electricity and other ignition sources in the immediate area and downwind of the release. The material is highly volatile and may form explosive mixtures with air. When heated to decomposition, the burning material may generate carbon monoxide and oxides of nitrogen. Vapors are heavier than air and may settle in low lying areas. Vapors may travel considerable distances to an ignition source and flash back. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for working in atmospheres where Isopropylamine is present. Runoff may be flammable and/or toxic. Isopropylamine is water soluble. This material is incompatible with strong oxidizers and acids. Empty containers containing product residue may be hazardous and proper safety precautions should be followed.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Miscible.
Solubility in Other Chemicals: Acetone, alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 0.7
Vapor Density (Air=1): 2.0
Boiling Point: 32°C (89°F)
Melting Point: -101°C (-150°F)
Freezing Point: 66°C (150°F)
Molecular Weight: 59.10
Heat of Combustion: -16,940 BTU/LB. (-9,420 CAL/G.)
Evaporation Rate: Unavailable.
Vapor Pressure: 478 mm Hg at 20°C (68°F)
Flash Point: -37°C (-35°F)
Autoignition Temperature: 402°C (756°F)
Flammable Limits: 2.3% (LEL) - 12.0% (UEL)
Stability: Highly volatile.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with strong oxidizing agents and acids.
Other Characteristics: Decomposes with heat and produces carbon monoxide and oxides of nitrogen.

IDENTIFICATION

Shipping Name(s): Isopropylamine (USDOT & IMO)
Synonyms and Tradenames: 2-Propanamine, 2-Propylamine, Monoisopropylamine, 1-Methylethylamine, 2-Aminopropane, Propanal, 2-Amino, SEC-Propylamine, NCS 62775 and 2-Propaneamine. CAS Registry No: 75-31-0
Chemical Formula: $(CH_3)_2CHNH_2$
Molecular Formula: C_3H_9N
UN/NA Designation: UN1221
IMO Designation: 3.1
RTECS Number: NIOSH/NT8400000
OHMTADS Number: 7216771
NFPA 704 Hazard Rating: 3 (Health): 4 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear/colorless
Odor Characteristics: Ammonia-like odor
Common Uses: Product is used as a solvent and a chemical intermediate in the synthesis of rubber accelerators, pharmaceuticals, dyes, insecticides, bactericides, and textile specialties.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ISOPROPYLAMINE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10-20 ppm

Unusual Hazards: Material may be corrosive and toxic upon skin contact. Is severely irritating to the mucous membranes. Exposure to the vapors may cause transient corneal edema.

Time Weighted Average (TLV-TWA): 5 ppm

Short Term Exposure Limit (STEL): 10 ppm

IDLH: 4000 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong oxidizers and acids.

HEALTH HAZARDS

Potential Health Effects: Isopropylamine is extremely irritating to the eyes, skin, nose and throat. It may be poisonous if inhaled or absorbed through the skin. Vapors may cause transient corneal edema. The material is corrosive to body tissues. Skin contact can cause dermatitis and burns. Eye contact may result in burn and permanent injury. Ingestion of alkaline corrosives such as iso propylamine causes burns to the lips, tongue, oral mucosa and esophagus. Vomiting and abdominal pain may also occur. Inhalation of vaporized caustics may result in dyspnea and pulmonary edema. Acute inhalation overexposure may cause erythema, fatigue, chest pains, dizziness, depression, convulsions, narcosis, and possibly unconsciousness.

Hazards of Skin Contact: Isopropylamine may be absorbed through the skin in toxic amounts. Skin contact may cause deep, corrosive burns and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, tearing, blurred vision, burns or transient corneal edema. Permanent eye injury may result.

Inhalation Hazards: Inhalation of vaporized caustics may result in severe nose and throat irritation, dyspnea and pulmonary edema. Acute inhalation overexposure may cause erythema, fatigue, chest pains, dizziness, depression, convulsions, narcosis, and possibly unconsciousness.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache and nausea. Ingestion of alkaline corrosives such as isopropylamine causes burns to the lips, tongue, oral mucosa and esophagus. Vomiting and abdominal pain may also occur.

FIRE HAZARDS

Lower Flammable Limit: 2.3%

Upper Flammable Limit: 12.0%

Behavior in Fire: Isopropylamine is an extremely volatile, flammable liquid with high fire potential. It will readily ignite if exposed to sources of heat, sparks, flame and static electricity. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic. Burning isopropylamine is difficult to control because of the ease of reignition of vapors.

Hazardous Decomposition Products: When heated to decomposition, material releases carbon monoxide and oxides of nitrogen.

EXPLOSION HAZARDS

Explosive Potential: Isopropylamine has high volatility, a low flash point, and a relatively low ignition temperature which produces a high explosion potential. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are butyl rubber (Breakthrough Time = 1 to 4 hours), polyvinyl alcohol and teflon. Structural firefighting protective clothing will provide a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits. Protection provided by air purifying respirators is limited.

1221

ISOPROPYLAMINE

Class 3 (Flammable Liquid)

FIRST AID

Nonspecific Symptoms: Skin contact may cause corrosive burns and dermatitis. Excessive exposures may cause temporary central nervous system depression with anesthetic effects such as narcosis, dizziness, fatigue, nausea, convulsions, headache, respiratory difficulty, confusion, pulmonary edema, loss of coordination and loss of consciousness. Eye contact may result in transient corneal edema. Inhalation may result in severe nose and throat irritation, dyspnea and pulmonary edema.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and DO NOT INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog), or alcohol-resistant foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be flammable and/or toxic.

SPILL RESPONSES

General Information: Isopropylamine is a highly flammable, corrosive liquid that may cause environmental contamination. Vapors may reignite easily. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Non-sparking tools and explosion-proof equipment are recommended to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways and storm drains. Underflow dams are an ineffective means to dike material since it is miscible in water and it is lighter than water. As a result, recovery efforts from water borne releases are difficult. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

ISOPROPYLAMINE

Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of ignition such as heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...Based on its vapor pressure, isopropylamine is expected to exist almost entirely in the vapor phase in ambient air. Isopropylamine usually has a short residence time in the atmosphere when released. Since its vapors are heavier than air, the highest concentrations of vapor will be at ground level in low lying and enclosed areas. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

FOAM...Alcohol-resistant foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways, and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

ISOPROPYLAMINE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...Isopropylamine is expected to volatize if released into water sources. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is miscible. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

Dams may be used to confine the spill to a limited area until appropriate clean-up activities can be initiated. The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms will not be an effective means to recover spilled material since the material miscible. Barriers of suitable material may also be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material does not float on the surface of the water.

CONSEQUENCE

Material will travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

ISOPROPYLAMINE
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Based on its vapor pressure, isopropylamine should rapidly evaporate from dry surfaces, especially when present in high concentrations in spill situations. Spilled material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment may become contaminated and/or damaged with removed product due to its corrosive effects.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Mechanical equipment may also become damaged with removed product due to its corrosive effects.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

March 1995

ISOPROPYLBENZENE

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Isopropylbenzene, also commonly called Cumene, is a colorless liquid hydrocarbon with a sharp and penetrating odor similar to gasoline. It is used as a solvent, polymerization catalyst, laboratory reagent, and as a raw material for making various other chemicals. Practically insoluble in water and lighter, isopropylbenzene will form a floating and fairly persistent surface slick. A flash point in the range of 96 to 111°F indicates that the product can be easily ignited if subjected to high ambient temperatures or some degree of preheating. Under such conditions, isopropylbenzene vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor from warm or hot liquid isopropylbenzene in confined spaces such as buildings or sewers may explode if ignited. There is some very limited potential for containers of liquid to rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.2 pounds per gallon.

Isopropylbenzene does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing materials and certain strong acids, however, and may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low to moderate. Products of combustion include toxic constituents.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if isopropylbenzene is leaking from its container but not on fire. If a bulk container is exposed to direct flame or fire becomes uncontrollable, consider evacuating for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket. (Note: Although isopropylbenzene has a relatively high boiling point and low vapor pressure, the latter recommendation can be found in the USDOT 1990 Emergency Response Guide.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; reported values of 50 ppm at 68 °F (20°C) and 780 ppm at 77°F (25°C) are somewhat inconsistent.

Solubility in Other Chemicals: Soluble in acetone, benzene, carbon tetrachloride, ether, ethyl alcohol, and many other organic solvents.

Specific Gravity (Liquid): 0.862-0.864 at 68°F (20°C)

Boiling Point: 306.3°F (152.4°C) at 1 atm.

MeltingPoint: – 140.9°F (– 96.1°C)

Freezing Point: See melting point

Molecular Weight: 120.2

Heat of Combustion: – 9,840 cal/g

Vapor Pressure: 3.2-3.5 mm Hg (0.0619-0.0677 psia) at 68°F (20°C)

Flash Point: 96-111°F (35.6-43.9°C), closed cup; reported values vary.

Autoignition Temperature: 795-797°F (424-425°C)

Burning Rate: 5.0 mm/minute

Stability: Stable

Corrosiveness: Not corrosive to metals but may attack some plastics, rubber, and coatings. One authority recommends use of hoses constructed of propylene, Teflon, or Viton.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react, ignite, or explode in contact with strong oxidizing agents or materials. Reported to cause temperature and pressure to rise in closed containers when mixed with 70 nitric acid, oleum, or chlorosulfonic acid.

IDENTIFICATION

Shipping Names: Isopropylbenzene (USDOT and IMO).

Synonyms and Tradenames: Isopropylbenzene; isopropyl benzol; cumol; 2-phenylpropane; 1- methylethyl benzene

Chemical Formula: $C_6H_5CH(CH_3)_2$

Constituent Components (% each): 90% or more pure; remainder expected to consist of similar substances in most cases. The properties presented in this guide are for the essentially pure product.

UN/NA Designation: UN1918

IMO Designation: 3.3, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sharp, penetrating, fragrant; aromatic; like gasoline

Common Uses: Raw material for making various other chemicals; polymerization catalyst; laboratory reagent; solvent in paints, enamels, and other substances.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ISOPROPYLBENZENE

Class 3 (Flammable Liquid)
or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Several sources give values in the range of 0.008 to 0.047 ppm; 1.2 ppm has also been reported.

Unusual Hazards: Relatively typical combustible liquid hydrocarbon that borders on being classified as a flammable liquid.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: (Skin) 50 ppm over each 8 hours of a 40 hour work week (ACGIH TLV, 1990 - 91; OSHA PEL. 1989.)

Conditions to Avoid: Heat. fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Although not severe, the major health hazard of isopropylbenzene is associated with inhalation of the vapor concentrations that may be present in air at the spill site and immediately downwind. Direct contact and ingestion should also be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid isopropylbenzene may result in drying and cracking of the skin due to the defatting action of the substance. Also reported is the possibility of redness, thickening, itching, a rash, and/or blistering. Some amounts of isopropylbenzene may be absorbed through the skin but the hazard appears minimal unless the exposure is considerable and prolonged. Contact of liquid isopropylbenzene with the eyes is reported to cause mild irritation. Contact lenses should not be worn when working with this chemical.

Hazards of Inhalation: Exposure to isopropylbenzene vapors in air may cause irritation of the eyes and throat in humans at a concentration on the order of 200 ppm. Other symptoms at unstated concentrations are said to include dryness of the mouth and throat, respiratory tract irritation, sore throat, coughing, shortness of breath, headache, and nausea. Intense short-term exposures may cause narcosis and central nervous system depression with symptoms including dizziness, slight incoordination, and unconsciousness. Recovery from these effects are reported to require one or two days because of the slow rate at which isopropylbenzene is eliminated from the body. Dangerous short-term exposures are deemed unlikely (but not impossible) by various authorities because of isopropylbenzene's relatively low vapor pressure. Although exposure of rats to 8000 ppm in air for four hours and exposure of mice to about 5000 ppm for two hours resulted in death of 50% of the animals in laboratory experiments, it must be observed that the saturated vapor concentration of isopropylbenzene (i.e., the maximum concentration directly over a pool of the liquid) is on the order of 4600 ppm at 68°F and 6050 ppm at 77°F based on available vapor pressure data. Thus, it appears that the irritating properties of isopropylbenzene vapors will normally be of greater concern than the possibility of fatalities resulting from exposures, provided that response personnel and members of the public are properly protected or isolated from extreme and prolonged exposures.

Hazards of Ingestion: Liquid isopropylbenzene is of relatively low toxicity by ingestion. Nevertheless, ingestion may result in a burning sensation in the mouth and stomach, abdominal pain, nausea, vomiting (possibly bloody), chest pain, coughing, hoarseness, salivation, and possibly death in severe exposures. As is the case with similar hydrocarbon substances, it may be expected but is not confirmed) that aspiration of liquid isopropylbenzene into the lungs during vomiting might lead to pulmonary edema and chemical pneumonitis with possibly severe consequences. These latter effects may be delayed in onset.

FIRE HAZARDS

Lower Flammable Limit: 0.9%

Upper Flammable Limit: 6.5%

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite when cool or cold. May generate flammable vapors upon release if heated or if released under high ambient temperature conditions. In such cases, isopropylbenzene vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flash back. Containers have some very limited potential to rupture violently and possibly rocket in fires.

Hazardous Combustion products: Reported to include carbon monoxide, carbon dioxide, aldehydes, and other toxic gases.

EXPLOSION HAZARDS

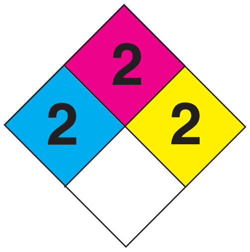
Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from warm or hot liquid are ignited in a confined area. There is a some very limited potential for containers to rupture violently and possibly rocket in fires.

1918

ISOPROPYLBENZENE
Class 3 (Flammable Liquid)
or Combustible Liquid



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include chlorinated polyethylene and Viton/neoprene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister 2500 ppm or less) or a chemical cartridge respirator with a full facepiece (1000 ppm or less) and organic vapor cartridge(s) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the nose, respiratory tract. eyes or skin; symptoms of narcosis and central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward and keep head below hips to reduce risk of aspiration of liquid isopropylbenzene into the lungs.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility (albeit limited) that the container may tear or rupture, possibly rocket, and suddenly release massive amounts of product when exposed to high heat such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operatlons, and other downstream users of potentially contaminated water. Note that intake of liquid isopropylbenzene may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take into account while planning the response that isopropylbenzene is a combustible liquid with a relatively low flash point for such substances. Indeed, some shipments may possibly qualify for flammable liquid status.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Liquid isopropylbenzene discharges may expose downwind areas to toxic and flammable concentrations in some cases. particularly if large quantities have spilled in hot weather and/or the liquid was heated prior to release.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

ISOPROPYLBENZENE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

MONITOR THE SITUATION . . . Isopropylbenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed, particularly for small spills or for spills at less than high ambient temperatures.

CONSEQUENCE

Hazardous levels of isopropylbenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . Water fog or spray applied to isopropylhenzene vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of isopropylbenzene from contact with its airborne vapors .

MITIGATION

Where deemed necessary, contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. (Note: Containment of runoff is only likely to be warranted where critical water bodies and/or environmentally sensitive areas may be impacted. The low solubility of isopropylbenzene in water indicates that runoff from water sprays are unlikely to be significantly contaminated in many cases.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of isopropylbenzene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid isopropylbenzene may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained isopropylbenzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

ISOPROPYLBENZENE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, vermiculite, clay, fly ash, perlite, peat moss, saw dust, straw, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders. scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid isopropylbenzene will form a floating slick on the surface of the water body. Small amounts will dissolve in the water.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards may pose a risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

ISOPROPYLBENZENE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skmming devices may be deployed to recover floating isopropylbenzene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose a risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with isopropylbenzene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards may pose a risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources. Note that noncombustible sorbents are preferred when available in order to reduce the hazard in the event of a fire.

TECHNIQUE

ADSORPTION . . . Some small amounts of isopropylbenzene may dissolve in water. Although some of this isopropylbenzene may later volatilize from the water surface, some amounts may remain in the water column for a time. It has been reported that approximately 0.25 ppm of isopropylbenzene in water may cause an adverse taste in fish. Where deemed necessary due to water quality or use considerations, addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Where deemed necessary due to water quality or use considerations, water containing dissolved isopropylbenzene may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body. The technique is better suited to substances with higher vapor pressures than isopropylbenzene but may nevertheless be effective if applied to a contained body of contaminated water for a sufficient period of time.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard, but note that the low solubility of isopropylbenzene in water suggests that air emissions should not be a problem in most cases.

March 1995

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

GENERAL INFORMATION

Isopropyl chloroformate is a colorless poisonous liquid with an irritating, pungent, and acrid odor. Used for making other chemicals, the substance is slightly heavier than water, considered relatively insoluble, and slowly reactive, so may be expected to sink slowly while simultaneously reacting to form hydrochloric acid and probably isopropyl alcohol. Its flashpoint indicates it may be easily ignited at moderate ambient temperatures. Vapors may travel some distance to a source of ignition and flash back, particularly at warmer temperatures. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 9.1 pounds per gallon.

Isopropyl chloroformate is relatively stable in normal transportation, except for an apparent tendency to decompose slowly to hydrogen chloride and isopropyl alcohol, but is likely to be reactive with a variety of other chemicals, certain types of metals and rubber, and certain metallic rusts and salts. Any hydrochloric acid formed will be corrosive to most metals and may cause evolution of flammable and potentially explosive hydrogen gas during the corrosion process. The corrosivity of isopropyl chloroformate itself to bodily tissues is high and requires that all contact with the product be strictly avoided. Products of combustion are both toxic and corrosive and are likely to include hydrochloric acid, phosgene, chlorides or chlorine, chloroformate fumes, carbon monoxide, and other toxic constituents.

If isopropyl chloroformate is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half ($^1/_2$) mile for protection from flying debris if the container should rupture violently. (Note: Specific information on isopropyl chloroformate in the literature is highly limited. Much of this guide is based on the characteristics of methyl chloroformate and ethyl chloroformate. The guide is therefore considered only generally accurate.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble; may react slowly (see below).

Solubility in Other Chemicals: Soluble in ether and benzene.

Specific Gravity (liquid): 1.08–1.09 at 68°F (20°C)

Boiling Point: 220.3–220.8°F (104.6–104.9°C) at 1 atm.

Melting Point: Unavailable

Freezing Point: Unavailable

Molecular Weight: 122.55

Heat of Combustion: Unavailable

Vapor Pressure: Unavailable

Flash Point: 60°F (15.6°C); method unspecified

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable in normal transportation except for possible slow decomposition.

Corrosiveness: any hydrochloric acid formed will be corrosive to most metals, particularly iron and aluminum, with evolution of hydrogen gas. Related products are best handled in glass, lead, porcelain, tantalum, high density polyethylene, polypropylene, or furans. Some are known to attack elastometric materials such as rubber (e.g., neoprene, Viton, etc.).

Reactivity with Water: Related chloroformates are known to react with water, usually slowly, to form corrosive hydrogen chloride or hydrochloric acid while generating heat. This product is likely to also produce isopropyl alcohol upon reaction with water.

Reactivity with Other Chemicals: May decompose with generation of heat, possibly explosively, in presence of iron salts. Known to have once exploded while stored in a refrigerator. Related products are known to be incompatible with oxidizing agents, alkali or caustics, acids, amines, certain metals, rust, and certain types of rubber.

IDENTIFICATION

Shipping Names: Isopropyl chloroformate (USDOT and IMO);

Synonyms and Tradenames: Chloroformic acid, isopropyl ester; isopropylchlorocarbonate; isopropyl chloromethanoate; car bonochloride acid, 1-methylethyl ester; carbonochloridic acid, 1-methylethyl ester.

Chemical Formula: $(CH_3)_2CHOOCCl$

Constituent Components (% each): Related products are usually 94-95% or more pure with remainder including hydrochloric acid, alcohol (isopropyl in this case), alkyl carbonates, and possibly a trace of phosgene.

UN/NA Designation: UN2407

IMO Designation: 6.1, poisonous material

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Similar products have irritating, pungent, and acrid odors.

Common Uses: Making of other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive and flammable liquid. May react with water to form isopropyl alcohol and hydrogen chloride or hydrochloric acid.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is likely to be from inhalation of the relatively high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Isopropyl chloroformate is considered to be corrosive and destructive to living tissue. Contact with the skin or eyes may cause severe acid-type burns. Vapors of the product are irritating to the eyes and likely to cause tears at low concentrations in air.

Hazards of Inhalation: Vapors of related chloroformates are highly irritating to the respiratory tract. Inhalation is likely to cause burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting, chest pain, edema of larynx and bronchi, chemical pneumonitis, pulmonary edema (which may be delayed in onset), convulsions, and possibly death. Exposure to 299 ppm in air for one hour was fatal to 50% of mice in laboratory experiments. A level of 200 ppm was the lowest concentration causing fatalities in rats in five hours.

Hazards of Ingestion: Moderately toxic when ingested. Ingestion of similar products may result in severe burns of the mouth, throat and stomach, stomach pain, nausea, vomiting, esophageal or gastric necrosis, and possibly death.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquid. Vapors may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire due to overheating and/or product decomposition. May generate large quantities of flammable and corrosive gas or vapor upon release.

Hazardous Combustion Products: Toxic and corrosive; likely to include hydrochloric acid, phosgene, chlorides or chlorine, chloroformate fumes, carbon monoxide, and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Note that some chloroformates may explode due to pressure or catalysis.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with isopropyl chloroformate. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full face piece (or the equivalent)

2407

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; choking, coughing, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, halon, foam. Note that isopropyl chloroformate may react with water. Water or foam should be applied with caution at first.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Note that sealed containers may contain some pressure due to product decomposition. Take the corrosive, flammable, reactive, and volatile nature of the product into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Isopropyl chloroformate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities of fumes and vapors are being generated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to isopropyl chloroformate vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain isopropyl chloroformate, hydrochloric acid, and isopropyl alcohol from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM ... There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of hazardous vapors or fumes into the atmosphere. (Note: Since foam is recommended for fire fighting, it may also be beneficial for this purpose. Due to the potential reactivity of the product, apply foam with caution at first. Be advised that various authorities disagree on whether alcohol or regular foam should be used.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION ... The rapid addition of flooding quantities of water to contained liquid isopropyl chloroformate may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid isopropyl chloroformate and its products of reaction with water may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION ... Spreading of liquids may be controlled by absorbing liquid with dry sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ISOPROPYL CHLOROFORMATE

Division 6.1 (Poisionous Material)

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note that this response will address presence of acid but not alcohol. See next technique for alcohol removal where necessary. Note also that some time may be necessary for reaction of product with water.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION…Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

KEROSENE

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Kerosene is a colorless to light brown liquid commonly known as fuel oil no. 1. It is used as a heating fuel and solvent. It is essentially insoluble in water and lighter, so may be expected to form a floating oil slick. Its minimum flash point of 100ºF indicates that high ambient temperature conditions or some degree of heating is necessary before the product can be ignited easily. Accumulations of vapor from warmed liquid in confined spaces such as buildings or sewers may result in explosions if ignited. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.8-7.1 pounds per gallon.

Kerosene does not react with water or many other common materials and is stable in normal transportation. It is a relatively noncorrosive substance and is primarily incompatible with strong oxidizing materials that may cause its ignition. The toxicity by potential routes of exposure is low to moderate. Products of combustion may include toxic constituents. The product may contain traces of sulfur and benzene.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Essentially insoluble.
Solubility in Other Chemicals: Soluble in other hydrocarbons.
Specific Gravity (Liquid): 0.81-0.85 at 59ºF (15ºC)
Vapor Density: 5.5 (approximately)
Boiling Point: Reports vary, 175-617ºF (79-325ºC)
Melting Point: See freezing point.
Freezing Point: -45 to -55ºF (-43 to -48ºC)
Molecular Weight: 170 (approximately)
Heat of Combustion: -10,300 cal/g
Evaporation Rate (butyl acetate=1): 0.04
Vapor Pressure: .23 - 2 mmHg (0.039 psia) at 68ºF (20ºC); 5 mmHg at 100ºF (37.7ºC); 22 mmHg at 158ºF (70ºC)
Flash Point: 100-162°F (37.7-72.2ºC)
Autoignition Temperature: 428ºF (220°C)
Burning Rate: 4 mm/minute
Flammable Limits: 0.7% (LEL) - 5% (UEL)
Stability: Stable
Polymerization Potential: Will not occur.
pH: Essentially neutral.
Corrosiveness: Noncorrosive
Reactivity with Water: No reaction.
Reactivity and Incompatibility: Avoid contact with strong oxidizers such as chlorine, fluorine, nitrogen tetraoxide, concentrated oxygen, and sodium hypochlorite or other hypochlorites.

IDENTIFICATION

Shipping Name(s): Kerosene (USDOT & IMO)
Synonyms and Tradenames: JP-1; Fuel oil no. 1; Range oil; Kerosine; Coal oil; Lamp oil; Light petroleum; Light distillate; Jet fuel; No. 1 heating oil.
CAS Registry No.: 8008-20-6
Chemical Formula: Complex mixture of petroleum hydrocarbons and additives.
Constituent Components (% each): Varies, generally close to 100% pure.
UN/NA Designation: UN1223
IMO Designation: 3.3, Flammable liquids
RTECS Number: OA5500000
NFPA 704 Hazard Rating: 1(Health): 2(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless to yellowish, oily, may contain red dye.
Odor Characteristics: Strong, characteristic hydrocarbon odor.
Reportable Quantity: See appendix I.
Common Uses: Heating fuel and solvent.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

KEROSENE

Class 3 (Flammable Liquid) or
Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.11 ppm

Unusual Hazards: None

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 100 mg/m^3

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, fire, and sparks, contact with incompatible materials, runoff to sewers or water bodies, inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Health hazards are generally low unless the product is ingested in significant quantities. Nevertheless, all major exposures should be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with fuel oils may cause drying and cracking of the skin due to the defatting action of these products, as well as the possibility of blisters. Contact with the eyes results in mild or negligible irritation in most cases.

Hazards of Inhalation: Prolonged exposure to high vapor concentrations in air may cause headache, drowsiness, irritation of the eyes and nose, and lung irritation. Such concentrations are generally unlikely outdoors, however, except in the immediate vicinity of the spilled product.

Hazards of Ingestion: Ingestion may cause irritation of the gastrointestinal tract, nausea, vomiting, cramping, and possible central nervous system depression with symptoms ranging from headache to anesthesia, coma, and death. Aspiration into the lungs during vomiting may result in coughing, gagging, difficult breathing, substernal distress, rapidly developing pulmonary edema, and delayed bronchopneumonia and pneumonitis with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 0.7%

Upper Flammable Limit: 5%

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite unless warmed. There is some limited possibility that containers may rupture violently in fire. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back.

Hazardous Combustion Products: Thermal decomposition products may include carbon monoxide, carbon dioxide, oxides of sulfur and nitrogen, and other toxic gases.

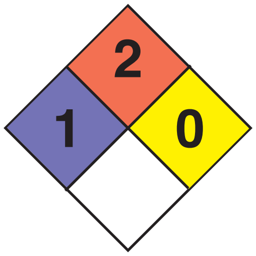
EXPLOSION HAZARDS

Explosive Potential: Explosions may result if vapors of warm liquid are ignited in a confined area. There is some limited possibility that containers may rupture violently in fire.

1223

KEROSENE

Class 3 (Flammable Liquid) or
Combustible Liquid



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, polyurethane, polyvinyl alcohol, Viton® , and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge may suffice.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Foam, dry chemical, carbon dioxide, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of kerosene may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment.

KEROSENE

Class 3 (Flammable Liquid) or Combustible Liquid

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of fuel oil in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to kerosene vapors or fumes may accelerate their dispersal in the atmosphere and will accumulate in low lying areas.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

FOAM . . . Foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications and monitor the area until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

KEROSENE

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

KEROSENE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating kerosene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with kerosene may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

August 1997

LIQUEFIED NATURAL GAS

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Liquefied natural gas (LNG) is a colorless, odorless liquid whose primary constituent is methane and is used mainly as a fuel or industrial raw material. It has a boiling point as low as -162°C (-260°F) which indicates that in spill situations it will be a vigorously boiling liquid that will evolve large amounts of vapor that are extremely flammable. It burns rapidly at 11.6-12.5 mm/min. which can initially be increased when it comes into contact with the relatively warmer ground or water. Methane vapor is colorless, but boiling LNG produces whitish vapors due to condensation of water vapor from the air. Although lighter than air at normal temperatures, vapor evolved from any spilled LNG will initially be heavier, may accumulate and persist in low areas, and/or may travel a considerable distance to a source of ignition, flash back, and possibly even explode, especially if the gas has accumulated in a confined or partially confined space, such as buildings, sewers or ditches.

Although LNG is non-toxic, it poses a health risk from frostbite like burns from the cryogenic nature of the shipped material as well as an asphyxiation hazard from the high levels of vapors that can be produced. Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if natural gas is leaking from its container. If a bulk container is exposed to prolonged flame, or a fire becomes uncontrollable, an evacuation radius of one-half ($^1/_2$) mile will be necessary just for protection if the container should rupture and instantaneously release the entire liquid contents creating a large fire. At the temperature of LNG, ordinary carbon steels and most alloy steels lose their flexibility, become brittle, and may crack or break without warning.

LNG is primarily used as a fuel and cooking gas, manufacture of chemicals and hydrogenated oils, and in many peak shaving plants in local communities as a means to handle high demands for natural gas.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible; 0.6g/100g water.
Solubility in Other Chemicals: Soluble in ether, benzene and toluene. Slightly soluble in ethanol and acetone.
Specific Gravity: 0.426 at boiling point for liquid; 0.555 at 15.6°C (60.1°F) for gas
Vapor Density: 0.554 at 0°C (32°F)
Boiling Point: -162 to -154°C (-259.6 to -245.2°F)
Melting Point: -182°C (-295.6°F)
Freezing Point: See melting point
Molecular Weight: 16.043
Heat of Combustion: -13214 cal/g
Evaporation Rate: High
Vapor Pressure: 21.84 atm (320.8 psia) at -100°C (-148°F)
Flash Point: Less than -188°C (-306°F)
Autoignition Temperature: 482-632°C (899.6-1169.6°F)
Burning Rate: Approximately 11.6-12.5 mm/min, can be twice this if spilled on relatively warmer ground or water.
Flammable Limits: 5.0% (LEL) - 15% (UEL)
Stability: Stable
Polymerization Potential: Will not occur
Corrosiveness: The light hydrocarbons found in LNG are non-corrosive to metals but may attack some forms of plastics, rubber, and coatings.
Reactivity and Incompatibility: Incompatible with oxidizing agents. Mixtures with bromine pentafluoride, chlorine and yellow mercuric oxide, nitrogen trifluoride, liquid oxygen or oxygen difluoride may explode.

IDENTIFICATION

Shipping Name(s): Natural gas, refrigerated liquid; Methane, refrigerated liquid
Synonyms and Tradenames: Methane; LNG; Natural gas
CAS Registry No: 74-82-8
Chemical Formula: CH_4
Constituent Components (% each): Mostly methane; possibly < 2% ethane, nitrogen or some other hydrocarbon.
UN/NA Designation: UN1972
IMO Designation: 2.1
RTECS Number: PA1490000
Physical Form as Shipped: Liquid
Physical Form as Released: Gas or boiling liquid
NFPA 704 Hazard Rating: 1 (Health): 4 (Flammability): 3 (Reactivity) Note: this rating is for liquefied methane or LNG due to its cold temperature. The lealth rating for methane gas is 0.
Odor Characteristics: Odorless, but may have a faint petroleum-like odor if other hydrocarbons are present.
Reportable Quantity: See appendix I
Common Uses: Primarily used as a fuel and cooking gas, mfg. of chemicals and hydrogenated oils, and by peak shaving plants to handle high demands for natural gas.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

LIQUEFIED NATURAL GAS

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless.

Unusual Hazards: Super cold liquid can cause brittle failure to ordinary carbon and most alloy steels, and may crack without warning. Flames of relatively pure burning methane may not be visible at times. Liquid entering sewers could cause explosions.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable (Simple asphyxiant)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry of liquid into a sewer system or other confined spaces; inhalation of high gas or vapor concentrations; direct physical contact with very cold gas, vapor, or liquid.

HEALTH HAZARDS

Potential Health Hazards: Major hazard is from the high gas concentrations that may be present in air in the immediate spill area and over some distances downwind. Very cold gas, vapor, or liquid may cause frostbite of exposed bodily tissues.

Hazards of Skin or Eye Contact: Contact of the eyes or skin with LNG or its very cold vapors may result in frostbite and subsequent tissue damage. Do not wear contact lenses under conditions that may lead to frostbite in the event of a discharge.

Hazards of Inhalation: Vapors evolved from LNG are considered to be nontoxic. Very high concentrations in air may cause narcosis, central nervous system depression, and asphyxiation due to displacement of oxygen in the atmosphere. Effects are variably reported to include headache, excitation, euphoria, dizziness, drowsiness, incoordination, disorientation, faulty judgment, blurred vision, shortness of breath, increasing fatigue, tremors, nausea, vomiting, irregular heart rhythm, bluish color of the skin, convulsions, loss of consciousness, coma, respiratory arrest, and death. At least one producer indicates the additional possibility that vapors or mists may cause irritation of the nose and throat. Very cold vapors may cause frostbite of respiratory passages.

Hazards of Ingestion: Ingestion of LNG in harmful quantities is considered highly unlikely. Contact with the extremely cold liquid would, at the very least, cause frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 5.0%

Upper Flammable Limit: 15%

Behavior in Fire: Will generate large quantities of vapor upon release. The vapors from LNG are initially heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture in a prolonged fire and instantaneously release the entire contents creating a large fire. Depending on composition, flames may be invisible, pale and faintly luminous, or luminous and clean.

Hazardous Decomposition Products: Carbon monoxide, carbon dioxide.

EXPLOSION HAZARDS

Explosive Potential: High. Explosion may result if gas or vapor is ignited in a confined area. Can readily form explosive mixtures with air. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged heat or fire may fail and releasing the entire contents creating a large fire.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

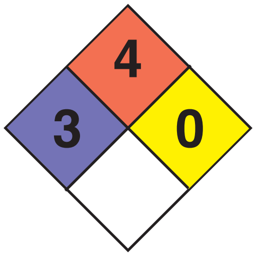
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Full fire retardant structural firefighting clothing meeting NFPA standards is recommended for handling spills when fire is the major concern.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations.

1972

LIQUEFIED NATURAL GAS

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Frostbite or freeze burns of any bodily tissues; headache, euphoria, dizziness, drowsiness, incoordination, faulty judgment, blurred vision, shortness of breath, fatigue, nausea, vomiting, or other symptoms associated with contact or inhalation.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination

First Aid for Skin Contact: In case of skin contact with cold liquid, remove contaminated clothing and wash affected body areas with large amounts of warm water. Clothing should not be removed if it is frozen and stuck to the skin since it will remove the skin or pull out tissue. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming such as wrapping effected area gently in blankets if warm water is not available. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Highly unlikely route of exposure. If occurs, the victim should be treated for potential frostbite. Have victim drink warm water, but do not induce vomiting without medical supervision. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, water spray (fog) or foam. A fine water spray or fog can be used on large discharges to control the fire by preventing its spread and absorbing some of its heat. Do not apply water streams directly on a LNG pool fire since this may greatly and/or suddenly increase the rate of burning and/or the size of the fire by increasing the vaporization rate of the liquid.

Extinguishing Techniques: Stay upwind. Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind. Wear breathing apparatus and appropriate protective clothing. Wear full thermal protective suit as necessary and appropriate. Move container from fire if no risk. Be alert to the possibility that the container may tear or rupture when exposed to prolonged heat, such as from a direct flame, and suddenly release massive amounts of product. Do not extinguish burning gas or liquid unless its flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fire in cargo area, use unmanned hose holder or monitor nozzles for cooling. If this is impossible, withdraw and let burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of a tank due to fire. Note that direct application of water on LNG tank pressure relief devices could result in ice formation, thus preventing their proper functioning. Dike fire control water for proper disposal since it may contain flammable gases.

SPILL RESPONSES

General Information: LNG is highly flammable. Restrict access to area. Eliminate all sources of ignition. Keep unprotected personnel upwind of spill area. Avoid contact with very cold gas or liquid unless properly equipped for such contact. If transfer operations are anticipated, only use equipment specifically designed for use with the material being transferred and its temperature and pressure at the time of transfer. One method to dispose of excess or undesired natural gas is to “flare” it under controlled conditions; consult qualified experts for advice on safe flaring techniques if this approach is considered. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows and depressions. Use combustible gas detectors prior to entering any potentially affected confined space or any low area in which cold, heavier-than-air gases or vapors may have accumulated (but keep in mind that the gas or vapor will become lighter than air as it warms and will disperse more easily). Do not direct water at a venting safety device since this may cause icing to occur. Note that the rapid escape of gas under pressure may generate a static electricity charge that could cause gas ignition. Be advised that the very low temperatures associated with LNG can cause many materials to become brittle and subject to sudden failure or cracking. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of flammable vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

MONITOR THE SITUATION . . . LNG is expected to exist almost entirely in the vapor phase when released into the atmosphere. Depending on the magnitude of the release, flammable concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable gas.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

LIQUEFIED NATURAL GAS

Division 2.1 (Flammable Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors. It can also be used effectively to stop small LNG leaks from valves by forming an ice plug around the super cold metal thereby significantly slowing down the lead to buy more time to complete evaluation.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam can be applied in large volumes to the surface of confined pools of LNG to slow the rate of vapor evolution, particularly after boiling pools have quieted down. Be advised of the possibility of a short-term increase in vapor evolution when the foam (which will be warmer than the LNG) is first applied.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression. Avoid plunging the foam.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to the soil, initially liquid will rapidly boil, generate a large amount of flammable vapors and freeze the ground it is in contact with. Much later, the liquid will reach a less rapid boiling rate thereby evolving less vapors. Containment dikes or barriers using soil, sand or other related materials may be effective to confine the spill to a limited area thereby reducing the surface area and volume of gas generated until liquid evaporates. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material.

CONSEQUENCE

Contained material will take longer to evaporate.

MITIGATION

Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches. Generally practicable only for small leaks. Reducing the spill surface area will decrease the vapor generation.

CONSEQUENCE

Contained material will take longer to evaporate. Mechanical equipment could ignite material.

MITIGATION

Continually monitor for flammable conditions. Dig a deep pit with small area to reduce vapor generation rate. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill pits.

LIQUEFIED NATURAL GAS

Division 2.1 (Flammable Gas)

TECHNIQUE

MECHANICAL REMOVAL . . . Most if not all natural gas components will rapidly vaporize from soil surfaces once the bulk of the LNG has vaporized. Mechanical equipment can be used to grade frozen ground to eliminate any pockets of material.

CONSEQUENCE

Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Continually monitor for flammable conditions.

TECHNIQUE

LET BURN . . . If pool is not ignited or is already ignited, it may be safer to burn the LNG rather than attempt to recover it or put out fire.

CONSEQUENCE

If pool is not well confined, fire may spread and increase burn area. If large amount of liquid spilled, the time of burn may be too long.

MITIGATION

Ensure pool is well confined and unable to spread. Ensure area is well clear of any population that may be exposed to heat or material that could be ignited by intense heat. Consult qualified personnel regarding safety of flaring the gas.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake and monitor situation.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

MONITOR THE SITUATION . . . LNG will vigorously and rapidly boil off the surface of water bodies.

CONSEQUENCE

Flammable concentrations will exist in the area before time and distance from the spill area has diluted the methane gas.

MITIGATION

Evacuate area affected and continually monitor until conditions are safe.

March 1995

MALEIC ANHYDRIDE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Maleic anhydride is a colorless or white crystalline solid that melts at 127°F and that may be shipped as a solid or molten liquid. It has an acrid, choking odor and is used to make various resins, pesticides, oil and fat preservatives, pharmaceuticals, plasticizers, surface coatings, lubricants, dyes, inks, detergents, and other chemicals. A flash point of 215°F indicates that the product must be preheated before ignition can occur. Vapors over a molten surface in a closed tank may be within the explosive range, however, and a cloud of maleic anhydride dust in air may be ignited by a flame or spark and explode. The product is heavier than water and moderately soluble so may be expected to sink and dissolve at a fairly rapid rate. The product weighs approximately 89.2 pounds per cubic foot when solid.

Maleic anhydride reacts relatively slowly with cold water to form maleic acid, but hot water may cause frothing. It is stable in normal transportation and corrosive to some metals when in contact with water. Explosive or violent reactions may occur in the presence of alkali metals or amines at high temperatures, as well as with sodium or potassium carbonate or hydroxide or with aqueous ammonia, pyridine, or calcium hydroxide, particularly if the reaction is confined. Some of these substances may be present in dry chemical or loaded stream fire extinguishers. Copolymerization is possible with controlled mixtures of olefins and catalysts, and the product is also reactive with other chemicals. The substance is a strong irritant to tissue and may cause burns to the skin or eyes, particularly if exposure is prolonged. Products of combustion or decomposition may be acrid and toxic.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 16.3 g/100 g water at 86°F (30°C)

Solubility in Other Chemicals: Appreciably soluble in acetone, alcohol, benzene, chloroform, dioxane, ethyl acetate, ether, toluene, and o-xylene.

Specific Gravity (Liquid): 1.3 at 158°F (70°C); 1.43 for solid

Boiling Point: 386.6-395.6°F (197-202°C) at 1 atm.

Melting Point: 127-140°F (53-60°C)

Freezing Point: 127°F (53°C)

Molecular Weight: 98.06

Heat of Combustion: –3298 cal/g

Vapor Pressure: 0.16 mm Hg (0.003 psia) at 68°F (20°C); 5 mm Hg (0.097 psia) at 146.1°F (63.4°C)

Flash Point: 215°F (102°C), closed cup; 230°F (110°C), open cup.

Autoignition Temperature: 878-890°F (470-477°C)

Burning Rate: 1.4 mm/minute when liquid

Stability: Stable

Corrosiveness: Attacks metals when in contact with water.

Reactivity with Water: Slow reaction evolving maleic acid and heat with cold water. Hot water may cause frothing.

Reactivity with Other Chemicals: Reacts with alkali metals, amines, sodium or potassium carbonate or hydroxide, aqueous ammonia or ammonium hydroxide, pyridine solution, sodium hydroxide, calcium hydroxide, mixtures of olefins and catalysts, and strong oxidizers.

IDENTIFICATION

Shipping Names: Maleic anhydride (USDOT and IMO)

Synonyms and Tradenames: cis-Butenedioic anhydride; 2,5-furandione; maleic acid anhydride; toxilic anhydride; dihydro-2,5-dioxofuran.

Chemical Formula: $(CHCO)_2O$

Constituent Components(% each): 99.5% or more pure

UN/NA Designation: UN2215

IMO Designation: 8, corrosive

Physical State as Shipped: Solid or molten liquid

Physical State as Released: Solid or molten liquid

Color of the Shipped Material: Colorless or white crystalline solid

Odor Characteristics: Acrid, choking

Common Uses: Mfg. of polyester resins, alkyd coating resins, pesticides, oil and fat preservative, pharmaceuticals, plasticizers, lubricants, dyes, inks, detergents, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

MALEIC ANHYDRIDE

Class 8 (Corrosive Material)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.3-0.5 ppm (1.3-2.0 mg/m^3)

Unusual Hazards: Even traces of some chemicals in contact with hot maleic anhydride may initiate reactions producing heat and gases that may rupture closed containers. Some of these chemicals may be found in dry chemical or loaded stream fire extinguishers. Contact with hot water may cause frothing.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 0.25 ppm (1 mg/m^3) over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazards are posed by inhalation of vapors or dusts or eye contact. Other direct physical contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Skin contact with maleic anhydride dust may cause a delayed or immediate burning sensation. Prolonged or repeated contact may cause skin irritation or chemical burns. Molten liquid may cause thermal burns. Eye contact with the solid may result in highly injurious burns. High fume concentrations in air may cause sensitivity to light, double vision, and visualizing rings around lights.

Hazards of Inhalation: Dust and vapor are highly irritating to eyes, nose, throat, and respiratory tract and may cause coughing, nosebleeds, headache, nausea, and vomiting. Severe exposure may result in bronchitis or may provoke attacks in individuals with a previous history of asthma. Levels in air of 1.5-2 ppm cause nasal irritation in 1 minute and eye irritation in 15-20 minutes. (Note: 1 ppm=4.08 mg/m^3.)

Hazards of Ingestion: Maleic anhydride is of low to moderate toxicity by ingestion.

FIRE HAZARDS

Lower Flammable Limit: 1.4%

Upper Flammable Limit: 7.1%

Behavior in Fire: Combustible solid. Will burn but difficult to ignite (unless dust cloud in air). Containers may rupture violently in fire due to overpressurization if exposed to 300°F in presence of certain materials. See General Information section for details.

Hazardous Combustion Products: Unknown, but said to be acrid and toxic.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may explode or rupture in fire under special conditions. Contact with certain other chemicals may result in formation of explosive mixtures. Vapors above molten liquid in tanks or other confined spaces may be in explosive range. Dust clouds may be exploded by flame or a spark.

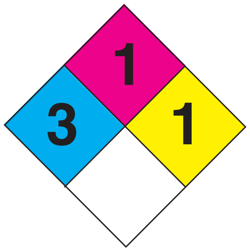
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials (for maleic acid) may include natural rubber, neoprene, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, polyurethane, polyvinyl chloride, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 12.5 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (12.5 ppm or less) or an organic vapor cartridge respirator with a full facepiece (12.5 ppm or less) within the use limitations of these devices. (Note: These devices should also include dust and mist filters.)

2215

MALEIC ANHYDRIDE
Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, skin, throat, or respiratory tract.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide. Water or foam may cause frothing.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the limited possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources where necessary. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Use explosion-proof or spark-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the special reactivity hazards of maleic anhydride into account while planning the response (see General Information section).

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Maleic anhydride, usually, will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of maleic anhydride in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid maleic anhydride with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

MALEIC ANHYDRIDE
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to maleic anhydride vapors or dust may absorb vapors, knockdown dusts, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain maleic acid from contact with vapors or dusts.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Maleic anhydride may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Solutions of maleic anhydride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials. Protect solid product as necessary to prevent wetting by water. Allow molten maleic anhydride to freeze.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material. Keep product dry.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause maleic anhydride dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

MALEIC ANHYDRIDE
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Anion exchangers may also be useful.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

July, 1994

METAM SODIUM
Class 9 (Other Regulated Material)

GENERAL INFORMATION

Metam sodium is clear, yellow to greenish-yellow liquid with a pungent, sulfurous odor. It is not flammable and is shipped as a solution composed of 32.7% metam sodium in water. While it is stable in this proportion, upon contact with additional water, acidic soil components, or exposure to heat, metam sodium will decompose forming carbon disulfide, methylisothiocyanate, monomethylamine and hydrogen sulfide gasses.

Metam sodium solutions are not flammable, however, on decomposition they will release flammable vapors in the form of carbon disulfide and monomethylamine. The rate of decomposition will determine volumes of gas generated.

Metam sodium is soluble and reactive with water. Spills contacting water are expected to distribute in the water column where metam sodium will decompose. Methylisothiocyanate is one of the major products of decomposition and will likely be the predominant threat to water bodies. In soils, metam sodium will distribute freely, like water, and undergo decomposition.

While the vapor pressure of metam sodium is low, gasses produced from decomposition will present a potential for inhalation exposures. Such exposures will result in irritation to the eyes, nose and throat. Direct contact will likely cause irritation, and if exposure is sufficient, burns to the exposed area. If ingested, metam sodium will cause irritation to exposed tissues and may produce symptoms of central nervous system depression.

Metam sodium is used in agriculture as a weed killer, nematocide (worm control), insecticide and soil fumigant. Its controlled decomposition in soils is the method by which metam sodium performs these functions.

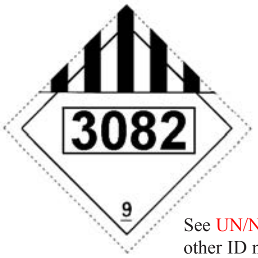
CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble, decomposes.
Solubility in Other Chemicals: Moderate in ethyl alcohol, sparingly soluble in acetone, xylene, and kerosene.
Specific Gravity (Liquid): 1.54 to 1.18
Vapor Density (Air= 1): 1.0
Boiling Point: 110°C (230°F)
Melting Point: Approx. 0°C (32°F)
Freezing Point: Approx. 0°C (32°F)
Molecular Weight: 129.18
Heat of Combustion: Non-flammable.
Vapor Pressure: 21 to 24 mmHg @ 25°C (77°F)
Flash Point: Non-flammable.
Autoignition Temperature: Non-flammable.
Burning Rate: Non-flammable.
Stability: Stable in concentrated aqueous solutions, decomposes when diluted with water, introduced into moist soil, or heated. Slow decomposition occurs on exposure to air. Principal decomposition product is methylisothiocyanate.
Corrosiveness: Alkaline pH, irritant to skin. Also corrosive to copper and copper alloys, brass, aluminum, and zinc.
Reactivity with Water: Stable in concentrated aqueous solutions, decomposes in dilute solutions. Mixtures decompose on dilution with water to release carbon disulfide, methylisothiocyanate, monomethylamine and hydrogen sulfide.
Reactivity with Other Chemicals: Decomposes in the presence of acids and heavy metal salts.

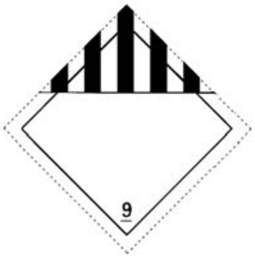
IDENTIFICATION

Shipping Names: Environmentally Hazardous Substance, N.O.S. (Metam sodium).
Synonyms and Tradenames: Sodium -n-methyldithiocarbamate; metam-sodium; VAPAM; methylcarbamodithoic acid, sodium salt; sodium methyldithiocarbamate; SMDC; carbathione; trimaton; n-methylaminodithioformic acid, sodium salt; VPM, maposol; sistan; CAS 137-42-8.
Chemical Formula: $CH_3NHC(S)SNa \cdot 2HOH$
Constituent Components (%o each): Typically 32.7% metam sodium in water.
UN/NA Designation: UN3082 (US), UN2992 (IMO).
IMO Designation: 6.1, poisonous material.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Yellow to light greenish yellow liquid.
Odor Characteristics: Pungent sulfurous odor. Similar to carbon disulfide.
Common Uses: Uses include fungicide, nematocide, weed killer, insecticide, and soil fumigant.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616



METAM SODIUM
Class 9 (Other Regulated Material)



See UN/NA Designation for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Methylisothiocyanate, 45.45 ppm (15 mg/m^3).

Unusual Hazards: Metam sodium decomposes in the presence of heat, water, and in soils to produce carbon disulfide, methylisothiocyanate, monomethylamine and hydrogen sulfide gasses. High decomposition rates may support the development of flammable or toxic gas concentrations.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): Unavailable.

Conditions to Avoid: Contact with water or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Toxic by inhalation, ingestion, and skin absorption. Direct contact with metam sodium solutions or direct contact with contaminated materials is the most likely route of exposure. It is a strong irritant and a possible sensitizing agent. Metam sodium is non-flammable but may decompose producing flammable vapors. Decomposes to produce methylisothiocyanate, carbon disulfide, monomethylamine and hydrogen sulfide gasses.

Hazards of Skin and Eye Contact: Irritating to eye tissues. Exposure to vapors may be irritating. Exposure to liquid or mists can cause comeal damage and corneal edema. Severe exposures may result in bums to the eye. Irritating to the skin. If exposure is prolonged, metam sodium may cause burns to the skin. It can be absorbed through intact skin on repeated or prolonged exposures. Metam sodium is a potential skin sensitizer.

Hazards of Inhalation: May cause irritation to respiratory mucous membranes. May aggravate pre-existing respiratory conditions such as asthma or allergies. In sensitized individuals, may elicit an allergic response such as development of a skin rash or various degrees of respiratory response such as wheezing and asthma. Allergic responses will vary depending on the sensitivity of the individual exposed but could become life threatening.

Hazards of Ingestion: May result in alkali burns to the throat and mouth depending on the concentration. Gastrointestinal distress, nausea, and vomiting are likely to occur depending on the severity of the exposure. May produce symptoms of central nervous system toxicity. Symptoms may include headache, dizziness, loss of coordination, nausea and vomiting. Symptoms may progress, in severe exposures, to loss of consciousness or death.

FIRE HAZARDS

Lower Flammable Limit: Non-flammable.

Upper Flammable Limit: Non-flammable.

Behavior in Fire: Decomposes when exposed to high heat. Decomposition products may include flammable gasses such as carbon disulfide or monomethylamine.

Hazardous Combustion Products: Thermal decomposition products are likely to include methylisothiocyanate, carbon disulfide, monomethylamine and hydrogen sulfide gasses. May also include oxides of nitrogen, oxides of carbon, sulfur, and hydrogen sulfide gasses.

EXPLOSION HAZARDS

Explosiveness: No explosive behaviors identified. Metam sodium is not subject to violent polymerization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with metam sodium liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully covering or encapsulating suits, made of compatible material are appropriate for most large spill situations.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

1075

See UN/NA Designation for
other ID numbers.

METAM SODIUM
Class 9 (Other Regulated Material)

FIRST AID

Nonspecific Symptoms: Irritation to eyes, localized and transient irritation to skin. Burns may result from prolonged exposure. Abdominal distress may result from ingestion. Central nervous system effects may include headache, dizziness and loss of coordination. Irritation to respiratory tissues on inhalation exposures.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 20 minutes, occasionally lifting the eyelid. Seek medical assistance immediately. Risk of permanent eye damage. Prompt medical evaluation is essential. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance immediately.

First Aid for Ingestion: Do not induce vomiting. If victim is conscious, give large amounts of water by mouth. Never give anything by mouth to an unconscious person. Be alert to the development of signs of central nervous system depression including dizziness, nausea, vomiting, and loss of coordination. Provide supportive care and seek medical assistance immediately. Metam sodium solutions are alkali and corrosive to mucous membranes.

FIRE RESPONSE

Extinguishing Materials: Metam sodium is non-flammable. Extinguishing techniques will be based on the fuel involved. Consider that metam sodium solutions will decompose when diluted with water, possibly emitting flammable gasses.

Extinguishing Techniques: Techniques should be selected as appropriate to the burning material. Metam sodium solutions will decompose when diluted with water streams. Runoff will likely be contaminated.

SPILL RESPONSES

General Information: Restrict access to the area and avoid direct contact with spilled product. Prevent liquids from entering sewers and waterways. If waterways are threatened, notify proper authorities, water and sewage treatment plant operators, and other downstream users of the potential for contaminated water. Protect spills, if possible, from contact with firefighting streams or other water sources. Metam sodium decomposes when diluted with water releasing methylisothiocyanate, carbon disulfide, monomethylamine, and hydrogen sulfide. If spilled in water, the predominant contaminant will likely be methylisothiocyanate. Metam sodium is not likely to produce large amounts of airborn contaminants unless exposed to water, heat, or contaminants which would increase the rate of decomposition. Decomposition will occur when metam sodium is exposed to the air but the rate is relatively slow compared to the reactions with contaminants, heat or water.

METAM SODIUM
Class 9 (Other Regulated Material)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Metam sodium may not evolve large amounts of hazardous airborne contaminants if it is kept away from water. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of metam sodium decomposition products may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

MITIGATION

Remove spilled metam sodium as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

FOAM . . . Vapor generation from metam sodium spills may not be sufficient to warrant foam applications. Fire fighting (AFFF) or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of metam sodium decomposition products into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume. Water from foam mixtures may increase decomposition rate.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with metam sodium. Use compatible foam products.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of metam sodium solutions on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Metam sodium solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking product.

CONSEQUENCE

Metam sodium solutions may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Contamination with water will increase the rate of decomposition. Where possible, line containment areas with suitable, impervious material.

LAND SPILL *(CONTINUED)*

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed. Avoid equipment constructed with aluminum, zinc, brass, copper or copper alloys.

TECHNIQUE

ABSORPTION . . . Spilled liquids can be absorbed and immobilized with inert materials such as sand, earth, saw dust, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with metam sodium solution and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL . . . Metam sodium contaminated soil may be removed by shovels, motorized graders, scrapers, loaders, buldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use, with soap and water. Use equipment which is compatible with spilled product. Avoid equipment constructed with aluminum, zinc, brass, copper or copper alloys. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

METAM SODIUM
Class 9 (Other Regulated Material)

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

September 2000

METHACRYLIC ACID, INHIBITED

Class 8 (Corrosive Material)

GENERAL INFORMATION

Methacrylic acid is a colorless liquid with an acrid, repulsive odor. It is used for a variety of purposes and is quite soluble in water and a variety of other chemicals. The toxicity hazards of the product are considerable by all routes of exposure and primarily derive from the highly irritating and corrosive nature of the substance. It has a low pH, and is therefore a strong acid. The flash point of 149ºF indicates the product must be heated before ignition may occur. Above 170ºF explosive vapor/air mixtures may be formed. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back at any temperature above the flash point. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is a possibility that containers of liquid may rupture violently if exposed to certain conditions (see below). The product weighs approximately 8.5 pounds per gallon.

Material may polymerize explosively and will polymerize readily in the absence of an inhibitor due to heating or under the presence of light, oxidizing agents such as peroxides, or in the presence of traces of hydrochloric acid. When transported, methacrylic acid typically contains the monomethyl ether of hydroquinone to prevent polymerization. It may react with water and is highly reactive with oxidizing agents and hydrochloric acid. It is generally stable in normal transportation but this product is not stable when contaminated or the inhibitor has been used up.

Product is flammable and reactive under elevated pressure or temperature conditions. The products of combustion may include toxic and irritating constituents as well as carbon monoxide and carbon dioxide. Liquid freezes to solid at 61ºF.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble

Solubility in Other Chemicals: Soluble in ether, acetone, ethanol, alcohol, ether, ethylene glycol (slightly), methyl ethyl ketone, tetrahydrofuran, carbon tetrachloride, aromatic and chlorinated hydrocarbons, esters, ketones and most organic solvents .

Specific Gravity (Liquid): 1.02

Vapor Density: 2.97

Boiling Point: 325ºF (163ºC)

Melting Point: 61ºF (16ºC)

Freezing Point: See melting point

Molecular Weight: 86.1

Heat of Combustion: Approximately -6310 cal/g

Evaporation Rate (butyl acetate=1): <1

Vapor Pressure: 1 mmHg at 68ºF (20ºC)

Flash Point: 170ºF (76ºC) closed cup; 149ºF (65ºC) open cup

Autoignition Temperature: 750ºF (399ºC)

Burning Rate: Unavailable

Flammable Limits: 1.6% (LEL) - 8.7% (UEL)

pH: 1.2

Stability: Generally stable in normal transportation but this product is not stable when contaminated or inhibitor has been used up.

Polymerization Potential: Material may polymerize explosively. The substance will polymerize readily in the absence of an inhibitor due to heating or under the presence of light, oxidizing agents such as peroxides, or in the presence of traces of hydrochloric acid, with fire or explosion hazard.

Corrosiveness: Attacks metal and is corrosive to bodily tissue. Contact with metals may evolve flammable hydrogen gas.

Reactivity with Water: May react.

Reactivity and Incompatibility: Highly reactive with oxidizing agents and hydrochloric acid. The product may undergo dangerous decomposition, condensation or polymerization. It may react violently with water to emit toxic gases or may become self-reactive under conditions of shock or increase in temperature or pressure.

IDENTIFICATION

Shipping Name(s): Methacrylic acid, inhibited (USDOT & IMO)

Synonyms and Tradenames: Crotonic acid; alpha-Methylcrylic acid; 2-Methyl-2-propenoic acid; Methyl acrylic acid.

CAS Registry No.: 79-41-4

Chemical Formula: $CH_2{=}C(CH_3)COOH$

Constituent Components (% each): Most sources report approximately 100% pure solutions. (Note: Typically contains 100 ppm of the monomethyl ether of hydroquinone to prevent polymerization.)

UN/NA Designation: UN2531

IMO Designation: 8, Corrosives

RTECS Number: OZ2975000

NFPA 704 Hazard Rating: 3(Health): 2(Flammability): 2(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid; freezes to solid at 61ºF.

Color of the Shipped Material: Colorless

Odor Characteristics: Acrid, repulsive odor.

Reportable Quantity: See appendix I.

Common Uses: Stabilizer; component of spray drift retardant; coating for nylon film; appliances. Methacrylic acid cannot be used as an end product, but is processed into other methacrylic products. One important use of methacrylic acid is in paint and varnish resins and dispersions, which in turn are processed into paints and different kinds of varnish.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHACRYLIC ACID, INHIBITED
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.21 ppm.

Unusual Hazards: The substance will polymerize readily due to heating or under the presence of light, oxidizing agents such as peroxides, or in the presence of traces of hydrochloric acid, with fire or explosion hazard.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 20 ppm (70 mg/m^3)

Ceiling (C) Limit: Unavailable

IDLH: No data

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and downwind as well as direct physical contact. Ingestion is also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with the skin may cause redness, skin burns, pain and blisters and may cause an allergic skin reaction. Product may be absorbed through the skin. Contact with the eyes may cause redness, pain, loss of vision and severe deep burns.

Hazards of Inhalation: Inhalation of vapors irritates the mucous membranes and respiratory tract. Symptoms may include sore throat, shortness of breath, coughing, wheezing, headache, nausea and vomiting. Inhalation may be fatal as a result of spasm, inflammation, edema of the larynx and bronchi and chemical pneumonitis.

Hazards of Ingestion: Ingestion may cause abdominal cramps, abdominal pain, burning sensation and weakness.

FIRE HAZARDS

Lower Flammable Limit: 1.6%

Upper Flammable Limit: 8.7%

Behavior in Fire: Exposure of containers to fire or heat may result in violent polymerization and possible container rupture. May generate large quantities of flammable gas or vapor upon release. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back.

Hazardous Combustion Products: Carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Excessive heat may cause spontaneous polymerization resulting in violent container rupture. Violent polymerization may also occur. Above 170°F explosive vapor/air mixtures may be formed.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

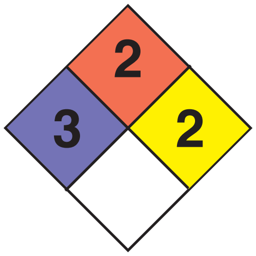
Protective Clothing Required: Equipment should prevent any possibility of skin contact and eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas tight safety goggles, and other impervious and resistant clothing. Viton® and butyl rubber are reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases according to some authorities to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices.

2531

METHACRYLIC ACID, INHIBITED

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues and eyes, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, alcohol type concentrate foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Take the relative volatility, flammability, and toxicity of product into account when planning the response. (Note: Liquid freezes to solid at 61ºF.) Note that there is potential for the product to polymerize under a variety of conditions.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind. Note that even very low concentrations may be irritating to the eyes and respiratory system.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

METHACRYLIC ACID, INHIBITED
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL TYPE CONCENTRATE FOAM . . . There is a possibility that alcohol type concentrate foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

PROTECTION FROM THE WIND . . . If product has solidified, cover solid product with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Methacrylic acid may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

METHACRYLIC ACID, INHIBITED

Class 8 (Corrosive Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

METHACRYLIC ACID, INHIBITED

Class 8 (Corrosive Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2006

METHANOL

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methanol, commonly known as methyl alcohol, is a colorless fairly volatile liquid with a faintly sweet pungent odor like ethyl alcohol. It is used as a raw material for making numerous other chemicals, as a fuel, and as an ingredient in a wide variety of products. The substance is fully soluble in water. Its flash point of 54°F indicates that it can be easily ignited over a wide range of ambient temperature conditions. Vapors of the alcohol are slightly heavier than air and may travel some distance to a source of ignition and flash back in warm weather. Accumulations of vapors in confined spaces such as buildings or sewers may explode if ignited. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 6.6 pounds per gallon.

Methanol does not react with water or many other common materials and is stable in normal transportation. It is reactive with strong oxidizing materials and strong acids, as well as certain other chemicals. It may attack some forms of plastics, rubber, and coatings; and may be somewhat corrosive to lead and aluminum. Products of combustion may include formaldehyde, carbon monoxide, carbon monoxide and unburned methanol.

If methanol is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. For larger spills, increase in the downwind direction as conditions warrant. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 0.792 at 68°F (20°C)
Vapor Density: 1.1
Boiling Point: 148.1°F (64.5C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –144°F (–97.8°C)
Molecular Weight: 32.1
Heat of Combustion: –4677 cal/g
Evaporation Rate (butyl acetate=1): 2.1
Vapor Pressure: 97 mm Hg (1.87 psia) at 68°F (20°C)
Flash Point: 54°F (12.2°C), cc; 61°F (16.1°C), oc.
Autoignition Temperature: Min. 725°F (385°C); max. 878°F (470°C); reported values vary
Burning Rate: 1.7 mm/minute
Flammable (Explosive) Limits: 6% (LEL) – 36% (UEL)
Stability: Stable
Polymerization Potential: Will not occur
pH: Not applicable
Corrosiveness: May be corrosive to lead and aluminum; may attack some forms of plastics, rubber and coatings.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with strong oxidizers, strong acids, strong bases, zinc, perchloric acid, calcium hypochlorite, hypochlorites, peroxides, sodium, potassium or sodium hydroxide and chloroform, sulfuric acid, caustics, aliphatic amines, isocyanates and other materials.

IDENTIFICATION

Shipping Names: Methanol (USDOT & IMO)
Synonyms and Tradenames: Methyl alcohol; Wood alcohol; Methyl hydroxide; Carbinol; Methylol; Monohydroxymethane; Wood spirit; Columbian spirits; Wood naphtha; Pyroxylic spirit; Pyroligneous spirit; Colonial spirit.
CAS Registry No.: 67-56-1
Chemical Formula: CH_3OH
Constituent Components(% each): 99.9–100% pure
UN/NA Designation: UN1230
IMO Designation: 3, flammable liquids; 6.1 toxic substances
RTECS Number: PC1400000
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Instability)
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Faintly sweet, pungent, like ethyl alcohol or wine.
Reportable Quantity: See Appendix I
Common Uses: Solvent for inks, resins, adhesives, dyes; ingredient in paint removers, cleaning products, duplicating fluids, embalming fluids, antifreezes, enamels; mfg. of photo film, plastics, pharmaceuticals, plastics, soaps, stains, coatings, glass, dyes, artificial leather, and many chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHANOL

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Faint odor at 2000 ppm but reported values vary widely, some as low as 4.3, therefore, caution should be used in relying on odor alone as a warning of potentially hazardous exposures.

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back. Vapors may persist for a time in pits, hollows and depressions. Flowing product may be ignited by self-generated static electricity. Exposures by inhalation or ingestion are a well-known cause of optic nerve and eye damage.

Short Term Exposure Limits (STEL): 250 ppm (325 mg/m^3) (skin) (NIOSH)

Time Weighted Average (TLV-TWA): 200 ppm (260 mg/m^3) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 6000 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazards are from inhalation of the high vapor concentrations that may be present in air or ingestion of methanol. Prolonged and extensive skin contact should also be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid methanol may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Some amount of absorption via the skin may also occur. External contact with the eyes usually causes a mild temporary reaction.

Hazards of Inhalation: Breathing very high vapor concentrations of methanol may result in headache, weakness, drowsiness, light-headedness, nausea, drunkenness, eye irritation, blurred vision, blindness, loss of consciousness, and possibly death. Victims may improve and then get worse again up to 30 hours later.

Hazards of Ingestion: Ingestion of as little as one-third to one-half ounce may cause serious poisoning with effects similar to those of inhalation and absorption through the skin. Toxic effects are more common after ingestion.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 6%

Upper Flammable (Explosive) Limit: 36%

Behavior in Fire: Flammable liquid. May generate quantities of flammable vapor upon release. Vapors may be heavier than air and may travel to a source of ignition and flash back. There is some limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: May include formaldehyde, carbon monoxide, carbon dioxide and unburned methanol.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

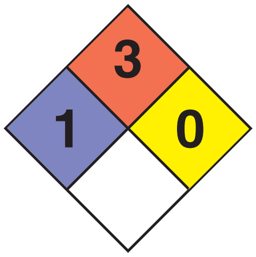
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, chlorinated polyethylene, polyurethane, sytrene-butadiene rubber, Viton®, Teflon® and nitrile-butadiene rubber. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® (CPF 2; SL; CPF 4; Responder®; Responder® CSM; TK; Reflector®; CPE; ThermoPro); Trellchem HPS® suits; Saranex® coated suits; Butyl 874R gloves; Butyl 878 gloves; Neop. Chloroflex N5/N8 gloves; Viton 890® gloves, Viton 892® gloves; 4H® and Silver Shield® brand gloves. The following materials are ***not*** recommended for use: Tychem® PVC; Tychem® F; Tychem® CPF 1; Tychem® QC; Tychem® CPF 3.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 6000 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For concentrations (6000 ppm or less): any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece. For concentrations (5000 ppm or less), any supplied-air respirator operated in a continuous-flow mode. For concentrations (2000 ppm or less), any supplied-air respirator.

1230

METHANOL

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Headache, weakness, and other symptoms of systemic intoxication.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 15 minutes. Get medical attention immediately if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water. Get medical attention immediately. Note: Sources disagree on whether to make a conscious victim vomit if methanol has been ingested.

Note to Physician: One source reports that ethyl alcohol is an accepted antidote. Symptoms may improve and then get worse again up to 30 hours later.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol-resistant foam, water spray or fog. Water may be ineffective except for cooling containers.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Methanol will completely dissolve in water. Dike fire control water for proper disposal since it may contain flammable vapors. Note that methanol has a flash point of 54°F. Note that methanol burns with a rather non-luminous bluish flame.

SPILL RESPONSES

General Information: Methanol is a highly flammable and volatile liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of methanol may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that methanol is a highly flammable substance that may evaporate rapidly, dissolve in water and is lighter than water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

METHANOL
Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Methanol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed.

CONSEQUENCE

Hazardous levels of methanol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb methanol vapors and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Water runoff may contain varying amounts of methanol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water, and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL-RESISTANT FOAM . . . Alcohol-resistant foam applied to the surface of liquid pools may slow the release of methanol vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

METHANOL

Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methanol may be contained by building dikes or barriers using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained methanol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible, non-combustible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

METHANOL
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment techniques.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Activated carbon may not be highly effective.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2003

1-METHOXY-2-PROPANOL

Class 3 (Flammable Liquid)

GENERAL INFORMATION

1-Methoxy-2-propanol is a clear, flammable liquid with a sweet, ethereal odor. It is commonly known as propylene glycol monomethyl ether (PGME). It is soluble in water and is used as a solvent in making acrylics, dyes, inks and stains and as a heat transfer fluid. It is also used in the pharmaceutical industry as an extractant, in cosmetics, adhesives, agrochemical formulations and industrial and household cleaners. It is a flammable liquid, having a low flash point of 91.4°F, indicating that it may be easily ignited at warmer ambient temperatures. It is reactive with strong acids and oxidizing agents and acts as a solvent with many resins, plastics and rubbers. The product weighs approximately 7.7 pounds per gallon.

Prolonged or repeated contact causes defatting of the skin with irritation, dryness and cracking. Exposure may cause central nervous system depression and irritation of the eyes, skin and mucous membranes. PGME has a vapor pressure of 10.9 mm Hg at 68°F, making it a moderate hazard at normal ambient temperatures. Vapors are heavier than air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers. Products of combustion may include toxic gases.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of 1-methoxy-2-propanol is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 0.924
Vapor Density: 3.11
Boiling Point: 247.2°F (119.6°C)
Melting Point: -143°F (-97°C)
Freezing Point: See melting point
Molecular Weight: 90.1
Heat of Combustion: -7580 cal/g
Evaporation Rate (butyl acetate=1): 0.71
Vapor Pressure: 10.9 mm Hg at 68°F (20°C)
Flash Point: 91.4°F (33°C)
Autoignition Temperature: 546.8°F (286°C)
Burning Rate: Unavailable
Flammable Limits: 1.7% (LFL) - 11.5% (UFL)
Stability: Stable under normal conditions
Polymerization Potential: Will not occur
pH: Unavailable
Reactivity with Water: None
Reactivity and Incompatibility: Oxidizing agents (such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine and fluorine), strong acids (such as sulfuric acid, hydrochloric acid, and nitric acid) or isocyanates. This substance acts as a solvent with many resins, plastics and rubbers.

IDENTIFICATION

Shipping Name(s): 1-Methoxy-2-propanol (USDOT & IMO)
Synonyms and Tradenames: 1-Methoxy-2-hydroxypropane; Propylene glycol monomethyl ether (PGME); 1-Methoxypropan-2-ol; alpha-Propylene glycol monomethyl ether; Dowanol 33b; Dowanol pm; Dowtherm 209; Glycol ether pm; Methoxy ether of propylene glycol; Methoxypropanol, alpha isomer; Polypropylene glycol methyl ether; Poly-solve mpm; Propasol solvent m; Propylene glycol 1-methyl ether; Propylene glycol methyl ether; 1-Methoxy-2-hydroxypropane
CAS Registry No.: 107-98-2
Chemical Formula: $CH_3OCH_2CH(OH)CH_3$
Constituent Components (% each): Typically 98% to 100% pure
UN/NA Designation: UN3092
IMO Designation: 3, Flammable liquids
RTECS Number: UB7700000
NFPA 704 Hazard Rating: 0 (Health): 3 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear, colorless liquid
Odor Characteristics: Sweetish odor, ethereal odor
Common Uses: It is used as a solvent in making acrylics, dyes, inks and stains and as a heat transfer fluid. Widely used in the surface coating industry, as a solvent and to regulate flow, leveling and coalescence. It is also used in the pharmaceutical industry as an extractant, in cosmetics, adhesives, printing inks, agrochemical formulations and industrial and household cleaners.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1-METHOXY-2-PROPANOL

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10 ppm

Unusual Hazards: Product is flammable. Fumes and vapors are heavier than air, may travel to a distant source of ignition and flash back.

Short Term Exposure Limit (STEL): 150 ppm (553 mg/m^3) (NIOSH & ACGIH)

Time Weighted Average (TLV-TWA): 100 ppm (NIOSH & ACGIH)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat or sources of ignition; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to the high vapor concentrations that may be present in the local spill area and immediately downwind.

Hazards of Skin or Eye Contact: May cause skin and eye irritation. Prolonged and/or repeated contact causes defatting of the skin with irritation, dryness, cracking or folliculitis.

Hazards of Inhalation: May cause respiratory tract irritation. Inhalation of high concentrations may cause central nervous system effects characterized by nausea, headache, dizziness, unconsciousness and coma. Vapors may cause dizziness or suffocation.

Hazards of Ingestion: May cause gastrointestinal irritation with nausea, vomiting and diarrhea. May cause central nervous system depression, headache, dizziness, drowsiness and nausea. Prolonged exposure may cause collapse, unconsciousness, coma and possible death due to respiratory failure.

FIRE HAZARDS

Lower Flammable Limit: 1.7%

Upper Flammable Limit: 11.5%

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas and may travel to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: May include carbon monoxide, carbon dioxide and irritating and toxic fumes and gases.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

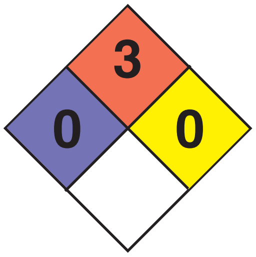
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, nitrile, neoprene, natural rubber (all reported to have a greater than 8 hour breakthrough time). Viton® has a reported breakthrough time of 165 minutes. Based on the chemical subclass, the following apparel may have a greater than 8 hour breakthrough time: Tychem® 9400, Tychem® BR and Tychem® TK. (NOTE: According to Dupont, prediction of chemical resistance of a material from data on other chemicals has not been successful. However, when data is unavailable, information on related chemicals within a sub-class may at least rank alternative chemical protective materials as to their probable chemical resistance.)

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

3092

1-METHOXY-2-PROPANOL

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Defatting of the skin with irritation, dryness, and cracking. May cause central nervous system depression. May cause eye, skin, respiratory and digestive tract irritation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if irritation develops or persists. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Seek medical advice on whether or not to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, alcohol-resistant foam, water spray, fog or carbon dioxide.

Extinguishing Techniques: Toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: 1-Methoxy-2-propanol is a flammable liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

1-METHOXY-2-PROPANOL

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic and/or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression. Flashback may occur.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashback may occur.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Spills may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

1-METHOXY-2-PROPANOL
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

1-METHOXY-2-PROPANOL
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July, 1994

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl acrylate is a clear, colorless liquid with an acrid odor. Vapors are irritating and will induce tear formation in the eyes. Methyl acrylate is a mobile, volatile, and flammable liquid weighing approximately 8 pounds per gallon. The liquid is less dense than water and if spilled on water, will tend to float on the surface.

Methyl acrylate vapors may travel a considerable distance to a source of ignition. Vapors are heavier than air and may concentrate in low lying areas or confined spaces. Vapors may ignite and flashback to the source and if ignition occurs in a confined setting, ignition may proceed explosively.

Methyl acrylate will polymerize readily in the presence of Uv light, sunlight or heat. Contact with peroxides, oxidizers, nitrates, azides, strong bases, strong acids and catalytic metals such as copper and iron can also initiate violent or explosive polymerization reactions. Liquid methyl acrylate is typically treated with monomethyl ether of hydroquinone and stored in a 5 - 8% oxygen atmosphere to inhibit polymerization. The inhibitor may become depleted in a spill situation or in the presence of heat. If containers are exposed to heat, violent polymerization and container rupture is possible. Vapors are not inhibited and may polymerize. If this occurs in confined spaces such as vents or stacks, polymer accumulations may be sufficient to plug these spaces.

Methyl acrylate is toxic by all exposure routes and may be absorbed through the skin. Skin exposures will likely result in severe irritation or burns. Inhalation effects may result in irritation or burns to respiratory mucous membranes depending on the exposure.

Methyl acrylate is used in a variety of processes including the manufacture of acrylic polymers, surfactants and vitamin B_1. It is also used in the manufacture of leather finishing resins, textile and paper coatings, and plastic films.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 6 gm/100 ml.
Solubility in Other Chemicals: Soluble in alcohol and ether.
Specific Gravity (Liquid): 0.95
Vapor Density (Air =1): 3.0
Boiling Point: 80.5°C (176.9°F)
Melting Point: -76.5°C (-105.7°F)
Freezing Point: -76.5°C (-105.7°F)
Molecular Weight: 86.09
Heat of Combustion: -5500 cal/gm
Vapor Pressure: 65 - 70 mmHg @ 20°C (68°F)
Flash Point: -3 to -3.8°C (26.6 to 25.16°F) OC
Autoignition Temperature: 468°C (874.4°F)
Burning Rate: Unavailable.
Stability: Readily polymerizes. Polymerization is enhanced in the presence of heat or light.
Corrosiveness: Not corrosive.
Reactivity with Water: Impurities in water could contribute to initiating polymerization.
Reactivity with Other Chemicals: Peroxides, oxidizers, nitrates, azides, strong bases, strong acids and catalytic metals such as copper and iron can initiate violent or explosive polymerization reactions.

IDENTIFICATION

Shipping Names: Methyl Acrylate, Inhibited
Synonyms and Tradenames: 2-propenoic acid, methyl ester; acrylic acid, methyl ester; CAS 96-33-3.
Chemical Formula: $CH_2{:}CHCOOCH_3$
Constituent Components (% each): Methyl acrylate 100%, inhibited with 15 - 20 ppm monomethyl ether of hydroquinone.
UN/INA Designation: UN1919
IMO Designation: 3.2, flammable liquid.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Colorless.
Odor Characteristics: Acrid odor.
Common Uses: Used in the manufacture of acrylic polymers and surfactants. Also used in the manufacture of leather finishers, textile and paper coatings, plastic films, and vitamin B_1.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.0047 ppm (0.017 mg/m^3)

Unusual Hazards: Uninhibited liquid is a violent polymerization hazard. Vapors are not inhibited and may also polymerize. Contaminants, sunlight, Uv light, and heat may initiate polymerization. Liquid is inhibited against polymerization and 5 - 8% oxygen atmospheres are required for inhibitor to work. Temperatures in excess of 38.8°C (100°F) will increase polymerization potential. Liquids readily polymerize on loss or inactivation of inhibitor. Flammable vapors may travel considerable distance to source of ignition and flashback to source.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): 10 ppm (35 mg/m^3) skin., OSHA PEL - TWA

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: *Toxic* by ingestion, and to a lesser degree, by absorption and inhalation. Irritant to skin and eyes. Highly irritating to eyes, skin and mucous membranes. Inhalation exposure may result in severe irritation to the respiratory mucous membranes, pulmonary edema, and in severe cases, chemical pneumonia.

Hazards of Skin and Eye Contact: Exposure to eyes may result in severe irritation and corneal injury. Vapors may be irritating to eyes and cause tearing. Skin contact may result in severe irritation, redness, blistering or burns. Severity increasing with quantity and duration of exposure. Toxic by skin absorption on prolonged contact.

Hazards of Inhalation: Primarily an irritant to respiratory mucous membranes. Prolonged exposure to excessive vapors may result in varying degrees of respiratory impairment including burning sensation, coughing, wheezing, shortness of breath. Severe exposures may result in pulmonary edema and chemical pneumonia. Development of pulmonary symptoms may be delayed. Risk of systemic toxicity slight by inhalation route.

Hazards of Ingestion: Severe irritation or burns of the mouth, throat, stomach and associated tissue. May cause nausea, vomiting, and gastrointestinal distress. May produce symptoms of dizziness, difficulty in breathing, and nervousness.

FIRE HAZARDS

Lower Flammable Limit: 2%

Upper Flammable Limit: 12%

Behavior in Fire: May polymerize violently or explosively in fire situations. Intact containers may rupture violently if exposed to heat due to runaway polymerization of methyl acrylate. Temperatures above 38.8°C (100°F) may favor polymerization reaction. Smoke may contain toxic and irritating vapors. Vapors are heavier than air and will tend to collect in confined spaces or low lying areas. Vapor concentrations may present a source for ignition and flashback to the source.

Hazardous Combustion Products: May include unburned product, aldehydes, oxides of carbon and other constituents.

EXPLOSION HAZARDS

Explosiveness: Vapor mixtures within the flammable limits may ignite explosively. Loss of inhibitor, exposure to heat, and contamination may initiate violent polymerization.

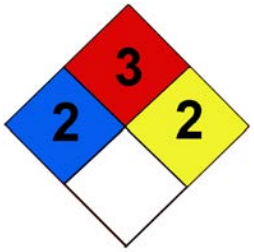
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with methyl acrylate liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully encapsulating suits made of compatible material are appropriate for most large spill situations. Butyl rubber and neoprene have been reported as appropriate materials of construction.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

1919

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or burns to skin, eyes and respiratory tract. Irritation or burns to mouth throat and stomach, gastrointestinal distress, nausea, vomiting, dizziness and difficulty breathing in cases involving accidental ingestion.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure. This may result in increased respiratory distress with time. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists or exposure is severe.

First Aid for Ingestion: Do not induce vomiting. If victim is conscious, administer large quantities of water or milk. Never give anything by mouth to an unconscious person. Seek medical assistance immediately. Be alert to signs of difficulty in breathing, nervousness or other indications of systemic toxicity.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, compatible multi-purpose foam, carbon dioxide, or dry chemical extinguishing agents. Water as a direct stream may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with methyl acrylate. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Intact containers may rupture violently if exposed to heat due to runaway polymerization of methyl acrylate. Temperatures above 38.8°C (100°F) may favor polymerization reaction. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water, from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water as a direct stream may be ineffective. Carbon dioxide or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing, system. Alcohol foam is appropriate for fires involving methyl acrylate.

SPILL RESPONSES

General Information: Methyl acrylate is a severe polymerization hazard when inhibitor is exhausted or in high temperature conditions. It is flammable and toxic. Response strategies should account for the fact that flammable vapors are heavier than air and may collect locally in enclosed spaces or low lying areas. Flammable vapors may travel a considerable distance to source of ignition and flash back to source. When spilled in water, methyl acrylate is only slightly soluble and will tend to float on the water's surface. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of methyl acrylate may result in explosion.

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl acrylate spills may expose downwind areas to toxic or flammable concentrations over considerable distances, in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog applied to methyl acrylate vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain a small amount (if any) of methyl acrylate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of methyl acrylate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with methyl acrylate.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of methyl acrylate liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Methyl acrylate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking methyl acrylate.

CONSEQUENCE

Methyl acrylate may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Methyl acrylate is highly flammable and explosion proof (intrinsically safe) equipment must be used.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION . . . Spilled methyl acrylate can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbents.

CONSEQUENCE

Sorbents will become contaminated with methyl acrylate and will pose the same hazards as the spilled product. Use of sorbents will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbents to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with methyl acrylate may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines. Explosion proof (intrinsically safe) equipment must be used due to the high flammability of methyl acrylate.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Removed materials may pose a continued risk of fire or contamination.

MITIGATION

Decontaminate all equipment after use, with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

METHYL ACRYLATE, INHIBITED
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible materials may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of the spilled methyl acrylate.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating methyl acrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose a hazard to future users. Fire hazards pose risk to personnel and equipment.

MITIGATION

Decontaminate equipment after use. Store recovered methyl acrylate in a safe and secure location. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with methyl acrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of the contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

METHYLAMINE, ANHYDROUS

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Methylamine is a colorless gas with a fishy odor at lower concentrations and an ammonia-like or suffocating odor at higher concentrations. It is used mainly as an intermediate in organic synthesis but also has other uses such as an intermediate for water gel explosives, accelerators, pharmaceuticals, insecticides, in tanning, component of photographic developers, paint removers, fuel additive, production of dyes, polymerization inhibitor and rocket propellant. It is produced from methanol and ammonia in the presence of an Al_2O_3 catalyst at 450°C (842°F). The resultant mix of mono-, di-, and tri- methylamines is separated by distillation under pressure. It is very soluble in water, of which the resultant pH is basic at 11.8, as well as being soluble in alcohol, ethanol, acetone, diethyl ether and benzene. It is normally stable although it may react with strong acids, oxidizing agents, halogens and some other materials. It is corrosive to aluminum, copper, copper alloys, zinc alloys, and galvanized surfaces.

Methylamine is a very flammable gas with a lower explosive limit of 4.9% and an upper explosive limit of 20.7%. During a fire, toxic nitrogen oxide gases may be generated. Flame is nearly invisible in daylight. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Hazardous decomposition products include carbon dioxide, carbon monoxide, nitrogen oxides, ammonia and traces of organic compounds including hydrogen cyanide, nitriles, isocyanates, nitrosamines and amines.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very soluble (108 g/ml at 25°C (77°F))
Solubility in Other Chemicals: Soluble in alcohol, ethanol, acetone, diethyl ether and benzene. Miscible with ether.
Specific Gravity (Water=1): .693 at -6.5°C (20°F)
Vapor Density (Air=1): 1.07
Boiling Point: -6.3°C (20.7°F)
Freezing Point: -93.5°C (-136.3°F)
Molecular Weight: 31.07
Heat of Combustion: -8340 cal/g
Vapor Pressure: 300 pKa (2.96 atm) (27 psi) at 20°C (68°F); 2622 mm Hg at 25°C (77°F); approximately 760 pKa (7.5 atm) at 50°C (122°F)
Flash Point: -17.8°C (0°F)
Autoignition Temperature: 430°C (806°F)
Burning Rate: Rapid
Flammable Limits: 4.9% (LEL) - 20.7% (UEL)
Stability: Stable
Polymerization Potential: Will not occur.
pH: 11.8 (.1 M solution) (calculated)
Corrosiveness: Corrosive to aluminum, copper, copper alloys, zinc alloys and galvanized surfaces. May attack some forms of plastics, rubber and coatings.
Reactivity and Incompatibility: May react with strong acids, oxidizing agents and halogens. Calcium hypochlorite and sodium hypochlorite react to form normal chloroamines, which are explosive. Mercury reacts to form shock sensitive compounds. Nitromethane reaction products may detonate. Nitrosyl perchlorate mixtures can explode. Violent reaction may result when mixed with oxidizing agents like peroxides, permanganate, etc.

IDENTIFICATION

Shipping Name(s): Methylamine, anhydrous (USDOT & IMO)
Synonyms and Tradenames: Aminomethane; Carbinamine; Methanamine (9Cl); Methylamine; Methylamine, anhydrous; Mercurialin; MMA; Monomethylamine
CAS Registry No: 74-89-5
Chemical Formula: CH_3NH_2
Constituent Components (% each): Greater than 98% pure.
UN/NA Designation: UN1061
IMO Designation: 2.1
RTECS Number: PF6300000
NFPA 704 Hazard Rating: 3 (Health): 4 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquefied compressed gas
Physical Form as Released: Fuming liquid or gas
Color of the Shipped Material: Colorless
Odor Characteristics: Characteristic fishy odor at lower concentrations and an ammonia-like or suffocating odor at high concentrations (100-500 ppm).
Reportable Quantity: See appendix I
Common Uses: Used mainly as an intermediate in organic synthesis, as an intermediate for water gel explosives, accelerators, pharmaceuticals, insecticides, N-methylpyrrolidine, methylalkanolamines, surface active agents, fungicides, in tanning, component of photographic developers, paint removers, fuel additive, production of dyes, polymerization inhibitor and rocket propellant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHYLAMINE, ANHYDROUS

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 4.7 ppm (detection); wide range reported from .0009-4.68 ppm. Olfactory fatigue may occur.

Unusual Hazards: Extremely flammable with relatively wide range of flammability. Very toxic and may be fatal if inhaled in large concentrations and harmful if swallowed. Extremely irritating to the respiratory tract and may cause delayed lung injury. Low concentrations of amines may cause a temporary visual disturbance known as “blue haze” or “halo vision”. Frostbite like burns may occur from contact with liquid or concentrated cold gas.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 10 ppm

Ceiling (C) Limit: Unavailable

IDLH: 100 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong acids, oxidizing agents, mercury, nitromethane and halogens. Corrosive to aluminum, copper, copper alloys, zinc alloys and galvanized surfaces.

HEALTH HAZARDS

Potential Health Hazards: Material may cause burns or ulceration to the skin. Eye contact can cause irritation. High vapor concentrations can cause corneal opacity or eye corrosion with corneal or conjunctival ulceration. Inhalation can cause irritation of the respiratory tract. Ingestion can cause gastrointestinal irritation. Individuals with preexisting lung disorders or skin disorders may have increased susceptibility to this material.

Hazards of Skin or Eye Contact: Material is corrosive and can cause redness, pain and inflammation. Contact with liquid or concentrated cold gas can cause frostbite like burns with symptoms ranging from numbness, prickling, itching, burning and/or stiffness. Tissue can become discolored and appear white to yellow. In severe cases, blistering, tissue death and gangrene may occur. Brief exposure to the eyes can cause irritation such as redness and tearing. Longer exposure can lead to inflammation of the eyes leading to blurred vision. Liquid or concentrated cold gas may cause freezing or clouding of the cornea leading to loss of sight. Permanent eye damage or blindness can result. Conditions known as “blue haze” or “halo vision” from exposure to amines is known to exist and usually clears up within a day, although it is not known whether methylamine can cause this condition

Hazards of Inhalation: Material is severely irritating to the respiratory tract. Symptoms of brief exposure are irritation and burning of the nose and throat. Symptoms of exposure to higher concentrations can include coughing, wheezing, headache, nausea, faintness, vomiting, diarrhea, abdominal cramps and feelings of anxiety. Symptoms disappear when exposure stops. In severe cases, death can result from inflammation of the bronchi and lungs and fluid accumulation in the lungs known as pulmonary edema. Symptoms of pulmonary edema can develop several hours after exposure and are aggravated by physical exertion.

Hazards of Ingestion: Ingestion is unlikely due to physical nature of methylamine as a gas, but can cause severe gastrointestinal irritation severe gastrointestinal irritation, nausea, vomiting or burns. It can also cause frost like symptoms.

FIRE HAZARDS

Lower Flammable Limit: 4.95%

Upper Flammable Limit: 20.75%

Behavior in Fire: Material is extremely flammable with a wide range of flammability. Aqueous solution of 5% or greater are still flammable. During a fire, toxic nitrogen oxide gases may be generated. It will readily ignite if exposed to sources of heat and flame. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Containers exposed to prolonged heat or fire may violently rupture.

Hazardous Decomposition Products: Carbon dioxide, carbon monoxide, nitrogen oxides, ammonia and traces of organic compounds including hydrogen cyanide, nitriles, isocyanates, nitrosamines and amines.

EXPLOSION HAZARDS

Explosive Potential: High. Can readily form explosive mixtures with air. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged heat or fire may violently rupture.

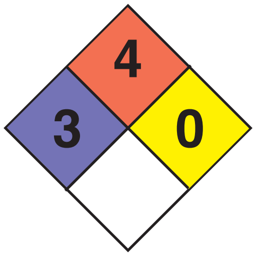
PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level

1061

METHYLAMINE, ANHYDROUS

Division 2.1 (Flammable Gas)



A Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product. Suitable materials of construction are: butyl rubber, nitrile rubber, Tychem® 10,000 and Viton®(longer than 8 hours); neoprene (longer than 4 hours), polyvinylchloride, 4H® (1 to 4 hours); and, Barricade®, Tychem® 9400 (105 minutes). Natural rubber, Chemrel® and polyvinylalcohol have less than 1 hour resistance to breakthrough and are not recommended for use. Structural firefighting protective clothing will not provide an adequate level of personal protection for this product.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved full-facepiece chemical cartridge respirator with cartridge, gas mask with canister, powered air-purifying respirator with cartridge should provide adequate protection for post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

FIRST AID

Nonspecific Symptoms: Symptoms of skin contact can include redness, pain, inflammation and frostbite. Eye contact can cause irritation, inflammation, blurred vision and even loss of vision. Inhalation can cause severe respiratory irritation; symptoms of exposure to higher concentrations can include coughing, wheezing, headache, nausea, faintness, vomiting, diarrhea, abdominal cramps and feelings of anxiety. In severe conditions, pulmonary edema can result. Although ingestion is unlikely, symptoms are irritation of the nose, throat, esophagus and stomach.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Do not allow patient to move if not necessary, pulmonary edema symptoms can be delayed up to 48 hours. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact, flush with lukewarm water until chemical is removed. In cases of frostbite, do not attempt to rewarm the affected area on site without medical advice. Remove contaminated clothing, if clothing is stuck to an affected area gently cut around affected area and remove rest of garment. Loosely cover the affected area with a sterile dressing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water for 15 minutes while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large quantities of water, milk or activated charcoal slurry if victim is conscious but do not induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Special Note to Physicians: To prepare activated charcoal slurry, suspend 50 grams of activated charcoal in 400 ml of water and shake well. Give 5 ml/Kg of body weight or 350 ml for an average adult.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam, or water spray (fog).

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Solid streams of water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

METHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

SPILL RESPONSES

General Information: Methylamine is a highly flammable and corrosive gas that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

MONITOR THE SITUATION . . . With a boiling point of -6.3°C (21°F) flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG . . . Water sprays may be used to reduce vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

METHYLAMINE, ANHYDROUS

Division 2.1 (Flammable Gas)

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents may be applied to the surface of liquid pools to reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid may slow the release of vapors into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

METHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor for flammable conditions.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water via a processing system constructed on land.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

METHYLAMINE, AQUEOUS SOLUTION

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methylamine is a colorless liquid with a fishy odor at lower concentrations and an ammonia-like or suffocating odor at higher concentrations. It is used mainly as an intermediate in organic synthesis but also has other uses such as an intermediate for water gel explosives, accelerators, pharmaceuticals, insecticides, in tanning, component of photographic developers, paint removers, fuel additive, production of dyes, polymerization inhibitor and rocket propellant. It is produced from methanol and ammonia in the presence of an Al_2O_3 catalysts at 450°C (842°F). The resultant mix of mono-, di-, and tri- methylamines is separated by distillation under pressure. It is very soluble in water, of which the resultant pH is basic at 11.8, as well as being soluble in alcohol, ethanol, acetone, diethyl ether and benzene. It is normally stable although it may react with strong acids, oxidizing agents, halogens and some other materials. It is corrosive to aluminum, copper, copper alloys, zinc alloys, and galvanized surfaces.

Methylamine is very flammable, with a lower explosive limit of 4.9% and an upper explosive limit of 20.7%. During a fire, toxic nitrogen oxide gases may be generated. Flames from methylamine are nearly invisible in daylight. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Hazardous decomposition products include carbon dioxide, carbon monoxide, nitrogen oxides, ammonia and traces of organic compounds including hydrogen cyanide, nitriles, isocyanates, nitrosamines and amines.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very soluble

Solubility in Other Chemicals: Soluble in alcohol, ethanol, acetone, diethyl ether and benzene. Miscible with ether.

Specific Gravity (Water=1): .902 at 20°C (68°F) (40% sol.)

Vapor Density (Air=1): 1.07

Boiling Point: 48°C (118°F) (40% solution)

Melting Point: -39°C (-38°F)

Freezing Point: Unavailable

Molecular Weight: 31.07

Heat of Combustion:

Vapor Pressure: 236 mmHg (40% solution); 569 mmHg (50% solution) at 20°C

Evaporation Rate: Unavailable; probably rapid.

Flash Point: -10 °C (14°F), (closed cup), (40% solution); -34°C (-29°F) (50% solution)

Autoignition Temperature: 430°C (806°F)

Burning Rate: Unknown

Flammable Limits: 4.9% (LEL) - 20.7% (UEL)

Stability: Stable

Polymerization Potential: Will not occur.

pH: 11.8 (.1 M solution) (calculated)

Corrosiveness: Corrosive to aluminum, copper, copper alloys, zinc alloys and galvanized surfaces. May attack some forms of plastics, rubber and coatings.

Reactivity and Incompatibility: May react with strong acids, oxidizing agents and halogens. Calcium hypochlorite and sodium hypochlorite react to form normal chloroamines, which are explosive. Mercury reacts to form shock sensitive compounds. Nitromethane reaction products may detonate. Nitrosyl perchlorate mixtures can explode. Violent reaction may result when mixed with oxidizing agents like peroxides, permanganate, etc.

IDENTIFICATION

Shipping Name(s): Methylamine, aqueous solution (USDOT & IMO)

Synonyms and Tradenames: Aminomethane; Carbinamine; Melamine, solution aqueous; Methanamine; Methylamine; MMA; Monomethylamine

CAS Registry No: 74-89-5

Chemical Formula: CH_3NH_2 in H_2O

Constituent Components (% each): Commercially available as solutions of methylamine gas in water (30-50% by weight).

UN/NA Designation: UN1235

IMO Designation: 3.2

RTECS Number: PF6300000

NFPA 704 Hazard Rating: 3 (Health): 4 (Flammability): 0 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Characteristic fishy odor at lower concentrations and an ammonia-like or suffocating odor at high concentrations (100-500 ppm).

Reportable Quantity: See appendix I

Common Uses: Used mainly as an intermediate in organic synthesis, as an intermediate for water gel explosives, accelerators, pharmaceuticals, insecticides, surface active agents, fungicides, in tanning, component of photographic developers, paint removers, fuel additive, production of dyes, and polymerization inhibitor.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHLAMINE, AQUEOUS SOLUTION

Class (Flammable liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 4.7 ppm (detection); wide range reported from .0009-4.68 ppm. Olfactory fatigue may occur.

Unusual Hazards: Highly flammable with wide range of flammability. Material is very toxic and may be fatal if inhaled in large concentrations and harmful if swallowed. Extremely irritating to the respiratory tract and may cause delayed lung injury. Low concentrations of amines may cause a temporary visual disturbance known as “blue haze” or “halo vision”. Material is corrosive to tissue.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 10 ppm

Ceiling (C) Limit: Unavailable

IDLH: 100 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong acids, oxidizing agents, mercury, nitromethane and halogens. Corrosive to aluminum, copper, copper alloys, zinc alloys and galvanized surfaces.

HEALTH HAZARDS

Potential Health Hazards: Material may cause burns or ulceration to the skin. Eye contact can cause irritation; higher concentrations can cause corneal opacity or eye corrosion with corneal or conjunctival ulceration. Inhalation can cause irritation of the respiratory tract. Ingestion can cause gastrointestinal irritation. Individuals with preexisting lung disorders or skin disorders may have increased susceptibility to this material.

Hazards of Skin or Eye Contact: Material is corrosive and can cause redness, pain and inflammation. Tissue can become discolored and appear white to yellow. In severe cases, blistering, tissue death and gangrene may occur. Brief exposure to the eyes can cause irritation such as redness and tearing. Longer exposure can lead to inflammation of the eyes leading to blurred vision. Liquid may cause clouding of the cornea leading to loss of sight. Permanent eye damage or blindness can result. Conditions known as “blue haze” or “halo vision” from exposure to amines is known to exist and usually clears up within a day, although it is not known whether methylamine can cause this condition

Hazards of Inhalation: Material is severely irritating to the respiratory tract. Symptoms of brief exposure are irritation and burning of the nose and throat. Symptoms of exposure to higher concentrations can include coughing, wheezing, headache, nausea, faintness, vomiting, diarrhea, abdominal cramps and feelings of anxiety. Symptoms disappear when exposure stops. In severe cases, death can result from inflammation of the bronchi and lungs and fluid accumulation in the lungs known as pulmonary edema. Symptoms of pulmonary edema can develop several hours after exposure and are aggravated by physical exertion.

Hazards of Ingestion: Ingestion can cause severe gastrointestinal irritation, nausea, vomiting or burns.

FIRE HAZARDS

Lower Flammable Limit: 4.95%

Upper Flammable Limit: 20.75%

Behavior in Fire: Material is flammable and will very likely ignite if exposed to sources of heat. Aqueous solutions of 5% or greater are still flammable. During a fire, toxic nitrogen oxide gases may be generated. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Flame is nearly invisible in daylight. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Runoff may be flammable and/or toxic. Containers exposed to prolonged heat and flame may violently rupture.

Hazardous Decomposition Products: Carbon dioxide, carbon monoxide, nitrogen oxides, ammonia and traces of organic compounds including hydrogen cyanide, nitriles, isocyanates, nitrosamines and amines.

EXPLOSION HAZARDS

Explosive Potential: Can form explosive mixtures with air. Can accumulate in confined spaces, resulting in an explosion or toxicity hazard. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Containers exposed to prolonged heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

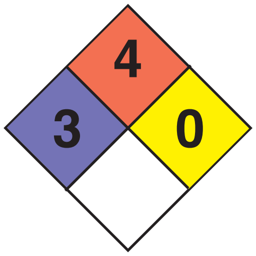
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are: butyl rubber, nitrile rubber, Tychem® 10,000 and Viton®(longer than 8 hours); neoprene (longer than 4 hours); polyvinylchloride, 4H® (1 to 4 hours); and, Barricade® and Tychem® 9400 (254 minutes; 40% solution). Natural rubber, Chemrel® and polyvinylalcohol have less than 1 hour resistance to breakthrough and are not recommended for use. Structural firefighting protective clothing will not provide an adequate level of personal protection for this product.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

1235

METHLAMINE, AQUEOUS SOLUTION

Class (Flammable liquid)



FIRST AID

Nonspecific Symptoms: Symptoms of skin contact can include redness, pain, and inflammation. Eye contact can cause irritation, inflammation, blurred vision and even loss of vision. Inhalation can cause severe respiratory irritation; symptoms of exposure to higher concentrations can include coughing, wheezing, headache, nausea, faintness, vomiting, diarrhea, abdominal cramps and feelings of anxiety. In severe conditions, pulmonary edema can result. Although ingestion is unlikely, symptoms are irritation of the nose, throat, esophagus and stomach.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Do not allow patient to move if not necessary, pulmonary edema symptoms can be delayed up to 48 hours. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact, flush with plenty of soap and water for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large quantities of water or activated charcoal slurry but do not induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Special Note to Physicians: To prepare activated charcoal slurry, suspend 50 grams of activated charcoal in 400 ml of water and shake well. Give 5 ml/Kg of body weight or 350 ml for an average adult.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam or water spray (fog).

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Solid streams of water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Methylamine is a highly flammable and corrosive liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

METHLAMINE, AQUEOUS SOLUTION
Class (Flammable liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

MONITOR THE SITUATION . . . Depending on the concentration of the methylamine solution, the vapor pressure could be low and the boiling point high enough that hazardous vapor concentrations should not occur beyond the immediate spill area. However, continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapor, especially if a large spill and fire is involved.

CONSEQUENCE

If spill is large, hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. If conditions warrant, evacuate the immediate area and downwind of the site of the release and to allow vapors to dissipate. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG . . . Water sprays may be used effectively to control the production of vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents may be applied to the surface of liquid pools to slow the release of methylamine vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid may slow the release of vapors into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

METHLAMINE, AQUEOUS SOLUTION

Class (Flammable liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where material is likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering sewers, waterways and storm drains. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for the presence of flammable vapors.

METHLAMINE, AQUEOUS SOLUTION

Class (Flammable liquid)

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water via a processing system constructed on land.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

METHYL BROMIDE

Class 2.3 (Poison Gas)

GENERAL INFORMATION

Methyl bromide is a colorless relatively odorless poison gas shipped as a liquid under pressure and used as a fumigant, in food sterilization, as a solvent, as a refrigerant, and for making other chemicals. It is heavier than and slightly soluble in water. Its boiling point of approximately 38.4°F indicates it will boil or rapidly vaporize under most ambient temperature conditions, thus evolving a large amount of vapor or gas that is heavier than air and may persist in pits, hollows, and depressions. Although it is considered practically nonflammable and has been used on occasion as a fire extinguishing agent, methyl bromide can be ignited with a high energy source of ignition. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. There is also a potential for accumulations of vapor in confined spaces such as buildings or sewers to result in explosions if a suitable ignition source is present. Liquid methyl bromide weighs approximately 14 pounds per gallon.

Methyl bromide is stable in normal transportation. It does not react with water or many common materials but may react with a variety of other chemicals including strong oxidizers and is incompatible with magnesium, aluminum, and their alloys. Reactions with dimethyl sulfoxide, alkali and alkaline earth elemental metals, certain other metals, peroxides, and strong reducing agents may be explosive. The product is highly toxic by all routes of exposure. Products of combustion may include highly toxic fumes.

If methyl bromide is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 900 mg/l at 68°F (20°C)

Solubility in Other Chemicals: Mixes with most organic solvents; alcohol, ether, chloroform, carbon disulfide, benzene, and carbon tetrachloride.

Specific Gravity (Liquid): 1.68 at 68°F (20°C)

Boiling Point: 38.3 – 38.5 °F (3.5 - 3.6°C) at 1 atm.

Melting Point: –136.5 to –136.7°F (– 93.6 to – 93.7°C)

Freezing Point: –135°F (– 93°C)

Molecular Weight: 94.94

Heat of Combustion: –1771 cal/g

Vapor Pressure: 2 atm (29.4 psia) at 73.9°F (23.3°C)

Flash Point: Unavailable; practically nonflammable

Autoignition Temperature: 999°F (537°C)

Burning Rate: Not pertinent

Stability: Stable

Corrosiveness: Attacks aluminum (forming spontaneously combustible aluminum alkyls), magnesium, and the alloys of these metals. May also attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with aluminum, dimethyl sulfoxide, mineral acids, amines, strong oxidizing agents, caustics, nitrides, alkali or alkaline earth elemental metals, other metals, organic peroxides or hydroperoxides, strong reducing agents, azo and diazo compounds and hydrazines.

IDENTIFICATION

Shipping Names: Methyl bromide (USDOT & IMO)

Synonyms and Tradenames: Bromomethane; Brom-o-Gas; Bromosol; Brozone; Celfume; Dowfume; Edco; Embafume; Fumigant-1; Halon 1001; Iscobrome; Kayafume; MB; MBX; M-B-C Fumigant MEBR; Metafume; Methogas; Monobromomethane; Pestmaster; Profume; Rotex; Terr-o-gas 100; Zytox

Chemical Formula: CH_3Br

Constituent Components(% each): Technical, pure (99.5% min), or less than 2% chloropicrin in liquid methyl bromide; commercial mixtures may include chloropicrin, ethylene dibromide, or nonflammable compressed gas in varying amounts.

UN/NA Designation: UN1062

IMO Designation: 2.3, poison gas

Physical Shte as Shipped: Liquefied gas

Physical State as Released: Gas, boiling liquid, or evaporating liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Like chloroform; sweet; relatively odorless except at higher levels, but chloropicrin may produce sharp, penetrating odor if present.

Common Uses: Soil and space fumigant; solvent; herbicide; refrigerant; raw material for organic chemical mfg.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYL BROMIDE

Class 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Methyl bromide boils or rapidly vaporizes upon release to produce large amounts of toxic vapors and gases that are heavier than air. The product may be absorbed through the skin in toxic amounts. Vapors may persist in pits, hollows, and depressions.

Short Term Exposure Limits(STEL): (Skin) 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 5 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Inhalation or physical contact; strong ignition sources; water contamination; incompatible materials.

HEALTH HAZARDS

Public Health Hazards: Major hazard to the public is via inhalation of vapors in air since the vapor cloud or plume from a spill may expose the public to toxic levels over considerable distances. Also of concern are burns or toxic effects due to physical contact with liquid methyl bromide and ingestion of contaminated water supplies.

Hazards of Skin or Eye Contact: Methyl bromide can be absorbed through the skin in toxic amounts. Liquid splashed on clothing or leather and held in contact with skin may cause skin burns with large blisters appearing after several hours. Less severe exposures may cause itching skin rash after several days. Contact of liquid with eyes may cause irritation and/or severe but usually reversible injury involving temporary blindness.

Hazards of Inhalation: Breathing methyl bromide may cause headache, dizziness, nausea, vomiting, blurred vision, slurred speech, tremors, and convulsions. High concentrations may cause lung irritation, permanent nervous system injury, kidney damage, unconsciousness and possibly death. Onset of toxic symptoms may be delayed from 30 minutes to several days. Lung effects may include pulmonary edema.

Hazards of Ingestion: Methyl bromide is a strong irritant and highly toxic poison if ingested.

FIRE HAZARDS

Lower Flammable Limit: 10% (or 13.5%)

Upper Flammable Limit: 14.5-16%

Behavior in Fire: Practically nonflammable liquefied gas. Will burn but very difficult to ignite. Containers may rupture violently in fire due to overpressure.

Haardous Combustion Products: Highly toxic fumes are produced in fires.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Practically nonflammable but containers may rupture violently in fire due to overpressure. Contact with certain other substances may result in formation of explosive mixtures. See General Information section.

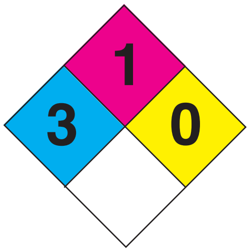
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact or any reasonable probability of eye contact with liquid methyl bromide or its concentrated vapors or fumes. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1062

METHYL BROMIDE
Class 2.3 (Poison Gas)



FIRST AID

Nonspecific symptoms: Headache, dizziness, nausea, vomiting, and other effects of inhalation. Eye or skin irritation or burns from direct contact. Symptoms may be delayed.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, foam, carbon dioxide, dry chemical.

Extinguishing Techniques: Unusual toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Eliminate ignition sources. Use explosion-proof equipment where necessary. Choose equipment that is not attacked or otherwise damaged by the spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Take into account when planning the response that methyl bromide is highly toxic and boils or rapidly evaporates in the open environment. Vapors may persist in pits, hollows, and depressions. Reactions with aluminum form spontaneously combustible compounds.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl bromide spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl bromide vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point downwind of the spill. Do not get water on liquid pools of methyl bromide as this may accelerate vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of methyl bromide from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

METHYL BROMIDE
Class 2.3 (Poison Gas)

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of methyl bromide vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. It is possible that vapor generation will temporarily increase during initial stages of foam application. Proceed with caution. Consult qualified experts.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if the response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methyl bromide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained methyl bromide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

METHYL BROMIDE
Class 2.3 (Poison Gas)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

CONTAINMENT . . . Spilled product may sink in water and exist as slowly dissolving liquid on bottom when released at sufficient depth under water or when water is very cold. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery. Equipment should be of adequate pressure capacity.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

March 1995

METHYL tert-BUTYL ETHER

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl tert-butyl ether is a colorless, volatile, and flammable liquid with an odor that has variably been described as unpleasant, like a pleasant hydrocarbon, mint-like, or resembling terpene. The product is fairly soluble in water and lighter, so can be expected to dissolve at an appreciable rate while also evaporating from the water surface. Its boiling point of approximately 131°F and lowest reported flash point of 18.4’F indicate that methyl tert-butyl ether is easily ignited under virtually all ambient temperature conditions. Vapors of methyl tert-butyl ether are heavier than air, may travel a considerable distance to a source of ignition and flash back, and/or may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.2 pounds per gallon.

Methyl tert-butyl ether does not react with water or many other common materials and is considered stable in normal transportation. It is reported as incompatible with strong oxidizing agents, caustics, strong acids, amines, alkanolamines, aldehydes, ammonia, and chlorinated compounds. It should be especially noted that a similar ether reacts violently, forms an explosive mixture, and/or spontaneously explodes in contact with a wide variety of strong oxidizing agents. Additionally, it should be appreciated that some ethers are known to form unstable and explosive peroxides upon prolonged storage and/or when exposed for a time to heat, air and/or light. Although there is evidence that methyl tert-butyl ether requires several years to form unstable peroxides in normal storage, it is prudent to recognize the potential hazards associated with this phenomena under abnormal emergency conditions.

Methyl tert-butyl ether is not expected to be corrosive to common metals but may attack some types of plastic and rubber. Toxicity of the substance is generally low. Products of combustion may include toxic constituents.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if methyl tert-butyl ether is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Partially soluble; 48,000 ppm at 68°F (20°C); equal to about 5.042 g/100 g water at this temperature.

Solubility in Other Chemicals: Soluble in alcohol and ether

Specific Gravity (Liquid): 0.740-0.741 at 68°F (20oC)

Boiling Point: 131-131.4°F (55-55.2°C) at 1 atm.

MeltingPoint: –166.0 to –163.5°F (–110 to –108.6°C)

Freezing Point: See melting point

Molecular Weight: 88.15

Heat of Combustion: About 8400 cal/g

Vapor Pressure: 240 mm Hg (4.639 psia) at 68°F (20°C); 313 mm Hg (6.050 psia) at 86°F (30°C); 414 mm Hg (8.002 psia) at 100°F (38°C)

Flash Point: –18.4 to –16.6°F (–28 to –27°C) by Tag closed-cup and Abel-Pensky methods

Autoignition Temperature: 815°F (435°C) or 379°F (193°C); reported values vary widely

Burning Rate: Not available

Stability: Stable in normal transportation.

Corrosiveness: Similar ethers are generally noncorrosive to metals but may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Methyl tert-butyl ether is simply reported to be incompatible with strong oxidizing agents, caustics, strong acids, amines, alkanolamines, aldehydes, ammonia, and chlorinated compounds.

IDENTIFICATION

Shipping Names: methyl tert-butyl ether (USDOT and IMO).

Synonyms and Tradenames: tert-Butoxymethane; tert-butyl methyl ether; 2-methoxy-2-methylpropane; methyl 1,1-dimethylethyl ether; 2-methyl-2-methoxypropane; 2,2-methylmethoxypropane; (2-methyl-2-propyl) methyl ether; 2,2-MMOP; MTB; MTBE; propane, 2-methoxy-2-methyl.

Chemical Formula: $(CH_3)_3COCH_3$

Constituent Components (% each): Limited data available; commercial products appear to be relatively pure.

UN/NA Designation: UN2398

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid (boils at about 131°F)

Color of the Shipped Material: Clear and colorless

Odor Characteristics: Variably described as pleasant hydrocarbon odor; unpleasant; mint-like; or resembling terpene.

Common Uses: Used as ingredient of unleaded gasoline to boost octane (typically 2 to 8 concentration by weight in gasoline, but permitted as high as 11%); also used to make isobutene.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYL tert-BUTYL ETHER

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available

Unusual Hazards: Volatile and flammable liquid with heavier than air vapors that may persist in low areas. Some information implies the product may be sensitive to ignition by static electricity. See discussions above and below about the possibility of potentially explosive peroxide formation.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; extended storage; exposure to air and/or light.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from prolonged inhalation of the very high vapor concentrations that may be present in air in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided. Note that overexposure to a similar ether has been reported to increase the severity of effects related to drinking alcoholic beverages. It is not known whether this will occur upon exposure to methyl tert-butyl ether.

Hazards of Skin or Eye Contact: Brief contact of exposed skin with liquid methyl tert-butyl ether is expected to cause little or no irritation. Repeated or prolonged skin contact with the liquid may result in drying and cracking of the skin due to the defatting action of the product. Some degree of local edema, redness, and death of skin tissue may also occur as the result of excessive exposures. Contact of the eyes with the liquid is simply reported to cause irritation. By analogy to a similar ether, it is presumed that a transitory smarting sensation and slight but reversible eye injury are the most likely outcomes of eye contact. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Vapors of methyl tert-butyl ether are generally of low toxicity in acute exposures. High concentrations in air may cause irritation of the eyes, nose, throat, and respiratory tract. Based on animal experiments, inhalation of very high concentrations is expected to cause narcosis and central nervous system depression with symptoms including dizziness, headache, sleepiness, incoordination, irregular respiration, prostration, hyperemia (i.e., excess of blood, engorgement) in the lungs, unconsciousness, and possibly death due to respiratory system failure in extreme cases. Similar ethers have been found to cause additional symptoms in humans such as excitement, stupor, nausea, vomiting, paleness, lowering of the pulse and body temperature, muscular relaxation, excessive salivation, weakness, irregular heartbeat, and possibly jaundice, liver damage, and/or kidney damage. The lowest concentration of methyl tert-butyl ether reported to kill 50 of rats in laboratory experiments was about 23,575 ppm in four-hour exposures. Data are not available for exposures of shorter duration. Note that the saturated vapor concentration of the product in air is about 315,800 ppm directly over the surface of liquid pools at 68°F and will drop off rapidly with distance.

Hazards of Ingestion: The single-dose oral toxicity of methyl tert-butyl ether is generally low. Ingestion of relatively significant quantities is expected to result in depression of the central nervous system and symptoms which may include lachrymation, dizziness, muscular weakness, diminished activity, incoordination, tremors, labored breathing, inflammation of the stomach and/or small intestine, prostration, and possibly death in extreme cases. Other symptoms associated with inhalation may also be possibly observed. The oral LD60 for rats, the dose which proves fatal to 50 of the animals, is reported as approximately 3.9 g/kg of body weight. Overall, fatal oral doses for rats are reported to range from 2.9 to 4.8 g/kg of body weight.

FIRE HAZARDS

Lower Flammable Limit: 1.65%, 2%, or 2.5%; reported values vary but 2% appears to be preferred by most.

Upper Flammable Limit: Most references say 15.1% but one maker of the product lists a value of 8.4%.

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in a fire and possibly rocket. Although not reported as a hazard for methyl tert-butyl ether specifically, be advised that the heat from a nearby fire has been presumed to possibly promote formation of unstable explosive peroxides in similar ethers.

Hazardous Combustion Products: Not well-defined; include carbon monoxide, carbon dioxide, and possibly other toxic constituents. One authority reports that acrid smoke and fumes are generated upon thermal decomposition of methyl tert-butyl ether.

2398

METHYL tert-BUTYL ETHER

Class 3 (Flammable Liquid)

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire and possibly rocket. Contact with strong oxidizing agents may potentially cause an explosion. Exposure to heat, air, and/or light may produce unstable and explosive peroxides with time in various ethers. Although there are indications that methyl tert-butyl ether does not readily form such peroxides in normal storage, it is best to be aware of this possibility under emergency conditions.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. One maker of methyl tert-butyl ether indicates that buna-n provides generally acceptable chemical resistance to the product. Clothing materials listed as potentially compatible by various authorities for generally similar ethyl ether (also known as diethyl ether) include chlorinated polyethylene, polyvinyl alcohol, Teflon, Silvershield, neoprene/styrene-butadiene rubber, butyl rubber, nitrile rubber, polyethylene, and polyurethane. The specific resistance of these materials to methyl tert-butyl ether cannot be confirmed.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; symptoms of narcosis or central nervous system depression.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water if the ether has not already evaporated. Get medical attention if eye or skin irritation persists after washing.
First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately. (Note: This recommendation is from a maker of the product and a product distributor who are consistent in their advice. Be advised, however, that authorities disagree on whether saltwater should be administered to conscious victims and vomiting be induced in cases involving the generally similar diethyl ether, also known as ethyl ether. To be safe, it is advised that immediate and qualified medical advice be obtained on this issue if possible when necessary, realizing that either course of action is likely to entail risks to the victim. If vomiting occurs naturally or otherwise, have the victim lean forward and keep head below hips to reduce risk of aspiration of liquid into the lungs.)

FIRE RESPONSE

Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective, but very large quantities (at ratios of more than 20:1 water to ether; no less) may possibly be used to dilute a spill to a nonflammable mixture. (Note: Authorities are divided on whether alcohol or standard foam should be used. It is possible that both types are suitable to some degree. Be advised that one reference indicates that this product has been reported to be difficult to extinguish with a foam of unspecified type because "no film-forming effect is shown".)
Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may rupture violently, suddenly release massive amounts of product, and possibly rocket when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

METHYL tert-BUTYL ETHER
Class 3 (Flammable Liquid)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of methyl tert-butyl ether may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take the volatility and flammable nature of methyl tert- butyl ether into account when planning the response. Beware of possible heavy vapor accumulations in low areas. To be prudent with respect to the possibility of hazardous peroxide formation, avoid direct sunlight and exclude air from the recovered product if at all possible. Seek expert advice on appropriate disposal or treatment procedures.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors to dissipate. Methyl tert-butyl ether discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION . . . Due to its generally low inhalation toxicity, methyl tert-butyl ether discharges may not pose a significant toxic hazard to downwind populations in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, evaporates or is otherwise treated, especially when spills are small and flammability hazards are limited.

CONSEQUENCE

Hazardous levels of the ether may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl tert-butyl ether vapors in air may absorb some amount of the vapors and/or accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of the ether from contact with its vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of methyl tert-butyl ether vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution. Be advised that authorities are divided on whether alcohol or regular foam is more appropriate; it is possible that both are suitable to some degree. Note also that there are indications that some types of foam may not work well when applied to this product.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. If the foam is breaking down too rapidly, apply a different response technique.

METHYL tert-BUTYL ETHER
Class 3 (Flammable Liquid)

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid methyl tert-butyl ether may slow the release of vapors into the atmosphere. The amount of water must be sufficient to completely dissolve the ether or the response will not be effective. Thus, be prepared to add 20-25 times (or more) as much water by weight as the amount of ether that has spilled.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methyl tert-butyl ether may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material .

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, vermiculite, perlite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note than noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

METHYL tert-BUTYL ETHER
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammahle vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal. and public users to stop water intake or to monitor water for contamination. Note: Methyl tert-butyl ether is not only volatile in all but very cold weather but its solubility in water, though limited, is appreciable. Although some authorities may suggest the possibility of using oil spill type containment and cleanup techniques for spills on water, such techniques would only be suitable under relatively unusual conditions and are therefore not listed below. Also be advised that methyl tert-butyl ether is expected to have a significant and rapid tendency to volatilize fiom surface waters; one reference reports a half-life in surface water of only 9 hours under the conditions studied. However, the product imparts an odor to water at concentrations as extremely low as 20 to 50 parts per billion. The 96-hour LC^{50} for fathead minnows is 706 ppm in water; never the less, one authority reports that the product is expected to be of relatively low toxicity to aquatic life in short-term exposures.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained or diverted to impoundment area by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

METHYL CHLORIDE
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Methyl chloride is a colorless gas shipped under pressure as a liquid and having a faintly sweet odor that resembles ether. It is used as a solvent, extractant and propellant, and for making a variety of other chemicals. Being slightly soluble in water, liquid spills on water will boil off rapidly with small amounts dissolving. All spills on land or water will evolve relatively large amounts of flammable and relatively toxic gases or vapors that are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of gas in confined spaces such as buildings or sewers may result in explosions if ignited, and there is an unconfirmed possibility of explosions involving unconfined vapor clouds. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 8.3 pounds per gallon near its boiling point temperature.

Methyl chloride does not react with water and is stable in normal transportation. It reacts with zinc, aluminum, magnesium, and the alloys of these metals, will attack some forms of plastics, rubber and coatings, and is otherwise reactive with various chemicals. Vapors are relatively toxic and may be present in air in high concentrations. Contact with the liquid or cold gas streams may result in frostbite. Products of combustion may include phosgene, hydrogen chloride, and other toxic and irritating gases.

Downwind evacuation should be considered if methyl chloride is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.6 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetic acid, acetone, alcohol, benzene, chloroform and ether.

Specific Gravity (Liquid): 0.997 at –11.2°F (–24°C); 0.916 at 68°F (20°C)

Boiling Point: –11.6°F (–24.2°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: –143.9°F (– 97.7°C)

Molecular Weight: 50.49

Heat of Combustion: –2939 cal/g

Vapor Pressure: 4.8 atm (70.5 psia) at 68°F (20°C)

Flash Point: Very low, flammable gas

Autoignition Temperature: 1170°F (632°C)

Burning Rate: 2.2 mm/minute

Stability: Stable

Corrosiveness: Reacts with zinc, aluminum, magnesium, and their alloys when dry, especially when they are powdered. May take on the reactivity of hydrochloric acid when wet. Will attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction, but slowly hydrolyzes to hydrochloric acid.

Reactivity with Other Chemicals: See corrosiveness section above. Also incompatible with die castings, potassium, sodium, and possibly other chemicals and materials.

IDENTIFICATION

Shipping Names: Methyl chloride (USDOT and IMO)

Synonyms and Tradenames: Chloromethane; Freon 40; monochloromethane; Artic.

Chemical Formula: CH_3C1

Constituent Components (% each): 99.5% pure

49 STCC: 49 057 61

UN/NA Designation: UN1063

IMO Designation: 2.3, poison gas

Physical State as Shipped: Liquefied gas

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Faint, sweet, pungent, like ether

Common Uses: Refrigerant; solvent in synthetic rubber industry; extractant for greases, oils, and resins; propellant; mfg. of fumigants, herbicides, drugs, and other chemicals.

METHYL CHLORIDE
Class 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10.1 ppm reported, but may be much higher
Unusual Hazards: Extremely volatile and flammable substance with heavier than air vapors that may persist in pits and depressions. May be hazardous over considerable downwind distances.
Short Term Exposure Limits (STEL): 100 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 50 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and downwind. Ingestion and physical contact are also to be avoided.
Hazards of Skin or Eye Contact: Contact of the skin with liquid methyl chloride or venting gas may result in frostbite. Contact with the eyes may cause temporary burns.
Hazards of Inhalation: High concentrations of methyl chloride in air may cause narcosis and a toxic encephalopathy with symptoms including dizziness, vomiting, abdominal pain, diarrhea, anemia, kidney or liver damage, vision disturbances, convulsions, nausea, weakness, slurred speech and confusion, cyanosis, paralysis, coma, and possibly death. Effects are usually delayed for several hours. Exposures to 3000 ppm in air for 7 hours was lethal to 50% of mice in laboratory experiments. Very high concentrations may also asphyxiate by displacement of air.
Hazards of Ingestion: Ingestion may cause frostbite of the mouth and throat, anorexia, nausea, vomiting, abdominal pain, diarrhea, jaundice, hepatomegaly, and splenomegaly.

FIRE HAZARDS

Lower Flammable Limit: 8.1–8.25%
Upper Flammable Limit: 17.2–18.7%
Behavior in Fire: Flammable liquefied gas. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.
Hazardous Combustion Products: May include phosgene, carbon monoxide, hydrogen chloride, and other toxic and irritating gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. By analogy to ethyl chloride, there might be some possibility that unconfined vapor clouds of methyl chloride may explode if ignited.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent skin contact with cold methyl chloride or cold containers and any reasonable probability of eye contact with the cold product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene and nitrite-butadiene rubber.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1063

METHYL CHLORIDE
Class 2.1 (Flammable Gas)

FIRST AID

Nonspecific symptoms: Frostbite; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. Do not administer adrenalin.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or skin irritation persists after washing. Do not use hot water or rub frostbitten areas.

First Aid for Ingestion: If victim is conscious, give warm water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas. Use dry chemical, carbon dioxide, or water fog as necessary but note that water may increase gas evolution from any pools of liquid methyl chloride.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the highly volatile, flammable, and toxic nature of methyl chloride into account while planning the response. Note also that heavy gas may persist in pits and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl chloride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYL CHLORIDE
Class 2.1 (Flammable Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl chloride vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid methyl chloride as this may increase gas or vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of methyl chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methyl chloride or its solutions may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained methyl chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

METHYL CHLORIDE
Class 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards, particularly if any hydrochloric acid has formed in the water.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

METHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Methyl chloroformate is a colorless to light yellow poisonous liquid with an irritating, pungent, unpleasant, and acrid odor. It is used for making pharmaceuticals, herbicides, plastics, and other chemicals, and was once used by the military as a warfare agent. The substance is slightly heavier than water, slightly soluble, and slowly reactive, so may be expected to sink slowly while simultaneously reacting to form methyl alcohol and hydrochloric acid. Its flash point indicates it may be easily ignited under a wide range of ambient temperature conditions. Vapors may travel some distance to a source of ignition and flash back, particularly at warmer temperatures. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 10.3 pounds per gallon.

Methyl chloroformate is relatively stable in normal transportation, except for an apparent tendency to decompose slowly to hydrogen chloride and methyl alcohol, but is reactive with a variety of other chemicals, certain types of metals and rubber, and certain metallic rusts and salts. Any hydrochloric acid formed will be corrosive to most metals and may cause evolution of flammable and potentially explosive hydrogen gas during the corrosion process. The corrosivity of methyl chloroformate itself to bodily tissues is high and requires that all contact with the product be strictly avoided. Products of combustion are both toxic and corrosive and may include hydrochloric acid, phosgene, chlorides or chlorine, chloroformate fumes, carbon monoxide, and other toxic constituents.

If methyl chloroformate is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half ($^{1}/_{2}$) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; gradually decomposes (see below).

Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, and ether.

Specific gravity (Liquid): 1.22 at 68°F (20°C)

Boiling Point: 158–161.6°F (70–72°C) at 1 atm.

Melting Point: –113.8°F (–81°C) or below; reported values vary.

Freezing Point: See melting point

Molecular Weight: 94.5

Heat of Combustion: –2600 cal/g

Vapor Pressure: 529.3 mm Hg (10.23 psia) at 141°F (60.6°C)

Flash Point: Reported values range widely from below 30°F (–1.1°C) to 76°F (24.4°C) on both closed cup and open cup basis.

Autoignition Temperature: 904°F (484°C) or 940°F (504°C); reported values vary.

Burning Rate: 2.0 mm/minute

Stability: Stable in normal transportation except for possible slow decomposition.

Corrosiveness: Any hydrochloric acid formed will be corrosive to most metals, particularly iron and aluminum, with evolution of hydrogen gas. Best handled in glass, lead, porcelain, tantalum, high density polyethylene, polypropylene, or furans. Attacks elastomeric materials such as rubber (e.g., neoprene, Viton, etc.).

Reactivity with Water: Reacts slowly to form flammable methyl alcohol and corrosive hydrochloric acid (also known as muriatic acid) or hydrogen chloride while generating heat. Reaction may be hazardous if water is hot.

Reactivity with Other Chemicals: Incompatible with oxidizing agents, alkali or caustics, amines, certain types of rubber and certain metals (and possibly their rust). Iron, zinc, and aluminum salts may catalyze decomposition, possibly explosively.

IDENTIFICATION

Shipping Names: Methyl chloroformate (USDOT and IMO); methyl chlorocarbonate (IMO).

Synonyms and Tradenames: Methyl chlorocarbonate; chloroformic acid, methyl ester; methoxycarbonyl chloride; carbonochloridic acid, methyl ester; K-stoff.

Chemical Formula: $ClCOOCH_3$

Constituent Components (% each): 95% or more pure; remainder may include small amounts of hydrochloric acid, dimethyl carbonate, and possibly a trace of phosgene.

UN/NA Designation: UN1238

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless to light yellow

Odor Characteristics: Acrid; unpleasant; pungent; irritating

Common Uses: Making of pharmaceuticals, herbicides, plastics, and other organic chemicals; used as military warfare agent in World War I.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

METHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly flammable and corrosive liquid. Reacts with water to form methyl alcohol and hydrogen chloride or hydrochloric acid.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the relatively high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Methyl chloroformate is considered to be corrosive and destructive to living tissue. Contact with the skin or eyes may cause severe acid-type burns and the skin may become sensitized on occasion. Vapors of the product are irritating to the eyes and cause tears, with 10 ppm being sufficient to cause an effect in 10 minutes. Irritation may persist after cessation of exposure.

Hazards of inhalation: Vapors of methyl chloroformate are highly irritating to the respiratory tract. Data for this and related products indicate that inhalation may cause burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting, choking, chest pain, edema of the larynx and bronchi, chemical pneumonitis, pulmonary edema (which may be delayed in onset), and possibly death. Exposure to 190 ppm for 10 minute scan be lethal to humans.

Hazards of Ingestion: May cause severe burns of the mouth, throat, and stomach leading to death. Similar materials cause stomach pain, nausea, vomiting, and esophageal or gastric necrosis.

FIRE HAZARDS

Lower Flammable Limit (LFL): 6.7%

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire due to overheating and/or product decomposition. May generate large quantities of flammable and corrosive gas or vapor upon release.

Hazardous Combustion Products: Toxic and corrosive; may include hydrochloric acid, phosgene, chlorides or chlorine, chloroformate fumes, carbon monoxide, and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Note that some chloroformates may explode due to pressure or catalysis.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with methyl chloroformate. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full face piece (or the equivalent).

1238

METHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; choking, coughing, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, halon, foam. Note that methyl chloroformate may react with water. Water or foam should be applied with caution at first.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated . Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the corrosive, flammable, reactive, and volatile nature of the product into account when planning the response. Note that sealed containers may contain some pressure due to product decomposition.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl chloroformate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities of fumes and vapors are being generated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to methyl chloroformate vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain methyl chloroformate, hydrochloric acid, and methyl alcohol from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM ... There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of hazardous vapors or fumes into the atmosphere. (Note: Since foam is recommended for firefighting, it may also be beneficial for this purpose. Due to the potential reactivity of the product, apply foam with caution at first. Be advised that various authorities disagree on whether alcohol or regular foam should be used.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION ... The rapid addition of flooding quantities of water to contained liquid methyl chloroformate may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid methyl chloroformate and its products of reaction with water may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

METHYL CHLOROFORMATE
Division 6.1 (Poisonous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION ... Spreading of liquids may be controlled by absorbing liquid with dry sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

METHYL CHLOROFORMATE

Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: This response will address presence of acid but not alcohol. See next technique for alcohol removal where necessary. Note also that some time may be necessary for reaction of product with water.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

METHYLCHLOROMETHYL ETHER

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Methylchloromethyl ether is a colorless poisonous liquid that has an irritating odor and that is used for treating textiles and making ion exchange resins, pharmaceuticals, and other chemicals. Its flash point of 0°F indicates the product is easily ignited under most ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approxiately 8.9 pounds per gallon.

Methylchloromethyl ether is stable in normal transportation but reacts with water or moisture to rapidly (but nonviolently) form formaldehyde, hydrogen chloride or hydrochloric acid, and methanol. Any hydrochloric acid formed will be corrosive to most metals and may evolve flammable and potentially explosive hydrogen gas during the corrosion process. Although specific information on other reactivity hazards is unavailable, the product may also be assumed to be incompatible with strong oxidizing agents that may cause its ignition. Toxicity of the product must be considered high due to its corrosive effects on bodily tissues and the fact that it is a suspected human carcinogen in long term occupational exposures. Products of combustion are highly toxic and irritating and may include hydrogen chloride, phosgene, and carbon monoxide. Any unburned material may form a powerful tear gas in air.

Downwind evacuation should be considered if methylchloromethyl ether is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below

Solubility in Other Chemicals: Soluble in alcohol, ether, and acetone. Decomposes in hot alcohol.

Specific Gravity (Liquid): 1.061 – 1.074 at 68°F (20°C)

Boiling Point: 138.2 –139.1°F (59 – 59.5°C) at 1 atm.

Melting Point: –154.3°F (–103.5°C)

Freezing Point: See melting point

Molecular Weight: 80.5

Heat of Combustion: – 4,100 cal/g (est.)

Vapor Pressure: Estimated 191.7 mm Hg (3.705 psia) at 70°F (21.1°C)

Flash Point: 0°F (–17.8°C), open cup

Autoignition Temperature: Unavailable

Burning Rate: 3.0 mm minute

Stability: Stable in normal transportation.

Corrosiveness: Any hydrochloric acid formed in contact with moisture will be corrosive to most metals, particularly iron and aluminum, with evolution of hydrogen gas.

Reactivity with Water: Reacts rapidly but not violently with water to form formaldehyde, hydrogen chloride or hydrochloric acid, and methanol.

Reactivity with Other Chemicals: Unavailable. Would at least expect incompatibility with strong oxidizing agents.

IDENTIFICATION

Shipping Names: Methyl chloromethyl ether, anhydrous (USDOT & IMO); methylchloro-methyl ether (IMO)

Synonyms and Tradenames: Chloromethoxymethane; chloromethylmethyl ether; chlorodimethyl ether; monochlorodimethyl ether; CMME dimethylchloroether; methoxymethylchloride; methoxychloromethane

Chemical Formula: CH_3OCH_2Cl

Constituent Components (% each): Commercial grade may contain 1– 8% of highly carcinogenic bis(chloromethyl) ether.

UN/NA Designation: UN1239

IMO Designation: 6.1, poisonous Substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Irritating

Common Uses: Synthesis of chloromethylated chemical compounds, ion exchange resins, and some pharmaceuticals; treatment of textiles.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYLCHLOROMETHYL ETHER

Division 6.1 (Poisonous Material)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Volatile, flammable, toxic, reactive, and potentially corrosive liquid. Vapors are heavier than air and may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA):Listed as suspected human carcinogen by ACGIH. Minimize exposure.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in the spill area and downwind. Ingestion and direct physical contact are also to be strictly avoided. Note that this product is a suspected human carcinogen (causing lung cancer) in long term occupational exposures and also has mutagenic properties.

Hazards of Skin or Eye Contact: Contact of the skin with liquid methylchloromethyl ether may result in pain and second degree burns after only a few minutes. Contact of the eyes may result in severe burns and corneal necrosis.

Hazards of Inhalation: Vapors of methylchloromethyl ether are irritating to the eyes, nose, and throat. Severe exposures may result in coughing, wheezing, fever, chills, difficult breathing, pulmonary congestion, pulmonary edema (which may be delayed in onset), blood stained sputum, pneumonia, and possibly death. A concentration of 313 ppm in air was fatal to 50% of mice in two hours in laboratory experiments. Exposures to 55 and 65 ppm were respectively and similarly lethal to rats and hamsters in seven hours.

Hazards of Ingestion: Ingestion of methylchloromethyl ether may cause severe burns of the mouth, throat, and stomach leading to possible death.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable and corrosive vapors or fumes upon release.

Hazardous Combustion Products: Highly toxic and irritating; may include hydrogen chloride, phosgene, and carbon monoxide. Unburned material may form powerful tear gas.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with methylchloromethyl ether. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

1239

METHYLCHLOROMETHYL ETHER
Division 6.1 (Poisonous Material)

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, foam. Note that water reacts with the product nonviolently to form water soluble flammable liquids. Water may possibly be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the volatile, flammable, toxic, reactive, and potentially corrosive nature of the product into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methylchloromethyl ether spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methylchloromethyl ether vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain various chemicals from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

METHYLCHLOROMETHYL ETHER

Division 6.1 (Poisonous Material)

TECHNIQUE

DILUTION . . . The addition of flooding quantities of water to liquid methylchloromethyl ether may eventually slow the release of vapors or fumes into the atmosphere. This response may be better suited to smaller spills and entails special risks if the reaction with water becomes hazardous.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

FOAM . . . There is a possibility that application of an appropriate firefighting foam to the surface of liquid pools may slow the release of vapors into the atmosphere. The fact that foam is recommended for firefighting suggests it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methylchloromethyl ether may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

METHYLCHLOROMETHYL ETHER

Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance. (Note: Neutralization agents can only be used to modify any hydrochloric acid or formaldehyde formed in reactions with water. Methanol may still be present.)

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

METHYLCHLOROMETHYL ETHER

Division 6.1 (Poisonous Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Neutralization agents can only be applied to hydrochloric acid and formaldehyde formed in water. Methanol will still be present in water.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture some of the formaldehyde in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

METHYLDICHLOROSILANE
Division 4.3 (Dangerous When Wet)

GENERAL INFORMATION

Methyldichlorosilane is a clear, colorless to straw colored, highly flammable, corrosive, and fuming liquid with an odor variably described as sharp, pungent, acrid, irritating and resembling hydrochloric acid. It can be easily ignited under virtually all ambient temperature conditions. A reported boiling point range of 105.8 - 107.6°F (41 - 42°C) indicates that methyldichlorosilane is highly volatile, will boil at high ambient temperatures, and will rapidly vaporize and evolve relatively large quantities of vapors and fumes. Its vapors and fumes are heavier than air, may persist for a time in low areas, and may travel a considerable distance to a source of ignition and flash back. Accumulations in confined spaces such as buildings or sewers may explode if ignited. The liquid weighs 9.2 - 9.3 pounds per gallon.

Although stable when in sealed containers, methyldichlorosilane reacts violently with water to form corrosive hydrochloric acid and flammable hydrogen gas while generating heat, white acid fumes, and a mixture of methylsiloxanes. The liquid product also generates acid fumes when exposed to moist or humid air. Methyldichlorosilane is otherwise reactive with a broad range of materials and may form explosive mixtures with several. Both the liquid and its vapors and fumes are highly corrosive to bodily tissues by all routes of exposure. Products of combustion are not well defined but are variably reported to include corrosive hydrogen chloride and hydrochloric acid, extremely toxic phosgene gas, carbon monoxide, carbon dioxide, silicon oxide, silicon dioxide, highly dispersed silica, and other irritant and toxic substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if methyldichlorosilane is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts violently.

Solubility in Other Chemicals: Soluble in benzene, ether, heptane, and toluene.

Specific Gravity (Liquid): 1.11 at 77°F (25°C).

Boiling Point: 105.8 - 107.6°F (41 - 42°C) at 1 atm.

Melting Point: - 135°F (- 93°C) or - 131°F (- 90.6°C).

Freezing Point: See melting point.

Molecular Weight: 115.04.

Heat of Combustion: - 2,600 cal/g.

Vapor Pressure: 100 mm Hg (1.933 psia) at 15.8°F (- 9°C); 400 mm Hg (7.732 psia) at 74.7°F (23.7°C).

Flash Point: - 26 to - 15°F (- 32.2 to - 26.1°C), closed-cup; - 14°F (- 25.6°C), open-cup.

Autoignition Temperature: 600°F (316°C) or greater.

Burning Rate: Not available.

Stability: Stable in sealed container.

Corrosiveness: Carbon steel is satisfactory for use with the dry product but any contact with water or moisture produces hydrochloric acid which is corrosive to most metals, particularly iron and aluminum, and which will generate flammable and potentially explosive hydrogen gas.

Reactivity with Water: Reacts violently with water to form hydrochloric acid and hydrogen gas while generating heat, white acid fumes, and a mixture of methylsiloxanes. Methyldichlorosilane will generate acid fumes and hydrogen gas when exposed to moist or humid air.

Reactivity with Other Chemicals: Generates flammable gases and possibly hydrogen chloride gas upon contact with acids, bases (alkalis), or oxidizing materials. The hydrogen gas evolved upon contact with a base may ignite spontaneously. Mixtures with potassium permanganate, lead (II) oxide, lead (IV) oxide, copper oxide, or silver oxide form impact-sensitive explosive materials. The very similar methyltrichlorosilane is reported as incompatible and capable of potentially violent reactions with chemically active metals such as potassium, sodium, magnesium, and zinc. Overall, methyldichlorosilane should be considered to be a highly reactive substance capable of reacting vigorously, violently or explosively with a broad range of other materials.

IDENTIFICATION

Shipping Names: Methyldichlorosilane.

Synonyms and Tradenames: Dichlorohydridomethylsilicon; dichloromethylsilane; methyl dichlorosilane; and monomethyldichlorosilane.

Chemical Formula: CH_3SiHCl_2.

Constituent Components (% each): Typically 95% to 99% pure with remainder consisting of similar silanes.

UN/NA Designation: UN1242.

IMO Designation: 4.3, Dangerous When Wet.

Physical State As Shipped: Liquid.

Physical State As Released: Fuming and/or boiling liquid, gas, or mixture of gas and aerosols.

Color of the Shipped Material: Colorless; to straw colored.

Odor Characteristics: Variably described as sharp, pungent, acrid, irritating, and resembling hydrochloric acid.

Common Uses: Used to make silicon polymers.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

METHYLDICHLOROSILANE
Division 4.3 (Dangerous When Wet)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10 ppm in air. Range for hydrogen chloride or hydrochloric acid is 1 to 5 ppm.
Unusual Hazards: Highly reactive fuming liquid. Reacts violently with water. Spraying water on the source of any leak may potentially cause corrosion due to formation of hydrochloric acid and increase the leakage area.
Short Term Exposure Limit (STEL): Not established by recognized authority.
Time Weighted Average (TWA) Limit: Not established by recognized authority.
Ceiling (C) Limit: Not established for methyldichlorosilane. For hydrogen chloride, the absolute ceiling limit is 5 ppm (ACGIH, 1992 -93; OSHA, 1989).
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; contact with water or moisture; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Methyldichlorosilane is highly corrosive to bodily tissues by all routes of exposure. Dangerous concentrations of vapors and fumes may be present in air in the spill area and over considerable downwind distances.
Hazards of Skin or Eye Contact: Liquid methyldichlorosilane may rapidly cause severe burns and tissue destruction upon contact with the skin or eyes, with eye effects possibly including inflammation, damage to the cornea and eyelids, and possibly permanent injury and/or loss of sight. Effects due to skin contact may additionally include inflammation, pain, shock, and a risk of secondary infections. Exposure to concentrated vapors or fumes in air may also cause significant eye and skin irritation and also has the potential to result in eye damage. Contact lenses should not be worn when working with this chemical.
Hazards of Inhalation: Vapors and fumes of methyldichlorosilane are highly irritating and corrosive to the nose, mouth, throat, respiratory tract, and lungs. Excessive exposures may result in such symptoms as a burning sensation, immediate distress, coughing, wheezing, hoarseness, laryngitis, shortness of breath, a choking sensation, headache, nausea, vomiting, spasms, bleeding of the nose and gums, possible ulceration of nasal and oral mucosa, inflammation and edema of the larynx and bronchi, possible kidney damage, loss of consciousness, pulmonary edema (which may be delayed in onset), chemical pneumonitis, and possibly death. Exposure to 300 ppm of methyldichlorosilane in air for 4 hours was sufficient to kill 50% of rats in laboratory experiments. It has been crudely estimated that exposure to 3000 ppm of methyldichlorosilane or 6000 ppm of anhydrous hydrochloric acid (i.e., hydrogen chloride) for 10 minutes (and possibly less) may be lethal to some humans. More conservative estimates are that concentrations of 1300 to 2000 ppm of hydrogen chloride in air may be lethal within a few moments. The saturated vapor concentration over a pool of liquid methyldichlorosilane is about 131,580 ppm at 15.8°F (-9°C) and 464,475 ppm at 68°F (20°C). At or above its boiling point of 105.8 -107.6°F (41- 42°C), vapor concentrations will be 100% by volume.
Hazards of Ingestion: Ingestion of methyldichlorosilane will cause severe burns of the mouth, throat, and stomach and may prove fatal. Symptoms presumed to be associated with excessive single oral doses (based on the effects of similar materials) include increased salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Vomit may have the appearance of coffee grounds. The potential for circulatory collapse is expected to be high.

FIRE HAZARDS

Lower Flammable Limit: 3.4% to 6%.
Upper Flammable Limit: Greater than 55%.
Behavior in Fire: Flammable liquid. Difficult to extinguish and prone to reignition. May generate large quantities of flammable and corrosive vapors and fumes upon release. Vapors may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in a fire and possibly rocket.
Hazardous Combustion Products: Not well-defined; variably reported to include corrosive hydrogen chloride and hydrochloric acid, extremely toxic phosgene, carbon monoxide, carbon dioxide, silicon oxide, silicon dioxide, highly dispersed silica, and other irritants and toxic substances.

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in a fire and possibly rocket. Reaction with water or moisture produces potentially explosive hydrogen gas as well as hydrochloric acid. This acid may evolve hydrogen gas in contact with most metals. Mixtures with certain other chemicals may result in an explosion or formation of explosive compounds. There is a possibility that entry of water into a closed container of methyldichlorosilane may result in its rupture if sufficiently high gas and vapor pressures are generated.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and/or gas-tight safety goggles, and other

1242

METHYLDICHLOROSILANE
Division 4.3 (Dangerous When Wet)

PROTECTIVE CLOTHING AND EQUIPMENT *(CONTINUED)*

impervious and resistant clothing as appropriate. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary for fire fighting and wherever high vapor or fume concentrations may be encountered in air. Based on limited data, one authority indicates that Viton and polyethylene/ethylene vinyl alcohol/polyethylene (PE/EVAL/PE) materials may be compatible with methyldichlorosilane. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting, spasms, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If conscious, have victim wash out mouth with large amounts of water which should not be swallowed; then slowly administer 1 or 2 glasses of water or milk to an adult, proportionately less to a chill. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Authorities disagree substantially on which agents to apply. NFPA 49 recommends dry chemical, carbon dioxide, foam, or water spray while noting that water may be ineffective. The U.S. DOT (in ERG90) agrees with the NFPA for small fires but suggests use of water spray, fog, or regular foam on large fires. A major maker of the product warns that water should not be used because of the violent reaction that may take place but considers the use of foam acceptable. A Coast Guard publication warns not to use either water or foam because of the reaction problem. A major Canadian response guide suggests use of dry chemical, soda ash, or lime on small fires. For large fires, it says to use dry sand, dry chemical, soda ash or lime, or else to withdraw from area and allow fire to burn. Everyone agrees that no water should be permitted to enter containers. Overall, it appears most prudent to avoid use of water or foam if the fire is small unless the burning liquid can rapidly and truly be flooded with comparatively massive amounts. For large fires which cannot reasonably be permitted to burn themselves out, use extreme caution and apply water in very large quantities as a spray or fog, or apply large amounts of foam, from a protected location or from as far a distance as possible. Use professional judgment as necessary to select from or modify these recommendations.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with products of combustion or vapors/fumes of methyldichlorosilane is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire. Do not apply water or foam to leakage area of methyldichlorosilane containers or permit either to enter such containers if possible.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product or its vapors or fumes. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use. Handle and store this material under dry nitrogen if possible. Take all the reactivity, corrosivity, toxicity, volatility, and flammability hazards of methyldichlorosilane into account when planning the response.

METHYLDICHLOROSILANE
Division 4.3 (Dangerous When Wet)

AIR SPILL *(CONTINUED)*

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and allow vapors or fumes to dissipate. Methyldichlorosilane spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors and fumes in air may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid methyldichlorosilane as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain varying amounts of hydrochloric acid and other chemicals from contact with vapors and fumes.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FLOODING WITH WATER . . . The rapid addition of flooding quantities of water to pools of liquid methyldichlorosilane may eventually slow the release of vapors and fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor and fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. The reaction between water and methyldichlorosilane may be violent.

MITIGATION

Some possibilities include knockdown of vapors and fumes via large amounts of water fog and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts. Contain resulting liquids and neutralize and/or remove them as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that alcohol or regular foam applied to the surface of liquid pools may slow the release of vapors and fumes into the atmosphere. (Note: Several authorities suggest foam use for firefighting even though the water in the foam will clearly react with the spilled product. Thus, foam may possibly control vapor and fume evolution if a blanket can be maintained over liquid pools.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. There may be at least an initial increase in vapor and fume evolution when the foam is first applied.

MITIGATION

Proceed with caution. Stand ready to control increases in vapor or fume evolution with water spray or fog applied at a point downwind and/or temporarily evacuate downwind populations and other vulnerable resources. Abandon the effort if vapor and fume evolution does not decrease after a reasonable amount of foam has been applied. If the method works, continue foam application until the spilled product is removed or otherwise treated. Contain increased volume of liquids.

TECHNIQUE

NEUTRALIZATION . . . There is a possibility that application of an appropriate neutralization agent to liquid methyldichlorosilane may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing methods.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methyldichlorosilane, its reaction products with water, or contaminated water runoff may be contained by building dikes or barriers using dry sand, soil, or other compatible materials.

LAND SPILL *(CONTINUED)*

Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained substances and spread of contamination.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION.. . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the liquid may become damaged or develop leaks. High pressures may rapidly develop in equipment if methyldichlorosilane is recovered under high ambient temperature conditions or if water or moisture is present in the equipment.

MITIGATION

Use compatible equipment that has adequate pressure capacity and is free of moisture as and if necessary. Consider using a cold gas such as carbon dioxide or nitrogen to precool transfer lines and receiving containers. Consult qualified experts as necessary for advice on safe precooling techniques.

TECHNIQUE

ABSORPTION . . . Spreading of liquids may be controlled by absorbing them with dry sand, earth, clay, lime, soda ash, vermiculite, commercial sorbents, or other compatible substances as appropriate and available according to various authorities.

CONSEQUENCE

Once used, most sorbent materials pose the same hazards as the absorbed liquid. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product or other contained liquids to less hazardous substances.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and/or chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product and any hydrochloric acid that may be present. Do not operate motorized equipment in potentially flammable atmospheres (including those caused by evolution of hydrogen gas due to reaction of water with methyldichlorosilane or corrosion of metals by hydrochloric acid). Consult qualified experts for advice where necessary.

METHYLDICHLOROSILANE
Division 4.3 (Dangerous When Wet)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Methyldichlorosilane reacts violently with water to produce corrosive hydrochloric acid, potentially large quantities of acid fumes, and a mixture of methylsiloxanes that are not generally soluble in water. Specific data on the nature, properties, and hazards of these methylsiloxanes were not available, so only general guidance can be provided about containment and recovery methods that may be appropriate. Contact shippers or other sources of expert advice for assistance.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION. . . Application of a suitable neutralization agent to the contaminated water may reduce the environmental hazards of hydrochloric acid.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

CONTAINMENT . . . Some methylsiloxanes are likely to sink in water and not dissolve therein. Where necessary, use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Where deemed necessary and appropriate, stream or lake beds may be dredged to remove heavier-than-water methylsiloxanes and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. There may be other hazards associated with methylsiloxanes.

MITIGATION

Consult qualified experts for guidance.

METHYLENE DIPHENYL DIISOCYANATE*

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Methylene Diphenyl Diisocyanate is a dark brown poisonous liquid with a weak musty odor used to bond rubber to rayon and nylon, and in two component polyurethane coating systems which are used for aircraft, tank trucks and truck trailers due to durability and toughness. It is also used to produce polyurethane lacquer coatings applied to certain automobile components. Methylene diphenyl diisocyanate is manufactured from the reaction of P,P-diphenylmethane diamine and phosgene.

Methylene diphenyl diisocyanate liquid, vapors and aerosols are irritants to the mucous membranes in the respiratory tract (nose, throat and lungs). It is also an irritant to the skin and eyes. The most common routes of exposure are through inhalation and skin contact. It may be absorbed through the skin in toxic amounts. Ingestion of the product can cause irritation and corrosive action in the mouth, stomach tissue and digestive tract. It is a skin and pulmonary sensitizer.

The fire potential for Methylene diphenyl diisocyanate is moderate, however, when heated it will release highly toxic and irritating gases. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for working in atmospheres where methylene diphenyl diisocyanate is present. Runoff may be toxic. Methylene diphenyl diisocyanate is not water soluble. The product is normally stable, however at temperatures greater than 400°F, or if the product comes into contact with incompatible materials, it can polymerize and decompose which can cause pressure build-up in closed containers. It is compatible with amines, strong bases and alcohols.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble.
Solubility in Other Chemicals: Acetone, benzene, kerosene and nitrobenzene.
Specific Gravity (Liquid): 1.2 @ 25°C (77°F)
Vapor Density (Air=1): 8.5
Boiling Point: 208°C (406°F)
Melting Point: 37°C (99°F)
Freezing Point: Unavailable.
Molecular Weight: 250.27
Heat of Combustion: Unavailable.
Vapor Pressure: 0.001 mm Hg at 40°C (104°F)
Flash Point: 202°C (396°F)
Autoignition Temperature: Not established.
Flammable Limits: Not established.
Stability: Stable.
Polymerization Potential: May occur.
Reactivity and Incompatibility: Incompatible with amines, strong bases and alcohols.
Other Characteristics: Will cause some corrosion to copper alloys and aluminum. Product reacts slowly with water to form carbon dioxide. This can cause sealed containers to expand and possibly rupture.

IDENTIFICATION

Shipping Name(s): Methylene Diphenyl Diisocyanate
Synonyms and Tradenames: MDI, Methylenebis (4-Phenylisocyanate), Mondur 577, 4,4-Methylene Diphenyl Diisocyanate, Diphenylmethane Diisocyanate, Methylene Bisphenyl Isocyanate, Methylene Di-P-Phenylene. CAS Registry No: 101-68-8.
Chemical Formula: $CH_2(C_6H_4NCO)_2$
Molecular Formula: $C_{15}H_{10}N_2O_2$
UN/NA Designation: UN2489
IMO Designation: 6.1
RTECS Number: NIOSH/NQ9350000
OHMTADS Number: Unavailable.
NFPA 704 Hazard Rating: 3 (Health): 1 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Dark brown
Odor Characteristics: Weak, musty odor
Common Uses: Used to bond rubber to rayon and nylon, and in two component polyurethane coating systems which are used for aircraft, tank trucks and truck trailers due to durability and toughness. It is also used to produce polyurethane lacquer coatings applied to certain automobile components.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHYLENE DIPHENYL DIISOCYANATE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Products of combustion may include traces of hydrogen cyanide. Contamination with water results in a slow reaction that liberates CO_2 gas. Warning properties (i.e., irritation of the eyes, nose, throat or odor) are not adequate to prevent exposure.

Time Weighted Average (TLV-TWA): 0.005 ppm

Short Term Exposure Limit (STEL):Unavailable.

IDLH: Approximately 10 ppm.

Conditions to Avoid: Heat, sparks, flame, incompatible materials, such as strong bases, amines, and alcohols, contamination with water, runoff to sewers, storm drains and waterways, skin contact, inhalation and ingestion. Material may not be stored near food stuffs.

HEALTH HAZARDS

Potential Health Effects: Methylene diphenyl diisocyanate is a skin, eye, nose, throat and lung irritant. May be fatal if absorbed through the skin or inhaled in toxic amounts. Prolonged contact can cause skin and pulmonary sensitization. Individuals with pre existing, non-specific bronchial hyperactivity can respond to concentrations below the TLV with similar symptoms, as well as asthma attack. Exposures well above the TLV may lead to bronchitis, bronchial spasm, and pulmonary edema. These effects are usually reversible. Chemical pneumonitis has also been reported. These symptoms may be delayed up to several hours after exposure. Medical conditions aggravated by exposure include asthma, bronchitis, emphysema, and skin allergies. This product can produce asthmatic sensitization upon either a single inhalation exposure to a relatively high concentration or upon repeated inhalation exposures to lower concentrations.

Hazards of Skin and Eye Contact: Product reacts with skin protein and moisture, and can cause irritation that includes redness, swelling, rash, scaling or blistering. Prolonged contact can cause skin sensitization. Individuals who suffer skin sensitization can develop these symptoms from contact with liquid or vapors. Liquid, aerosols and vapors are irritating to the eyes and can cause tearing, redness and swelling. If left untreated, corneal damage can occur and injury is slow to heal. However, damage is usually reversible.

Inhalation Hazards: Vapors or mists at concentrations above the TLV can irritate (i.e., burning sensation) the mucous membranes in the respiratory tract (nose, throat, lungs) causing runny nose, sore throat, coughing, chest discomfort, shortness of breath, and reduced lung function. Individuals with preexisting, non-specific bronchial hyperactivity can respond to concentrations below the TLV with similar symptoms, as well as asthma attack. These effects are usually reversible. Chemical pneumonitis has also been reported. These symptoms may be delayed up to several hours after exposure.

NOTE: As a result of previous repeated overexposures or a single large dose, certain individuals develop isocyanate sensitization (chemical asthma) which will cause them to react to a later exposure to isocyanate levels well below the TLV. These symptoms which include chest tightness, wheezing, cough, shortness of breath or asthma attack, could be immediate or delayed (up to several hours after exposure). This sensitization may be temporary or permanent.

Ingestion Hazards: Ingestion may result in irritation and corrosive action in the mouth, stomach tissue, and digestive tract. Symptoms include sore throat, abdominal pain, nausea, vomiting and diarrhea.

FIRE HAZARDS

Lower Flammable Limit: Not established.

Upper Flammable Limit: Not established.

Behavior in Fire: Although it will not readily ignite, methylene diphenyl diisocyanate will burn if exposed to sources of heat and flame.

Hazardous Decomposition Products: When heated to decomposition, product generates highly toxic and irritating gases such as carbon monoxide, oxides of nitrogen, and traces of hydrogen cyanide.

EXPLOSION HAZARDS

Explosive Potential: Although the product is generally stable and the potential for an explosion is low, at temperatures greater than 400°F, or if the product comes into contact with incompatible materials, it can polymerize and decompose which can cause pressure build-up in closed containers. Containers may violently rupture. Violent reactions may also occur if the product comes into contact with alcohols.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

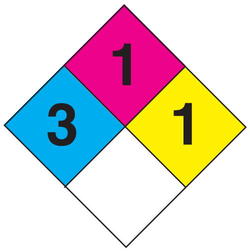
Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Fully encapsulating, vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are nitrile rubber and butyl rubber. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits.

2489

METHYLENE DIPHENYL DIISOCYANATE

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Skin contact can produce irritation, inflammation, and dermatitis. Central nervous system (CNS) effects may include nausea, headache, dizziness or general weakness. The material is known to be a mucous membrane irritant. Other symptoms may include vomiting, diarrhea, coughing, difficulty breathing, sore throat and abdominal pain.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Remove contact lenses if in place. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water or milk. DO NOT INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physicians: Eye Exposures. Stain for evidence of corneal injury. If cornea is burned, instill antibiotic steroid preparation frequently. For skin exposures, treat symptomatically as for contact dermatitis or thermal burns. For ingestion, treat symptomatically. There is no specific antidote.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray, AFFF multi-purpose foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water spray to cool fire-exposed containers, disperse vapors, and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may rupture violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be toxic.

SPILL RESPONSES

General Information: Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, storm drains or waterways. If temporary control of vapors is required, a blanket of protein foam may be placed over the spill. Overflow dams may be effective to dike material since it is not water soluble and it is heavier than water. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers. Runof may be toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous concentrations before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

METHYLENE DIPHENYL DIISOCYANATE

Division 6.1 (Poisonous Materials)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, storm drains or waterways.

TECHNIQUE

MONITOR THE SITUATION...If released into the atmosphere, methylene diphenyl diisocyanate is expected to exist primarily in the vapor phase. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Reaction with water vapor in the atmosphere may significantly increase the degradation rate. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, storm drains or waterways.

TECHNIQUE

FOAM...Aqueous Film Forming Foam (AFFF) or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation. If temporary control of vapors is required, a blanket of protein foam may be placed over the spill.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

METHYLENE DIPHENYL DIISOCYANATE
Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, product will react with water to form a hard crust of inert, water insoluble material. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Product will react with water to form a hard crust of inert, water insoluble material comprised primarily of polyureas. This crust will prevent further contact with water, thereby increasing the persistence time. Dams may be used to confine or divert the spill to a limited area until the material can be recovered.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may be an effective means to recover spilled material since the material is not water soluble and crust will float on the surface of the water. Barriers of suitable material may be used to con fine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming may be effective since the material is not water soluble and crusts will float on the surface of the water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dis pose of contaminated water as soon as possible in accordance with applicable local, state and federal envi ronmental regulations. Consult environmental specialists for assistance, as needed.

METHYLENE DIPHENYL DIISOCYANATE

Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Liquid will solidify on contact with soil, therefore leaching will not occur. Product will react with water to form a hard crust of inert, water insoluble material comprised of polyureas. This crust will prevent further contact with water, thereby increasing the persistence time. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

May result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains or sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

January 1988

METHYL ETHYL KETONE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl ethyl ketone is a colorless fairly volatile liquid with a pleasant pungent odor like acetone or lacquer thinner. It is used as a solvent, for making other chemicals, and for production of wax from petroleum. It is moderately soluble in water and lighter, so may be expected to float while rapidly dissolving. Its flash point of 20°F indicates that the product is easily ignited under a wide range of ambient temperature conditions. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.7 pounds per gallon.

Methyl ethyl ketone does not react with water or many common materials and is stable in normal transportation. It is reactive with strong oxidizing materials, however, and will dissolve or soften some plastics. Toxicity is low to moderate via the various potential routes of exposure, but vapors are highly irritating and may be present in air in relatively high concentrations. Products of combustion may include toxic constituents.

Downwind evacuation should be considered on a case by case basis if methyl ethyl keytone is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 27 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.806 at 68°F (20°C)
Boiling Point: 175.3°F (79.6°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –123.3°F (–86.3°C)
Molecular Weight: 72.11
Heat of Combustion: –7491 cal/g
Vapor Pressure: 71.2 mm Hg (1.38 psia) at 68°F (20°C)
Flash Point: 20°F (–6.7°C), closed cup; 22°F (–5.6°C), open cup.
Autoignition Temperature: 961°F (516°C)
Burning Rate: 4.1 mm/minute
Stability: Stable
Corrosiveness: Softens or dissolves some plastics
Reactivity with Water: No reaction
Reactivity with Other Chemicals: May react with strong oxidizers, chlorosulfonic acid, oleum, potassium tert-butoxide, peroxides, explosives, radioactive materials, and poisons.

IDENTIFICATION

Shipping Names: Methyl ethyl ketone (USDOT or IMO); ethyl methyl ketone (USDOT or IMO).
Synonyms and Tradenames: 2-Butanone, MEK, butanone, ethyl methyl ketone, methyl acetone, butanone.
Chemical Formula: $CH_3COCH_2CH_3$
Constituent Components (% each): 99% or more pure
49 STCC: 49 092 43
UN/NA Designation: UN1193
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pleasant, pungent, like acetone, lacquer thinner, or mint.
Common Uses: Solvent for resins, nitrocellulose coatings, vinyl films, cements and adhesives, dewaxing lube oils, nail polish remover, cleaning fluids, and paint stripper manufacturing of smokeless powder and other chemicals; printing catalyst and carrier.

METHYL ETHYL KETONE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10.9–27 ppm
Unusual Hazards: Fairly volatile flammable liquid with heavier than air vapors that may travel to a source of ignition.
Short Term Exposure Limits (STEL): 300 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 200 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the local spill area and immediately downwind. Ingestion and physical contact are also to be avoided.
Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid methyl ethyl ketone may result in drying and irritation of the skin. Contact with the eyes may cause irritation and moderate but usually reversible injury.
Hazards of Inhalation: Vapors of methyl ethyl ketone cause irritation of the eyes, nose, and throat. High concentrations in air may be narcotic and depress the central nervous system with symptoms including nausea, vomiting, headache, dizziness, drowsiness, weakness, loss of consciousness, and possibly death. Headache and throat irritation may occur at levels as low as 300 ppm in air.
Hazards of Ingestion: Moderately toxic, but specific details are unavailable. Expect irritation of the mouth and throat and possibly symptoms of ingestion among others.

FIRE HAZARDS

Lower Flammable Limit: 1.8%
Upper Flammable Limit: 11.5%
Behavior in Fire: Flammable liquid. May generate quantities of flammable vapor upon release. Vapors are heavier than air and may travel some distance to a source of ignition and flash back. There is some limited possibility that containers may rupture violently in fire.
Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

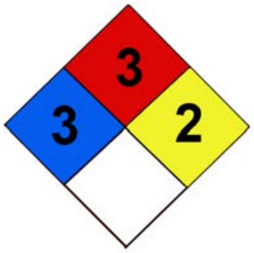
Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some limited possibility that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 30,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (30,000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1193

METHYL ETHYL KETONE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, or throat; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the volatility and flammability of methyl ethyl ketone into account while planning the spill response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl ethyl ketone spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Methyl ethyl ketone may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of methyl ethyl ketone in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

METHYL ETHYL KETONE

Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb methyl ethyl ketone vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of methyl ethyl ketone from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of methyl ethyl ketone vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid methyl ethyl ketone may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methyl ethyl ketone may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained methyl ethyl ketone may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

METHYL ETHYL KETONE
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

METHYL ETHYL KETONE
Class 3 (Flammable Liquid)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary. (Note: Carbon may not be highly effective.)

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

METHYL FLUORIDE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Methyl fluoride is a colorless and flammable liquefied compressed gas with an odor resembling ether. It is used in propellant mixtures and in scientific investigations. Being slightly soluble in water and lighter, liquid methyl fluoride spills on water will rapidly boil off with only small amounts dissolving. Vapors of the product are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration.The liquid weighs approximately 7.3 pounds per gallon near its boiling point and approximately 4.65 pounds per gallon at 77°F when under its own pressure.

Methyl fluoride does not react with water violently, but there is an uncertain and unconfirmed possibility that slow hydrolysis in water may produce highly corrosive hydrofluoric acid. The product is stable in transportation, noncorrosive to common metals when dry, and known to be incompatible with oxidizing agents and chemically active metals such as potassium, powdered aluminum, magnesium, and zinc. Vapors may be present in air at high concentrations, and although not formally studied, are generally considered to be of relatively low toxicity. Contact with the liquid or cold gas streams may result in frostbite and possible irritation. Products of combustion are toxic and corrosive and may include hydrogen fluoride, carbonyl fluoride, fluorine, and carbon monoxide.

Downwind evacuation should be considered if large amounts of methyl fluoride are leaking (not on fire) until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently. (Note: Due to its limited use in industry, little information is generally available on the characteristics of methyl fluoride. Be advised that many of the recommended spill response procedures in this guide were derived via analogy of the product with related materials such as methyl chloride.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 166 cc of gas/100 g water at 59°F (15°C)

Solubility in Other Chemicals: Soluble in alcohol and ether

Specific Gravity (Liquid): 0.877 at –108.4°F (–78°C); 0.557 at 77°F (25°C)

Boiling Point: –109.1 to –108.8°F (–78.4°C to –78.2°C) at 1 atm.

Melting Point: –223.2°F (–141.8°C)

Freezing Point: See melting point

Molecular Weight: 34.0

Heat of Combustion: Unavailable

Vapor Pressure: 37.6 atm (552.7 psia) at 70°F (21.1°C)

Flash Point: Flammable gas

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Noncorrosive to common metals except as noted below when dry. May eventually become corrosive in presence of water or moisture (see below).

Reactivity with Water: There is a possibility reported that slow hydrolysis in water may produce highly corrosive hydrofluoric acid but this is uncertain and unconfirmed.

Reactivity with Other Chemicals: Known to be incompatible with oxidizing agents and chemically active metals such as potassium, powdered aluminum, magnesium, and zinc.

IDENTIFICATION

Shipping Names: Methyl fluoride (USDOT and IMO); Refrigerated gas R 41 (USDOT).

Synonyms and Tradenames: Fluoromethane

Chemical Formula: CH_3F

Constituent Components (% each): Unavailable; likely to be relatively pure

UN/NA Designation: UN2454

IMO Designation: 2.1, flammable gas

Physical State as Shipped: Liquefied compressed gas

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Like ether; agreeable

Common Uses: Propellant mixtures; study of carbonfluorine bonds.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

METHYL FLUORIDE
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Flammable liquefied compressed gas with heavier than air vapors that may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact with very cold liquid, gas, or containers.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct physical contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with liquid methyl fluoride or cold venting gas may result in frostbite and possible irritation.

Hazards of Inhalation: Methyl fluoride is considered to be relatively nontoxic but has not been formally studied. Inhalation of high concentrations in air are expected to cause central nervous system depression and narcosis with symptoms such as dizziness, disorientation, incoordination, nausea, or vomiting. Very high concentrations may cause asphyxiation and possibly death due to displacement of oxygen in air.

Hazards of Ingestion: Due to its low boiling point, ingestion of methyl fluoride is considered unlikely.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquefied compressed gas. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flashback. Containers may rupture violently in fire. Flame is relatively colorless like that of alcohol.

Hazardous Combustion Products: Toxic and corrosive; may include hydrogen fluoride, carbonyl fluoride, fluorine, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. One authority states that the product "can detonate or explode under strong initiating source, or after contacting water and heating under confinement." The validity and exact meaning of these statements are not clear.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent skin contact with cold methyl fluoride or cold containers and any reasonable probability of eye contact with the cold product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus(SCBA) may be advisable in some cases to prevent contact with high concentrations of combustion products in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2454

METHYL FLUORIDE

Division 2.1 (Flammable Gas)

FIRST AID

Nonspecific Symptoms: Frostbite; any symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing. Do not use hot water on frost bitten areas and do not rub frozen tissues.

FIRE RESPONSE

Extinguishing Materials: Stop flow if possible or else allow fire to burn out while cooling surroundings with water spray. Carbon dioxide, dry chemical, or water spray may be used for extinguishment when reignition is no longer possible. Note that contact of water with pools of liquid methyl fluoride may increase vapor evolution.

Extinguishing techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Electrically ground and bond lines and equipment as necessary. Take the highly volatile, flammable, and heavier than air nature of methyl fluoride into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl fluoride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases if large quantities are released.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to methyl fluoride vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid methyl fluoride as this may increase gas or vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of methyl fluoride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

METHYL FLUORIDE
Division 2.1 (Flammable Gas)

TECHNIQUE

FOAM ... There is a possibility that an appropriate firefighting foam applied to the surface of quiescent liquid pools may slow the release of methyl fluoride vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid methyl fluoride or contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment if pure liquid methyl fluoride is involved.

MITIGATION

Use compatible equipment with proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines. (Note: Most residues will rapidly evaporate.)

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

METHYL FLUORIDE
Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Most methyl fluoride will rapidly vaporize from the surface of a water body with little dissolution. The significance of any contamination and the need for containment and treatment must be determined on a case-by-case basis. Consult qualified experts where necessary.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1990

METHYL FORMATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl formate is a colorless and highly volatile liquid with a pleasant; agreeable odor that has been described as being fruity and also resembling ether. It is used as a solvent, as a fumigant and larvicide, as a refrigerant, and for making various organic chemicals. It is very soluble in water and will mix and dissolve rapidly. A boiling point of 88.7–89.8°F and a flash point that has been reported to be as low as –32°F indicate that methyl formate is easily ignited under all ambient temperature conditions. Vapors of methyl formate are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.1 pounds per gallon.

Methyl formate reacts slowly with water to form formic acid and methanol (methyl alcohol) in a reaction that is not hazardous. It is stable in normal transportation and not reactive with many other common materials. It may react vigorously or ignite in contact with strong oxidizing agents, however, and reacts with methyl alcohol and sodium methoxide to form an explosive substance. Methyl formate is noncorrosive to metals but may attack some types of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low to moderate but the volatility of methyl formate indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

If methyl formate is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; approx. 30 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in almost all conventional organic solvents such as alcohols, ethers, and esters.

Specific Gravity (Liquid): 0.97–0.98 at 68°F (20°C)

Boiling Point: 88.7–89.8°F (31.5–32.1°C) at 1 atm.

Melting Point: –148.4 to –146.2°F (–100.2 to –99°C)

Freezing Point: See melting point

Molecular Weight: 60.05

Heat of Combustion: –3880 cal/g

Vapor Pressure: 476–480 mm Hg (9.200–9.278 psia) at 68°F (20°C)

Flash Point: Reported values vary from –32°F (–35.6°C) to 1.4°F (–17°C) via various types of flash point measurement methods.

Autoignition Temperature: 840–869°F (449–465°C)

Burning Rate: 2.5 mm/minute

Stability: Stable

Corrosiveness: Noncorrosive to metals but may attack some types of plastics, rubber, and coatings.

Reactivity with Water: Slow reaction to form formic acid and methanol (methyl alcohol); reaction is not hazardous. Formic acid has a Reportable Quantity (RQ) of 5000 lbs/2270 kgs that is subject to change. Refer to EPA regulations for current reporting requirements if large amounts of formic acid are formed under spill conditions.

Reactivity with Other Chemicals: May react vigorously or ignite in contact with strong oxidizing agents. Reacts with methanol and sodium methoxide to form an explosive product.

IDENTIFICATION

Shipping Names: Methyl formate (USDOT and IMO)

Synonyms and Tradenames: Methyl methanoate; formic acid, methyl ester

Chemical Formula: $HCOOCH_3$

Constituent Components (% each): 97% or more pure

49 STCC: 49 082 25

UN/NA Designation: UN1243

IMO Designation: 3.1, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid, boiling liquid, or gas (boils at 88.7–89.8°F)

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant; agreeable; like ether; fruity

Common Uses: Solvent; fumigant and larvicide; refrigerant; organic synthesis of pharmaceuticals, dyes, embalming fluids, and military poison gases

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

METHYL FORMATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1500–2000 ppm

Unusual Hazards: Highly volatile and flammable liquid with heavier than air vapors that may persist in pits, hollows, and depressions. Methyl formate may boil at higher ambient temperatures.

Short Term Exposure Limits (STEL): 150 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV TWA): 100 ppm over each 8 hours of a **40 h**our work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid methyl formate may result in drying and cracking of the skin as well as irritation due to the defatting action of the product. There is evidence that the liquid can be absorbed through the skin in toxic amounts. Contact of the liquid with the eyes may cause irritation. Do not wear contact lenses when working with methyl formate.

Hazards of Inhalation: Exposure to methyl formate vapors in air may result in irritation of the eyes, nose, throat, and lungs. Inhalation of high concentrations in air may cause temporary disturbances of vision as well as narcosis and central nervous system depression with symptoms including chest oppression, incoordination, difficult breathing, stupor, retching, nausea, headache, pulmonary edema, convulsions, unconsciousness, and possibly death in severe cases. Pulmonary edema may possibly be delayed in onset. Exposure of guinea pigs to 50,000 ppm for 30 minutes, 25,000 ppm for 60 minutes, or 10,000 ppm for three hours was lethal to the animals in laboratory experiments. All animals survived exposure to 3500 ppm for eight hours.

Hazards of Ingestion: Methyl formate is of relatively low toxicity by ingestion. Nevertheless, excessive ingestion may result in irritation of the mouth and stomach, severe gastric upset, and many of the effects of inhalation, including effects on vision, and possibly death. Although not reported in the literature, characteristics of the product suggest the possibility that aspiration of the concentrated liquid into the lungs during vomiting may have the potential to cause pulmonary edema with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: Most say 5% but 4.5% and 5.9% have also been reported.

Upper Flammable Limit: Most say 22.7–23% but 20% has also been reported.

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined; reported to produce acrid smoke, irritating fumes, carbon monoxide, carbon dioxide, formic acid, and possibly other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas-tight or splash-proof safety goggles as needed, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1243

METHYL FORMATE
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; disturbance of vision or symptoms of narcosis and central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: This is the recommendation made by several noted authorities. Be advised, however, that some sources do not recommend induction of vomiting. Seek immediate medical advice on this issue if possible, realizing that both courses of action pose various risks to the victim.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, Halon, alcohol foam, water spray. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of methyl formate may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that methyl formate is a highly volatile and flammable liquid with heavier than air vapors.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl formate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow. vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYL FORMATE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl formate vapors may absorb vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of methyl formate, formic acid, and methyl alcohol from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of methyl formate vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid methyl formate may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methyl formate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained methyl formate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

METHYL FORMATE
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, saw dust, straw, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Methyl formate will mix rapidly with water and react slowly to produce formic acid and methanol, both of which are soluble in water in all proportions. Formic acid is considered to be corrosive. See the Emergency Action Guide for methanol for further information about that product.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

METHYL FORMATE
Class 3 (Flammable Liquid)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards posed by the formation of formic acid.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of various chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

METHYLHYDRAZINE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Methylhydrazine is a colorless, fuming, highly reactive, corrosive, flammable, and highly toxic liquid that has a fishy, ammonia-like odor. It is used as a rocket fuel, as a solvent, and as an organic intermediate in the making of other chemical substances. It is fully soluble in water and will mix freely. Its lowest reported flash point of 17°F indicates that the product may easily be ignited under most ambient temperature conditions. Vapors and fumes may be somewhat heavier than air, particularly at higher ambient temperatures, and may in any case travel some distance to a source of ignition and flash back. Accumulations of vapors in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration due to spontaneous decomposition of the product. Unusual flammability characteristics include an upper flammable limit that has been reported to be as high as 99%, indicating that methylhydrazine may burn in the virtual absence of air. Liquid methylhydrazine weighs approximately 7.3 pounds per gallon.

Methylhydrazine does not react with water and is stable in normal transportation at ordinary ambient temperatures. It is a very strong reducing agent, however, that may spontaneously ignite in air in contact with porous materials such as earth, wood, cloth or asbestos, and that may ignite, explode, or react with a wide variety of other substances including rusty metals and oxidizing agents. Toxicity of the product is high by all routes of exposure and the material is corrosive to bodily tissues. Products of combustion include toxic nitrogen oxides, carbon monoxide, carbon dioxide, ammonia, and possibly other toxic constituents.

If methylhydrazine is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in ether, hydrazine, hydrocarbons, and monohydric alcohols.

Specific Gravity (Liquid): 0.874 at 68°F (20°C)

Boiling Point: 189.5°F (87.5°C) at 1 atm.

Melting Point: – 62.3°F (– 52.4°C)

Freezing Point: See melting point

Molecular Weight: 46. 1

Heat of Combustion: – 6766 cal/g

Vapor Pressure: 36 mm Hg (0.6958 psia) at 68°F (20°C)

Flash Point: 17°F (– 8.3°C), closed cup; 62 – 70°F (16.7 – 21.1°C) open cup

Autoignition Temperature: 382 – 385°F (194.4 – 196°C)

Burning Rate: 2.0 mm/minute

Stability: Stable in normal transportation if not in contact with iron, copper, or their alloys. Absorbs water and carbon dioxide from air, slowly decomposes and is therefore shipped in sealed containers under a nitrogen atmosphere. As many as 17 different decomposition products have been identified in air with primary constituents including formaldehyde methane, nitrogen, water, and methylhydrazone depending upon the surfaces being contacted by the reactants. The half life of methyl hydrazine vapors ranges from 2 to 7 hours in confinement when mixed with air.

Corrosiveness: Use glass or stainless steels, except those containing 0.5% or more molybdenum. Methylhydrazine is highly reactive with several metallic oxides. Avoid contact with iron, copper manganese, molybdenum, lead, their alloys, and other catalytic metals and alloys (possibly but not necessarily including cadmium, cobalt, gold, silver, and zinc).

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Contact with porous materials such as wood, asbestos, cloth, or earth may result in spontaneous ignition. Ignites spontaneously upon contact with many oxidizers such as hydrogen peroxide, nitrogen tetroxide, fluorine, chlorine trifluoride and other halogen fluorides, and fuming nitric acid. May ignite or explode in contact with metallic oxide (rusty) surfaces. Methylhydrazine is a strong reducing agent that may react with a wide variety of other chemicals and catalytic metals (see section on Corrosiveness).

IDENTIFICATION

Shipping Names: Methylhydrazine (USDOT and IMO)

Synonyms and Tradenames: Monomethylhydrazine; 1-methylhydrazine, hydrazomethane, MMH

Chemical Formula: CH_3NHNH_2

Constituent Components (% each): 98% or more pure

UN/NA Designation: UN1244

IMO Designation: 6.1, poisonous substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless fuming liquid

Odor Characteristics: Like ammonia or amine; fishy

Common Uses: Rocket propellant; solvent; organic intermediate

CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYLHYDRAZINE

Division 6.1 (Poisonous Material)

Square background applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1–3 ppm

Unusual Hazards: Fuming, highly reactive, flammable, corrosive, and highly toxic liquid. Vapors or fumes may travel to a source of ignition and flash back. Methylhydrazine may continue to burn in the virtual absence of air.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): (Skin) 0.2 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the toxic vapor concentrations that may be present in the spill area and over considerable downwind distances. Ingestion and physical contact are also to be strictly avoided. Methylhydrazine is suspected of being a human carcinogen in long term occupational exposures and is also known to cause fetal abnormalities in animals and to be mutagenic.

Hazards of Skin or Eye Contact: Liquid methylhydrazine is corrosive to the skin, may be rapidly absorbed through the skin in toxic amounts to produce many of the symptoms of inhalation (including swelling of the eyes known as corneal edema), and may possibly cause allergic skin sensitization. Contact of the liquid with the eyes may also be extremely harmful and lead to temporary and possibly permanent blindness.

Hazards of Inhalation: Methylhydrazine vapors are irritating to the eyes, nose, and throat. Overexposure via inhalation is reported to cause central nervous system and other toxic effects including dizziness, incoordination, nausea, vomiting, diarrhea, frequent urination, rapid respiration, various blood abnormalities involving blood cell destruction, anemia and cyanosis, tremors, convulsions, corneal edema leading to temporary blindness, kidney damage, pulmonary hemorrhage and edema, and possibly death. Some effects such as corneal edema and pulmonary edema may be delayed in onset. Exposure of humans to 90 ppm for 10 minutes caused tickling of the nose, nasal drip, mild to medium eye irritation, and an unpleasant taste sensation. Exposure to 82 ppm for one hour was lethal to 50% of monkeys in laboratory experiments.

Hazards of Ingestion: Methylhydrazine is highly toxic by ingestion, causing many of the systemic effects reported for inhalation.

FIRE HAZARDS

Lower Flammable Limit: 2.5%

Upper Flammable Limit: 92 – 99%; reported values vary

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors may travel some distance to a source of ignition and flash back. Containers may rupture violently and or explode in fire.

Hazardous Combustion Products: May include highly toxic nitrogen oxides, ammonia, carbon monoxide, carbon dioxide, and possibly other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently or explode in fire. Contact with certain other chemicals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

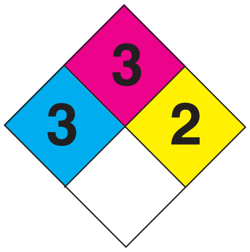
Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus may be necessary to prevent contact with high vapor or fume concentrations in air. Potentially compatible materials listed by various authorities include butyl rubber, polyvinyl chloride (PVC), chlorobutyl rubber, CR 39, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 0.2 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1244

METHYLHYDRAZINE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; dizziness, nausea, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical and/or water. Due to its wide flammability limits, low flash point, and reignition hazard, dilution of methylhydrazine spills to nonflammable mixtures by large amounts of water is the response of choice for large fires.

Extinguishing Techniques: Unusual toxic vapor and fume hazard. Stay upwind. Avoid bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture, or explosion of boilers or industrial process equipment. Use explosion-proof and spark-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the highly toxic, flammable, and reactive nature of methylhydrazine into account while planning the response. Where possible, store recovered methylhydrazine in closed containers under a nitrogen atmosphere.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent public exposure and to allow vapors or fumes to dissipate. Methylhydrazine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYLHYDRAZINE

Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methylhydrazine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain methylhydrazine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of methylhydrazine vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid methylhydrazine may slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid methylhydrazine after its dilution with water may further slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methylhydrazine may be contained by building dikes using dry sand, clay, bentonite, or other nonporous and noncombustible materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

METHYLHYDRAZINE
Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, clay, bentonite, diatomite, or similar nonporous and noncombustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

METHYLHYDRAZINE

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Methylhydrazine is fully soluble in water and will rapidly dissolve. Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2003

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Methyl isobutyl carbinol (MIBC) is typically a clear, flammable liquid with a mild odor, however, at least one manufacturer reports shipping it as a green product. It is a solvent for ethyl cellulose and certain phenolics as well as many oils, dyes, gums and natural resins. Methyl isobutyl carbinol is miscible with organic solvents, but has only limited solubility in water, so may be expected to form a floating surface slick that dissolves. It has a flash point of 106°F and therefore flammable, but it can be identified as a flammable or combustible liquid when in transportation. It’s flash point of 106°F indicates that it may be easily ignited at warmer ambient temperatures. It is stable under normal conditions and will not polymerize but is reactive with strong acids and oxidizing agents. MIBC has a vapor pressure of 2.8 mm Hg at 68°F, making it a moderate hazard at normal ambient temperatures. Vapors are heavier than air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers. Products of combustion may include toxic gases. The product weighs approximately 6.7 pounds per gallon.

Prolonged or repeated contact causes defatting of the skin with irritation, dryness and cracking. Exposure may cause central nervous system depression and irritation of the eyes, skin and mucous membranes. Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of methyl isobutyl carbinol is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; 1.50 g/100 mL
Solubility in Other Chemicals: Organic solvents
Specific Gravity (Liquid): 0.807
Vapor Density: 3.5
Boiling Point: 270°F (132°C)
Melting Point: -130°F (-90°C)
Freezing Point: See melting point
Molecular Weight: 102.176
Evaporation Rate (butyl acetate=1): 0.43
Vapor Pressure: 2.8 mm Hg at 68°F (20°C)
Flash Point: 106°F (41°C)
Autoignition Temperature: Reports vary slightly, 546.8°F (286°C) to 581°F (305°C)
Heat of Combustion: 36407 kJ/kg
Burning Rate: Unavailable
Flammable Limits: 1% (LFL) - 5.5% (UFL)
Stability: Stable under normal conditions
Polymerization Potential: Will not occur
pH: 7
Reactivity with Water: None
Reactivity and Incompatibility: Oxidizing agents (such as perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine and fluorine), strong acids (such as sulfuric acid, hydrochloric acid and nitric acid) or acid chlorides.

IDENTIFICATION

Shipping Name(s): Methyl Isobutyl Carbinol (USDOT & IMO)
Synonyms and Tradenames: 2-Methyl-4-pentanol; 4-Methyl-2-pentanol; 4-Methylpentan-2-ol; 4-Methylpentanol-2; Isobutylmethylcarbinol; Methyl-2-pentanol; Methylamyl alcohol; Methylpentanol; M.I.B.C.; Pentanol, 4-methyl-; sec-Hexyl alcohol
CAS Registry No.: 108-11-2
Chemical Formula: $C_6H_{14}O$
Constituent Components (% each): Typically 93% to 100% pure
UN/NA Designation: UN2053
IMO Designation: 3, Flammable liquids
RTECS Number: SA7350000
NFPA 704 Hazard Rating: 2 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear, colorless liquid. At least one manufacturor ships it as a green liquid.
Odor Characteristics: Mild odor
Common Uses: It is used as a solvent and in brake fluids; used in lacquers to improve gloss, flow out and blush resistance, and in the preparation of phenolic and alkyd-amine baking finishes; used as a hydraulic fluid component, as a frothing agent in ore flotation, as a chemical intermediate and in the manufacture of pharmaceuticals, photographic reagents and industrial cleaning compounds.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or
Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Product is flammable. Fumes and vapors are heavier than air, may travel to a distant source of ignition and flash back.

Short Term Exposure Limit (STEL): 40 ppm (167 mg/m^3) (NIOSH & ACGIH)

Time Weighted Average (TLV-TWA): 25 ppm (104 mg/m^3) (NIOSH & ACGIH)

Ceiling (C) Limit: Unavailable

IDLH: 400 ppm

Conditions to Avoid: Heat or sources of ignition; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to the high vapor concentrations that may be present in the local spill area and immediately downwind.

Hazards of Skin or Eye Contact: May cause skin and eye irritation. Prolonged and/or repeated contact causes defatting of the skin with irritation, dryness, cracking or folliculitis. Can be absorbed through the skin.

Hazards of Inhalation: May cause respiratory tract irritation. High concentrations causes central nervous system effects, such as dullness, dizziness and anesthesia.

Hazards of Ingestion: May cause gastrointestinal irritation with nausea, abdominal pain, vomiting, diarrhea, headache and dullness.

FIRE HAZARDS

Lower Flammable Limit: 1%

Upper Flammable Limit: 5.5%

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas and may travel to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: May include carbon monoxide, carbon dioxide and irritating and toxic fumes and gases.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

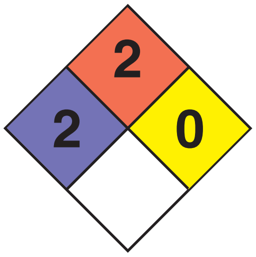
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: Up to 250 ppm (APF = 10), any supplied-air respirator. Up to 400 ppm, any supplied-air respirator operated in a continuous-flow mode (APF = 25), any self-contained breathing apparatus with a full facepiece (APF = 50), or any supplied-air respirator with a full facepiece (APF = 50). For unknown concentrations, fire fighting or high concentrations (above 400 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2053

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Defatting of the skin with irritation, dryness and cracking. May cause central nervous system depression. May cause eye, skin, respiratory and digestive tract irritation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if irritation develops or persists. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Seek medical advice on whether or not to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, alcohol-resistant foam, water spray, fog or carbon dioxide.

Extinguishing Techniques: Toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Do not use a solid stream of water, since the stream may scatter and spread the fire. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: Methyl isobutyl carbinol is a flammable liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or Combustible Liquid

AIR RELEASE

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic and/or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Alcohol-resistant foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Spills may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible, impervious material.

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

NOTE: The techniques described below are for floating, undissolved liquids. Due to the fact that some amount of the chemical is expected to dissolve, other techniques should be considered, such as containment dikes, aeration and adsorption.

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

METHYL ISOBUTYL CARBINOL

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Sorbent pads or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating product.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Sorbent pads, peat or commercial sorbent materials compatible with product may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

March 1995

METHYL ISOBUTYL KETONE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl isobutyl ketone is a clear colorless flammable liquid that is used as a solvent, as an alcohol denaturant, and for making methyl amyl alcohol. It is of low but significant solubility in water and lighter, so may be expected to form a floating slick that dissolves at a moderate rate. Its flash point range of 64-75°F indicates that it can be easily ignited at warmer ambient temperatures. Vapors are only slightly heavier than air at or above these temperatures but may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some limited potential that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.7 pounds per gallon.

Methyl isobutyl ketone does not react with water or many other common materials and is stable in normal transportation. It is reactive with strong oxidizers, however, and may soften a variety of plastics. Toxicity of the product is low to moderate via the various potential routes of exposure. Products of combustion are irritating and may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Somewhat soluble, 2 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, benzene, chloroform, diethyl ether, and ethyl alcohol.
Specific Gravity (Liquid): 0.802 at 68°F (20°C)
Boiling Point: 241.2°F (116.2°C) at 1 atm.
Melting Point: See freezing point
FreezingPoint: –119°F (–84°C)
Molecular Weight: 100.16
Heat of Combustion: –5800 cal/g
Vapor Pressure: 5 mm Hg (0.097 psia) at 67.5°F (20°C)
Flash Point: 64-73°F (17.8-22.8°C), closed cup; 75°F (23.9°C), open cup.
Autoignition Temperature: 840-860°F (448-460°C)
Burning Rate: Unavailable
Stability: Stable
Corrosiveness: Noncorrosive but may soften many plastics.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizing materials.

IDENTIFICATION

Shipping Names: methyl isobutyl ketone (USDOT and IMO).
Synonyms and Tradenames: 4-Methyl-2-pentanone; isobutyl methyl ketone; hexone; isopropyl acetone; MIK; MIBK; 4-methyl-2-oxopentane; 2-methyl-4-pentanone.
Chemical Formula: $(CH_3)_2CHCH_2COCH_3$
Constituent Components(% each): More than 95% pure by weight
UN/NA Designation: UN1245
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pleasant, mild or sharp, ketonic, like mint
Common Uses: Solvent for vinyl resins, camphors, oils, fats, waxes, paints, varnishes, lacquers, etc; alcohol denaturant; uranium extraction solvent; mfg. methyl amyl alcohol.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYL ISOBUTYL KETONE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.48-8 ppm

Unusual Hazards: None

Short Term Exposure Limits(STEL): 75 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 50 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations that may be present in the immediate spill area. Direct contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid methyl isobutyl ketone may cause drying, cracking, inflammation, and peeling of the skin due to the defatting action of the product. Contact with the eyes may result in pain and irritation.

Hazards of Inhalation: Vapors of methyl isobutyl ketone may be irritating to the eyes, nose, and throat. High concentrations in air may cause narcosis and central nervous system depression with symptoms including headache, nausea, drowsiness, dizziness, staggering gait, unconsciousness, and possibly death. Prolonged exposure to 100 ppm may cause headache and nausea. Exposure of rats to 4000 ppm in air for 4 hours was fatal in laboratory experiments.

Hazards of Ingestion:

Data unavailable. Product is of relatively low oral toxicity in animal experiments.

FIRE HAZARDS

Lower Flammable Limit: 1.4%

Upper Flammable Limit: 7.5%

Behavior in Fire: Flammable liquid. May generate some quantity of flammable vapors upon release. Vapors may be heavier than air at warmer temperatures and may travel to a source of ignition and flash back. There is some limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined but considered irritating; may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

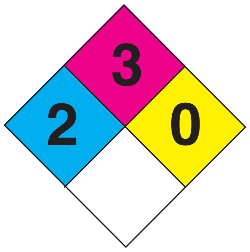
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, polyethylene, polyurethane, polyvinyl alcohol, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 3000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin style or front or back mounted organic vapor canister (3000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1245

METHYL ISOBUTYL KETONE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, or skin; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers, confined spaces, or waterways. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of methyl isobutyl ketone may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that methyl isobutyl ketone is a flammable liquid. Note that oil spill containment and cleanup techniques described for water spills are only effective before the spilled product dissolves in water.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Methyl isobutyl ketone may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of methyl isobutyl ketone in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl isobutyl ketone vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of methyl isobutyl ketone from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

METHYL ISOBUTYL KETONE
Class 3 (Flammable Liquid)

TECHNIQUE

ALCOHOL FOAM . . . There is a posssibility that alcohol foam applied to the surface of liquid pools may slow the release of methyl isobutyl ketone vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methyl isobutyl ketone may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained methyl isobutyl ketone may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

METHYL ISOBUTYL KETONE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

METHYL ISOBUTYL KETONE

Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating methyl isobutyl ketone.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with methyl isobutyl ketone may be used to absorb spilled product from the watersurface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

METHYL ISOCYANATE
Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Methyl isocyanate, often called MIC for short, is a colorless, flammable, highly toxic liquid with a boiling point of 102.4ºF and a sharp pungent odor that causes tears in the eyes. It is a general chemical intermediate used to make carbamate insecticides and herbicides. It is fairly soluble in water and slightly lighter, and will react with water in a complex manner discussed below. Its flash point of less than 0ºF indicates that it may be easily ignited under virtually all ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently and possibly explode if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.1 pounds per gallon.

Methyl isocyanate reacts with water to form methylamine (see separate guide for methylamine) and other substances described below. The product will also decompose on contact with alkali or acids and may polymerize while evolving heat in the presence of zinc, iron, tin, copper, salts of these metals, and other catalysts such as triphenylarsenic oxide, triethylphosphine, tributylin oxide, calcium oxide, sodium alkoxides, and ferric, tin, or copper chlorides. Such reactions will proceed violently or slowly depending on the specific catalyst involved. Toxicity of the volatile product is extremely high by all routes of exposure and its vapors in air can be lethal or otherwise harmful over considerable downwind distances. Thermal decomposition of MIC may produce hydrogen cyanide, nitrogen oxides, carbon monoxide, and possibly some amounts of unburned material. Only certain materials of construction listed below are safe in contact with MIC.

Downwind evacuation should be considered immediately if methyl isocyanate is leaking from its container but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently or explode.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Most reported is 6.7% wt or 6.7 g/100g water at 68ºF (20ºF). Note that MIC reacts with water.
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 0.96 at 68ºF (20ºC)
Vapor Density: 2.0
Boiling Point: 102.4ºF (39.1ºC) at 1 atm
Melting Point: -112ºF (-80ºC) or less
Freezing Point: See melting point
Molecular Weight: 57.05
Heat of Combustion: 4463 - 4722 cal/g
Evaporation Rate (butyl acetate=1): 26.8
Vapor Pressure: 348 mmHg (6.73 psia) at 68ºF (20ºC)
Flash Point: Less than 0ºF (-17.8ºC), open cup; 19 - 20ºF (-7.2 to -6.7ºC), closed cup.
Autoignition Temperature: 994 - 995ºF (534 - 535ºC)
Burning Rate: Unavailable
Flammable Limits: 5.3% (LEL) - 26% (UEL)
Stability: Can become unstable.
Polymerization Potential: Elevated temperatures. See general information section for polymerization catalysts to be avoided.
Corrosiveness: Do not use iron, steel, aluminum, zinc, galvanized iron, copper or tin or their alloys as these may initiate polymerization reactions. Suitable materials include types 304 and 316 stainless steel, nickel, pinhole free glass-lined steel, and fluorocarbon resins such as Teflon or Kel-f. Any other material may be unsuitable and possibly dangerous. MIC diffuses through polyethylene and attacks most elastomers.
Reactivity with Water: Reacts with water to produce carbon dioxide, methylamine, dimethylurea and/or trimethylbiuret accompanied by evolution of heat which may cause evaporation of the isocyanate. The reaction is relatively slow below 68ºF (20ºC) but becomes violent at more elevated temperatures or in the presence of acids or bases.
Reactivity and Incompatibility: Other incompatible substances include oxidizers and compounds such as alcohols, amines, acids, and urea derivatives that possess active hydrogen atoms.

IDENTIFICATION

Shipping Name(s): Methyl isocyanate (USDOT & IMO); Methyl isocyanate solution (IMO).
Synonyms and Tradenames: Isocyanatomethane; Methylcarbylamine; Isocyanic acid, Methyl ester; Methyl carbonimide; MIC.
CAS Registry No.: 624-83-9
Chemical Formula: CH_3NCO or C_2H_3NO
Constituent Components (% each): Relatively pure when shipped as methyl isocyanate (MIC).
UN/NA Designation: UN2480
IMO Designation: 6.1, Toxic substances
RTECS Number: NQ9450000
NFPA 704 Hazard Rating: 4(Health): 3(Flammability): 2(Reactivity): Reacts with water
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid (boils at 102.4ºF or so)
Color of the Shipped Material: Colorless liquid
Odor Characteristics: Sharp, causes tears; pungent.
Reportable Quantity: See appendix I.
Common Uses: Mfg. carbamate insecticides, herbicides; general chemical intermediate.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHYL ISOCYANATE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: No odor at 2 ppm but irritation and intense tearing occurs in 5 minutes.

Unusual Hazards: Highly toxic, reactive, volatile, and flammable substance. Containers may rupture violently in fire. Flammable vapors may travel to a source of ignition and flash back. Discharges into the atmosphere due to spills or potential runaway polymerization reactions can subject downwind areas to highly toxic concentrations in air over considerable distances.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.02 ppm (Skin)

Ceiling (C) Limit: Unavailable

IDLH: 3 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Dangerous by all routes of exposure. The major hazard is from the significant and extremely toxic vapor concentrations that may occur in the spill area and over considerable downwind distances, particularly in the event of a runaway exothermic reaction. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of liquid methyl isocyanate with the skin or eyes may result in severe burns and tissue destruction. The substance may be absorbed through the skin in toxic amounts. Eye contact may result in permanent damage. Vapors may also irritate the skin and eyes, with a substantial potential for temporary corneal injury.

Hazards of Inhalation: The vapors of methyl isocyanate cause intense lacrimation and irritation of the eyes, mucous membranes, and skin. High concentrations in air can cause headache, nausea, vomiting, coughing, difficult breathing, increased secretions, chest pain, pulmonary sensitization in susceptible individuals, delayed pulmonary edema, edema of the larynx and bronchi, spasm, and death. Exposure to only 5 ppm in air was fatal to 50% of rats within four hours in laboratory experiments. Humans experience marked irritation of the eyes, nose, and throat within 1 to 5 minutes at 4 ppm in air, with symptoms being less severe at 2 ppm and unbearable at 21 ppm. Some symptoms such as light sensitivity, coughing, difficult breathing, fatigue, dizziness, skin rashes, and others may reoccur.

Hazards of Ingestion: Ingestion of methyl isocyanate may be fatal. At the very least, burns of the mouth, throat, and stomach may be expected.

FIRE HAZARDS

Lower Flammable Limit: 5.3%

Upper Flammable Limit: 26%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors may be heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire and possibly explode. Unburned vapors may pose toxic hazard over considerable downwind distances.

Hazardous Combustion Products: Thermal decomposition may produce hydrogen cyanide, nitrogen oxides, carbon monoxide, and/or carbon dioxide. Some amounts of unburned methyl isocyanate may be included.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire and possibly explode. Contamination of product by various substances may occasionally initiate a potentially rapid polymerization reaction that may lead to violent container rupture and release of highly toxic gases. The product may explode violently when dropped on a hot surface; dried out MIC may explode if exposed to heat, flame, or shock.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Polyvinyl ACL is reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with hazardous vapor or fume concentrations in air under accident conditions. A MIC product bulletin suggests that the "butyl type" be used.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 0.02 ppm), a self-contained breathing apparatus (SCBA) with full facepiece.

2480

METHYL ISOCYANATE

Division 6.1 (Poisonous Materials)

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues and the respiratory tract; intense tearing of the eyes; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek medical attention immediately if skin irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide; use water spray or foam with caution due to the possibility of increased vapor evolution. Note that it may be best at times not to extinguish burning MIC due to toxic vapor and reignition hazards.

Extinguishing Techniques: Unusual corrosive and toxic vapor hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus. Wear full chemical protective suit if contact with material or fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800ºF), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Take into consideration the highly toxic nature of methyl isocyanate while planning the response. Downwind evacuation should be considered. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Use intrinsically safe equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product, and which will not initiate a reaction. Take the reactivity, flammability, volatility, and high toxicity of methyl isocyanate into account when planning the response.

AIR RELEASE

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYL ISOCYANATE

Division 6.1 (Poisonous Materials)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl isocyanate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Apply water at a point downwind in this case and do not permit it to contact pools of liquid methyl isocyanate as this may increase vapor as the water begins to react with the spill product and the reaction evolves heat. Water runoff may contain a small amount (if any) of methyl isocyanate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of methyl isocyanate vapors into the atmosphere. (Note: Several sources suggest foam use to control fires, thus suggesting that a foam blanket may have value in controlling vapor evolution even though methyl isocyanate is reactive with water.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid methyl isocyanate may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts. Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid methyl isocyanate may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

INTENTIONAL IGNITION . . . Due to the fact that MIC vapors in air were proven to be deadly in the Bhopal tragedy, and are of unusually high toxicity, very careful consideration might be given to the intentional ignition of vapors, particularly if methyl isocyanate vapors are entering the atmosphere at a high rate due to a runaway exothermic reaction of some kind.

CONSEQUENCE

The intentional ignition of a highly flammable substance under uncontrolled conditions can pose several dangers.

MITIGATION

Consult qualified experts if time permits. This response is extreme and is not recommended for casual use by the inexperienced.

METHYL ISOCYANATE

Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Liquid methyl isocyanate may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined methyl isocyanate may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with activated carbon, sand, or other nonreactive and compatible substances. (Note: A product bulletin for MIC suggests that 6 inches of carbon be added to each inch of liquid depth and that the absorbed MIC be allowed to react with moisture in the air over a 12 to 24 hour period.)

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

METHYL ISOCYANATE

Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Methyl isocyanate will react with water to form carbon dioxide, methylamine, dimethylurea, and/or trimethylbiuret.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

METHYL MERCAPTAN
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Methyl mercaptan is a colorless gas shipped as a liquid under pressure and having a strongly offensive, unpleasant odor like that of rotten cabbage or garlic. With a boiling point in the range 42-46°F, a low solubility in water, and a lighter weight, the liquid can be expected to float on water while boiling (in most cases) and slowly dissolving. The very low flash point of the product and its low boiling point indicate that large amounts of flammable (and toxic) vapors or gases may be evolved under most ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.2 pounds per gallon as a liquid.

Methyl mercaptan is stable in normal transportation. Some authorities warn that it reacts with water or steam to form toxic and flammable vapors, but this is somewhat uncertain. The product is known, however, to be reactive with a variety of chemical substances, and it is clear that warm water or steam would at the very least accelerate vapor evolution. Reactions with epoxides may be explosive. A major hazard of spills involves the toxicity of the vapors by inhalation, since they are toxic at low concentrations and large amounts of vapor or gas may be evolved. Products of combustion are toxic and may include sulfur dioxide.

Downwind evacuation should be considered if methyl mercaptan is leaking but not on fire. If a product container is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 2.33 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, and petroleum naphtha

Specific Gravity (Liquid): 0.868 at 68°F (20°C); 0.892 at 42.8°F (6°C)

Boiling Point: 42.4 - 45.7°F (5.8-7.6°C) at 1 atm.

Melting Point: – 186 to – 189.6°F (– 121 to – 123.1°C)

Freezing Point: – 186 to – 189°F (– 121 to – 123°C)

Molecular Weight: 48.1

Heat of Combustion: – 6141 cal/g

Vapor Pressure: 2 atm (29.4 psia) at 79°F (26.1°C)

Flash Point: less than 0°F (– 17.8°C)

Autoignition Temperature: Unavailable

Burning Rate: 3.8 mm/minute

Stability: Stable

Corrosiveness: Normally shipped in steel containers. Avoid copper, mercury, lead, and zinc.

Reactivity with Water: Uncertain; may react with water, or water or steam may simply accelerate vapor evolution.

Reactivity with Other Chemicals: Reacts with bleaches, halogenated organics, isocyanates, ketones, mineral acids, organic peroxides, strong oxidizers, alkali and alkaline earth metals, nitrides, strong reducing agents, epoxides, azo and diazo compounds, hydrazines, unsaturated organics, copper, mercury, lead, and zinc.

IDENTIFICATION

Shipping Names: Methyl mercaptan (USDOT & IMO)

Synonyms and Tradenames: Methanethiol; mercaptomethane; thiomethyl alcohol; methyl sulfhydrate; methylthioalcohol.

Chemical Formula: CH_3SH

Constituent Components(% each): 98-99.5% or more pure with 2% max hydrogen sulfite and traces of dimethylsulfide .

UN/NA Designation: UN1064

IMO Designation: 2.3 poison gas

Physical State as Shipped: Liquid compressed gas

Physical State as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas; water-white liquid

Odor Characteristics: Powerful, foul, offensive; like garlic or rotten cabbage.

Common Uses: Mfg. of jet fuel additives, pesticides, fungicides, plastics, dyes, pharmaceuticals, catalysts, and other chemicals

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYL MERCAPTAN

Poison Gas (Division 2.3)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.01-30 ppb (extremely low)

Unusual Hazards: Highly volatile, flammable, and toxic substance. Large amounts of toxic and flammable gases or vapors may be evolved from spills.

Short Term Exposure Limits: OSHA has 10 ppm ceiling limit as 15 minute average.

Time Weighted Average(TLV-TWA): (Skin) 0.5 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of vapors in air, but ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Methyl mercaptan is irritating to the skin and eyes. The liquid may cause frostbite or chemical type burns upon contact.

Hazards of Inhalation: Vapors are irritating to the eyes, nose, and throat and may cause restlessness, increased respiration, cyanosis, muscular weakness, and other symptoms of narcosis or central nervous system depression. High levels may cause respiratory paralysis, convulsions and death. Effects may include pulmonary edema and injury to the liver or kidneys. A level of 4 ppm in air may cause headaches and nausea in several hours. To laboratory rats a concentration of 10,000 ppm is lethal in 1 minute.

Hazards of Ingestion: Can be poisonous. Ingestion may result in irritation of the mouth and stomach plus symptoms described for inhalation.

FIRE HAZARDS

Lower Flammable Limit: 3.9%

Upper Flammable Limit: 21.8%

Behavior in Fire: Flammable liquefied compressed gas. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Toxic, include sulfur dioxide and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Reactions with epoxides may be explosive.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1064

METHYL MERCAPTAN

Poison Gas (Division 2.3)

FIRST AID

Nonspecific symptoms: Irritation of eyes, nose, and respiratory tract; other symptoms of inhalation or direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. Note that severe pain in eyes due to vapor exposure may be controlled by hot and cold compresses.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to liquid pools may increase rate of vapor evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account during response planning that methyl mercaptan is highly volatile, flammable, and toxic. Beware of possible heavy gas accumulations in pits, hollows, or depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl mercaptan spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

METHYL MERCAPTAN
Poison Gas (Division 2.3)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl mercaptan vapors or fumes from a point downwind of the spill may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a varying amount of methyl mercaptan from contact with airborne vapors or fumes. Any water entering liquid pools of spilled product may increase vapor evolution.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Keep water away from pools of liquid methyl mercaptan.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of quiescent liquid pools may slow the release of methyl mercaptan vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The rate of vapor evolution may increase temporarily as the foam is applied.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if the response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Methyl mercaptan may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained methyl mercaptan may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MTIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. High pressures may be developed in equipment.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

METHYL MERCAPTAN
Poison Gas (Division 2.3)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. The application of sorbent materials may temporarily increase vapor evolution from pools of liquid methyl mercaptan.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. (Note: Vented containers may be necessary.)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water containing dissolved methyl mercaptan may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: Oil spill containment devices may be considered for floating pools of liquid methyl mercaptan according to some authorities. Proceed with caution if necessary and if attempted.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

METHYL MERCAPTAN
Poison Gas (Division 2.3)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating contaminated water via use of a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

METHYL METHACRYLATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyl methacrylate is a colorless liquid with a sharp, fragrant, fruity odor. It is used for making plastics and resins. It is slightly soluble in water and slightly lighter, so may be expected to form a floating surface slick that slowly dissolves in water. Its flash point of 50°F indicates that it can be easily ignited under a wide range of ambient temperature conditions. Vapors are slightly heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapors in confined spaces such as sewers or buildings may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 7.9 pounds per gallon.

Methyl methacrylate does not react with water or many other common materials and is stable in normal transportation, particularly when inhibited to prevent potentially violent self-polymerization. Such polymerization may occur, however, if the product is exposed to heat, oxidizing agents or ultraviolet light, and the product is reactive with various other chemicals. It is an irritant to bodily tissues and may be toxic if inhaled in high concentrations in air. Products of combustion may include carbon monoxide and acid fumes as well as other substances.

Downwind evacuation should be considered on a case by case basis if methyl methacrylate is leaking but not on fire. If a fire becomes uncontrollable ora container is exposed to direct flame, evacuate for a radius of one-half ($^{1}/_{2}$)mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 1.5 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, and ether.
Specific Gravity (liquid): 0.945 at 68°F (20°C)
Boiling Point: 214°F (101°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –54°F (–48°C)
Molecular Weight: 100.12
Heat of combustion: –6310 cal/g
Vapor Pressure: 35 mm Hg (0.677 psia) at 68°F (20°C)
Flash Point: 50°F (10°C), open cup
Autoignition Temperature: 790–815°F (421–35°C)
Burning Rate: 2.5 mm/minute
Stability: Stable
Corrosiveness: Noncorrosive to steel, aluminum, or stainless steel.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with nitrates, oxidizing materials (including peroxides and other initiators of polymerization), strong alkalis, strong acids, and reducing agents.

IDENTIFICATION

Shipping Names: Methyl methacrylate monomer, stabilized (USDOT & IMO)
Synonyms and tradenames: 2-propenoic acid, 2-methyl-, methyl ester; methacrylic acid, methyl ester; methyl-alpha-methylacrylate; methyl2-methyl-2-propenoate; acrylic resin monomer; 2-methylpropenoic acid;alpha-methyl acrylic acid.
Chemical formula: $CH_2 = C(CH_3)COOCH_3$
Constituent Components(% each): 99.8% Or more pure with trace (22-120 ppm) of polymerization inhibitor.
UN/NA Designation: UN1247
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: liquid
Physical State as Released: liquid
Color of the Shipped Material: colorless
Odor Characteristics: Sharp, fragrant, pleasant, pungent, acrid, and fruity.
Common uses: Mfg. Plastics and resins used in a wide variety of products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

METHYL METHACRYLATE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.19–0.21 ppm

Unusual Hazards: Somewhat volatile flammable liquid with slightly heavier than air vapors that may travel to a source of ignition and flash back. Heat,chemical contaminants, or ultraviolet light may initiate self-polymerization with violent rupture of containers. Vapors are uninhibited and may form polymers in vents or flame arrestors, resulting in blockage.

Short Term Exposure Limits(STEL): 125 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 100 ppm over each 8 hours of a 40 hour work week.(ACGIH) conditions to avoid: heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in the spill area and immediately downwind. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with liquid methyl methacrylate may cause a skin rash, irritation, inflammation, and/or allergic skin reaction. Contact with the eyes may cause irritation requiring several days for recovery. One source suggests the possibility of corneal damage.

Hazards of Inhalation: Vapors of methyl methacrylate are irritating to the eyes, nose, throat, and respiratory system. High concentrations in air may cause narcosis with symptoms including drowsiness, headache, nausea, vomiting,and possibly unconsciousness. Exposure to 13,500 ppm in air for 3 hours was fatal to rabbits in laboratory experiments.

Hazards of Ingestion: Ingestion may result in irritation of the mouth, esophagus, and gastrointestinal tract as well as symptoms of narcosis.

FIRE HAZARD

Slower Flammable Limit: 2.1%

Upper Flammable Limit: 12.5%

Behavior in Fire: Flammable liquid. May generate significant quantities of flammable vapor upon release. Vapors are slightly heavier than air and may travel to a source of ignition and flash back. Exposure of containers to fire may result in polymerization and violent container rupture.

Hazardous Combustion Products: Include carbon monoxide, acid fumes, unburned methyl methacrylate, and other substances.

EXPLOSION HAZARD

Slower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat or light may cause spontaneous polymerization resulting in violent container rupture. Violent polymerization may also occur in the presence of oxidizing materials or ultraviolet light.

PROTECTIVE CLOTHING AND EQUIPMENT

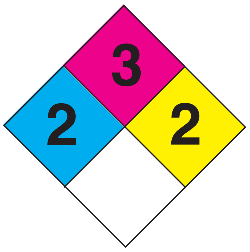
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, polyethylene, polyurethane, and polyvinyl alcohol.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 4000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (4000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1247

METHYL METHACRYLATE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, skin, or respiratory tract; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution:administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff.Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of methyl methacrylate may result in damage, rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that methyl methacrylate is a somewhat volatile flammable liquid that may violently self-polymerize under conditions described in the general information section.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Methyl methacrylate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION ... Methyl methacrylate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of methyl methacrylate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

METHYL METHACRYLATE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to methyl methacrylate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount of methyl methacrylate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and over fill impoundments.

TECHNIQUE

FOAM ... Firefighting foam applied to the surface of liquid pools may slow the release of methyl methacrylate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Methyl methacrylate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained methyl methacrylate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, peat moss, saw dust, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

METHYL METHACRYLATE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue maybe removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS ... Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS ... Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Up stream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION ... Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

METHYL METHACRYLATE
Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING ... Oil spill skimming devices may be deployed to recover floating methyl methacrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION ... Straw, hay, peat, or commercial sorbent materials compatible with methyl methacrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause over flow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

METHYL ORTHOSILICATE

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Methyl orthosilicate is a colorless liquid that solidifies at 24.8ºF. It is highly toxic by inhalation. Although the volume of the product used in commerce is limited, some amounts are used in making TV picture tubes, mold binders, coatings, paints, lacquers, and other chemicals. Unfortunately, however, limitations on use mean that the available information on the properties and hazards of methyl orthosilicate is also limited and contains inconsistencies. It is unclear, for example, whether the product is insoluble in water as claimed by one authority or easily hydrolyzed (i.e., it decomposes or reacts) as claimed by others. Its flash point of 69ºF indicates the product may be easily ignited at moderate to high ambient temperatures. Vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.6 pounds per gallon, which is only very slightly heavier than water.

Compounds related to methyl orthosilicate are known to be thermally stable in transportation. Information on water reactivity (if any), corrosivity, and reactivity with other chemicals is generally unavailable but it can be safely assumed the product is incompatible with strong oxidizing agents that may cause its ignition. The primary reason that the product is little used in industry is that the liquid and its vapors pose considerable danger to the eyes and have an insidious delayed effect. In addition, it is of moderate to high toxicity by other routes of exposure. Products of combustion are not defined but likely to be irritating and/or poisonous.

Downwind evacuation should be considered if methyl orthosilicate is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Considered insoluble by one authority and soluble by another but there is a possibility it reacts; see below.

Solubility in Other Chemicals: Soluble in alcohol and ether.

Specific Gravity (Liquid): 1.023 - 1.032 at 68ºF (20ºC)

Vapor Density: 5.25

Boiling Point: 249.8 - 251.6ºF (121 - 122ºC) at 1 atm.

Melting Point: 24.8ºF (-4ºC)

Freezing Point: See melting point

Molecular Weight: 152.22

Heat of Combustion: Unavailable

Evaporation Rate: Unavailable

Vapor Pressure: 12 mmHg (0.2319 psia) at 77ºF (25ºC); another source reports 3.35 psi at 68ºF (20ºC).

Flash Point: 69ºF (20.6ºC), closed cup

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Flammable Limits: Unavailable

Stability: Stable.

Polymerization Potential: Will not occur.

Corrosiveness: Unavailable

Reactivity with Water: May decompose on exposure to moist air or water. Readily hydrolized.

Reactivity and Incompatibility: Oxidizes with hexafluorides of rhenium, molybdenum and tungsten. Incompatible with oxidizing agents, acids and bases.

IDENTIFICATION

Shipping Name(s): Methyl orthosilicate (USDOT & IMO)

Synonyms and Tradenames: Methyl o-silicate; Methyl silicate; Tetramethoxysilane; Tetramethyl silicate; Tetramethyl orthosilicate; Tetramethyloxysilane; Silicic acid, Tetramethyl ester

CAS Registry No.: 681-84-5

Chemical Formula: $(CH_3O)_4SI$

Constituent Components (% each): Unavailable

UN/NA Designation: UN2606

IMO Designation: 6.1, Toxic Substances

RTECS Number: VV9800000

NFPA 704 Hazard Rating: 3(Health): 3(Flammability): 1(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Solid or liquid; pure product solidifies at 24.8ºF (-4ºC).

Color of the Shipped Material: Colorless

Odor Characteristics: Unavailable

Reportable Quantity: See appendix I.

Common Uses: Coating TV picture tubes; in mold binders and corrosion resistant coatings; silicone intermediate; in catalyst preparation; bonding agent in paints and lacquers. Little used in commerce at present.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

METHYL ORTHOSILICATE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic by inhalation and extremely hazardous to the eyes.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1 ppm

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazards are from inhalation or eye contact with the high vapor concentrations that may be present in air in the spill area and downwind. Ingestion and direct physical contact are also to be strictly avoided.

Hazards of Eye Contact: Both liquid methyl orthosilicate and its vapors are extremely hazardous to the eyes. Although immediate effects may be slight, a serious reaction may take place several hours after the exposure resulting in swelling of the lids and conjunctivae, pain, destruction and opacification of the cornea, and possibly permanent blindness. Exposure to even 1000 ppm of vapors in air for 15 minutes may require hospitalization.

Hazards of Skin Contact: Specific data on the effects of skin contact are unavailable but contact is expected to cause some type of injury.

Hazards of Inhalation: Excessive inhalation of methyl orthosilicate may result in pulmonary edema (which may be delayed in onset), kidney damage, and possibly severe consequences. Exposure to 160 ppm for 10 minutes was fatal to some mice in laboratory experiments while 250 ppm for four hours proved fatal to rats.

Hazards of Ingestion: Methyl orthosilicate is moderately toxic via ingestion. Effects may include pulmonary edema and injury to the kidneys.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquid. Containers may rupture violently in fire. May generate large quantities of flammable and toxic vapor upon release. Vapors may travel some distance to a source of ignition and flash back.

Hazardous Combustion Products: Toxic fumes of carbon monoxide, carbon dioxide, silicon oxide, hydrogen cyanide, oxides of nitrogen and methanol.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

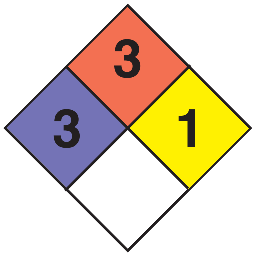
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, wear a self contained breathing apparatus (SCBA) with full facepiece.

2606

METHYL ORTHOSILICATE

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues. Highly destruction to skin, eyes, mucous membranes and upper respiratory tract. Ingestion or inhalation could prove fatal.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Information is limited. Get immediate medical advice and attention. One manufacturer suggests to administer large quantities of water and not to induce vomiting.

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Take the flammable and toxic nature of methyl orthosilicate into account when planning the response.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of fuel oil in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

METHYL ORTHOSILICATE

Division 6.1 (Poisonous Materials)

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited to spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to methyl orthosilicate vapors or fumes may accelerate their dispersal in the atmosphere. (Note: Apply water cautiously at first if liquid methyl orthosilicate is exposed. The reactivity of water with this product is not well defined.)

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of methyl orthosilicate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that application of an appropriate firefighting foam to the surface of liquid pools may slow the release of methyl orthosilicate vapors into the atmosphere. The fact that foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Methyl orthosilicate may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined methyl orthosilicate may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

METHYL ORTHOSILICATE
Division 6.1 (Poisonous Materials)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product. Pure product may solidify and clog lines or pumps in cold weather.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Keep product warm if necessary.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

METHYL ORTHOSILICATE

Division 6.1 (Poisonous Materials)

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Insufficient data precludes the provision of more specific advice in this guide.

October 1993

METHYLTRICHLOROSILANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Methyltrichlorosilane is a colorless, volatile, flammable, corrosive, and fuming liquid with an odor variably described as sharp, pungent, acrid, irritating and resembling hydrochloric acid. It can be easily ignited under most ambient temperature conditions. Its vapors and fumes are heavier than air, may persist in low areas, or travel some distance to a source of ignition and flash back. Accumulations in confined spaces such as buildings or sewers may explode if ignited. The liquid weighs about 10.6 pounds per gallon.

Although stable when in sealed containers, it reacts violently with water to form corrosive hydrochloric acid while generating heat, white acid fumes, and a mixture of methylsiloxanes which may or may not be heavier than water or soluble therein. It also generates acid fumes when exposed to moist or humid air. It is otherwise reactive with a broad range of materials. Both the liquid and its vapors and fumes are highly corrosive to bodily tissues by all routes of exposure. Products of combustion are not well defined but are variably reported to include corrosive hydrogen chloride and hydrochloric acid, extremely toxic phosgene, carbon monoxide, carbon dioxide, silicon oxide, highly dispersed silica, and other irritant and toxic substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if methyltrichlorosilahe is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts violently.
Solubility in Other Chemicals: Soluble in toluene.
Specific Gravity (Liquid): 1.270 - 1.273 at 77°F (25°C).
Boiling Point: 150.8 - 152°F (66 - 66.7°C) at 1 atm.
Melting Point: - 130°F (- 90°C) or - 108°F (- 77.8°C); reported values vary.
Freezing Point: See melting point.
Molecular Weight: 149.5.
Heat of Combustion: - 1,700 cal/g.
Vapor Pressure: 40 mm Hg (0.7732 psia) at 19.4°F (- 7°C); 132 mm Hg (2.551 psia) at 68°F (20°C).
Flash Point: Most say 15°F (- 9.4°C) closed-cup; 45°F (7.2°C), open-cup.
Autoignition Temperature: Greater than 760°F (404°C).
Burning Rate: 1.9 mm/minute.
Stability: Stable in sealed container.
Corrosiveness: Carbon steel is satisfactory for use with the dry product but any contact with water or moisture produces hydrochloric acid which is corrosive to most metals, and which will generate flammable and potentially explosive hydrogen gas.
Reactivity with Water: Reacts violently with water to form corrosive hydrochloric acid while generating heat, white acid fumes, and a mixture of methylsiloxanes. Methyltrichlorosilane will also generate acid fumes when exposed to moist or humid air.
Reactivity with Other Chemicals: Reported as incompatible and potentially capable of violent reactions producing hydrogen chloride with acids, bases (alkalis), oxidizing materials, and chemically active metals (such as potassium, sodium, magnesium, and zinc). Hydrogen gas evolved upon contact with a base may ignite spontaneously. Mixtures of very similar methyldichlorosilane with potassium permanganate, lead (II) oxide, lead (IV) oxide, copper oxide, or silver oxide form impact-sensitive explosive materials. It reacts violently with a broad range of other materials.

IDENTIFICATION

Shipping Names: Methyltrichlorosilane.
Synonyms and Tradenames: Methylsilicon trichloride; methylsilyl trichloride; methyl trichlorosilane; monomethyltrichlorosilane; trichloromethylsilane; and trichloromethylsilicon.
Chemical Formula: $\mathrm{CH3_3SiC1_3}$.
Constituent Components (% each): Apparently 95% or more pure with remainder consisting of 1 - 5% dimethyldichlorosilane and probably small quantities of similar substances.
UN/NA Designation: UN1250.
IMO Designation: 3, flammable.
Physical State As Shipped: Liquid.
Physical State As Released: Fuming liquid.
Color of the Shipped Material: Colorless.
Odor Characteristics: Sharp, pungent, acrid, irritating, resembling hydrochloric acid.
Common Uses: Used to make silicones for water repellants, electrical insulation, heat resistant paints, and other products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

METHYLTRICHLOROSILANE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available for methyltrichlorosilane; reported as 10 ppm in air for the similar methyldichlorosilane.

Unusual Hazards: Highly reactive fuming liquid. Reacts violently with water. Spraying water on the source of any leak may potentially cause corrosion due to formation of hydrochloric acid and increase the leakage area.

Short Term Exposure Limit (STEL): Not established by recognized authority.

Time Weighted Average (TWA) Limit: Not established by recognized authority.

Ceiling (C) Limit: Not established for methyltrichlorosilane. For hydrogen chloride, the absolute ceiling limit is 5 ppm (ACGIH, 1992 -93; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; contact with water or moisture; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Methyltrichlorosilane is highly corrosive to bodily tissues by all routes of exposure. Dangerous concentrations of its vapors and fumes may be present in the spill area and over considerable downwind distances.

Hazards of Skin or Eye Contact: Liquid methyltrichlorosilane may rapidly cause severe burns and tissue destruction upon contact with the skin or eyes, with eye effects including inflammation, pain, swelling, erosion of the cornea, severe damage to the cornea and lids, and possibly permanent injury and/or loss of sight. Effects on the skin may additionally include inflammation, pain, shock, and a risk of secondary infections. Exposure to concentrated vapors or fumes in air may also cause significant eye and skin irritation and also has the potential to result in eye damage. Contact lenses should not be worn when working with this material.

Hazards of Inhalation: Vapors and fumes of methyltrichlorosilane are highly irritating and corrosive to the nose, mouth, throat, respiratory tract, and lungs. Excessive exposures may result in such symptoms as a burning sensation, immediate distress, coughing, wheezing, hoarseness, laryngitis, shortness of breath, a choking sensation, headache, nausea, vomiting, spasms, bleeding of the nose and gums, possible ulceration of nasal and oral mucosa, inflammation and edema of the larynx and bronchi, possible kidney damage, loss of consciousness, pulmonary edema (which may be delayed in onset), chemical pneumonitis, and possibly death. Exposure to 450 ppm of methyltrichlorosilane in air for 4 hours or 1,550 ppm for 1 hour was sufficient to kill 50% of rats in laboratory experiments. It has been crudely estimated that exposure to 2,000 ppm of methyltrichlorosilane for 10 minutes (and possibly less) may be lethal to some humans. More conservative estimates are that concentrations of 1,300 to 2,000 ppm of hydrogen chloride in air may be lethal within a few moments. The saturated vapor concentration over a pool of liquid methyltrichlorosilane is about 52,630 ppm at 19.4°F (-7°C); 131,580 ppm at 53.8°F (12.1°C); and 173,685 ppm at 68°F (20°C).

Hazards of Ingestion: Ingestion of methyltrichlorosilane will cause severe burns of the mouth, throat, and stomach and may prove fatal. Symptoms of excessive single oral doses are additionally reported to include salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Any vomit generally has the appearance of coffee grounds. The potential for circulatory collapse is high. The lowest single oral dose reported to cause deaths among rats in laboratory experiments is 800 mg of methyltrichlorosilane per kilogram of an animal's body weight according to one source.

FIRE HAZARDS

Lower Flammable Limit: 7.2 to 7.6%.

Upper Flammable Limit: Variably reported as 11.9% to 20%.

Behavior in Fire: Flammable liquid. Difficult to extinguish and prone to reignition. May generate large quantities of flammable and corrosive vapors and fumes upon release. Vapors may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in a fire and possibly rocket.

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in a fire and possibly rocket. Reaction with water or moisture produces hydrochloric acid which may evolve potentially explosive hydrogen gas in contact with most metals. Mixtures with certain other chemicals may result in an explosion or formation of explosive compounds. There is a possibility that entry of water into a closed container of methyltrichlorosilane may result in its rupture if sufficiently high gas and vapor pressures are generated.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and/or gas-tight safety goggles, and other impervious and resistant clothing as appropriate. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary for fire fighting and wherever high vapor or fume concentrations may be encountered in

PROTECTIVE CLOTHING AND EQUIPMENT *(CONTINUED)*

air. Based on limited data, one authority indicates that Viton and polyethylene/ethylene vinyl alcohol/polyethylene (PE/EVAL/PE) materials may be compatible with methyltrichlorosilane. Compatible materials for various strengths of hydrochloric acid may include butyl rubber, natural rubber, neoprene, nitrile rubber, PE/EVAL, polyvinyl chloride (PVC), Viton, and Saranex according to various authorities. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting, spasms, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If conscious, have victim wash out mouth with large amounts of water which should not be swallowed; then slowly administer 1 or 2 glasses of water or milk to an adult, proportionately less to a child. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Authorities disagree substantially on which agents to apply. NFPA 49 recommends dry chemical, carbon dioxide, foam, or water spray while noting that water may be ineffective. The U.S. DOT (in ERG90) agrees with the NFPA for small fires but suggests use of water spray, fog, or regular foam on large fires. A major maker of the product warns that water should not be used because of the violent reaction that may take place but considers the use of foam acceptable. A Coast Guard publication warns not to use either water or foam because of the reaction problem. Everyone agrees that no water should be permitted to enter containers. Overall, it appears most prudent to avoid use of water or foam if the fire is small unless the burning liquid can rapidly and truly be flooded with comparatively massive amounts. For large fires which cannot reasonably be permitted to burn themselves out, use extreme caution and apply water in very large quantities as a spray or fog or apply large amounts of foam from a protected location or from as far a distance as possible. Use professional judgment as necessary to select from or modify these recommendations.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with products of combustion or vapors/fumes of methyltrichlorosilane is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire. Do not apply water or foam to leakage area of methyltrichlorosilane containers or permit either to enter such containers if possible.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away fromspill area. Avoid contact with spilled product or its vapors or fumes. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use. Handle and store this material under dry nitrogen if possible. Take all the reactivity, corrosivity, toxicity, volatility, and flammability hazards of methyltrichlorosilane into account when planning the response.

METHYLTRICHLOROSILANE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION. . . Evacuate local and downwind areas as conditions warrant to prevent exposure and allow vapors or fumes to dissipate. Methyltrichlorosilane spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors and fumes in air may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid methyltrichlorosilane as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain varying amounts of hydrochloric acid and other chemicals from contact with vapors and fumes.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FLOODING WITH WATER . . . The rapid addition of flooding quantities of water to pools of liquid methyltrichlorosilane may eventually slow the release of vapors and fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor and fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. The reaction between water and methyltrichlorosilane may be violent.

MITIGATION

Some possibilities include knockdown of vapors and fumes via large amounts of water fog and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts. Contain resulting liquids and neutralize and/or remove them as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that alcohol or regular foam applied to the surface of liquid pools may slow the release of vapors and fumes into the atmosphere. (Note: Several authorities suggest foam use for firefighting even though the water in the foam will clearly react with the spilled product. Thus, foam may possibly control vapor and fume evolution if a blanket can be maintained over liquid pools.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. There may be at least an initial increase in vapor and fume evolution when the foam is first applied.

MITIGATION

Proceed with caution. Stand ready to control increases in vapor or fume evolution with water spray or fog applied at a point downwind and/or temporarily evacuate downwind populations and other vulnerable resources. Abandon the effort if vapor and fume evolution does not decrease after a reasonable amount of foam has been applied. If the method works, continue foam application until the spilled product is removed or otherwise treated. Contain increased volume of liquids.

TECHNIQUE

NEUTRALIZATION . . . There is a possibility that application of an appropriate neutralization agent to liquid methyltrichlorosilane may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing methods.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid methyltrichlorosilane, its reaction products with water, or contaminated water runoff may be contained by building dikes or barriers using dry sand, soil, or other compatible materials.

METHYLTRICHLOROSILANE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained substances and spread of contamination.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Neutralize and/or remove contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the liquid may become damaged or develop leaks. High pressures may rapidly develop in equipment if water or moisture is present and liquid methyltrichlorosilane is to be recovered.

MITIGATION

Use compatible equipment that has adequate pressure capacity and/or which is free of moisture.

TECHNIQUE

ABSORPTION . . . Spreading of liquids may be controlled by absorbing them with dry sand, earth, clay, lime, soda ash, vermiculite, commercial sorbents, or other compatible substances as appropriate and available according to various authorities.

CONSEQUENCE

Once used, most sorbent materials pose the same hazards as the absorbed liquid. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product or other contained liquids to less hazardous substances.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and/or chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product and any hydrochloric acid that may be present. Do not operate motorized equipment in potentially flammable atmospheres (including those caused by evolution of hydrogen gas due to corrosion of metals by hydrochloric acid). Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Methyltrichlorosilane reacts violently with water to produce corrosive hydrochloric acid, potentially large quantities of acid fumes, and a mixture of methylsiloxanes that are not generally soluble

METHYLTRICHLOROSILANE
Class 3 (Flammable Liquid)

WATER SPILL *(CONTINUED)*

in water (though some might be to some extent) and which may or may not be heavier. Specific data on the nature, properties, and hazards of these methylsiloxanes were not available, so only general guidance can be provided about containment and recovery methods that may be appropriate. Contact shippers or other sources of expert advice for assistance.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce the environmental hazards of hydrochloric acid.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

CONTAINMENT . . . Some methylsiloxanes are likely to sink in water and not dissolve therein. Where necessary, use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Where deemed necessary and appropriate, stream or lake beds may be dredged to remove heavier-than-water methylsiloxanes and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. There may be other hazards associated with methylsiloxanes.

MITIGATION

Consult qualified experts for guidance.

March 1995

MOTOR FUEL ANTIKNOCK COMPOUND
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Motor fuel antiknock compounds considered here are variable mixtures of tetramethyl lead, tetraethyl lead, ethylene dibromide, ethylene dichloride, toluene, and other solvents or dyes. They have a sweet, musty and fruity odor and are used to increase the octane of gasoline. The mixtures are barely soluble in water and heavier, so may be expected to sink and dissolve at a slow rate. Depending on the specific mixture, flash points may vary from 30-264°F. Those mixtures with lower flash points may be ignited under a wide range of ambient temperature conditions. Their vapors may travel to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Regardless of the specific mixture involved, containers may rupture or explode if exposed to fire or excessive heat for sufficient time duration. The mixtures weigh approximately 12.5-14.2 pounds per gallon. Reportable quantities range from 100 lb (45.4 kg) for tetraethyl lead to 5000 lb (2270 kg) for ethylene dichloride.

Motor fuel antiknock compounds do not react with water but do react with oxidizing materials, active metals and rust, and concentrated acids. Temperatures above 212°F may initiate a self-sustaining decomposition that may lead to an explosion of containers if the hot compound is ignited by a flame or hot metal surface. The presence of ethylene dibromide in a specific mixture may, however, render it stable at temperatures as high as 300°F for 15 hours. All mixtures should be considered highly toxic and all exposures should be avoided. Products of combustion are also toxic and may include gases containing lead as well as several other toxic or irritating substances.

Downwind evacuation should be considered if motor fuel antiknock compound is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: 28-55 ppm at 60°F (15.6°C)
Solubility in Other Chemicals: Soluble in alcohol, benzene, ether, and petroleum ether.
Specific Gravity (Liquid): 1.5-1.7
Boiling Point: 200-300°F (93.3-148.9°C) at 1 atm; may decompose and explode
Melting Point: – 63.4 to 15.8°F (– 53 to – 9°C)
Freezing Point: – 63.4 to 15.8°F (– 53 to – 9°C)
Molecular Weight: Unavailable (mixture)
Heat of Combustion: –10100 cal/g (est.)
Vapor Pressure: 5.2-35.7 mm Hg (0.101-0.690 psia) at 68°F (20°C)
Flash Point: 30-228°F (–1.1 to 109°C) or more, closed cup; 89-265°F (31.7-129.4°C), open cup.
Autoignition Temperature: Begins to decompose above 212°F (100°C).
Burning Rate: Unavailable
Stability: Decomposes above 212°F (100°C) or 300°F (149°C) if ethylene dibromide present; may explode under such conditions.
Corrosiveness: Lead allyls may attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with oxidizing materials, active metals and rust, and concentrated acids.

IDENTIFICATION

Shipping Names: Motor fuel anti-knock compound (USDOT); antiknock compound (USDOT); motor fuel anti-knock mixtures (IMO).
Synonyms and Tradenames: Antiknock compound
Chemical Formula: Mixture
Constituent Components(% each): 50-60% lead allyls; 18-36% ethylene dibromide; 0-19% ethylene dichloride; 2-12% toluene, other solvents, and dyes.
UN/NA Designation: UN1649
IMO Designation: 6.1, poisonous substance
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Red, orange, or blue (dyed)
Odor Characteristics: Sweet, musty, fruity
Common Uses: Gasoline antiknock additive

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

MOTOR FUEL ANTIKNOCK COMPOUND

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic combustible or flammable liquid. Containers may explode or detonate if product is heated to decomposition.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 0.1-0.15 mg/m^3 (as lead) over each 8 hours of a 40 hour work week for lead alkyls.(ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Motor fuel antiknock compounds are highly toxic via all routes of exposure including skin absorption. Lead compounds may accumulate in the bodies of humans and animals.

Hazards of Skin or Eye Contact: Motor fuel antiknock compounds may be absorbed through the skin in toxic amounts. Eye contact may cause irritation and possibily other effects.

Hazards of Inhalation: Excessive exposure to motor fuel antiknock compounds may cause insomnia, anxiety, tiredness, paleness, nausea, loss of appetite, trembling, excitability, delirium, convulsive seizures, coma, and possibly death. Symptoms may be delayed in onset for up to eight days.

Hazards of Ingestion: See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable or combustible liquid. May generate significant quantities of flammable and toxic vapors upon release. Vapors of some mixtures may be heavier than air and may travel to a source of ignition and flash back. Containers may explode or rupture violently in fire.

Hazardous Combustion Products: Toxic; may include carbon monoxide, and gases containing lead, chlorides, bromides, and other hazardous substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may explode or rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact and any possibility of skin contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific symptoms: See hazards of inhalation above.

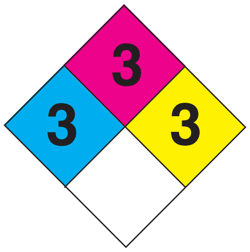
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Adminstration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with kerosene or similiar product followed by copious amounts of soap and water. Get medical attention immediately.

1649

MOTOR FUEL ANTIKNOCK COMPOUND

Division 6.1 (Poisonous Material)



FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray.

Extinguishing Techniques: Unusual toxicity and explosion hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the toxicity and properties of motor fuel antiknock compounds into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Motor fuel antiknock compound spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to motor fuel antiknock compound vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount of motor fuel antiknock compound from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of motor fuel antiknock compound vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

MOTOR FUEL ANTIKNOCK COMPOUND

Division 6.1 (Poisonous Material)

TECHNIQUE

COVERAGE . . . The application of water spray to the surface of contained liquid pools may slow the release of vapors into the atmosphere. Water should float on top of the spilled product.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Motor fuel antiknock compound may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained motor fuel antiknock compound may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

MOTOR FUEL ANTIKNOCK COMPOUND
Division 6.1 (Poisonous Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

MOTOR FUEL ANTIKNOCK COMPOUND

Division 6.1 (Poisonous Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 1992

NAPHTHALENE
Division 4.1 (Flammable Solid)

GENERAL INFORMATION

Naphthalene is a colorless to white to brownish solid that may be shipped in the form of powders, scales, prismatic plates, crystalline flakes, balls, or cakes. It may also be shipped as a hot molten liquid at a temperature above the melting point of the material or in solution with another liquid. Naphthalene is best known as the primary ingredient of moth balls and has the characteristic odor of this substance. The product has numerous other uses in industry, is practically insoluble in water, and with some exceptions, is expected to sink in water.

Naphthalene has a flash point in the range of 174 –190°F (79 – 88°C) and is therefore classified as a flammable solid. The solid form will usually be difficult to ignite unless preheated or in the form of a powder or dust, the latter of which has been known to explode if ignited when dispersed in air (presumably when confined to some degree). Since the melting point temperatures of solid grades of naphthalene range from 165 – 177.8°F (74 – 81°C), any hot molten naphthalene being transported or stored may be fairly easily ignited upon release until such time as it cools. Direct application of firefighting foam or water spray onto molten naphthalene may result in potentially violent or explosive foaming and spattering if the liquid is very hot. The solid product weighs in the range of 71.45 – 72.51 pounds per cubic foot. The molten liquid weighs about 8.03 pounds per gallon at a temperature of 212°F (100°C).

Naphthalene does not actually react with water or many other common materials and is primarily known to be incompatible with strong oxidizing materials that may cause a violent reaction or its ignition or explosion under appropriate conditions. It is not corrosive to common metals but molten naphthalene may possibly attack some forms of plastics, rubber, and coatings.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.0030–0.0034 g/100 g water in the temperature range of 68 – 77°F (20–25°C).

Solubility in Other Chemicals: Very soluble in benzene, carbon tetrachloride, carbon disulfide, chloroform, ether, hydronaphthalenes, and fixed and volatile oils. Soluble to varying degrees in acetone, alcohols, other aromatic solvents, chlorinated hydrocarbons, olive oil, and turpentine.

Specific Gravity: 1.145–1.162 at 68°F (20°C) for relatively pure solid; 0.963 at 212°F (100°C) for hot molten liquid.

Boiling Point: 424 –424.4°F (217.8 –218°C) at 1 atm for pure substance.

Melting Point: 176–177.8°F (80–81°C) for relatively pure product; 165 –177.8°F (74 – 81°C) is the overall range reported for crude to pure grades.

Freezing Point: See melting point

Molecular Weight: 128.17

Heat of Combustion: –9287 cal/g

Vapor Pressure: 0.05 – 0.054 mm Hg (0.00097 –0.00104 psia) at 68°F (20°C); 1 mm Hg (0.01933 psia) at 127°F (52.6°C); 10 mm Hg (0.1933 psia) at 186°F (85.6°C).

Flash Point: Reported closed and open-cup temperatures range from 174–190°F (79–88°C).

Autoignition Temperature: Reported values range from 979–1089°F (526–587°C).

Burning Rate: 4.3 mm/minute

Stability: Stable

Corrosiveness: Not reported as corrosive to common metals. Molten naphthalene may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: Molten naphthalene spatters and foams in contact with water or firefighting foams according to one authority. Another reports that the foaming may be violent if the naphthalene is at a temperature at or above 230'F (110'C). Naphthalene does not actually chemically react with water.

Reactivity with Other Chemicals: Contact with strong oxidizers may result in violent reaction, ignition or explosion. For compatibility classification purposes, naphthalene is considered to be in the family of phenols and cresols. Such materials typically generate heat in reactions with non-oxidizing mineral acids or organic peroxides or hydroperoxides.

IDENTIFICATION

Shipping Names: Naphthalene, crude; naphthalene, refined; naphthalene, molten.

Synonyms and Tradenames: Camphor tar; moth balls; moth flakes; naphthalin; naphthaline; naphthene; NTM; tar camphor; white tar.

Chemical Formula: $C_{10}H_8$ (as two fused benzene rings)

Constituent Components (% each): Naphthalene derived from coal tar contains about 90–95% naphthalene. Naphthalene is graded according to its melting point according to another authority; crude forms have a minimum melting point of 165°F (74°C) while refined grades have melting points of 174°F (79°C) or greater.

49 STCC: 49 403 60 (crude); 49 403 61 (other than crude); 49 174 59 naphthalane, molten.

UN/NA Designation: UN1334 (crude or refined); UN2304 (molten)

IMO Designation: 4.1, flammable solid

Physical State As Shipped: Hot liquid when molten at temperatures above the melting point of naphthalene. Various forms of solids such as scales, powders, prismatic plates, crystalline flakes, round balls, or cakes at lower temperatures.

Physical State As Released: Same as shipped; molten liquid will solidify as it cools down.

Color of the Shipped Material: Normally colorless or white; some grades may be brownish in color.

Odor Characteristics: Like mothballs or coal tar

Common Uses: Used or found in the production of antiseptics, cable coatings, celluloid, coatings, detergents, dyes, emulsion breakers, fungicides, insecticides, lampblack, lubricants, and moth repellants.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

NAPHTHALENE
Division 4.1 (Flammable Solid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: The lowest odor threshold found in the literature was 0.003 ppm in air but most reference sources report a range of 0.3 to 0.9 ppm as being detectable by humans. The characteristic odor of mothballs is said to be recognizable at about 25 ppm in air.

Unusual Hazards: Certain population groups are far more sensitive to the effects of naphthalene exposure than others. Very hot molten naphthalene may foam and spatter, possibly violently or explosively, upon contact with water or firefighting foam steam generation in tanks could be violent and cause tank rupture or personnel burns. By analogy to other substances, there is a possibility that pressure relief devices (if any) on tanks of the molten liquid may be susceptible to plugging with solid and subsequent malfunction. Moreover, naphthalene may remain molten under a solid crust for extended periods; check carefully before walking on such crusts.

Short Term Exposure Limit (STEL): 15 ppm (75 mg/m^3) for 15 minutes (ACGIH, 1991–92; OSHA, 1989).

Time Weighted Average (TWA) Limit: 10 ppm (50 mg/m^3) over each 8 hours of a 40 hour work week (ACGIH, 1991 –92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry to sewers or water bodies; generation of dust clouds; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate vicinity and directly downwind of a spill, particularly and especially if molten naphthalene has been discharged.

Hazards of Skin or Eye Contact: Hot molten naphthalene may cause severe burns upon contact with the skin or eyes. Otherwise contact of naphthalene with the eyes in spill situations is irritating but not injurious unless actual particles are allowed to remain in contact with the cornea, in which case temporary superficial corneal injury, inflammation, and localized diminished visual acuity lasting as long as two weeks (according to experiments with rabbits) may be experienced. Vapors of naphthalene are reported as distinctly irritating to the eyes at levels above 15 ppm in air. Do not wear contact lenses when working with this chemical. Prolonged or repeated skin contact may cause itching, redness, swelling, scaling and/or crusting and, in some cases, an allergic rash. Massive and/or prolonged exposure of the skin to naphthalene may also result in absorption through the skin which is facilitated by the presence of oils, and which may cause a number of the effects associated with inhalation and ingestion.

Hazards of Inhalation: Poisoning from exposures in the normal working environment is rare according to one authority. Another reports that concentrations above 10 ppm can eventually cause headache, vomiting, nausea, and profuse sweating. Prolonged or excessive exposures to high levels of dust, fumes or vapors in air are additionally reported to potentially cause coughing, mental confusion, irritation of the nose and throat, abdominal cramps, inflammation of the optic nerve, cataracts and possibly other severe eye effects destruction of red blood cells leading to anemia, fever and yellow jaundice, kidney and liver damage, painful urination, bloody or dark urine, tiredness, diarrhea, convulsions, coma, and possibly death. Increased susceptibility to poisoning has been reported among persons with the inherited metabolic deficiency discussed above. Indeed, exposure to concentrations as low as 10 ppm (for unspecified time periods, but presumably fairly prolonged ones) may produce adverse blood changes in some such hypersusceptible individuals. In any case, some of the effects reported above may not appear for 2–4 hours after exposure and others may be considerably further delayed in onset. There is limited evidence that excessive exposure to naphthalene may damage the developing fetus in pregnant women. At 68°F (20°C), the saturated vapor concentration of naphthalene in air just over the spilled material is in the range of 66 to 71 ppm. It is about 1315 ppmat 126.7°F (52.6°C) and about 13,160 ppm at 186.4°F (85.8°C). Any airborne naphthalene dust in air will add to vapor exposures.

Hazards of Ingestion: The effects of ingesting naphthalene are generally similar to those associated with excessive inhalation. Although the oral toxicity of the substance is considered low, the lowest published lethal dose for a human child by ingestion is just 100 mg of naphthalene per kilogram of body weight. Larger doses are apparently necessary to prove lethal to human adults and animals, with considerable variability shown among species.

FIRE HAZARDS

Lower Flammable Limit: *0.9%*

Upper Flammable Limit: *5.90*

Behavior in Fire: Combustible solid product may require preheating prior to ignition but powdered form or dust in air may be more easily ignited. Molten product is likely to be flammable upon release and easily ignited. Direct application of foam or water spray onto molten naphthalene may result in extensive foaming and possible spattering which may possibly be violent and even somewhat explosive if the molten liquid is very hot.

Hazardous Combustion Products: Not well-defined burning naphthalene is reported to produce dense acrid smoke, irritating fumes, carbon dioxide, carbon dioxide, and possibly other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from the hot molten liquid are ignited in a confined area. Contact with certain other chemicals may result in an explosion. Naphthalene dust may explode if dispersed in air and ignited, particularly in a confined area.

1334

NAPHTHALENE
Division 4.1 (Flammable Solid)

See UN/NA Designation for
other ID numbers.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with hot molten naphthalene. For "cool" solids, equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, dust-or splash-proof safety goggles as appropriate, and other impervious and resistant clothing. Compatible materials for non-molten naphthalene may include Teflon according to one authority. Another authority, which treats the product as an aromatic hydrocarbon and not the closely related polynuclear hydrocarbon it actually is, suggests that Viton, chlorinated polyethylene, and Viton/neoprene may be compatible materials. Be advised that handling of hot molten naphthalene may require clothing that provides protection against high temperatures. Handling of "cool" solid naphthalene for relatively short periods of time may possibly be accomplished using any of a wide variety of clothing or glove materials.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations (500 ppm or less), a gas mask with chin-style or front or back mounted organic vapor canister and dust filter or a chemical cartridge respirator for organic vapors with a dust filter and a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific symptoms: Irritation of the skin or eyes; headache, nausea, profuse sweating, vomiting, coughing, irritation of the nose and throat, mental confusion, and diarrhea, among others.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention if irritation persists after washing or if burns have occurred. If molten naphthalene contacts the skin, immediately flush the skin with large amounts of water, remove contaminated clothing, and get medical attention immediately. Note that removal of solidified molten material from the skin may require qualified medical assistance. In other cases, promptly wash affected skin with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Seek qualified medical advice as soon as possible on the question as to whether vomiting should be induced since various authorities disagree on this issue. A 1981 NIOSH guide recommends that large quantities of water be administered if the victim is conscious, that vomiting be induced, and that immediate medical attention be obtained. More recent publications essentially say: Have conscious victim rinse mouth thoroughly with water and then drink glass of water. Do not induce vomiting. If vomiting occurs naturally, have victim rinse mouth and repeat administration of water. In either case, never make an unconscious person vomit. If vomiting is induced or occurs naturally, have the victim lean forward with head below hips to reduce the risk of aspiration into the lungs. Get qualified medical attention as soon as possible. (Note: There "appear" to be some valid reasons in the literature that support the recommendation that vomiting not be induced if relatively prompt medical attention is available, except possibly in cases where fats have been ingested together with the naphthalene or the victim is a small child.)

FIRE RESPONSE

Extinguishing Materials: Sand or earth can be used on small fires. Also, water spray, carbon dioxide, dry chemical, or foam. Authorities disagree on whether regular or alcohol foam should be used; both are probably effective to some degree. Solid streams of water may be ineffective. Note that application of foam or a direct water spray may potentially cause extensive and possibly violent or somewhat explosive foaming if applied to very hot molten naphthalene but are nevertheless recommended for use by most authorities. Apply these agents with caution at first.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be advised that introduction of water into a tank of molten naphthalene may possibly result in frothing, boilover, and/or violent steam generation. By analogy to other substances, do not depend on pressure relief devices to limit pressure in tank of molten liquid; these may possibly become plugged with solid.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers or confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Keep the unusual toxicological characteristics of naphthalene in mind when planning the response. Use professional judgment with respect to which precautionary measures listed above and others are most suitable for a given situation. Give special attention to whether the naphthalene is molten or one of several possible forms of solid since hazards will vary in severity and type depending on the answer to this question. Be advised that there is a possibility that the discharge of a carbon dioxide fire

SPILL RESPONSES (continued)

General Information (continued): extinguisher at the point of leakage of hot molten naphthalene has the potential to solidify the naphthalene and stop the leak in some cases, at least temporarily. Other means of attempting to solidify the leaking naphthalene via cooling may also work. Whether or not the "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the container and its temperature. It may become necessary to repeat the procedure several times until the leak can be patched or to ultimately abandon the effort. Again, use professional judgment in attempting this type of response action.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Naphthalene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations, especially if it is discharged as a "cool" non-dusty solid. It may be advisable in such cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of naphthalene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and dusts to dissipate. Naphthalene discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases, particularly if hot molten naphthalene has spilled or large amounts of dust somehow become airborne.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary. Note that the vapor pressure of the molten product and its vapor emission rate will decrease as it solidifies and cools in the ambient environment or if various means (see below) are used to accelerate its rate of cooling.

TECHNIQUE

PROTECTION FROM WIND . . . Where necessary, cover solid naphthalene with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to naphthalene vapors or fumes in air may accelerate their dispersal in the atmosphere. Similarly, this response may knockdown any dust in air. Cooling of spills of molten naphthalene with water spray will solidify and cool the product, thus reducing its temperature and vapor emission rate. Maintenance of a layer of water on top of a contained pool of molten naphthalene that has solidified on its surface may greatly reduce vapor emissions. A fine water fog used to wet the surface of exposed powdered naphthalene may reduce generation of airborne dust.

CONSEQUENCE

Water runoff may contain varying amounts of naphthalene. As discussed earlier, contact of hot molten naphthalene with a direct water spray may result in potentially violent foaming and spattering of the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Apply water spray with caution to hot molten naphthalene at first.

TECHNIQUE

FOAM . . . There is a possibility that alcohol or regular firefighting foam applied to the surface of contained liquid pools of hot molten naphthalene may slow the release of vapors into the atmosphere. (Note: The fact that both types of foam are recommended by various authorities for firefighting purposes suggests they may also have value in suppressing vapor evolution.)

TECHNIQUE (continued)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors may increase unless the products of breakdown form a layer of water over the solidified products. Products of foam breakdown will add to the volume of spilled material. As discussed earlier, contact of hot molten naphthalene with firefighting foam may result in potentially violent foaming and spattering of the product.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply foam with caution to hot molten naphthalene at first.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Naphthalene in most forms may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained naphthalene solutions or contaminated water used for cooling may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases depending on the form of the product and circumstances of the spill and response.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools of contaminated water or naphthalene solutions may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. This response is unlikely to be appropriate for molten naphthalene since cooling of the product may result in its solidification and subsequent plugging or clogging of transfer or storage equipment.

CONSEQUENCE

Equipment that is incompatible with the liquid being recovered may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the liquid being recovered.

TECHNIQUE

ABSORPTION . . . Spreading of contaminated water or naphthalene solutions may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil or spilled product or its residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or combustible dusts present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable or combustible atmospheres. Eliminate ignition sources. Take precautions not to handle solid naphthalene in a manner that generates airborne dusts. Wait for molten naphthalene to solidify and cool before attempting removal. Consult qualified experts for advice where necessary.

NAPHTHALENE
Division 4.1 (Flammable Solid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Note that most forms of solid naphthalene are slightly heavier than water and are therefore expected to sink to the bottom of water bodies and dissolve at an extremely slow rate. Although hot molten naphthalene is slightly lighter than water, it is likely to sink as it solidifies in most cases. Be advised, however, that some forms of solid naphthalene may contain sufficient air pockets to permit their flotation. These may require collection from the water surface using various means not discussed below.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . For spilled product that sinks in water, use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface in significant quantities may emit some amounts of toxic vapors if exposed to the open air and permitted to dry.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . According to available data, water containing dissolved naphthalene may potentially be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

NICKEL CARBONYL
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Nickel carbonyl is a clear, colorless to yellow liquid with a musty, stale, sooty odor that some have described as resembling brick dust. It is used for organic synthesis, as a catalyst, and for making high purity nickel powder and nickel coatings. Barely soluble in water and heavier, it can be expected to sink to the bottom of a water body and dissolve very slowly. Its flash point of less than - 4°F indicates that it can be easily ignited under most ambient temperature conditions. Vapors of nickel carbonyl are heavier than air, may travel some distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Some authorities report that containers of liquid may explode if exposed to temperatures at or above 140°F. The product weighs approximately 11 pounds per gallon and is typically shipped in cylinders pressurized with carbon monoxide to a pressure of 15 psig at 68°F, though pressures may increase in storage due to slow decomposition of the product.

Despite its slow decomposition, nickel carbonyl is considered stable in normal transportation. It does not react with water or many other common materials. Reports on its reactivity with air differ. Some authorities state that it reacts slowly with air to produce nickel oxide (dry) and nickel carbonate (wet). Others report that dilute vapors in air will be rapidly decomposed to metallic nickel and carbon monoxide, while some note that nickel carbonyl will form a deposit which becomes peroxidized and which tends to decompose and ignite in the presence of air. The product is reactive with a variety of other chemicals and forms potentially explosive mixtures with several. It may ignite combustible vapors in air in its presence, and must be considered extremely toxic by all routes of exposure. Indeed, it is one of the most hazardous materials in commerce and should be approached and handled with the utmost of care at all times. Special precautions may be necessary to prevent exposure of pregnant women due to the high fetal toxicity of the substance. Note that the volatility of the product indicates that very high concentrations of nickel carbonyl vapors may be present in air.

If nickel carbonyl is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.0176 g/100 g water at 49.64°F (9.8°C); may oxidize somewhat due to air in water.

Solubility in Other Chemicals: Soluble in alcohol, ether, benzene, chloroform, acetone, many other organic solvents, carbon tetra chloride, and concentrated nitric acid.

Specific Gravity (Liquid): 1.32 at 62.6°F (17°C)

Boiling Point: 107.6–109.8°F (42–43.2°C) at 1 atm.

Melting Point: Reported values vary, some give -13°F (-25°C) while others give approximately 2.7°F (19.3°C)

Freezing Point: See melting point

Molecular Weight: 170.73

Heat of Combustion: –1650 cal/g

VaporPressure: 315–330 mm Hg (6.09–6.38 psia) at 68°F (20°C)

Flash Point: Less than –4°F (–20°C)

Autoignition Temperature: Less than 200°F (93.3°C vapor; liquid may possibly explode if confined and heated to 140°F (60°C) or above.

Burning Rate: 2.7 mm/minute

Stability: In the presence of air, nickel carbonyl may form a deposit which becomes peroxidized and which tends to decompose and ignite. See Autoignition Temperature and General Information sections above.

Corrosiveness: Liquid nickel carbonyl and its vapors harden natural rubber and may attack some forms of plastics, rubber, and coatings. Nickel carbonyl is not itself corrosive to metals but some nickel plating of surfaces may occur.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: May form explosive mixtures with tetrachloropropadiene, nitric acid, liquid bromine, chlorine, mixture of n-butane and oxygen, and other oxidizers. Generally incompatible with epoxides, explosives, and polymerizable materials. May ignite combustible vapors in air. Emits carbon monoxide on contact with acid or acid fumes. Ignites in combination with nitrogen tetroxide. Reacts slowly with air. Also see General Information and Stability sections above.

IDENTIFICATION

Shipping Names: Nickel carbonyl (USDOT and IMO)

Synonyms and Tradenames: Nickel tetracarbonyl

Chemical Formula: $Ni(CO)_4$

Constituent Components (% each): Over 99.9% pure in cylinders pressurized with carbon monoxide

UN/NA Designation: UN1259

IMO Designation: 6.1, poisonous substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless to yellow

Odor Characteristics: Musty; stale; sooty; like brick dust

Common Uses: Organic synthesis; making high purity nickel powder and nickel coatings; catalyst

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

NICKEL CARBONYL

Division 6.1 (Poisonous Material)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies widely with individual; reported values range from 0.03 ppm in some data sources to 1- 3 ppm in others.

Unusual Hazards: Extremely toxic, volatile, and flammable liquid. Liquid may possibly explode if heated to 140°F (60°C) or above when confined. Vapors are heavier than air and may persist for a time in pits, hollows, or depressions.

Short Term Exposure Limits (STEL): Unavailable from ACGIH, but note that the NIOSH IDLH for 30 minute exposures is only 0.001 ppm.

Time Weighted Average(TLV-TWA): 0.05 ppm as Nickel over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Exposure to nickel carbonyl is extremely hazardous by all routes of exposure. All exposures should be strictly avoided. Although recent research conflicts with the finding, nickel carbonyl has long been considered a human carcinogen in long-term occupational environments. It is definitely known to cause cancer in laboratory animals and to adversely affect unborn fetuses.

Hazards of Skin or Eye Contact: Contact of liquid nickel carbonyl with the skin may cause irritation, itching, redness, sores, and possibly second and third degree burns. The product can be absorbed through the skin and cause symptoms similar to those of inhalation. Contact of liquid nickel carbonyl with the eyes may be very injurious and minimally cause severe irritation, redness, and sores. Do not wear contact lenses when working with nickel carbonyl .

Hazards of Inhalation: Vapors of nickel carbonyl may cause severe irritation of the eyes and throat. Initial symptoms of over exposure via inhalation typically include frontal headache, giddiness, vertigo, shortness of breath, nausea, vomiting, weakness, sweating, cold and clammy skin, and occasional substernal and epigastric pain. These early effects may be mild at times and usually disappear when the victim is removed to fresh air. Within 12 to 36 hours following exposure, delayed symptoms may appear, including constrictive chest pain characteristic of delayed onset of pulmonary effects such as pneumonitis or bronchopneumonia, as well as leukocytosis, rapid breathing, cough, fever, cyanosis with bluish discoloration of the skin, profound weakness, and possible gastrointestinal symptoms. Except for pronounced weakness and hyperpnea, physical symptoms resemble a viral or influenzal pneumonia. Terminally, delirium and convulsions frequently occur; death due to pneumonitis, respiratory system failure, cerebral hemorrhage, or edema has occurred from 3 to 13 days of exposure. Convalescence of survivors is usually protracted (2 - 3 months) and characterized by excessive fatigue upon exertion. In some cases, the two stages of effects may merge. Note that concentrations of nickel carbonyl as low as 30 ppm have been reported to cause human fatalities after 30 minute exposures.

Hazards of Ingestion: Ingestion of liquid nickel carbonyl may cause irritation of the mouth, throat, and stomach. Although specific data on the degree of hazard by ingestion are not available, it is best to assume that the substance is highly toxic by this route of exposure, possibly causing symptoms of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 2%

Upper Flammable Limit: 34%

Behavior in Fire: Flammable liquid that burns with yellow flame. May generate large quantities of flammable and extremely toxic vapors upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Some authorities claim that containers may explode if heated to temperatures of 140° for above.

Hazardous Combustion Products: Unusually toxic gases may be formed by incomplete combustion. These may include nickel oxide fumes and carbon monoxide and conceivably unburned nickel carbonyl. Exposure to high temperatures may convert nickel carbonyl to metallic nickel and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Some authorities report that containers may explode if heated to temperatures of 140°F or above. Contact with certain chemicals may result in formation of explosive mixtures. See section on Reactivity with Other Chemicals for details.

1259

NICKEL CARBONYL

Division 6.1 (Poisonous Material)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. Compatible materials may include butyl rubber, chlorinated polyethylene, and polyvinyl alcohol. Note that the USDOT and a maker of the product report that normal firefighter's protective clothing may not be effective and that special chemical protective clothing may be necessary under accident conditions. Thus, fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent all contact.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 0.001 ppm), a self-contained breathing apparatus (SCBA) with full face piece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, respiratory tract, or skin; most symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Note: Nickel carbonyl is approximately 100 times more toxic than carbon monoxide. Advise medical professionals, where necessary, that specific antidotes for inhalation include dithiocarb (sodium diethyldithiocarbamate), d-penicillamine, or triethylenetetramine. Dimercaprol (BAL) and disulfiram (Antabuse) are less effective than penicillamine. Dithiocarb is the chelating agent of choice.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Although the above recommendation is from NIOSH, be aware that at least one manufacturer of nickel carbonyl recommends that vomiting should not be induced. Seek immediate medical advice on this issue if possible, realizing that both courses of action have different risks and benefits to the victim.)

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may not be fully effective due to the insolubility of the product, but note that liquid nickel carbonyl is heavier than water and that contained pools may possibly be carefully covered with a layer of water to reduce fire risks where foam is not available. Note also that there is some disagreement among authorities as whether alcohol or regular foam is most suitable.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may explode if exposed to excessive heat for sufficient time duration. Use water from a safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other down stream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment where necessary. Take the extremely toxic, flammable, explosive, and reactive nature of nickel carbonyl into account while planning the response. Note that heavier than air vapors may persist for a time in pits, hollows, and depressions.

NICKEL CARBONYL
Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Nickel carbonyl discharges may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nickel carbonyl vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of nickel carbonyl from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of nickel carbonyl vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution. Be aware that some authorities suggest the use of alcohol foam instead of regular foam.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER APPLICATION . . . There is a possibility that application of water to the surface of contained liquid pools of nickel carbonyl may reduce emissions of vapors. Since liquid nickel carbonyl is somewhat heavier than water and practically insoluble, a carefully applied layer of water may serve to suppress vapor evolution from contained pools.

CONSEQUENCE

Addition of water will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Nickel carbonyl may be contained by building dikes or barriers using soil, sand or other materials. Note that liquid nickel carbonyl is highly volatile and has a boiling point in the range of 107.6–109.8°F. The product will vaporize rapidly under most ambient temperature conditions.

CONSEQUENCES

Contained nickel carbonyl may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

NICKEL CARBONYL
Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, vermiculite, wood fibers, straw, saw dust, compatible commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

NICKEL CARBONYL
Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination. (Note: Nickel carbonyl will dissolve extremely slowly from the bottom of the water body. Some small amounts may react with air dissolved in the water to form nickel oxide and nickel carbonate.)

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit highly toxic or flammable vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGA TION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

CHEMICAL TREATMENT . . . Application of appropriate chemical agent(s) to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

NITRATING ACID
Class 8 (Corrosive Material)

GENERAL INFORMATION

Nitrating acid is a colorless to light yellow or gray to reddish brown mixture of sulfuric acid and nitric acid that may contain some amount of dissolved sulfur trioxide. It is used as an industrial oxidizing and nitrating agent in chemical reactions. It is fully soluble but may react violently upon contact with water with the production of heat, fumes, and spattering. Although nitrating acid is not combustible, contact with various metals may generate flammable and potentially explosive hydrogen gas as well as toxic nitrogen oxides. In addition, the product is a strong oxidizing agent that may ignite or react violently or explosively with combustible or reactive materials and may accelerate their burning. There is some limited potential that containers of the product may rupture due to overpressurization and release toxic nitrogen oxides if exposed to fire or excessive heat for suffcient time duration. The product weighs approximately 12.7-15.9 pounds per gallon depending on composition. Its fumes and vapors may be heavier than air.

Nitrating acid is highly corrosive to most metals and is also highly corrosive to bodily tissues. Products of decomposition in a fire may include toxic oxides of nitrogen.

If nitrating acid is in a mixed load shipment (small packages shipped with other small packages in the same outer packaging, railcar, container, or trailer) and exposed to fire or direct flame, evacuate for a radius of 1500 feet. (Note: See the guides in the series for nitric acid, sulfuric acid, and oleum for additional information on the components of nitrating acids. The composition of such acids is variable and may include 10-90% nitric acid, 10-90% sulfuric acid, and 0-30% sulfur trioxide.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions but reacts violently (see below.)
Solubility in Other Chemicals: Data unavailable
Specific Gravity (Liquid): Approx 1.53-1.79
Boiling Point: 179.6-206.6°F (82-97°C) at 1 atm.
Melting Point: Variable, but approx. – 49°F (– 45°C)
Freezing Point: Variable, but approx. – 49°F (– 45°C)
Molecular Weight: 63.01 (nitric acid); 98.08 (sulfuric acid) 80.06 (sulfur trioxide)
Heat of Combustion: Not flammable
Vapor Pressure: 1-45 mm Hg (0.0193 - 0.870 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Normally stable
Corrosiveness: Highly corrosive to most metals with the generation of hydrogen gas and toxic nitrogen oxides. May attack some forms of plastics, rubber, and coatings
Reactivity with Water: Reacts violently with the production of heat, fumes, and spattering.
Reactivity with Other Chemicals: Reacts with most metals, bases, carbides, hydrogen sulfide, oxidizable inorganic compounds, organic acids, and combustible organic materials. Combustible or oxidizable materials (including powered metals) may be ignited or may react explosively.

IDENTIFICATION

Shipping Names: Nitrating acid , mixtures (USDOT and IMO);
Synonyms and Tradenames: Mixed acid; acid mixtures; nitric-sulfric and mixtures. nitric-sulfuric acid mixtures.
Chemical Formula: HNO_3 (nitric acid); H_2S0_4 (sulfuric acid); SO_3 (sulfric trioxide).
Constituent Components (% each): 10-90% HNO_3; 10-90% H_2SO_4; 0-30% SO_3.
UN/NA Designation: UN1796
IMO Designation: 8, corrosive
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to light yellow or gray to reddish brown.
Odor Characteristics: Acrid
Common Uses: Industrial oxidizing and nitrating acid.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

NITRATING ACID

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive acid. Reacts violently with water. May ignite or react explosively or violently with combustible or oxidizable materials and may increase their flammability. Evolves hydrogen gas and toxic nitrogen oxides in contact with most metals.

Short Term Exposure Limits(STEL): 4 ppm (10 mg/m^3) nitric acid for 15 minutes (ACGIH). Unavailable for sulfuric acid.

Time Weighted Average(TLV-TWA): 2 ppm (5 mg/m^3) nitric acid or 1 mg/m^3 sulfuric acid over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat or fire; sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure. Vapors and fumes in air may include toxic oxides of nitrogen as well as nitric and sulfuric acids.

Hazards of Skin or Eye Contact: Contact of liquid nitrating acid or its concentrated vapors or fumes in air with the skin or eyes may result in immediate, severe and deep burns. Ths skin may be ulcerated and stained a yellow or yellowish brown color. The eyes may be permanently damaged.

Hazards of Inhalation: Vapors or fumes of nitrating acid in air may cause irritation and burns of the nose, mouth, throat, and respiratory system as well as erosion of exposed teeth. Exposure to high concentrations in air may also cause lung irritation, nitrogen oxide poisoning, and pulmonary edema and pneumonitis with possibly severe consequences. Onset of the latter effects may be delayed for 4-30 hours.

Hazards of Ingestion: Ingestion of nitrating acid may result in immediate pain and burns of the mouth, esophagus and gastrointestinal tract, perforation of the esophagus or stomach; staining and erosion of teeth; nausea and vomiting of blood and tissue; and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: There is some limited potential that containers may rupture violently in fire due to overpressurization. May generate large quantities of toxic and corrosive vapors and fumes upon release.

Hazardous Combustion Products: Decomposition products include toxic nitrogen oxides.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: There is some limited potential that containers may rupture violently in fire due to overpressurization. Contact with numerous other chemicals and materials may result in violent or explosive reactions. Contact with most metals produces hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene, nitrile rubber, chlorinated polyethylene, polyvinyl chloride, Viton, and nitrile-butadiene rubber for concentrated (more than 70%) acids.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 mg/m^3 total acid), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations a gas mask with chin-style or front or back mounted canister and high efficiency particulate filter within the use limitations of these devices. The canister should provide protection against nitric and sulfuric acids and should not contain oxidizable materials such as activated charcoal.

1796

NITRATING ACID
Class 8 (Corrosive Material)

FIRST AID

Nonspecific symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Avoid giving carbonates.)

FIRE RESPONSE

Extinguishing Materials: Water spray in flooding quantities is recommended, but apply water cautiously since it may react violently with spilled acid.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that nitrating acid is highly corrosive and reactive. Contact with most metals may produce flammable and potentially explosive hydrogen gas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Nitrating acid spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large quantities have spilled and/or large amounts of fumes and vapors are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Nitrating acid may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled or the acid is not fuming.

CONSEQUENCE

Hazardous levels of nitrating acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

NITRATING ACID
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nitrating acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of concentrated acid as this may increase fume evolution,

CONSEQUENCE

Water runoff may contain nitrating acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid nitrating acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid nitrating acid may eventually slow the release of vapors or fumes into the atmosphere. This response has special risks and is better suited to smaller spills.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Nitrating acid may react violently with water.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Nitrating acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained nitrating acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

NITRATING ACID
Class 8 (Corrosive Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

NITRATING ACID
Class 8 (Corrosive Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGA TION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land. (Note: Anion exchangers may be necessary to capture nitrates formed during neutralization.)

March 1995

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

GENERAL INFORMATION

Fuming nitric acid is a colorless to pale yellow to reddish brown liquid that has a sweet to acrid odor and may fume in air. It is used to make various fertilizers, explosives, dyes, chemicals, pesticides, and rocket fuels and is also used for etching, bright-dipping, electroplating, and photoengraving. It is fully soluble in water but also reacts to produce heat and toxic and corrosive fumes. Although the product is not combustible, contact with many metals may generate flammable and potentially explosive hydrogen gas as well as toxic nitrogen oxides. In addition, the product is a strong oxidizing agent that may ignite or react explosively or violently with combustible or reactive materials and may accelerate their burning. There is some limited potential that containers may rupture due to overpressurization and release toxic nitrogen oxides if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 12.4-12.6 pounds per gallon. Its fumes and vapors may be heavier than air.

Fuming nitric acid is very corrosive to wood, paper, cloth, and most metals, and may also attack some forms of plastics, rubber, and coatings. Contact with such materials or heating of the liquid may generate toxic red oxides of nitrogen into the air. The product is also highly corrosive to bodily tissues.

Downwind evacuation should be considered if fuming nitric acid is leaking from its container. If nitric acid, fuming is in a mixed load shipment (small packages shipped with other small packages in the same outer packaging, railcar, container, or trailer) and exposed to fire or direct flame, evacuate for a radius of 1500 feet. If the material is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions but also reacts (see below).
Solubility in Other Chemicals: Soluble in ether.
Specific Gravity (Liquid): 1.49-1.55 for 95% or more HNO_3
Boiling Point: 190.4-203°F (88-95°C) at 1 atm.
Melting Point: – 59.8 to – 49°F (– 45 to – 51°C)
Freezing Point: – 59.8 to – 49°F (– 45 to – 51°FC)
Molecular Weight: 63.01 HNO_3
Heat of Combustion: Not flammable
Vapor Pressure: 47.9 mm Hg (0.926 psia) at 68°F (20°C) for 100% HNO_3; up to 103 mm Hg (1.99 psia) for red fuming HNO_3.
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Evolves toxic red oxides of nitrogen when heated.
Corrosiveness: Very corrosive to wood, paper, cloth, and most metals. May attack some plastics, rubber, and coatings. Compatible with aluminum or stainless steel.
Reactivity with Water: Produces heat and toxic and corrosive fumes.
Reactivity with Other Chemicals: Reacts with a wide variety of metals (especially when powdered), bases, carbides, cyanides, sulfides, fulminates, picrates, chlorates, oxidizable inorganics, organic chemicals, turpentine, and combustible materials. Many substances may be ignited or may react violently or explosively.

IDENTIFICATION

Shipping Names: Nitric acid, red fuming (USDOT and IMO)
Synonyms and Tradenames: Hydrogen nitrate; Aqua fortis; Azotic acid; Nital; nitryl hydroxide; white fuming acid; red fuming acid.
Chemical Formula:: HNO_3
Constituent Components(% each): 95-99% pure
UN/NA Designation: UN2032
IMO Designation: 8, corrosive
Physical Shte as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to pale yellow to reddish brown
Odor Characteristics: Acrid, sweet to acrid, suffocating
Common Uses: Mfg. fertilizers, explosives, dyes, chemicals, pesticides, and rocket fuels; used for etching, bright-dipping, electroplating, photoengraving, and metal cleaning

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive acid. May ignite or react explosively or violently with combustible or oxidizable materials and may increase their flammability. Evolves hydrogen gas and toxic nitrogen oxides in contact with most metals.

Short Term Exposure Limits(STEL): 4 ppm (10 mg/m^3) for 15 minutes. (ACGIH)

Time Weighted Aversge(TLV-TWA): 2 ppm (5 mg/m^3) over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat or fire; sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure. Vapors and fumes in air include toxic oxides of nitrogen as well as nitric acid.

Hazards of Skin or Eye Contact: Contact of fuming nitric acid or its concentrated vapors or fumes in air with the skin or eyes may result in immediate, severe and deep burns. Ths skin may be ulcerated and stained a yellow or yellowish brown color. The eyes may be permanently damaged.

Hazards of Inhalation: Vapors or fumes of nitric acid in air may cause irritation or burns of the nose, mouth, throat, and respiratory system as well as erosion of exposed teeth. Exposure to high concentrations in air may also cause lung irritation, nitrogen oxide poisoning, and pulmonary edema and pneumonitis with possibly severe consequences. Onset of the latter effects may be delayed for 4-30 hours.

Hazards of Ingestion: Ingestion of nitric acid may result in immediate pain and burns of the mouth, esophagus, and gastrointestinal tract, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: There is some limited potential that containers may rupture violently in fire due to overpressurization. May generate large quantities of toxic and corrosive vapors and fumes upon release.

Hazardous Combustion Products: Decomposition products include toxic nitrogen oxides.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: There is some limited potential that containers may rupture violently in fire due to overpressurization. Contact with numerous other chemicals and materials may result in violent or explosive reactions. Contact with most metals produces hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include natural rubber, neoprene, nitrile rubber, polyethylene, chlorinated polyethylene, polyvinyl chloride, Viton, nitrile-butadiene rubber, and Saranex for concentrated (more than 70%) nitric acid.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister or a chemical cartridge respirator with a full facepiece within the use limitations of these devices. The canister or cartridge should provide protection against nitric acid and should not contain oxidizable materials such as activated charcoal.

2032

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

FIRST AID

Nonspecific symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Avoid giving carbonates such as baking soda.)

FIRE RESPONSE

Extinguishing Materials: Apply water spray in flooding quantities, but note reactivity with water.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that fuming nitric acid is highly corrosive and reactive. Contact with most metals may produce flammable and potentially explosive hydrogen gas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Nitric acid spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nitric acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of nitric acid as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain nitric acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION...Application of an appropiate neutralization to liquid nitric acid may eventually slow the release of vapors or fumes into the atomsphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid nitric acid may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Nitric acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained nitric acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

NITRIC ACID, RED FUMING
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land. (Note: Anion exchangers may be necessary to capture nitrates formed during neutralization.)

October 1991

NITRIC OXIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Nitric oxide has a normal boiling point of approximately –240°F and a critical temperature of approximately –135°F. It is therefore normally shipped as a compressed nonflammable poisonous gas in steel cylinders or tank cars (ton containers). The gas is itself colorless but may become reddish-brown at higher concentrations upon release as it reacts with oxygen in the air to form nitrogen dioxide and nitrogen tetroxide. Nitric oxide is practically insoluble in water but the nitrogen oxides it forms with oxygen are considerably more soluble and form nitric and nitrous acids. The odor of the gas has variably been described as sharp, sweet, acrid, unpleasant, pungent, and mildly irritating. Nitric oxide is used to make or stabilize a variety of other chemicals, for bleaching rayon, and for calibration of air pollution measurement instruments. (Note: See the Guide for nitrogen tetroxide for additional information on the properties and hazards associated with nitrogen dioxide and tetroxide.)

The gases of concern are heavier than air and may persist in pits, hollows, and depressions. Since cylinders and other containers used in transportation of nitric oxide are not equipped with pressure relief devices, excessive exposure to fire or heat is more likely than usual to result in violent rupture and possible rocketing of the container, due not only to overpressurization but also to instability of the compressed gas at high pressures and temperatures.

Since nitric oxide is shipped at temperatures far in excess of its critical temperature, this being the temperature above which it cannot be liquefied regardless of the pressure applied, the weight of gas within a container is a function of the volume of the container, the temperature of the gas, and the degree to which the container is pressurized. As best as can be determined, the maximum pressure allowed in a cylinder is 750 psig (about 52 atm) at 70°F, but many shippers do not pressurize above 500 psig (about 35 atm). Shipments in tank cars are reported to be pressurized to no more than 200 psig (about 14.6 atm).

Nitric oxide is not itself combustible, but it and the other nitrogen oxides it forms in air are extremely reactive oxidizers that may cause fire or explosion upon contact with combustible or oxidizable materials and will support and accelerate their burning. Nitric oxide gas is not corrosive to most structural materials when dry. In the presence of moisture, however, the formation of nitric and nitrous acids may develop corrosive conditions. Nitric oxide and the other gaseous nitrogen oxides of concern are extremely toxic and dangerous if inhaled or contacted. (Note: Although not fully applicable to transportation of the compressed gas, it is well to be advised that liquid nitric oxide is very sensitive to detonation, even in the absence of a fuel.)

If nitric oxide is leaking from its container, downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions. A large release may require an evacuation or protective action zone measured in miles. Evacuation may also become necessary if a container is exposed to direct flame or a fire becomes uncontrollable, not only for protection from flying debris if the container should rupture violently, but also because a large amount of non-flammable but extremely toxic gases may be suddenly released to the atmosphere.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.00618 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Reported to be soluble to some degree in alcohol, carbon disulfide, sulfuric acid, and aqueous solutions of ferrous sulfate ($FeS0_4$). Be advised that nitrogen oxides may react with alcohols or carbon disulfide according to some authorities.

Specific Gravity (Liquid): 1.27 at –238.4°F (–150.2°C)

Boiling Point: –241.6 to –239.8°F (–152 to –151°C) at 1 atm.

Melting Point: –263.2 to –257.8°F (–164 to –161°C)

Freezing Point: See melting point

Molecular Weight: 30.01

Heat of Combustion: Not flammable

Vapor Pressure: Approx 64.6 atm (949.4 psia) at –135.2°F (–91.2°C). This is the critical pressure and related critical temperature of nitric oxide. See the General Information section above for further details.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable in normal transportation when sealed in gas-tight container. Will react with oxygen in air upon release to form nitrogen dioxide (NO_2) gas which will itself partially convert to nitrogen tetroxide (N_2O_4). These gases may appear as reddish-brown in air if present in sufficient concentration.

Corrosiveness: Nitric oxide is not corrosive to most common metals of construction when pure. In the presence of oxygen and moisture, however, corrosive conditions will develop due to the formation of nitric and nitrous acids. Nitric oxide will attack some forms of plastics, rubber, and coatings.

Reactivity with Water: Any nitric oxide that dissolves in water will form corrosive nitric and nitrous acids in a reaction that is reported not to be violent.

Reactivity with Other Chemicals: The NO_2 which forms when nitric oxide (NO) combines with oxygen, as well as NO itself, are strong oxidizing agents with potential to react violently, ignite, or explode in contact with numerous combustible and/or oxidizable materials.

IDENTIFICATION

Shipping Names: Nitric oxide (USDOT and IMO); mixtures of nitric oxide and nitrogen tetroxide may be shipped as "poisonous gas, n.o.s." under USDOT regulations but shipping papers are required to indicate the specific constituents of the cargo in such cases.

Synonyms and Tradenames: Nitrogen monoxide; nitrogen oxide; mononitrogen monoxide; nitrogen (II) oxide

Chemical Formula: NO

Constituent Components (9c each): When shipped as nitric oxide, the product is typically 98.5% or more pure. It may also be shipped as various mixtures with nitrogen tetroxide.

49 STCC: 49 203 30 (nitric oxide); 4920370 (nitric oxide and nitrogen tetroxide mixtures)

UN/NA Designation: UN1660 (USDOT and IMO for nitric oxide); NA1955 (USDOT for nitric oxide and nitrogen tetroxide mixtures shipped as "poisonous gas, n.o.s."); UN1975 (IMO for nitric oxide and nitrogen tetroxide mixtures).

IMO Designation: 2.3, poison gas

Physical State As Shipped: Compressed gas

Physical State As Released: Gas; may possibly form some liquid droplets of nitrogen tetroxide in air under appropriate environmental and discharge conditions.

Color of the Shipped Material: Colorless gas that may become reddish-brown at higher concentrations as it reacts with oxygen in air to form nitrogen dioxide. Deep blue when liquid or bluish-white snow when solid at very low temperatures.

Odor Characteristics: Variably described as sharp, sweet, acrid, unpleasant, pungent, and irritating.

Common Uses: Making nitric acid, nitrosyl carbonyls, and a variety of other chemicals; bleaching rayon.

See UN/NA Designation for other ID numbers.

NITRIC OXIDE
Division 2.3 (Poison Gas)

Square background applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reported data vary; one source says the odor of NO_2 is perceptible to some people at 0.11 ppm and for most at 0.22 ppm. Others list an odor threshold of 5 ppm.

Unusual Hazards: Extremely toxic compressed gas that may be dangerous over very considerable downwind distances depending on location, rate and duration of release, as well as weather conditions. Lethal doses may be inhaled before a victim experiences any significant discomfort. A highly reactive and strong oxidizing agent. Nitric oxide gas and its reaction products with oxygen may be heavier than air and persist in low areas.

Short Term Exposure Limits (STEL): Not established for nitric oxide; 5 ppm as NO_2 for 15 minutes (ACGIH, 1990–91); 1 ppm for 15 minutes as NO_2 (OSHA, 1989).

Time Weighted Average (TWA) Limits: 25 ppm as nitric oxide or 3 ppm as NO_2 over each 8 hours of a 40 hour work week (ACGIH TLV, 1990–91); 25 ppm as nitric oxide (OSHA PEL, 1989) under similar circumstances. OSHA permitted a transitional ceiling limit for NO_2 of 5 ppm in 1989 which will be phased out over time in favor of the STEL reported above.

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff of contaminated water to sewers or water bodies; direct physical contact or inhalation.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of nitric oxide gas and its products in combination with oxygen in even low concentrations. Significant discharges may be highly dangerous at the spill site and over considerable distances downwind. Direct contact of the gas with the skin and particularly the eyes should also be strictly avoided. Note that the following discussions are generalized in order to address the mixture of nitrogen oxides that may be present in air following a discharge of gaseous nitric oxide.

Hazards of Skin or Eye Contact: The gases of concern are extremely irritating to the eyes, nose, throat, and skin. Excessive contact with the skin may result in burns; one authority states that prolonged or widespread skin contact may result in absorption of potentially harmful amounts. Contact with the eyes may cause severe irritation or possibly permanent injury involving marked redness, swelling, and opecification of the cornea; only 70 ppm of nitrogen tetroxide vapors in air for 8 hours were required to cause persistent corneal opacification in the eyes of rabbits that survived the experiment; higher concentrations may possibly cause this effect in far less time.

Hazards of Inhalation: Depending on the level and duration of exposure, these gases and vapors may cause different responses in victims. At high levels in air, symptoms potentially include irritation of the eyes, nose and throat, drowsiness, dizziness, headache, tightness and/or burning in the chest, coughing, choking, production of frothy or mucoid sputum, salivation, restlessness, anxiety, mental confusion, nausea, vomiting, tremors, incoordination, cyanosis, fatigue, increasing and/or irregular respiratory and heart rates, difficulty in breathing, and lung airway constriction resulting in asphyxiation, convulsions, coma and possibly rapid death. For example, exposure of mice to 5000 ppm of nitric oxide for 6 to 8 minutes was fatal, as was exposure to 2500 ppm for 12 minutes. Cyanosis occurred after a few minutes; breathlessness, paralysis, convulsions and death followed. Substantially lower concentrations can result in delayed pulmonary edema and death, often with little or no initial symptoms or warning signs. For example, breathing as little as 25 ppm of nitrogen oxides for 8 hours, 100 to 150 ppm for 30 to 60 minutes, or just a few breaths at 200 to 700 ppm, may cause severe effects after a latent period of as little as 2 hours, 5 to 8 hours (apparently most typical), or as long as 48 hours in which there are few significant symptoms (if any) and the victim may feel well. The respiratory system effects discussed above will suddenly appear after this period and may ultimately cause death. In yet other cases, there may be mild or moderate signs of injury immediately after the exposure. These will disappear over a period of 2 to 3 weeks, only to be followed by sudden onset of fever, chills, increasing difficultly in breathing, increasing cyanosis, pulmonary edema, and possibly death. Survivors usually recover in another 2 to 3 weeks; however, some do not return to normal but experience varying degrees of impaired lung function. Pneumonia is a general threat from all major exposures. Other significant observations are that: 1) NO_2 exposures may decrease resistance to pulmonary infection; 2) severity of the pulmonary reaction may be lessened if the victim avoids exertion after exposure; 3) just a few ppm in air (e.g., 4–5 ppm of NO_2 for 15 minutes) may rapidly cause increased resistance to the flow of air and other effects in the respiratory systems of healthy adults; 4) inhalation of nitrogen oxides at very low concentrations (e.g., 0.1 ppm of NO_2 for 2 hours) may aggravate the conditions of people with "reactive airway disease", including those who suffer from asthma, chronic bronchitis, or inflammatory or fibrotic pulmonary disease; and 7) survivors of significant exposures may occasionally develop "bronchiolitis fibrosa obliterans" (fibrotic lesions in the lungs) between 10 days to 6 weeks after resolution of acute symptoms.

Hazards of Ingestion: Since it is not normally shipped as a liquid or solid, and due to its very low boiling point, ingestion of nitric oxide is extremely unlikely.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable gas that is a strong oxidizer and may support and possibly greatly intensify surrounding fires upon release. There is a possibility that some substances that do not normally burn in air will ignite or explode in a highly oxidizer enriched atmosphere. Containers may rupture violently and possibly rocket in a fire, suddenly releasing large quantities of extremely toxic oxidizing gases into the atmosphere.

1660

NITRIC OXIDE
Division 2.3 (Poison Gas)

See UN/NA Designation for
other ID numbers.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable
Upper Explosive Limit: Not flammable
Explosiveness: Containers of nitric oxide do not normally have pressure relief valves or devices. They may rupture violently in a fire and possibly rocket. The gases of concern are strong oxidizers that may possibly cause a wide variety of materials to ignite or explode upon contact when in high concentrations in the atmosphere. Be advised that any liquid nitric oxide that may be encountered in non-transportation situations may be very sensitive to detonation even in the absence of a fuel.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with nitric oxide. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing for normal working conditions. Several authorities strongly recommend the use of fully encapsulating suits with self-contained breathing apparatus (SCBA) to prevent contact with the gas concentrations that may result in air from discharges. Compatible materials for nitric oxide may include butyl rubber, polyvinyl chloride (PVC), and chlorinated polyethylene. Compatible materials for nitrogen tetroxide may include chlorinated polyethylene, polyethylene, chlorobutyl rubber, and CR 39.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister (5 ppm or less) containing non-oxidizable sorbents and providing protection against the nitrogen oxides of concern or a chemical cartridge respirator (5 ppm or less) with a full facepiece and cartridges) containing non-oxidizable sorbents and providing protection against the nitrogen oxides of concern within the use limitations of these devices. Nitrogen oxides are oxidizers and should not come in contact with oxidizable materials. Some cartridges and canisters may contain oxidizable materials such as activated charcoal or carbon and should therefore not be used to provide protection against these contaminants. (Note: NIOSH recommendations for pure nitric oxide are less strict than those presented here. The above recommendations acknowledge that considerable amounts of nitric oxide may combine with oxygen in air upon release to form nitrogen dioxide and nitrogen tetroxide. They were extracted from NIOSH documents discussing protection from nitrogen dioxide.)

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, nose, throat, or skin; other symptoms of exposure to the nitrogen oxides of concern.
First Aid for Inhalation: Anyone exposed even momentarily to high concentrations of nitrogen oxides in air should receive immediate attention. Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Get medical attention immediately. Qualified personnel should administer oxygen as soon as possible to prevent or minimize the possibility of pulmonary edema. Keep the victim warm, quiet, and under medical observation until the danger of delayed pulmonary edema has passed (at least 72 hours). Physical exertion should be discouraged as it may increase the severity of resulting pulmonary edema or chemical pneumonitis. Note that there are specific medical treatments recommended for exposure to these substances.
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention immediately.

FIRE RESPONSE ,

Extinguishing Materials: Authorities disagree. The USDOT (1990) recommends that only water spray or fog be used on small fires or where a fire must otherwise be fought. It specifically says not to apply dry chemical, carbon dioxide or Halon, but its rationale for avoiding all alternatives is unclear. Others recommend use of water, foam, carbon dioxide, or dry chemical on surrounding fires as necessary. It would appear best to follow USDOT recommendations or to use other extinguishing agents with due caution. In particular, note that certain Halons have the potential to react violently with the nitrogen oxides of concern.
Extinguishing Techniques: Unusual toxic gas, corrosive fume, and oxidizing agent hazard. Keep combustible and oxidizable materials away from discharge. Stop leak if you can do it without risk. Stay upwind. Wear breathing apparatus and appropriate protective clothing, including fully-encapsulating vapor-protective suit where contact with material is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may rupture violently, possibly rocket, and suddenly release massive amounts of product when exposed to high heat. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

NITRIC OXIDE
Division 2.3 (Poison Gas)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area and out of low areas. Avoid all contact with discharged product. Eliminate ignition sources. Stop leak if safe to do so. Prevent concentrated gas from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff where acids may form due to use of water spray or fog in a highly contaminated atmosphere. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water where significant runoff occurs. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Since reverse flow into a cylinder may cause rupture, use a check valve or other protective device in any line or piping from a cylinder to prevent reverse flow. Take the extremely toxic and reactive nature of nitric oxide and its products in combination with oxygen into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow gas to dissipate. Nitric oxide discharges may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nitrogen oxides in air may absorb gases and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain corrosive nitric and nitrous acids from contact with airborne gases.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible (see below) to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Water runoff that is significantly contaminated with nitric and nitrous acids and deemed to pose a public safety or environmental threat may be contained by building dikes using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods. (Note: The recommendations provided here and below for containment and cleanup of contaminated runoff resulting from the use of water sprays may not be necessary in all cases. Seek guidance from a qualified expert where necessary.)

CONSEQUENCE

Contained acids may percolate into soil or seep through dike material. This may result in loss of contained liquids and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as excessive fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

NITRIC OXIDE
Division 2.3 (Poison Gas)

TECHNIQUE

EXCAVATION . . . Where deemed necessary, a trench or ditch may be excavated to contain contaminated runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Where deemed necessary, accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the nitric and nitrous acids may be corroded or otherwise damaged. Leaks may develop.

MITIGATION

Use equipment compatible with nitric and nitrous acids.

TECHNIQUE

ABSORPTION . . . Where deemed necessary, spreading of liquids may be controlled by absorbing them with sand, earth, clay, fly ash, cement powder, vermiculite, perlite, compatible commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the contaminated liquids. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under the guidance of a qualified expert. Note that noncombustible sorbents should be used in order to reduce the risk of fire.

TECHNIQUE

NEUTRALIZATION . . . Where deemed necessary, application of an appropriate neutralization agent may modify the contained acids to less hazardous substances.

CONSEQUENCE

Application and removal of chemical neutralization agents may entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Where deemed necessary, contaminated soil and liquid residues may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Certain oxidizable substances that have been exposed to the nitrogen oxides and acids of concern may possibly be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with nitric and nitrous acids. Store contaminated materials in a safe and secure location. Do not operate motorized equipment where their use may lead to ignition of combustible materials. Consult qualified experts for advice where necessary.

NITRIC OXIDE
Division 2.3 (Poison Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Where significantly contaminated water runoff has entered a body of water, notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: This recommendation and those that follow may not be required in some cases if contaminants will be diluted below harmful levels. Seek guidance from a qualified expert where necessary.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Where necessary, contaminated water may be contained (or diverted to an impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Where necessary, application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

ortho-NITROANILINE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Nitroaniline (ortho isomer) is a reddish orange or yellowish gold colored crystalline solid with an odorless or musty odor. It is used for making dyes, explosives, photo anti-fogging agents and various other chemicals, and may be shipped as a molten liquid. It is very slightly soluble in water and heavier, so may be expected to sink and then dissolve at a very slow rate. Its flash point of 266°F indicates that the product must be preheated before ignition may occur easily. There is a limited possibility that containers may rupture violently at very high temperatures. The product weighs approximately 78-90 pounds per cubic foot as a solid.

Ortho-nitroaniline does not react with water, is relatively noncorrosive at ambient temperatures, and is stable in normal transportation. Reactions with chlorine trifluoride, caustics, alkali and alkaline earth elemental metals, nitrides, strong oxidizers, or strong reducing agents may be explosive, and the product is reactive with a variety of other chemicals. There is some indication that contact with organic materials in the presence of moisture may result in spontaneous combustion. The product is a highly toxic substance and considered a poison. Products of combustion are toxic and may include nitrogen oxides.

If ortho-nitroaniline is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 4700 ppm at 77°F (25°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.

Specific Gravity (Solid): 1.25-1.44 at 60°F (15.5°C)

Boiling Point: 543°F (284°C) at 1 atm. (may decompose)

Melting Point:: 160.7°F (71.5°C)

Freezing Point: 160°F (71°C)

Molecular Weight: 138.13

Heat of Combustion: – 5544 cal/g

Vapor Pressure: Less than 0.1 mm Hg at 86°F (30°C); 1 mm Hg (0.019 psia) at 219.2°F (104°C)

Flash Point: 266°F (130°C), open cup (lowest found).

Autoignition Temperature: 970°F (521°C)

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Not corrosive at ambient temperatures. Can be handled in mild steel with only color degradation. Can also use glass or type 304 or 316 stainless steel.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: May react with chlorine trifluoride, acids, aldehydes, halogenated organics, peroxides, alkali or alkaline earth elemental metals, strong reducing agents, strong oxidizers, epoxides, isocyanates, dithiocarbamates, nitrides, and possibly organic materials.

IDENTIFICATION

Shipping Names: Nitroanilines (USDOT & IMO)

Synonyms and Tradenames: Aniline, 2-nitro; 2-nitroaniline; 1-amino-2-nitrobenzene; o-nitroaniline; numerous tradenames with words fast orange or orange, GR or JR, and base or salt.

Chemical Formula: $NO_2C_6H_4NH_2$

Constituent Components(% each): Almost 100% pure with traces water and organic impurities.

UN/NA Designation: UN1661

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Solid, or molten liquid.

Physical State as Released: Solid, or molten liquid that freezes.

Color of the Shipped Material: Reddish orange; yellowish gold; orange.

Odor Characteristics: Musty or odorless

Common Uses: Mfg. of dyes, explosives, photo anti-fogging agent, coccidiostat, benzotriazole, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:

CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ortho-NITROANILINE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Highly toxic substance that affects ability of blood to carry oxygen. Effects are more dangerous than readily apparent and may be delayed up to 4 hours. Ingestion of alcohol may aggravate toxic effects.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable. TLV for para isomer is 0.5 ppm or 3 mg/m^3 over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of vapors or dust in air or ingestion. Prolonged contact with the skin and eyes are also to be avoided. Liver damage is a possibility if exposures are prolonged or severe.

Hazards of Skin or Eye Contact: Contact of the skin with o-nitroaniline may cause irritation and the product may be absorbed through the skin in toxic amounts to cause cyanosis. Contact with the eyes may result in corneal injury.

Hazards of Inhalation: Causes cyanosis and thereby affects the ability of the blood to carry oxygen. Symptoms include irritation of mucous membranes, irregular pulse, bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, nausea, vomiting, shortness of breath, drowsiness, unconsciousness, and possibility of death if treatment is not prompt. Effects may be delayed up to 4 hours and are aggravated by ingestion of alcohol.

Hazards of Ingestion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Will burn but difficult to ignite. There is a limited potential that containers may rupture violently in fire due to overpressurization.

Hazardous Combustion Products: Toxic, may include nitrogen oxides.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: There is a very limited potential that containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Explosion may result if vapors from hot liquid are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials include neoprene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency particulate filter respirator with a full facepiece might be adequate within the use limitations of these devices.

1661

ortho-NITROANILINE

Division 6.1 (Poisonous Material)

FIRST AID

Nonspecific symptoms: Eye or skin irritation; symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contct: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention as necessary to cleaning hair and scalp, finger and toenails, nostrils and ear canals.)

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, dry chemical, carbon dioxide, water spray or fog.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the significant toxicity of ortho-nitroaniline into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Ortho-nitroaniline may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ortho-nitroaniline in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid ortho-nitroaniline with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

ortho-NITROANILINE

Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or dusts in air or the surface of the spilled product may reduce downwind concentrations.

CONSEQUENCE

Water runoff may contain a small amount of ortho-nitroaniline from contact with the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . ortho-Nitroaniline may be contained by building dikes or barriers using soil, sand or other materials. Liquids should solidify fairly rapidly.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Equipment can become clogged if product freezes.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product. Act promptly and prevent freezing if possible.

TECHNIQUE

ABSORPTION . . . Spreading of liquid product may be controlled by absorbing liquid with sand, earth, clay, fly ash or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means after product has frozen.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause toxic dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

ortho-NITROANILINE

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

NITROBENZENE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Nitrobenzene is a water-white or light greenish yellow to brownish oily liquid with an almond or bitter almond odor resembling paste shoe polish. It is used as a solvent, in oil refining, and for making dyes, rubber chemicals, drugs, metal and shoe polishes, TNT, and a variety of other chemicals. Being somewhat heavier than water and very slightly soluble, it can be expected to sink and then dissolve at a very slow rate. Its flash point of 171°F indicates that the product must be moderately heated before it can be ignited easily. There is a limited potential that containers of liquid may rupture at temperatures above 572°F. The product weighs approximately 10 pounds per gallon.

Nitrobenzene is stable in normal transportation and does not react with water or other common materials. Reactions with aluminum chloride and phenol, aniline and glycerin, nitric acid, nitrogen tetroxide, or silver perchlorate may be explosive, however, and the product is incompatible with strong oxidizers, and caustics in the presence of metals such as tin or zinc. It may attack some forms of plastics, rubber, and coatings and must be considered highly toxic by all routes of exposure. Products of combustion may be toxic and may include nitrogen oxides and carbon monoxide among other constituents.

Downwind evacuation should be considered in some cases if this material is leaking but not on fire. If nitrobenzene is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. (Note: Nitrobenzene is of low volatility in many spill situations but is highly toxic. Judgments are necessary on a case by case basis.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.19 g/100 g water at 68°F (20°F)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and various oils.

Specific Gravity (Liquid): 1.20 at 68°F (20°F)

Boiling Point: 411.6°F (210.9°C) at 1 atm.

Melting Point: 42.3°F (5.7°C)

Freezing Point: 41.2°F (5.1°C)

Molecular Weight: 123.11

Heat of Combustion: – 5791 cal/g

Vapor Pressure: 0.30 mm Hg (0.006 psia) at 77°F (25°C)

Flash Point: 190°F (87.8°C), closed cup; 171°F (77.2°C), open cup

Autoignition Temperature: 900-924°F (482-496°C)

Burning Rate: 2.9 mm/minute

Stability: Stable

Corrosiveness: Will attack some forms of plastics, rubber and coatings.

Reactivity with Water No reaction.

Reactivity with Other Chemicals: Reacts with aluminum chloride and phenol mixture, aniline and glycerin mixture, nitric acid, nitrogen tetroxide, silver perchlorate, strong oxidizers, and caustics together with chemically active metals like tin or zinc.

IDENTIFICATION

Shipping Names: Nitrobenzene (USDOT and IMO)

Synonyms and Tradenames: Benzene, nitro; essence of mirbane; essence of myrbane; mirbane oil; nitrobenzol; oil of mirbane; oil of myrbane; oil of bitter almonds.

Chemical Formula: $C_6H_5NO_2$

Constituent Components(% each): 97-100% pure with traces of dinitrobenzene and water.

UN/NA Designation: UN1662

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Light greenish-yellow to brown; may orignally be water-white.

Odor Characteristics: Almond or bitter almond; like paste shoe polish.

Common Uses: Solvent; crude oil refining processes; mfg. of dyes, rubber chemicals, drugs, metal and shoe polishes, TNT, and a variety of other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

NITROBENZENE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Various authorities give values from 1.6 ppb to 1.9 ppm.

Unusual Hazards:: Highly toxic substance that affects the ability of the blood to carry oxygen. Effects are more dangerous than readily apparent and may be delayed up to 4 hours. Ingestion of alcohol aggravates toxic effects. Excessive heat may initiate rapid decomposition of the product with generation of additional heat.

Short Term Exposure Limits(STEL): (Skin) 2 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 1 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Excessive heat or fire; contact with incompatible materials; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazards are inhalation of vapor or ingestion of liquid. Prolonged skin contact is also to be avoided. Pregnant women may be especially at risk as may individuals with glucose-6-phosphate dehydrogenase deficiency.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with liquid nitrobenzene may cause irritation. The product can be rapidly absorbed through the skin in toxic amounts to cause cyanosis.

Hazards of Inhalation: Causes cyanosis and thereby affects the ability of the blood to carry oxygen. Symptoms include bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, nausea, vomiting, shortness of breath, drowsiness, unconsciousness, and possibly death if treatment is not prompt. Effects may be delayed up to 4 hours and are aggravated by ingestion of alcohol.

Hazards of Ingestion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 1.8% at 200°F (93.3°C)

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but difficult to ignite. Containers may rupture in fire due to rapid and exothermic decomposition of product above 572°F (300°C).

Hazardous Combustion Products: Nitrogen oxides, carbon monoxide and others.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture in fire. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Explosion may result if vapors from hot liquid are ignited in a confined area.

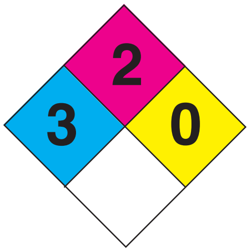
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact and any possibility of skin contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include polyvinyl alcohol, Viton, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA)with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (50 ppm or less) or an organic vapor cartridge respirator with a full facepiece (50 ppm or less) within the use limitations of these devices.

1662

NITROBENZENE
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecifc symptoms: Eye or skin irritation, symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention as necessary to cleaning hair and scalp, finger and toenails, nostrils, and ear canals.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Foam, dry chemical, carbon dioxide, water spray or fog. Water may be used to blanket fire but control any runoff.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of nitrobenzene may result in rutpure of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwide damaged by the spilled product. Take the significant toxicity of nitrobenzene into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Nitrobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of nitrobenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Nitrobenzene may expose downwind areas to toxic concentrations, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

NITROBENZENE

Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nitrobenzene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of nitrobenzene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

COVERAGE . . . The addition of water to the surface of liquid nitrobenzene may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of nitrobenzene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Nitrobenzene may be contained by building dikes or barriers using soil, sand or other materials. (Note: Nitrobenzene will freeze at low ambient temperatures.)

CONSEQUENCE

Contained nitrobenzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

NITROBENZENE
Division 6.1 (Poisonous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

NITROBENZENE
Division 6.1 (Poisonous Material)

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

meta-NITROCHLOROBENZENE

Division 6.1 (Poisous Material)

GENERAL INFORMATION

The meta isomer of nitrochlorobenzene is a yellow solid that is likely to have a sweet aromatic odor and that may be shipped as a molten liquid (that may solidify enroute). It is used as a chemical intermediate, especially for making dyes. It is practically insoluble in water and heavier, so may be expected to sink and dissolve at an extremely slow rate. A flash point of 261°F indicates that it must be heated far above its melting point to be ignited easily. The product weighs approximately 11.2 pounds per gallon as a liquid and 95.7 pounds per cubic foot as a solid.

Meta-nitrochlorobenzene does not react with water and should be stable in normal transportation. Reactions with alkali or alkaline earth elemental metals, certain other metals, peroxides, strong oxidizing or reducing agents, caustics, or chlorine trifluoride may be explosive, and the product is otherwise reactive with a variety of other chemicals. By analogy to other isomers, some forms of plastics, rubber, and coatings may be attacked by meta-nitrochlorobenzene, but the product is not corrosive to iron or steel when dry. It is a highly toxic substance. Products of combustion may be toxic and may include nitrogen oxides, hydrogen chloride gases, carbon monoxide, chlorides, and possibly chlorine.

If meta-nitrochlorobenzene is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble.

Solubility in Other Chemicals: Soluble in acetic acid, alcohol, benzene, chloroform, ether, and most organic solvents.

Specific Gravity (Liquid): 1.343 at 122°F (50°C); 1.534 at 68°F (20°C)

Boiling Point: 455-456.8°F (235-236°C) at 1 atm.

Melting Point: 111.2-112.1°F (44-44.5°C) or 74.7°F (23.7°C) depending on form.

Freezing Point: Unavailable

Molecular Weight: 157.56

Heat of Combustion: Unavailable

Vapor Pressure: Very low

Flash Point: 261°F (127°C), closed cup.

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Assumed stable.

Corrosiveness: By analogy to other isomers, dry product is not corrosive to iron and steel but traces of moisture may cause mild corrosion of steel. May attack some forms of plastics, rubber, and coatings.

Reacativity with Water: Data unavailable, but reaction is unlikely.

Reactivity with Other Chemicals: May react with mineral acids, amines, strong oxidizing or reducing agents, alkali or alkaline earth elemental metals, certain other metals, peroxides, caustics, nitrides, cyanides, mercaptans, other organic sulfides, azo and diazo compounds, hydrazines, aldehydes, and chlorine trifluoride.

IDENTIFICATION

Shipping Names: Chloronitrobenzenes (USDOT & IMO).

Synonyms and Tradenames: Benzene, 1-chloro-3-nitro; m-chloronitrobenzene; chloro-m-nitrobenzene; 1-chloro-3-nitrobenzene.

Chemical Formula: $C_6H_4ClNO_2$

Constituent Components(% each): Almost 100% pure.

UN/NA Designation: UN1578

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Solid, or molten liquid that solidifies enroute.

Physical State as Released: Solid or molten liquid

Color of the Shipped Material: Yellow

Odor Characteristics: Unknown, assume sweet aromatic odor by analogy to other isomers; may be ammonia-like.

Common Uses: Chemical intermediate, especially for dyes.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

meta-NITROCHLOROBENZENE
Division 6.1 (Poisous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic substance that affects ability of blood to carry oxygen. Ingestion of alcohol aggravates the toxic effects of this product. Effects are more dangerous than readily apparent and may be delayed up to 4 hours.

Short Term Exposure Limits(STEL): Unavailable. See data for para isomer.

Time Weighted Average(TLV-TWA): Unavailable. See data for para isomer.

Conditions to Avoid: Heat, fire, and sparks when product is hot liquid or airborne dust; contact with incompatible materials; contamination of water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from ingestion or inhalation of vapors and dusts. Prolonged skin contact is also to be avoided.

Hazards of Skin or Eye Contact: Contact may cause allergic dermatitis but usual effect (apparently) is slight eye or skin irritation. May be absorbed through the skin rapidly in toxic amounts to cause cyanosis. Molten liquid may cause thermal burns.

Hazards of Inhalation: Causes cyanosis and affects the ability of the blood to carry oxygen. Symptoms include bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, nausea, vomiting, shortness of breath, drowsiness, unconsciousness, and possibly death if treatment is not prompt. Effects may be delayed up to 4 hours and are aggravated by ingestion of alcohol. Exposure to 3.3 ppm of the para isomer in air for 24 hours was fatal to cats in laboratory experiments.

Hazards of Ingestion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit. Unavailable

Upper Flammable Limit. Unavailable

Behavior in Fire: Will burn but usually difficult to ignite.

Hazardous Combustion Products: Toxic nitrogen oxides, hydrogen chloride, carbon monoxide, chlorides, and possibly chlorine.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit. Unavailable

Explosiveness: Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Vapors may form explosive mixtures in air at high temperatures.

PROTECTIVE CLOTHING AND EQUIPMENT

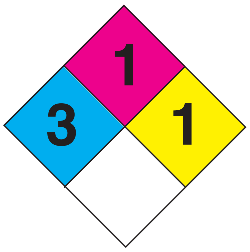
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an organic vapor canister type mask with particulate filters is recommended by a manufacturer of this isomer. See guide for para isomer for NIOSH recommendations relating to that isomer.

1578

meta-NITROCHLOROBENZENE

Division 6.1 (Poisous Material)



FIRST AID

Nonspecific Symptoms: Eye or skin irritation; symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention as necessary to cleaning hair and scalp, finger and toenails, nostrils, and ear canals.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Foam, dry chemical, carbon dioxide, water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Eliminate ignition sources as and if necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the significant toxicity of the product into account while planning the response. Note that the molten product may solidify at ambient temperatures.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Meta-nitrochlorobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of meta-nitrochlorobenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid meta-nitrochlorobenzene with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

meta-NITROCHLOROBENZENE

Division 6.1 (Poisous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapor or dusts in air or the surface of the spilled product may reduce downwind concentrations.

CONSEQUENCE

Water runoff may contain a small amount of meta-nitrochlorobenzene from contact with the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Meta-nitrochlorobenzene may be contained by building dikes or barriers using soil, sand or other materials. Liquid spills should freeze fairly rapidly under most ambient temperature conditions.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Equipment can become clogged if the product freezes.

MITIGATION

Use equipment compatible with spilled product. Act promptly and prevent freezing if possible.

TECHNIQUE

ABSORPTION . . . Spreading of liquid product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the over all volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines. Excessive agitation may cause toxic dust to become airborne.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

meta-NITROCHLOROBENZENE
Division 6.1 (Poisous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: This response included by analogy to para isomer.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

ortho-NITROCHLOROBENZENE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

The ortho isomer of nitrochlorobenzene is a yellow solid at temperatures below 90°F, has a sweet aromatic odor, and may be shipped as a molten liquid (that may solidify enroute). It is used as a chemical intermediate for making dyes, pigments, and other chemicals. It is barely soluble in water and heavier, so may be expected to sink and dissolve at an extremely slow rate. A flash point of 261°F indicates that it must be heated far above its melting point to be ignited easily. The product weighs approximately 11.4 pounds per gallon. ortho-Nitrochlorobenzene does not react with water and is stable in normal transportation. Reactions with alkali or alkaline earth elemental metals, peroxides, strong oxidizing or reducing agents, caustics, or chlorine trifluoride may be explosive, and the product is otherwise reactive with a variety of other chemicals. By analogy to other isomers, some forms of plastics, rubber, or coatings may be attacked by ortho-nitrochlorobenzene; but the product is not corrosive to iron or steel when dry. It is a highly toxic substance and is considered a poison. Products of combustion may be toxic and may include nitrogen oxides, hydrogen chloride gases, carbon monoxide, chlorides, and possibly chlorine.

If hot liquid is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.05% at 77°F (25°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene and ether.

Specific Gravity (Liquid): approx 1.37 at 72°F (22°C)

Boiling Point: 473-474.8°F (245-246°C)

Melting Point: 89.6-95°F (32-35°C)

Freezing Point: 90.5°F (32.5°C)

Molecular Weight: 157.56

Heat of Combustion: Unavailable

Vapor Pressure: 8 mm Hg (0.155 psia) at 246.2°F (119°C); very low at 68°F (20°C).

Flash Point: 261°F (127.2°C), closed cup; 264°F (128.9°C), open cup.

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Dry product is not corrosive to iron and steel but traces of moisture may cause mild corrosion of steel. By analogy to other isomers, may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: May react with mineral acids, amines, strong oxidizing or reducing agents, alkali or alkaline earth elemental metals, certain other metals, peroxides, caustics, nitrides, cyanides, mercaptans, other organic sulfides, azo and diazo compounds, hydrazines, aldehydes, and chlorine trifluoride.

IDENTIFICATION

Shipping Names: Chloronitrobenzenes (USDOT & IMO).

Synonyms and Tradenames: Benzene, 1-chloro-2-nitro; ONCB: chloro-o-nitrobenzene; o-chloronitrobenzene; 2-chloro-1-nitrobenzene; 1-chloro-2-nitrobenzene.

Chemical Formula: $C_6H_4ClNO_2$

Constituent Components(% each): 99.4% or more pure with 0.25% water max.

UN/NA Designation: UN1578

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Solid or molten liquid that solidifies enroute.

Physical State as Released: Solid or molten liquid

Color of the Shipped Material: Yellow

Odor Characteristics: Sweet aromatic nitro odor; may be ammonia-like.

Common Uses: Chemical intermediate for dyes, pigments, and other chemicals.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic substance that affects ability of blood to carry oxygen. Ingestion of alcohol aggravates the toxic effects of this product. Effects are more dangerous than readily apparent and may be delayed up to 4 hours.

Short Term Exposure Limits(STEL): Unavailable. See data for para isomer.

Time Weighted Average(TLV-TWA): Unavailable. See data for para isomer.

Conditions to Avoid: Heat, fire, and sparks when product is hot liquid or airborne dust; contact with incompatible materials; contamination of water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from ingestion or inhalation of vapors and dusts. Prolonged skin contact is also to be avoided.

Hazards of Skin or Eye Contact: Contact may cause allergic dermatitis but usual effect (apparently) is slight eye or skin irritation. May be absorbed through the skin rapidly in toxic amounts to cause cyanosis. Molten liquid may cause thermal burns.

Hazards of Inhalation: Causes cyanosis and affects the ability of the blood to carry oxygen. Symptoms include bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, nausea, vomiting, shortness of breath, drowsiness, unconsciousness, and possibly death if treatment is not prompt. Effects may be delayed up to 4 hours and are aggravated by ingestion of alcohol. Exposure to 3.3 ppm of the para isomer in air for 24 hours was fatal to cats in laboratory experiments.

Hazards of Ingestion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Will burn but usually difficult to ignite.

Hazardous Combustion Products: Toxic nitrogen oxides, hydrogen chloride, carbon monoxide, chlorides, and possibly chlorine.

EXPLOSION HAZARDS

Lower Explosive Limit:Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Vapors may form explosive mixtures in air at high temperatures.

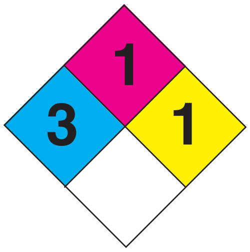
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknovm concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an organic vapor canister type mask with particulate filters is recommended by a manufacturer of this isomer. See guide for para isomer for NIOSH recommendations relating to that isomer.

1578

ortho-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Eye or skin irritation; symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention as necessary to cleaning hair and scalp, finger and toenails, nostrils, and ear canals.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Foam, dry chemical, carbon dioxide, water spray. Water or foam may cause frothing of very hot liquid.

Extinguishing Technique: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move non-leaking container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Eliminate ignition sources as and if necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the significant toxicity of the product into account while planning the response. Note that molten product will solidify at moderate ambient temperatures.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . ortho-Nitrochlorobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ortho-nitrochlorobenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid ortho-nitrochlorobenzene witha plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

ortho-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or dusts in air or the surface of the spilled product may reduce downwind concentrations.

CONSEQUENCE

Water runoff may contain a small amount of ortho-nitrochlorobenzene from contact with the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . ortho-Nitrochlorobenzene may be contained by building dikes or barriers using soil, sand or other materials. Liquid spills should freeze fairly rapidly under most ambient temperature conditions.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION
