ACKNOWLEDGEMENTS

The safety of our nations emergency responders is of primary concern to the American Association of Railroads. The Emergency Action Guides (EAGs) in this book have been prepared to assist emergency responders in safely responding to railroad emergencies in the initial phase of the incident. The EAGs were prepared using recognized reference sources and are based largely on the actual field experience of the railroad industry and hazardous materials product and container specialists from the emergency response community. All of the EAGs have received third party peer review. The Bureau of Explosives welcomes comments and suggestions for improvement of the EAGs. Comments should be directed to:

BOE@AAR.com

Manager, Hazardous Materials
AAR/TTCI
RE: EAG 2006

DISCLAIMER

The material in this book was prepared by the American Association of Railroads for use as Emergency Action Guides (EAG) for first responders who arrive at an emergency prior to product and container specialists. The actions recommended in this book were designed to address immediate emergency situations and do not address all of the potential hazards and risks that may be encountered in developing a comprehensive strategy or tactics for mitigating a hazardous materials incident. Consequently, these data do not address all the potential hazards, particularly those hazards which arise when several chemicals become mixed. These guides, furthermore, do not deal with all of the considerations necessary for site safety plans, personal hygiene, sanitation, or decontamination of persons, clothing, tools, or machines.

There is no possible way that this book can cover the full spectrum of problems and contingencies for dealing with every type of hazardous material or dangerous goods incident. The information in this book should not be viewed by the user as a substitute for the good judgment of qualified hazardous materials specialists at the scene of the emergency. The users of this book are directed to seek the expert assistance of specially qualified persons. An excellent source for technical assistance is the Chemical Transportation Emergency Center (CHEMTREC) at (800) 424-9300. In Alaska, Hawaii and Canada call (703) 527-3887. CHEMTREC communicators can place individuals at the emergency scene in touch with the transporter and shipper of the products.

Emergency response work is extremely dangerous and many responders have died or sustained serious injury and illness while attempting to mitigate an incident. The users of this book are warned to exercise all necessary cautions when dealing with hazardous materials. Always place personal safety first.

Even though this book is based on commonly used emergency response practices, references, laws, regulations, and consensus standards, it is not meant to set a standard of operations for any emergency response organization. The user's are directed to develop their own Standard Operating Procedures which follow all system, agency, or employer guidelines for handling hazardous materials. It is the user's sole responsibility to stay up to date with procedures, regulations, and product developments which may improve personal health and safety.

SPECIAL NOTES FOR THIS EDITION

As warranted, usually when enough chemicals are identified as moving annually by tank car in sufficient quantity, the Bureau of Explosives issues a supplement to the Emergency Action Guides. The supplement usually consists of approximately 15 to 18 new commodities along with updates to existing EAGs. This publication is constructed alphabetically. Any new commodities should simply be inserted where they logically appear in relation to the other commodities. Unless instructed otherwise any updated EAGs are to replace existing ones.

The former pagination system, which combines alpha/numeric sequencing, is being phased out. Therefore any numbering scheme appearing at the top of existing pages is to be ignored. Front and back matter pages are to be replaced only when clearly identified as updates to existing material. With every supplement you can expect the following pages to be updated and in need of replacement: Title Page, Table of Contents, Status of Pages, and some or all of the Appendices F—I.

The Bureau of Explosives is in the process of updating the standard terminology in the older Emergency Action Guides to be consistent with definitions found in the 2004 Emergency Response Guidebook; NFPA 471, *Recommended Practice for Responding to Hazardous Materials Incidents*; NFPA 472, *Standard for Professional Competence of Responders to Hazardous Materials Incidents*; and NFPA 473, *Standard for Competencies for EMS Personnel Responding to Hazardous Materials Incidents*. Until these older EAGs are updated users should be aware of the following.

Recently, there has been a recognition that in some instances *Shelter-In-Place* (Directing people to go inside of a building and remain indoors until the danger from a hazardous materials release has passed. Occupants must close doors and windows and shut down heating ventilation and air condition systems. See Appendix D for the complete definition.) can be used in place of an *Evacuation* (The controlled removal of people from an area of known danger or unacceptable risk to a safer area, or one where the risk is considered to be acceptable.) EAGs issued prior to the 2000 Supplement relied entirely on *Evacuation*. Until these earlier EAGs are revised to reflect this acceptance of *Shelter-In-Place*, users should refer Appendix D for the definition of *Shelter-in-Place* for instances when it can be used in place of *Evacuation*.

In the earlier EAGs the following terms have sometimes been used interchangeably. Users should use these definitions as guidance when using the action/consequence/mitigation approaches to chemical emergency response in an earlier EAG.

> Confinement - Those procedures taken to keep a material, once released, in a defined or local area (e.g., diking or damming).
>
> Containment - The actions taken to keep a material in its container (e.g., stop a release of the material or reduce the amount being released).
>
> Control - The defensive or offensive procedures, techniques, and methods used in the mitigation of a hazardous materials incident, including containment, extinguishment, and confinement.
>
> Damming - A water-based confinement tactic, (e.g., building an underflow dam to capture a petroleum product having a specific gravity less than 1).
>
> Diking - A land-based confinement tactic, e.g. building earthen dikes.
>
> Mitigation - Actions taken to prevent or reduce product loss, human injury or death, environmental damage, and property damage due to the release or potential release of hazardous materials.

In the 2006 Supplement, eighteen chemicals were updated. In these updated chemical a new TECHNIQUE “IMPLEMENT PUBLIC PROTECTION ACTIONS” was introduced as follows:

> Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

EAGs issued prior to 2006 that utilize evacuation or shelter-in-place should implement the above IMPLEMENT PUBLIC PROTECTION ACTION.

INTRODUCTION

The purpose of the hazardous materials Emergency Action Guides (EAGs) in this book is to provide accurate information about the hazardous commodities most frequently carried in bulk by rail transport. The guides were developed by the Association of American Railroads as part of a continuing effort to assist those who respond to transportation accidents involving hazardous materials and must assess the hazards at these incidents. The EAGs provide concise and accurate information for 268 commodities, representing about 98 percent by volume, of the hazardous materials most commonly carried in bulk by rail.

In addition to helping emergency responders identify chemicals and assess their hazards, the EAGs provide information to aid in the protection of the public and the environment. Using response techniques without fully considering the hazards and risks or the consequences is a common problem at many hazardous materials incidents. While taking prompt action may initially appear to control and suppress the problem, other problems more serious and worse than the first may arise as a result of the initial action taken which was not well though out. For example, flooding a spilled chemical with water may quickly remove the chemical from the immediate spill area and appear to improve the situation but may actually create a much more serious problem by contaminating sewer systems, water treatment facilities, lakes, rivers, and ground water. A more effective control method may be to simply contain the spilled chemical by a dike made of dirt until experts arrive on scene.

The unique feature of these guides is in their presentation of the action/consequence/mitigation approach to chemical emergency response. Potentially adverse consequences associated with each response technique and with ways to counteract such consequences, are described. The suggested response techniques do not, however, preclude other actions, which may be appropriate. The intent of these guides is to promote the development of alternative response techniques suitable for use at a spill incident. The hope of those who developed this book is that knowledge and use of the action/consequence/mitigation approach may prevent a situation from becoming worse than it already is.

The information in the EAGs is not a substitute for the knowledge gained by product and container specialists from actual field experience. This experience is especially critical in the assessment of damage to railroad tank cars and other containers. The EAGs will be most useful during actual incidents if they have first been used as part of first responder training. In training sessions, the guides can be supplemented by the experience of hazardous materials specialists.

Organization

This book is organized into three sections followed by a series of nine appendices. Section I contains a brief overview of the chemical emergency preplanning process. Section II discusses the overall design of the Hazardous Materials Emergency Action Guides and their user aids. Section III contains the guides themselves. The appendices give information about sources of additional aid chemical recognition, identification, and classification and a glossary of the technical terms used in the guides.

SECTION I

CHEMICAL EMERGENCY PLANNING

Preplanning is essential for hazardous materials emergency response. Preplanning requires knowing what kinds of accidents can happen, what must be done to control the situation and mitigate the damage and, perhaps most of all, knowing what resources will be needed and who can supply them. Unlike other emergency situations such as auto accidents or structure fires, a chemical release will require special talents uncommon to typical fire and police duties.

A good response plan must coordinate community services with outside responders; it is neither sufficient nor smart simply to assume that local governmental services are all that are available. If the emergency involves hazardous materials, help from the chemical producing and transporting industries and from state and federal agencies is only a phone call away. Knowing who to call and bringing them in during the earliest stages of preplanning for these emergencies will produce a plan that will work.

Individual railroads have developed contingency plans for handling derailments, floods, and other operating emergencies. Each company is also prepared to address chemical releases. Many railroads offer training or informative programs to communities along their lines. Railroad representatives can provide a great deal of information concerning railroad procedures, information sources, and communication networks vital to an emergency.

Like the railroads, and many other major transportation companies, the people who produce hazardous materials have also developed the capability to respond to accidents.

Federal and state emergency personnel, including the Environmental Protection Agency (EPA), the Coast Guard (USCG), the Federal Emergency Management Agency (FEMA), the Department of Energy (for radioactive materials), state offices of emergency preparedness, state police departments, fire marshals, and state environmental and public health offices can provide emergency response information and assistance.

Preplanning and coordination will both minimize confusion and greatly expand the resources available to a community. Because it is important to know who these people are and, better yet, to involve them in the earliest planning stages, a list of industry and governmental agencies available for information and assistance is found in Appendix E in this book. A place has been provided in Appendix E for the names and telephone numbers of other contacts developed in the preplanning process.

ACCIDENT ASSESSMENT

Safety is the first priority in responding to any accident. Thinking safety is even more important when the accident involves—or might involve—hazardous materials. It is absolutely necessary to know the properties of the materials involved. Some hazardous materials cannot be seen or smelled and yet there may be chemicals leaking in gas, liquid, or solid form. The danger of sudden fires or explosions must be assumed.

It is entirely possible that the scene of an accident involving hazardous materials will represent such a high degree of hazard that the only safe course is to protect the perimeter and evacuate those who may become exposed to the dangers of toxic fumes or violent container ruptures. These severe hazards may exist with or without the presence of fire, smoke, or odors.

If an accident involving hazardous materials happens, IMMEDIATELY:

1. Notify local emergency response authorities. The transportation carrier should also be notified.
2. Make an initial survey of the scene, determining the:

   - Location of threatened or potentially threatened people,
   - Presence of fire, smoke or fumes,
   - Presence of hazardous materials,
   - Overall condition of the vehicles and containers, wind direction and approximate speed; and
   - Type of terrain, including the proximity of streams or lakes.

3. Rescue the injured, if possible. Emergency response personnel must be adequately protected against the dangers present before any rescue is attempted. The EAGs list suggested protective clothing and respiratory equipment. Once rescue personnel are properly equipped, look for injured drivers and passengers in truck cabs and railroad personnel in each locomotive or near the train as well as for civilian casualties. If injuries appear to be due to chemical exposure, identify which chemicals are involved. In general, remove victims to fresh air and remove all chemical-soaked clothing. First aid personnel should protect themselves against direct contact with contaminated clothing or material.

4. Identify the specific products, cars, trailers or containers involved. The train crew or truck driver will have shipping papers containing this information. In a rail yard or truck terminal, the shipping papers are usually in the yard office or dispatcher's office. Placards applied to vehicles and/or labels on packages may help identify the presence or absence of hazardous materials, but the shipping papers are the best source of on-scene identification information. Appendices A, B, and C are provided to help interpret placards and markings. If the shipping papers and/or placards or labels are destroyed, the number on the rail car or motor vehicle can often be used to secure the name of the commodity being carried. Rail car numbers (also called reporting marks) are a series of letters followed by a series of numbers as in the following example: ABCX 12345. Many trucks use a similar numbering pattern. With this number, the carrier, or CHEMTREC at 800-424-9300 (in Alaska, Hawaii and Canada call (703) 527-3887).

   Using the guides in this book, identify and learn the dangerous characteristics of the hazardous materials involved and the generally applicable emergency response information. If an accident involves a commodity not in this book, *Emergency Handling of Hazardous Materials in Surface Transportation,* also published by the AAR's Bureau of Explosives, contains information on each DOT regulated hazardous material. If the only available commodity information is the 4-digit number on a vehicle placard or a 49 HAZMAT Code (7-digits) on a shipping or movement document, the cross reference appendices at the back of this book will help locate emergency response information. Placards on vehicles and labels on packages may also contain a single number at the bottom. This is a hazard class number assigned by the International Maritime Organization (IMO). A list of IMO class numbers and their divisions appear in Appendix C. Use this information to help identify commodities when planning evacuations, mitigation activities, personnel safety, and ultimate clean up.

5. Do not release any product(s) from containers or attempt to ignite or detonate either the products or the containers without expert advice and assistance.

6. If it is necessary to drag rail cars or other transport vehicles as a part of accident clearing operations, it should only be done with the expert advice and assistance of persons trained in and familiar with such techniques.

7. Sheltering-In-Place is the preferred and most effective method of protecting people who may be exposed to a short term airborne release of toxic hazardous materials. Emergencies of long duration involving airborne releases of toxic hazardous materials or flammable or explosive materials may require an evacuation. The size of the evacuation area, if any, will depend on the type and quantities of materials involved as well as weather and topographical conditions. Vapor clouds should be monitored for downwind hazards. The evacuation area may be modified as conditions change and additional information is obtained. Evacuation, while not always necessary, must be considered when a hazardous materials emergency occurs. The decision whether or not to evacuate must be made after considering the potential hazards and risks of the incident and the impact the evacuation may have on public safety. Evacuation may add to the immediate problems. Preplanning must include evacuation procedures which are coordinated with emergency management agencies and law enforcement authorities.

8. The shipper(s) should be contacted for additional information on the product(s) involved. Additional emergency response information is available from:

   CHEMTREC 800-424-9300
   In Alaska, Hawaii and Canada call (703) 527-3887.
   Puerto Rico and the Virgin Islands can use the "800" number.
   (In many cases, the CHEMTREC communicator will be able to establish direct contact with the shipper(s) of the product(s) involved.)

If you have the following information when you call, help will be able to reach you much faster:

1. Your name, location, and telephone number
2. Location of the incident
3. Carrier involved
4. Vehicle reporting marks (Car or truck numbers)
5. Placard/label applied
6. Name of commodity and shipper
7. Accessibility
8. Weather conditions
9. Local population information
10. Topographical features
11. Availability of water

Accident Mitigation

When fires are involved, the specific chemicals involved must be identified because conventional firefighting techniques are not always appropriate. The fact that a substance is on fire does not necessarily indicate that the fire should be put out or suppressed with water or any other material. For instance, water is not generally effective against hydrocarbon liquids, gases, or cryogenic liquids. Large amounts of water combined with spilled chemicals may do more to spread a hazard than to eliminate it. In some cases, foams added to water may be more appropriate. Where flammable liquids or gases are leaking and on fire, it may be better to let them burn unless the leak(s) can be stopped.

Escaping vapors or liquids may present a much greater hazard than fire. Identify sensitive areas in the path of released chemicals. Sewer systems and streams should be protected from chemical runoff. It is important to keep the hazard from spreading, because it is difficult and expensive to restore damaged areas. The EAGs provide commodity specific information on mitigation techniques.

Container Damage Assessment

Severe exterior damage to rail cars that appears serious may not have even effected the container's integrity. In contrast, a dent or gouge that looks small may lead to sudden total failure, especially if the tank is pressurized.

The full assessment of the accidental damage suffered by a container of hazardous materials—especially bulk containers such as tank cars, tank trailers, intermodal portable tanks and large cylinders ("ton containers")—is a matter for experts. If there is any question about the continuing integrity of a tank, experts should make an examination before decisions about moving the tank or transferring its contents are made. Expertise is available from container manufacturers, some transportation companies, the Hazardous Materials Services (BOE) (the AAR's Bureau of Explosives' services can be obtained through CHEMTREC), and some shippers of dangerous products.

Evaluating damaged rail cars is a very specialized area of expertise and it is difficult to list general guidelines for emergency responders. Some initial considerations are set out below for evaluating the damage to bulk containers that are NOT involved in a fire. (For fire considerations, see the following discussion of thermal ruptures [BLEVE]).

- Damage to only the outer skin or jacket of a tank will not usually reduce the strength of the tank itself, but training is necessary to recognize the difference between jacketed tanks and those that have no outer skin.

- As a very general rule of thumb, large dents are worse than small ones; dents—even if they are small—with sharp creases are worse than dents with "gentle" edges; dents with sharp bottoms are more dangerous than those with rounded bottoms; and one of the most dangerous situations of all exists when the metal of a tank is so damaged that it has folded back on itself.

- As another very general criteria, the scratches that a tank gets from sliding over dirt, gravel, or similar surfaces are not usually "fatal;" but gouges, especially those that have removed metal from the surface of the tank itself, and even more especially if the gouges continue to remove metal through the tank welds, can be VERY dangerous.

THERMAL RUPTURES (BLEVE)

The common definition of BLEVE refers to the thermal rupture of a tank. Briefly explained, when a railroad tank car is exposed to fire below the level of the liquid contained in it, the contents of the car act to transmit the external heat into the load with a consequent boiling (or vaporization) of some of the product. In the presence of liquid/metal contact, heat is conducted away from the tank and into the liquid and the heat is dispersed; where only product vapors contact the internal wall of the tank, the heat cannot be conducted away from the container wall adequately.

If and when the pressure inside a tank car builds up to the pressure relief valve setting, the valve opens, releasing product vapor. This pressure release results in a cooling of the contents of the car. Continued heating will cause this process to cycle as long as the heat input remains below the liquid level. As each opening of the safety valve releases product, it reduces the surface area in contact with the internal tank shell..

When the liquid level drops low enough that fire impinges on the tank surface with only vapor behind it, the vapor cannot remove the heat efficiently from the tank shell and the metal heats up. As the tank shell heats, the metal begins to lose tensile strength. If the heat is allowed to impinge on the tank shell without some way of dissipating it (an externally applied water stream has been effective in some, but not all cases), the metal will be reduced in strength to the level of the internal pressure. At that point, a tear will open in the tank shell and, if the tear runs in a ductile manner (i.e., "plastic," or with metal thinning), the tank will come apart violently. Often the car rips into three pieces: the head nearest the tear, that part of the tank in which the tear started (and which usually opens up to a large flat piece of steel), and the remainder of the car, which may "rocket" away from its original location.

EVACUATION RECOMMENDATIONS

Overview

At a hazardous materials incident, there are generally two reasons for an evacuation. One is to protect the public from any toxic, poisonous, or noxious vapors or fumes generated by the product itself; the second is to protect the public from thermal ruptures [(BLEVE)] and the container debris that may be hurled from an incident site. Container ruptures may, with some hazardous materials, also result in sudden massive fires or even fireballs. Responders should realize that both reasons for evacuation may exist at a single accident and that not all container ruptures are caused by fire or heat.

Evacuation may be necessary for public safety, but the process has dangers of its own. Studies show that those evacuated suffer stress. The evacuated area will have to be protected from vandalism. Evacuees may forget to turn off stoves and electrical appliances and these may start dwelling fires. Law enforcement or emergency management agencies resources may be limited and the evacuation may need to be conducted in stages, with people at greatest risk evacuated first.

While the evacuation distances and considerations contained in these Guides are the best judgment of technically trained and qualified people, they should only be used to *guide* the evacuation. Any evacuation distance may be modified based on the observations of trained responders at the incident who have made an assessment of the hazards. Those "in charge" at an incident must recognize that trained, professional industrial responders are aware of the risks involved in responding to a hazardous material release and they should be allowed to enter the scene to perform their work. It should also be realized that, as environmental or spill conditions change, any evacuation distance should be reconsidered and modified.

Protection From Vapors or Fumes

Protecting the public from toxic, poisonous, or noxious vapors or fumes requires consideration of site-specific information. Evacuation recommendations require knowledge about the nature of the chemical involved; the rate of its release; air temperature, wind speed, and other atmospheric conditions; and the terrain and vegetation surrounding the release. Because these are unique to each incident, the user of these Guides is advised to seek the aid of persons knowledgeable about the product and the effect of significant variables on it. Local and state air pollution officials are a source for this assistance, as are hazardous materials experts from chemical producing and transporting companies.

Instead of recommending specific evacuation perimeter distances to protect from these fumes and vapors, these Guides use phrases like "Down wind evacuation must be considered," and "Consider evacuation of the immediate spill area."

Protection From Thermal Ruptures

Thermal ruptures and their effects have been extensively studied, especially where they involve pressurized bulk containers. Actual distances traveled by container fragments have been measured and, where specific distances are given for fire-related ruptures, they are based on this history, rounded upwards for safety and convenience. The different distances given as recommendations are also based on factors such as the violent rupture potential of the product, any secondary or tertiary hazards it may have (whether or not they meet the DOT or IMO hazard class definitions) and the kind and size of container authorized for its transportation.

If a rupture occurs, the usual pattern is for the container to break in several pieces, but the rupture may or may not be violent depending on the incident conditions and the chemicals involved. If there is a violent rupture, it is likely that approximately the first 500 to 600 feet from the bulk container of liquefied petroleum gas will experience a fireball and radiant heat. The next 500 to 600 feet (out to a radius of approximately 1200 feet) will experience radiant heat from the fireball. Container fragments, sometimes massive in size, have traveled further than 1200 feet and can set fires beyond this perimeter. Where specific distances are recommended for ruptures caused by fire, those distances are based on a conservative estimate of the possible distance container debris might be hurled.

PERSONAL PROTECTIVE CLOTHING

Protective clothing is a key element in safe emergency response to a chemical release. In order to choose the correct clothing and equipment to perform a task, an initial assessment of the potential risks to human exposure must be made. Do not take unnecessary risks: injury to key responders just adds to the problem and delays the effective solution.

While a detailed treatment of personal protective clothing is beyond the scope of these Guides, the following should be considered:

- Hazards of the released chemicals
- Routes of possible chemical exposure
- Concentration of released chemicals
- Availability of equipment and trained personnel
- Possible chemical reactions at the scene
- Length of possible exposure
- Type of work to be performed
- Potential for additional chemical releases
- Environmental factors, (such as wind, rain, temperature)

When approaching an unknown or undefined hazardous materials release, full chemical protective clothing should be worn to protect the responder from adverse exposure until the actual conditions can be determined. Once the site situation is determined, an adequate level of protective clothing can be established.

Levels of Protection

Protective clothing is designed to eliminate (or at a minimum, reduce) chemical exposure to responders. The U.S. Environmental Protection Agency (USEPA) has recommended four levels of protective clothing when approaching a spill and/or hazardous waste site. These are outlined below. Fire fighters should realize that typical turnout gear *is not* full chemical resistant protective clothing, rather, this type of clothing provides closer to level B or C protection.

Level A **Maximum protection: high respiratory and high skin protection needed**

Level A Conditions:
- unknown gaseous concentrations
- known gaseous contaminants in high concentrations
- known gaseous contaminants that are extremely toxic
- possible or expected skin exposure to toxic or poisonous substances

Level A Personal Protective Equipment:
- positive pressure, self-contained breathing apparatus (OSHA/NIOSH approved)
- fully-encapsulating chemical resistant suit
- gloves (inner) chemical resistant, steel toe and shank (depending on suit boot construction, worn over or under suit boot)
- gloves (outer) chemical resistant
- underwear, cotton, long john type*
- hard hat (under suit)*
- disposable protective suit, gloves, and boots (worn over fully-encapsulating suit)*
- coveralls (under suit)*
- 2-way radio communications (intrinsically safe)

* optional equipment

Comment: This level of clothing would be worn for protection from exposures to dioxin, cyanide compounds, and concentrated pesticides.

Level B **Moderate protection:** High respiratory protection needed; skin protection needed but not of highest concern

Level B Conditions:
- known contaminant levels, and these contamination levels exceed the limit of air purifying devices
- atmosphere with less than 19.5% (by volume) of oxygen
- atmosphere with chemical concentrations above the Immediately Dangerous to Life and Health (IDLH) level.

Level B Personal Protective Equipment:
- positive pressure, self-contained breathing apparatus (OSHA/NIOSH approved)
- chemical resistant clothing (overalls and long sleeved jacket; coveralls; hooded, two-piece chemical-splash suit; disposable chemical resistant coveralls)
- coveralls (under splash suit)*
- gloves, outer, chemical resistant
- gloves, inner, chemical resistant boots, outer, chemical
- resistant, steel toe and shank
- boots, outer chemical resistant (disposable)*
- 2-way radio communications (intrinsically safe)
- hard hat*
- face shield*

* optional equipment

Comment: This level of clothing would be worn when responding to highly concentrated chemical atmospheres like fuming nitric acid or oleum.

Level C **Medium protection:** Limited respiratory protection needed; skin protection needed but not of high concern

Level C Conditions:
- atmosphere with greater that 19.5% (by volume) of oxygen
- atmosphere with chemical contaminant levels below ILDH limits
- chemical contaminants have adequate warning properties
- chemical contamination to unprotected areas such as head and neck are within skin exposure guidelines
- skin contact hazards are minimal or do not exist

Level C Personal Protective Equipment:
- full-face, air-purifying respirator (OSHA/NIOSH approved)
- chemical resistant clothing (one-piece coverall; hooded, two piece chemical splash suit; chemical resistant hood and apron; disposable chemical resistant coveralls)
- gloves, outer, chemical resistant
- gloves, inner, chemical resistant*
- boots, steel toe and shank, chemical resistant
- cloth coveralls (inside chemical protective clothing)*
- hard hat (face shield)*
- boots, outer, chemical resistant (disposable)*
- 2-way radio communications (intrinsically safe)

- escape mask

* optional equipment

Comment: The difference between level B and level C is in respiratory protection: at level C a full face chemical air purifying respirator is allowed to substitute for a pressure demand, self contained breathing apparatus. However, the chemical resistant clothes requirements are the same.

Level D Minimum protection: no respiratory protection required

Level D conditions:
- no possibility for respiratory exposure
- no possibility for skin contamination

Level D Personal Protective Equipment:
- Coveralls
- boots/shoes, safety or chemical resistant steel toe and shank
- boots, outer (chemical resistant disposables) *
- safety glasses or chemical splash goggles *
- hard hat (face shield) *
- escape Mask *
- gloves *

* optional equipment

Comment: This level of clothing is basic work clothes.

Chemical Compatibility

There is *no single ideal material* that offers protection from all chemicals. In fact, materials highly recommended for some chemicals may be totally unsuitable for others. Manufacturers of protective clothing do not provide blanket assurances that a generic type of material will be suitable for every chemical. For these reasons, these Guides use language such as "compatible materials may include . . . ." The Association of American Railroads recommends that persons and organizations purchasing protective clothing discuss the intended usage of it with the manufacturer or sales organization. Always determine the suitability of protective clothing *before* entering the immediate spill area.

Respiratory Protection

There are two basic types of respiratory protection: air supplied and air purifying. Air supplied respirators include positive pressure self-contained breathing apparatus (SCBA) or supplied air-line devices. Both of these should have full facepieces and should operate at positive pressure, that is, with a slight pressure in the facepiece at all times to prevent inward leaks of airborne contaminants.

Air Purifying Respirators (APR) are designed to filter airborne contaminants in atmospheres where there is an adequate concentration of oxygen (above 19.5%). These respirators may either have a full-face piece or a half-face piece (covering the nose and mouth) and a cartridge containing the filtering material. Care must be exercised to ensure that the type of cartridge used is appropriate for the specific contaminants at the incident. It is essential that the responder be aware that these devices should never be used in atmospheres where the oxygen concentration is less than 19.5% by volume. (Normal breathing atmospheres contain 20.9% oxygen by volume.) Responders without training in wearing respiratory protection and in performing self tests for proper facepiece fit should receive instruction before entering the area where the device is needed.

Maintenance of Protective Clothing

In order to maintain the integrity of protective clothing it should be regularly inspected and regularly maintained. Contact with a competent safety officer, industrial hygienist, or the equipment manufacturer will aid in establishing such a program. A word of caution: Responders should inspect all equipment, before donning. Any defective part should be fixed or replaced. Don't wear cracked or damaged clothing. This pre-donning inspection should include checks for:

- Cracks, brittleness, pinholes, or tears in the fabric;
- Zipper failure
- Cracks on the facepiece, rubber surface and seal;
- Condition of valves, canisters, warning devices, and hoses.

THINK SAFETY.

GENERAL SPILL SITE SAFETY PRECAUTIONS

These guides cannot deal with all of the considerations necessary to protect the health and safety of those responding to a chemical incident, but certain generally recognized precautions should be taken as a matter of course. These include recommendations to:

- Wash hands before eating, smoking, or using toilet facilities.
- Prohibit eating and smoking where any chemical is spilled.
- Prohibit rewearing of potentially contaminated clothing.
- Store potentially contaminated clothing in closed containers until the chemical is removed or the clothing is properly discarded.
- Provide facilities for flushing the eyes or skin with water (and soap or detergent) as necessary.
- Establish decontamination stations through which all personnel, tools and machines must pass before leaving a site contaminated with spilled chemicals.

The NIOSH/OSHA Occupational Health Guidelines for Chemical Hazards contain additional ideas for precautionary measures that may need to be considered. In addition, experts in safety, industrial hygiene and related fields may play a vital role in mitigating the potential for danger at an emergency involving chemicals.

Responders should also be aware of the need to maintain excellent physical fitness as a defense against the extra stress of handling an emergency. Regardless of body condition, factors such as the heat stress from wearing chemical protective clothing and the nervous stress of being in a life threatening environment will cause fatigue. Often the responder will tire much more quickly than normal and with fewer of the usual warning signs. Individual alertness and an awareness of other responder's reactions can prevent a dangerous situation from turning fatal.

SECTION II

EMERGENCY ACTION GUIDES FORMAT

Each Emergency Action Guide (EAG) is intended to supply those who respond to a chemical accident with enough information to handle a spill until expert support can be obtained. First response activities recommended in the guides are intended to minimize both short-term and long-term hazards to health and the environment.

All guides are organized into a consistent format. The cover page identifies and describes the commodity; gives physical/chemical data; and hazard identification information. The second and third pages, and in rare instances the fourth page, are devoted to potential hazards, protective clothing and equipment, first aid and general response information. At the top of the second and third pages are colored illustrations of placards, USDOT emergency numbers, and NFPA Fire Diamonds. The fourth, fifth, and sixth pages are devoted to response activities and environmental effects using the action/consequence/mitigation approach. Following the EAGs are a number of appendices including a Department of Transportation placard chart; the National Fire Protection Association 704 diamond system explanation chart; the International Maritime Organization hazard class definitions; a glossary of technical terms; emergency telephone numbers for industry and governmental agencies; a chemical name cross reference; a UN number cross reference; and a 49 HAZMAT code cross reference.

An explanation of the major sections of the guide follows:

Cover

1. *Chemical name*
2. *Description* of the commodity.
3. The *Chemical/Physical Data* section lists the physical and chemical properties of the material. These proper- ties include solubility in water and other chemicals, specific gravity, heat of combustion, flash point, auto- ignition temperature, reactivity with water and other chemicals and other data available for the particular commodity.
4. The *Identification* section lists shipping names, synonyms, and other trade names of the material along with its chemical formula, constituent compounds, the Standard Transportation Commodity Code number (STCC), the International Maritime Organization Code (IMDG), and United Nations (UN) designations. Physical properties of the commodity such as the physical state as shipped (liquid, gas, solid) and as released as well as color, odor, and common uses of the material are also given.
5. *Telephone numbers* for CHEMTREC.

Inside Left Page

6. The *Heading* displays a picture of the DOT placard, the name of the commodity, and the U. S. Department of Transportation (DOT) Hazard Class.
7. *Potential hazards* are subdivided into the following categories: *General hazards,* identifying short term exposure limits, general conditions to avoid, and unusual hazards of the material; *Health hazards,* describing how the material affects the body through contact, inhalation, or ingestion; *Fire hazards,* listing flammable limits, behavior in fire, toxic combustion products; and *Explosion hazards,* describing conditions contributing to explosion, general risks of explosion, and upper and lower explosion concentration limits.
8. The *Protective Clothing and Equipment* section lists the suggested protective clothing and breathing apparatus based on information from a number of recognized sources.

Inside Right Page

9. The *Heading* repeats the name and hazard class of the commodity. The orange panel is used in conjunction with the placard on the right hand side of the inside left page as an alternate display. On the right hand side is a fire diamond from the National Fire Prevention Association (NFPA) Hazard Signal System (Standard 704).
10. The *First Aid* section gives non-specific symptoms and first aid for inhalation, contact, and ingestion. Exposure levels are from NIOSH unless other data is available in the absence of any NIOSH data.
11. The *Fire Response* section lists compatible extinguishing materials and recommended techniques.
12. *Spill Responses.* At the beginning of this block is a general comment regarding the effects of the material on the surrounding environment and basic safety considerations. This is followed by techniques that will minimize the environmental impact of the spill, whether it has entered air, land, or water. Comments on the secondary consequences resulting from the use of these techniques and suggested methods to mitigate the effects of those consequences are included under each category.

Recognizing that every chemical spill is unique, these EAGs are designed to assist the user in evaluating alternative response actions and in selecting those actions most appropriate to the circumstances of a particular spill. By becoming familiar with the various response techniques and with the Action/Consequence/Mitigation process, one can consider the suitability of additional response methods.

Appendices

The appendices explain, define, illustrate, or list the following items:

A. Department of Transportation (DOT) placards.
B. National Fire Prevention Association (NFPA) fire diamonds.
C. International Maritime Organization (IMO) Dangerous Goods Code (IM-DG) numbers.
D. Glossary of terms
E. Industry and government agencies for information and assistance.
F. Chemical name cross reference.
G. United Nations (UN) code number cross reference.
H. 49 HAZMAT code cross reference.

Data in these guides were collected from a variety of sources that are considered reliable and accurate.

THIS PAGE LEFT INTENTIONALLY BLANK

January 1988

ACETALDEHYDE
Class 3 (Flammable liquid)

GENERAL INFORMATION

Acetaldehyde is a highly volatile colorless liquid with a penetrating and pungent fruity odor. It is used for making various other chemicals, synthetic rubber, perfumes, dyes, mirrors, plastics, pesticides, and pharmaceuticals and has uses in several other products and processes. It is fully soluble in water. Its flash point of –36°F indicates that the product can be easily ignited under all ambient temperature conditions. Its boiling point of about 69°F and its considerable vapor pressure indicate that the product will boil in warm weather and will otherwise evaporate rapidly to produce large amounts of heavier than air vapors. These vapors may travel a considerable distance to a source of ignition and flash back and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.5 pounds per gallon.

Acetaldehyde does not react with water or many common materials, but prolonged exposure to air may result in the formation of peroxides that may explode and burst the container. The product is non-corrosive to most metals, but oxidizes readily to form acetic acid. Exposure to heat, dust, strong oxidizing or reducing agents, or strong acids or bases may result in potentially violent self-polymerization. The product is an irritant and of moderate toxicity. It may be present in air in high concentrations. Products of combustion are irritating and may include toxic constituents.

Downwind evacuation should be considered if acetaldehyde is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

***Solubility in Water**:* Soluble in all proportions.
Solubility in Other Chemicals: Soluble in alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.780 at 68°F (20°C)
Boiling Point: 68.7°F (20.4°C) at 1 atm..
Melting Point: –185.8°F (–121°C)
Freezing Point: –189°F (–123°C)
Molecular Weight: 44.05
Heat of Combustion: –5890 cal/g
Vapor Pressure: 750 mm Hg (14.5 psia) at 68°F (20°C)
Flash Point: –36°F (37.8°C), closed cup; –58°F (–150°C), open cup.
Autoignition Temperature: 347–365°F (175–185°C)
Burning Rate: 3.3 mm/minute
Stability: Stable
Corrosiveness: Attacks some forms of plastics, rubber, and coatings. Noncorrosive to most metals but oxidizes readily to acetic acid.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with acids, acid anhydrides, bases, alkalis, alcohols, anhydrous ammonia, bromine, chlorine, fluorine, hydrogen sulfide, iodine, ketones, phenols, strong oxidizing or reducing agents, amines, and hydrogen cyanide.

IDENTIFICATION

Shipping Names: Acetaldehyde (USDOT and IMO); ethyl aldehyde (USDOT and IMO).
Synonyms and Tradenames: Acetic aldehyde; ethyl aldehyde; ethanal.
Chemical Formula: CH_3CHO
Constituent Components(% each): Over 99% pure with rest mostly water.
49 STCC: 49 072 10
UN/NA Designation: UN1089
IMO Designation: 3.1, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Gas or liquid; boils at 68.7°F
Color of the Shipped Material: Colorless
Odor Characteristics: Penetrating, pungent, sharp, and fruity
Common Uses: Mfg. of synthetic rubber, perfumes, flavors, dyes, explosives, disinfectants, mirrors, plastics, pesticides, and pharmaceuticals; hardening of gelatin, glues, and casein products; leather and food preservative.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ACETALDEHYDE

Class 3 (Flammable liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.01-0.031ppm.

Unusual Hazards: Highly volatile, flammable, and moderately toxic substance with heavier than air vapors. May boil or rapidly evaporate to produce large quantities of vapor. May self-polymerize violently under appropriate conditions (see General Information section). Vapors may persist in pits, hollows, and depressions.

Short Term Exposure Limits(STEL): 150ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 100ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations in air that may result from spills. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid acetaldehyde may result in irritation, redness, possibly burns, and possibly an allergic skin rash. Contact with the eyes may cause a burning sensation, secretion of tears, blurred vision, and possibly severe burns.

Hazards of Inhalation: Vapors of acetaldehyde may cause irritation of the eyes, nose, and throat. High concentrations in air may cause narcosis with symptoms including drowsiness, dizziness, headache, nausea, vomiting, unconsciousness, and possibly death. Delayed pulmonary edema may follow from severe exposures. A concentration of 200 ppm in air causes eye irritation in 15 minutes in humans. A level of 13600 ppm was lethal to cats in 15 minutes in laboratory experiments.

Hazards of Ingestion: Ingestion may result in drowsiness, dizziness, unconsciousness, kidney damage, and severe breathing difficulties that may be delayed in onset.

FIRE HAZARDS

Lower Flammable Limit: 4%

Upper Flammable Limit: 57-60%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently. Will generate large quantities of flammable gas or vapor upon release.

Hazardous Combustion Products: Not well-defined but considered irritating. May include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Violent polymerization may occur in presence of certain chemicals (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

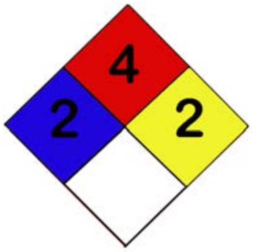
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor concentrations in air. Compatible materials may include butyl rubber, polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10000 ppm), a selfcontained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with front or back mounted organic vapor canister (10000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use of limitations of these devices.

1089

ACETALDEHYDE

Class 3 (Flammable liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, or skin; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water fog or spray. Water may be ineffective but may be used in large amounts to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Unusual toxic vapor hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Before responding, take into account that acetaldehyde is an extremely volatile and flammable substance with heavier than air vapors. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment, that acetaldehyde may polymerize violently under conditions described in the General Information section, and that accumulations of heavy vapors may persist for a time in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Acetaldehyde spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ACETALDEHYDE

Class 3 (Flammable liquid)

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to acetaldehyde vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of acetaldehyde from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid acetaldehyde may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of acetaldehyde vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Acetaldehyde may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained acetaldehyde may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ACETALDEHYDE

Class 3 (Flammable liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ACETALDEHYDE

Class 3 (Flammable liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2006

ACETIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Acetic acid is a colorless liquid with a sour, pungent odor resembling vinegar. The glacial acid is relatively pure and becomes a solid at about 62°F, but the product may also be shipped as a solution in water, as it is fully soluble in water. It is used as a food additive and for making rubber, nylon and fiber, dyes, vitamins, antibiotics, hormones, and a variety of other products and chemicals. A flash point of 104°F indicates that high ambient temperatures or some degree of heating is necessary before glacial acetic acid can be ignited easily. Accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. Containers of liquid have some potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. Glacial acetic acid weighs approximately 8.8 pounds per gallon.

Acetic acid does not react with water and is stable in normal transportation. It is corrosive to most common metals, particularly when diluted with water, and will attack many forms of plastics or rubber. It is also reactive with a variety of chemicals. Concentrated acid may burn bodily tissues by all routes of exposure, and the vapors are severely irritating. Products of combustion may also be irritating. Properties of acetic acid given in the following guide are for the glacial product unless indicated otherwise.

If acetic acid is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions for liquids and at least 75 feet (25 meters) for solid. For larger spills, increase in the downwind direction as conditions warrant. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, diethyl ether, glycerol, carbon tetrachloride and ether.

Specific Gravity (Liquid): 1.051 at 68°F (20°C)

Vapor Density: 2.1 (glacial); 3.45 (solution)

Boiling Point: 244.2°F (117.9°C) at 1 atm.

Melting Point: 61.9°F (16.6°C)

Freezing Point: 62.1°F (16.7°C)

Molecular Weight: 60.05

Heat of Combustion: –3136 cal/g

Evaporation Rate: 0.97

Vapor Pressure: 11 – 11.4 mmHg (0.213 – 0.220 psia) at 68°F (20°C)

Flash Point: 104°F (40°C), cc; 112°F (44.4°C), open cup

Autoignition Temperature: 800 – 869°F (426.7 – 465°C)

Burning Rate: 1.6 mm/minute

Flammable (Explosive) Limits: 4.0% (LEL) – 16% (UEL)

Stability: Stable

Polymerization Potential: Will not occur

pH: 2.4 (1.0M solution)

Corrosiveness: Attacks most common metals including most stainless steels, particularly when diluted. Dissolves synthetic resins or rubber. Use aluminum, 316SS, or 318SS for containers.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with chromic acid, sodium peroxide, nitric acid, acetaldehyde, ammonium nitrate, 2-amino-ethanol, chlorosulfonic acid, ethylene glycol, perchloric acid, ethylene diamine, ethylene imine, hydrogen peroxide, oleum, permanganates, xylene, sodium or potassium hydroxide, phosphorus trichloride, strong oxidizers or caustics, and various other chemicals.

IDENTIFICATION

Shipping Names: Acetic acid, glacial (USDOT & IMO); Acetic acid solution (USDOT & IMO).

Synonyms and Tradenames: Ethanoic acid; Methane carboxylic acid; Vinegar acid; Ethylic acid; Glacial acetic acid; Acetic acid (aqueous)

CAS Registry No.: 64-19-7

Chemical Formula: CH_3COOH

Constituent Components (% each): Glacial is about 99.5%

UN/NA Designation: UN2789 (glacial, > 80% solution); UN2790 (≤80% solution)

IMO Designation: UN2789 (8, corrosive substances; 3, flammable liquids); UN2790 (8, corrosive substances)

RTECS Number: AF1225000

NFPA 704 Hazard Rating: 3 (Health): 2 (Flammability): 0 (Instability) (glacial)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sharp; pungent; sour odor like vinegar.

Reportable Quantity: See appendix I

Common Uses: Food additive; petroleum production; mfg. of rubber, nylon, fiber, dyes, aspirin, plastics, solvents, pharmaceuticals, and other chemicals and products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ACETIC ACID

Class 8 (Corrosive Material)

*UN2789 (glacial, > 80% solution);
UN2790 (≤80% solution)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.2–24 ppm reported, neither odor nor degree of irritation are adequate indicators of vapor concentration.

Unusual Hazards: Corrosive combustible organic acid that solidifies at moderate temperatures when relatively pure. Heavier than air vapors that may travel to a source of ignition and flash back. Vapors may persist for a time in pits, hollows and depressions.

Short Term Exposure Limits (STEL): 15 ppm (37 mg/m^3) (NIOSH)

Time Weighted Average (TLV-TWA): 10 ppm (25 mg/m^3) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 50 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazards are from inhalation of concentrated vapors in the spill vicinity and direct physical contact with concentrated liquid acid. Ingestion of concentrated acid is also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with concentrated (50% or more) acetic acid may cause moderate to severe skin burns. More dilute solutions may cause relatively mild injury. Contact of concentrated acid with the eyes may result in severe injury with possibly permanent corneal opacification; while 4–10% (in vinegar) causes pain and conjunctival hyperemia, sometimes with injury to the corneal epithelium.

Hazards of Inhalation: Vapors of acetic acid may irritate the eyes, nose, throat, and lungs and may damage these tissues severely if concentrated. Symptoms may include coughing, chest pain, nausea, vomiting, and delayed breathing difficulties involving pulmonary edema and bronchopneumonia.

Hazards of Ingestion: Ingestion of concentrated glacial acetic acid may result in perforation of the esophagus (reported as little as 1.0 ml), bloody vomit, diarrhea, shock, hemolysis, hemoglobinuria, anuria and possibly death.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 4.0%

Upper Flammable (Explosive) Limit: 16%

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite when cool. There is some potential that containers may rupture violently in fire.

Hazardous Combustion Products: Carbon monoxide, carbon dioxide and other toxic and irritating products. May include unburned acid.

EXPLOSION HAZARDS

Explosive Potential: There is some potential that containers may rupture violently in fire. Explosion may result if vapors from warm liquid are ignited in a confined area. Contact with metals may produce explosive hydrogen gas.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

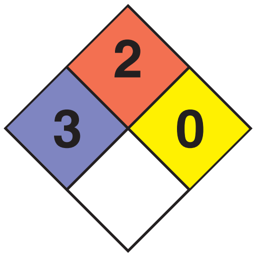
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with concentrated acetic acid. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, polyethylene, chlorinated polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, Viton®, and nitrile-butadiene rubber. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 2; Tychem® SL; Tychem® CPF 4; Tychem® Responder®; Tychem® Responder® CSM; Tychem® TK; Tychem® F; Tychem® Reflector®; Tychem® ThermoPro; Teflon® (gloves, suits, boots); 4H® and Silver Shield® brand gloves; Neop. Chloroflex 723 gloves; Chem Master gloves; N5/N8 Chloroflex gloves; Butyl 878 gloves; Viton® 890 gloves; Neoprene 6780 gloves; Ultraflex Neoprene 32 gloves; Nitty Gritty 65NFW gloves; Ultraflex Nitrile 22R gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Viton® (gloves, suits); Tychem® BR; Tychem® LV; Hustler PVC 725R gloves; Nitri Solve 727 gloves. The following materials are ***not*** recommended for use: Tychem® QC and Tychem® CPF 3.

2789

2790

ACETIC ACID

Class 8 (Corrosive Material)



Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 50 ppm): any supplied-air respirator operated in a continuous-flow mode (eye protection needed); any powered air-purifying respirator with organic vapor cartridge(s) (eye protection needed); any air-purifying full-facepiece respirator equipped with organic vapor cartridge(s); any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece.

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, nose, throat or skin; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid using mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact do not delay, remove contaminated clothing immediately and wash skin with plenty of cold water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Alcohol-resistant foam, dry chemical, carbon dioxide or water spray. Water may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Possible corrosive vapor or fume hazard.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the corrosiveness and reactivity of product with many common metals when deciding on the appropriate response and equipment. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust. Consult a qualified specialist on neutralization techniques. Take into account while planning the response that acetic acid may be highly corrosive and reactive. Contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Vapors may be heavier than air vapors and may persist for a time in low areas. Relatively pure acetic acid solidifies at moderate ambient temperatures.

ACETIC ACID

Class 8 (Corrosive Material)

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Acetic acid, may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill by checking for pH until the spilled product is removed.

CONSEQUENCE

Hazardous levels of acetic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acetic acid vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water spray should be applied to vapors present downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain acetic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL-RESISTANT FOAM . . . There is a possibility that alcohol-resistant foam applied to the surface of liquid pools may slow the release of acetic acid vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid acetic acid may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ACETIC ACID

Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Acetic acid may be contained by building dikes using soil, dry sand or other materials.

CONSEQUENCE

Contained acetic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

ACETIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

January 1988

ACETIC ANHYDRIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Acetic anhydride is a colorless liquid with a strong, pungent, and sour odor resembling vinegar. It is used in making fibers, plastics, lacquers and coatings, films and tapes, cigarette filters, pharmaceuticals, perfumes, explosives, weed killers, and a variety of other chemicals and products. It dissolves and reacts slowly with water to form acetic acid with the evolution of heat (which may be considerable if water spray is applied to the product). Its flash point of 120–127°F indicates that some degree of preheating is necessary before acetic anhydride can be ignited easily. Nevertheless, there is some potential that accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. The product weighs approximately 9 pounds per gallon.

Acetic anhydride is stable in normal transportation. It is corrosive to iron, steel, and other metals, and may eventually cause burns in contact with bodily tissues. It will also attack some forms of plastics, rubber and coatings, and is reactive with a variety of other chemicals. Products of combustion may be toxic and irritating.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.
Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 1.084 at 68°F (20°C)
Boiling Point: 282–284°F (138.9–140°C) at 1 atm.
Melting Point: –99.6°F (–73.1°C)
Freezing Point: –101°F (– 73.9°C)
Molecular Weight: 102.09
Heat of Combustion: –3921 cal/g
Vapor Pressure: 4 mm Hg (0.077 psia) at 68°F (20°C)
Flash Point: 120–127°F (48.9 – 52.8°C), closed cup; 132–136°F (55.6–57.8°C), open cup.
Autoignition Temperature: min. 600°F (315.6°C); max. 734–750°F (390–398.9°C); reported values vary.
Burning Rate: 3.3 mm/minute *Stability:* Stable
Corrosiveness: Corrodes iron, steel and other metals. Use aluminum or stainless steel. Will attack some forms of plastics, rubber, and coatings.
Reactivity with Water: Reacts slowly to evolve heat and acetic acid.
Reactivity with Other Chemicals: Reacts with chromic acid, sodium hydroxide or peroxide, glycerol, nitric acid, mineral acids, permanganates, alcohols, potassium hydroxide, strong oxidizers, strong caustics, amines, 2-aminoethanol, aniline, boric acid, ethylene imine, hydrogen fluoride or chloride, and several other chemicals.

IDENTIFICATION

Shipping Names: Acetic anhydride (USDOT and IMO)
Synonyms and Tradenames: Acetic acid, anhydride; acetic oxide; acetyl anhydride; acetyl ether; acetyl oxide; ethanoic anhydride; hydroxy biacetyl.
Chemical Formula: $(CH_3CO)_2O$
Constituent Components (% each): 75–100% pure
49 STCC: 49 313 04
UNINNA Designation: UN1715
IMO Designation: 8, corrosive
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Strong, pungent, sour, like vinegar.
Common Uses: Mfg. of fibers, plastics, lacquers, coatings, films and tapes, cigarette filters, pharmaceuticals, perfumes, explosives, weed killers, and other products and chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ACETIC ANHYDRIDE

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.14–0.36 ppm
Unusual Hazards: Relatively corrosive combustible liquid that reacts with water.
Short Term Exposure Limits (STEL): Unavailable
Time Weighted Average (TLV-TWA): 5 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Acetic anhydride poses a corrosive hazard to bodily tissue by all routes of exposure.
Hazards of Skin or Eye Contact: Although a burning sensation is not felt immediately, liquid acetic anhydride may cause reddening of the skin followed by skin becoming white and wrinkled and eventually burned. Contact with the eyes causes immediate burning followed by increasing injury and possibility of permanent loss of sight. Concentrated vapors are also harmful to the skin and eyes.
Hazards of Inhalation: Vapors of acetic anhydride may cause irritation of the eyes, nose; and throat as well as coughing. High concentrations may cause ulceration of nasal membranes, bronchospasm, difficult breathing, and possibly severe damage to the lungs with delayed effects.
Hazards of Ingestion: Ingestion may produce serious burns of the mouth and esophagus, burning pain in the stomach, nausea, and vomiting.

FIRE HAZARDS

Lower Flammable Limit: 2.7–2.75%
Upper Flammable Limit: 10–12.4%
Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite when cool.
Hazardous Combustion Products: Not well-defined but considered toxic and irritating.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors from warm liquid are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (250 ppm or less) or an organic vapor cartridge respirator with a full facepiece (250 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific symptoms: Irritation or burns of any tissue; coughing and other symptoms of inhalation or ingestion.
***First Aid for Inhalation*:** Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least *15* minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.
First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

1715

ACETIC ANHYDRIDE
Class 8 (Corrosive Material)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, dry chemical, carbon dioxide, and large amounts of water spray. Water may be used to dilute spills to nonflammable mixture but control any runoff. Note that dry chemical forced below the surface may cause foaming and boiling.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool. Note that water reacts with acetic anhydride to evolve acetic acid and heat.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Acetic anhydride may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of acetic anhydride in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb acetic anhydride vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain acetic anhydride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize -as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of acetic anhydride vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

ACETIC ANHYDRIDE

Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE .

CONTAINMENT DIKES . . . Acetic anhydride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained acetic anhydride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . . Spreading of acetic anhydride may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Although sorbents will immobilize the spill and help control spreading, they do not alter the hazardous nature of the spilled product. Their use adds to the volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified experts.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

ACETIC ANHYDRIDE
Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders arid scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

ACETONE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Acetone is a volatile colorless liquid with a sharp sweet odor resembling that of nail polish remover or paint. It is used as a solvent in paints and nail polish removers and for making pharmaceuticals, adhesives and other chemicals. It is fully soluble in water. Its flash point of 0°F indicates that the product may be easily ignited under most ambient temperature conditions. Vapors are somewhat heavier than air when concentrated and may travel to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. The product weighs approximately 6.6 pounds per gallon.

Acetone does not react with water or many other common materials and is stable in normal transportation. It attacks several forms of plastics and rubber, and is reactive with a variety of other chemicals. The product is generally of low to moderate toxicity by the various potential routes of exposure but may be present in air in high concentrations. Products of combustion include carbon dioxide and carbon monoxide.

If acetone is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 0.791 at 59°F (15°C)
Vapor Density: 2.0
Boiling Point: 133.2°F (56.2°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –138°F (–94.7°C)
Molecular Weight: 58.08
Heat of Combustion: –6808 cal/g
Evaporation Rate (butyl acetate=1): 5.6 – 7.7
Vapor Pressure: 180 mmHg (3.48 psia) at 68°F (20°C); 400 mmHg at 104°F (39.5°C)
Flash Point: 0°F (–17.8°C), cc; 4°F (–15.6°C), oc
Autoignition Temperature: 869°F (465°C)
Burning Rate: 3.9 mm/minute
Flammable (Explosive) Limits: 2.5% (LEL) – 12.8% (UEL)
Stability: Stable
Polymerization Potential: Will not occur
pH: Not available
Corrosiveness: Attacks many forms of plastics and rubber including rayon.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizing agents, chromyl chloride, chromic anhydride, chromyl alcohol, hexachloromelamine, hydrogen peroxide, potassium tertbutoxide, thioglycol, aliphatic amines, nitric and acetic acid, nitric and sulfuric acid, nitrosyl chloride, nitrosyl perchlorate and permonosulfonic acid. Reacts with chloroform and bromoform under basic conditions.

IDENTIFICATION

Shipping Names: Acetone (USDOT & IMO)
Synonyms and Tradenames: 2-Propanone; Dimethyl ketone; beta-Ketopropane; Methyl ketone; Pyroacetic ether, Dimethyl-ketal; Dimethyl formaldehyde; Propanone; Ketone propane
CAS Registry No.: 67-64-1
Chemical Formula: CH_3COCH_3
Constituent Components (% each): 99.5% pure remaining mostly water.
UN/NA Designation: UN1090
IMO Designation: 3, flammable liquids
RTECS Number: AL3150000
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Instability)
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sharp, sweet, pungent; like fruit, mint, or nail polish remover.
Reportable Quantity: See Appendix I
Common Uses: Solvent for paints, nail polish removers, and other products; mfg. of drugs, adhesives, pesticides, lube oils, and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ACETONE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reports vary 0.66–320 ppm, most fall within 13–62 ppm

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back or persist in low areas.

Short Term Exposure Limit (STEL): 750 ppm (ACGIH 2004)

Time Weighted Average (TLV-TWA): 250 ppm (590 mg/m^3) (NIOSH); 1000 ppm (2400 mg/m^3) (OSHA); 500 ppm (ACGIH 2004)

Ceiling (C) Limit: Unavailable

IDLH: 2500 ppm (10% LEL)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of very high vapor concentrations in air. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid acetone may cause drying and cracking of the skin due to the defatting action of the product. Contact with the eyes may result in eye irritation, conjunctivitis, and usually some degree of temporary corneal injury.

Hazards of Inhalation: High concentrations of acetone vapors may lead to central nervous system depression, symptoms may include headache, drowsiness, incoordination, dizziness, confusion, nausea, and unconsciousness. High concentrations in air may be irritating to the eyes, nose, throat and lungs.

Hazards of Ingestion: Ingestion may result in irritation of the mucous membranes, gastritis, nausea, vomiting and central nervous effects. May be an aspiration hazard and may be fatal.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 2.5%

Upper Flammable (Explosive) Limit: 12.8%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable vapor upon release.

Hazardous Decomposition Products: May include carbon dioxide and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

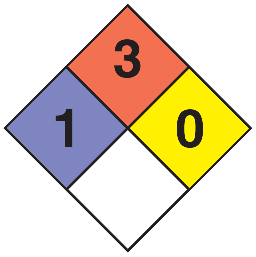
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include latex rubber or butyl rubber. The following materials are reported to have a greater than 8 hour breakthrough time: butyl rubber (gloves, suits, boots); Tychem® (CPF 3; CPF 4; BR; LV; Responder®; Responder® CSM; TK; F; Reflector®; ThermoPro); Barricade® coated suits; CPF3® suits; Trellchem HPS® suits; Butyl 878® gloves; Viton® 892; 4H® and Silver Shield® brand gloves. The following materials are **not** recommended for use: nitrile latex; Tychem® (CPF 2; SL; CPE; CPF 1; QC; PVC).

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2500 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 2500 ppm): any air-purifying half-mask respirator* equipped with organic vapor cartridge(s); any powered air-purifying respirator* with organic vapor cartridge(s); any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; any supplied-air respirator*; or any self-contained breathing apparatus with a full facepiece. Note: Respirators noted with (*) may require eye protection.

1090

ACETONE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, or throat; central nervous system depression and other symptoms of inhalation, physical contact, or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 15 minutes. Get medical attention immediately if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Alcohol-resistant foam, dry chemical, carbon dioxide or water fog or spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish fire unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Acetone will completely dissolve in water. Dike fire control water for proper disposal since it may contain flammable vapors. Note that acetone has a flash point of 0°F.

SPILL RESPONSES

General Information: Acetone is a highly flammable and volatile liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of acetone may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment are isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that acetone is a highly flammable substance that may evaporate rapidly, dissolve in water and is lighter than water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

ACETONE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Acetone may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed.

CONSEQUENCE

Hazardous levels of acetone in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acetone vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain acetone from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL-RESISTANT FOAM . . . There is a possibility that alcohol-resistant foam applied to the surface of liquid pools may slow the release of acetone vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid acetone may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ACETONE

Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Acetone may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained acetone may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible, non-combustible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ACETONE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

ACETONE CYANOHYDRIN, STABILIZED

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Acetone cyanohydrin is a colorless to straw color or brownish liquid with a cyanide or bitter almond odor, but may be odorless at low temperatures. It is highly toxic by inhalation or ingestion. It is used to make plastics, insecticides, pharmaceuticals, foaming agents and other chemicals. It is completely soluble in water and forms a colorless to straw color solution. Having a flash point of 165ºF, acetone cyanohydrin must be moderately heated before ignition may occur easily. There is some potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration since heat causes dissociation to acetone and hydrogen cyanide, both highly flammable materials. The latter substance is also a highly toxic gas. Acetone cyanohydrin weighs approximately 7.8 pounds per gallon.

Acetone cyanohydrin does not react with water and other common materials but is reactive with a variety of chemicals. Reactions with organic acids, isocyanates, epoxides, or nitrides may be explosive. Carbon steel, type 316 stainless steel, Teflon®, compressed asbestos, and buna S rubber are not attacked under most conditions. Although the product is generally stable in transportation, some decomposition to acetone and toxic hydrogen cyanide gas can be expected even in ambient storage. The products of combustion, according to one manufacturer, may be less hazardous than decomposition products (i.e., acetone and hydrogen cyanide).

Downwind evacuation should be considered if acetone cyanohydrin is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in alcohol, acetone, ether, and benzene. Slightly soluble in petroleum ether.

Specific Gravity (Liquid): 0.932 at 66ºF (19ºC)

Vapor Density: 2.93

Boiling Point: One source reports 176ºF (82ºC) while another lists 330ºF (166ºC) at 1 atm for decomposing.

Melting Point: -5.8ºF (-21ºC)

Freezing Point: See melting point

Molecular Weight: 85.11

Heat of Combustion: Unavailable

Evaporation Rate (butyl acetate=1): <1

Vapor Pressure: 0.8 mmHg (0.015 psia) at 68ºF (20ºC)

Flash Point: 165ºF (74ºC), closed cup

Autoignition Temperature: 1270ºF (688ºC)

Burning Rate: Unavailable

Flammable Limits: 2.2% (LEL) - 12.0% (UEL)

Stability: Generally stable but some decomposition to acetone and hydrogen cyanide can be expected.

Polymerization Potential: Will not occur.

pH: Unavailable

Corrosiveness: Unavailable

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with mineral acids, alkalis and alkaline earth metals, strong reducing agents, organic acids, isocyanates, epoxides, nitrides, azo and diazo compounds, hydrazines, and caustics.

IDENTIFICATION

Shipping Name(s): Acetone Cyanohydrin, stabilized (USDOT & IMO)

Synonyms and Tradenames: Lactonitrile, 2-methyl; ACY; ACN; alpha-Hydroxyisobutyronitrile; 2-Hydroxy-2-methylpropionitrile; 2-Hydroxy-2-methylpropanenitrile; Isopropylcyanohydrin.

CAS Registry No.: 75-86-5

Chemical Formula: $(CH_3)_2C(OH)CN$

Constituent Components (% each): 97-99% pure (or more) with traces of HCN, water, acetone, stabilizer, and inerts.

UN/NA Designation: UN1541

IMO Designation: 6.1, Toxic substances

RTECS Number: OD9275000

NFPA 704 Hazard Rating: 4(Health): 2(Flammability): 2(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless to straw colored or brown.

Odor Characteristics: Like cyanide (bitter almond), but may be odorless at low temperatures.

Reportable Quantity: See appendix I.

Common Uses: Manufacturing of plastics, insecticides, pharmaceuticals, foaming agents, and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ACETONE CYANOHYDRIN, STABILIZED

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic by inhalation or ingestion. Decomposes at 248ºF and at lower temperatures under alkaline conditions with evolution of highly toxic hydrogen cyanide. Some decomposition expected even in ambient storage. The substance is very toxic to aquatic organisms.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: 1 ppm (4 mg/m^3)

IDLH: Unavailable

Conditions to Avoid: Contact with ignition sources, heat, alkalies, or other incompatible materials; runoff to water or sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Acetone cyanohydrin is highly toxic by inhalation or ingestion and possibly by skin absorption. A major hazard is the potential for the product to evolve highly toxic hydrogen cyanide gas (see general information section).

Hazards of Skin or Eye Contact: Liquid acetone cyanohydrin may be absorbed through the skin and cause toxic effects. Contact may cause smarting of the skin and first degree burns upon short exposure. Prolonged exposures may result in secondary burns.

Hazards of Inhalation: Breathing vapors may result in dizziness, headache, nausea, mental dullness, rapid and/or irregular heartbeat, weak pulse, convulsions, and possibly unconsciousness and death. High concentrations in air may also irritate the eyes and respiratory system. Acetone cyanohydrin is highly toxic.

Hazards of Ingestion: Ingestion may result in the symptoms identified above for excessive inhalation.

FIRE HAZARDS

Lower Flammable Limit: 2.2%

Upper Flammable Limit: 12%

Behavior in Fire: Combustible liquid. Containers may rupture violently in fire. Heat will cause decomposition to acetone and highly toxic hydrogen cyanide.

Hazardous Decomposition Products: Toxic fumes of carbon monoxide, carbon dioxide, nitrogen oxides, hydrogen cyanide and acetone.

EXPLOSION HAZARDS

Explosive Potential: Reactive at high temperature or pressure. Containers may rupture violently in fire. Contact with other chemicals such as nitrides, organic acids, isocyanates, epoxides, alkali or alkaline earth metals, and certain other substances may result in violent polymerization or the formation of explosive mixtures. Explosion may result if vapors of heated liquid are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

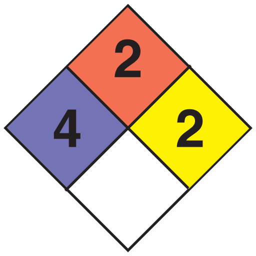
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Tychem® 9400, Tychem® BR and Tychem® 10000 are reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or where increased possibility of exposure exists, a self-contained breathing apparatus (SCBA) with full facepiece.

1541

ACETONE CYANOHYDRIN, STABILIZED

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Irritation or burns due to direct contact. Other symptoms of inhalation, ingestion, or absorption via skin.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious, administer artificial respiration. Administer amyl nitrite by crushing pearl in a cloth and lightly holding under nose 5 times for 15 seconds at about 15 second intervals. Repeat every 5 minutes as necessary for 3-4 pearls. Administer oxygen if victim remains unconscious or breathing is difficult. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer amyl nitrite as described above. Give one pint of 1% sodium thiosulfate solution (or soapy or mustard water) by mouth and induce vomiting. Repeat until vomit is clear. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Alcohol resistant foam, carbon dioxide, dry chemical, or water spray. Do not use soda-acid extinguisher.

Extinguishing Techniques: Unusual toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to rupture potential. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Take into consideration the highly toxic nature of acetone cyanohydrin while planning the response. Downwind evacuation should bo considered. Proceed with caution. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Restrict access to area. Keep unprotected personnel upwind. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Choose equipment that is not corroded or otherwise damaged by the spilled product. Consider using a buddy system due to the hydrogen cyanide gas hazard.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

ACETONE CYANOHYDRIN, STABILIZED
Division 6.1 (Poisonous Materials)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acetone cyanohydrin vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of acetone cyanohydrin from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid acetone cyanohydrin may slow the release of vapors into the atmosphere. If possible, adjust pH to 7 to suppress formation of hydrogen cyanide.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

OIL APPLICATION . . . Application of a fuel oil to the surface of liquid pools may reduce emissions of vapors or fumes.

CONSEQUENCE

Addition of oil will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL RESISTANT FOAM . . . There is a possibility that alcohol resistant foam applied to the surface of liquid pools may slow the release of acetone cyanohydrin vapors into the atmosphere. (Note: The fact that alcohol resistant foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol resistant foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

ACETONE CYANOHYDRIN, STABILIZED

Division 6.1 (Poisonous Materials)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid acetone cyanohydrin may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Liquid acetone cyanohydrin may be confined by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Confined acetone cyanohydrin may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ACETONE CYANOHYDRIN, STABILIZED

Division 6.1 (Poisonous Materials)

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

August 1994

ACROLEIN*
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Acrolein is a clear colorless or yellowish liquid with an acrid, piercing, and disagreeable odor. It is moderately soluble in water and is likely to form a colorless to light yellow solution. Its low flash point indicates that it can easily be ignited under most ambient temperature conditions.

Acrolein's boiling point and relatively high vapor pressure indicate that it will rapidly vaporize under normal conditions. This may result in the evolution of relatively large amounts of vapor. These vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as sewers or buildings may result in explosion. Containers of liquid acrolein may explode if exposed to fire or excessive heat for sufficient time duration.

Acrolein does not react with water or many other common materials. It is stable in normal transportation and shipped with an inhibitor, however, exposure to high temperatures (above 392°F), light, alkalies, and strong acids may promote self-polymerization. This may result in the evolution of heat and possibly the violent or explosive rupture of the container. Acrolein is very toxic by all routes of exposure and all exposures should be avoided.

Downwind evacuation should be considered if the product is leaking but not on fire. If the product container is exposed to direct flame or the fire becomes uncontrollable, evacuate for a radius of 2500 feet for protection should the container rupture violently. Acrolein is used in making plastics, pharmaceuticals, herbicides, and other chemicals. It is also used as an herbicide and as a fungus inhibitor in fuel mixtures. Acrolein weighs approximately 7 pounds per gallon.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 21 - 22 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, and acetone.

Specific Gravity (liquid): 0.841 - 0.845 at 68°F (20°C)

Vapor Density (Air = 1): 1.94

Boiling Point: 126.5°F (52.5°C) at I atm.

Melting Point: - 125.9 to - 124.4°F (- 87.7 to - 86.9°C)

Freezing Point: - 125°F (- 87°C)

Molecular Weight: 56.07

Heat of Combustion: - 6950 cal/g.

Vapor Pressure: 215 mm Hg (4.16 psia) at 68°F (20°C)

Flash Point: - 15°F (- 26°C), CC

Autoignition Temperature: 453°F - 532°F (234°C - 278°C)

Burning Rate: 3.8 mm/minute.

Stability: Normally stable. May violently polymerize if exposed to heat, contamination or light.

Corrosiveness: Non-corrosive to iron and low carbon steel unless accompanied by extreme heat.

Reactivity with Water: No reaction, dissolves.

Reactivity with Other Chemicals: Reacts with air, alkaline materials, amines, thiourea, oxidants, heat and light, sulfur dioxide, metal salts, acids, 2-aminoethanol, ethylene diamine, and ethyleneimine.

IDENTIFICATION

Shipping Names: Acrolein, inhibited (USDOT); acrolein, inhibited (IMO)

Synonyms and Tradenames: Propenal; 2-propenal; acrylic aldehyde; acrylaldehyde; acraldehyde; allyl aldehyde; ethylene aldehyde; aqualin; NSC 8819; prop-2-en-l-al; 2-propen-l-one; slimicide; biocide; trans-acrolein; acquinite; crolean; magnicide H; CAS 107-02-8.

Chemical Formula: CH_2=CHCHO

Constituent Components (% each): 92% or more pure; water is major contaminant; also has less than 1% inhibitor such as hydroquinone.

UN/NA Designation: UN1092

IMO Designation: 6.1, poisonous material.

Physical State as Shipped: Liquid, inhibited.

Physical State as Released: Liquid, inhibited.

Color of the Shipped Material: Colorless or yellowish.

Odor Characteristics: Disagreeable, causes tears; acrid, pungent.

Common Uses: Intermediate for synthetic glycerol, polyurethane, and polyester resins and pharmaceuticals; herbicide; warning agent in gasses; liquid fuel antimicrobial agent; chemical synthesis; biocide, agent in military chemical weapons; perfumes; colloidal forms of metal; plastics.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

applicable to rail cars

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.05 - 0.4 ppm (0.125 - 1 mg/m^3)

Unusual Hazards: Highly flammable, toxic, and volatile liquid. Vapors are heavier than air. Heat, light, or chemical contaminants may promote violent self-polymerization. Vapors are uninhibited and may form polymers in vents or flame arrestors resulting in stoppage.

Short Term Exposure Limits (STEL): 0.3 ppm (0.75 mg/m^3). (OSHA)

Time Weighted Average (TLV-TWA): 0.1 ppm (0.25 mg/m^3) over each 8 hours of a 40 hour work week. (OSHA)

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly toxic by all routes of exposure. Toxic vapors may travel considerable distances. Flammable liquid and under conditions of heat, exposure to light, and contamination, may polymerize violently.

Hazards of Skin and Eye Contact: Contact with liquid acrolein may cause severe skin or eye burns. Acrolein may also be absorbed via the skin in toxic amounts.

Hazards of Inhalation: Breathing of acrolein vapors may cause irritation, coughing, dizziness, headache, nausea, cyanosis, pulmonary edema, and possibly death. Exposure to 150 ppm in air may be lethal to humans in 10 minutes. Onset of pulmonary edema may be delayed.

Hazards of Ingestion: Ingestion may severely irritate the mouth and stomach and produce acute gastrointestinal distress and pulmonary edema. Onset of effects may be delayed..

FIRE HAZARDS

Lower Flammable Limit: 2.8%

Upper Flammable Limit: 31%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure to excessive heat may result in violent polymerization. May generate large quantities of flammable gas or vapor upon release.

Hazardous Combustion Products: Unburned acrolein, carbon monoxide, peroxides, and others.

EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Loss of inhibitor or excessive heat or light may cause spontaneous violent polymerization resulting in container rupture. Violent polymerization may also occur in presence of alkaline materials, amines, metal salts, thiorourea, oxidants, sulfur dioxide, and acids.

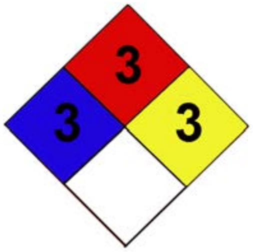
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or a chemical cartridge respirator with a full facepiece within the use limitations of these devices.

1092

ACROLEIN
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, skin, or respiratory tract, coughing, dizziness, headache, nausea, chest pains, and others.

First Aid For Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention iqmmediately. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of pulmonary edema. Onset may be delayed and symptoms may grow progressively worse with time.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if there is evidence of irritation or chemical burns.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting not be induced if immediate medical attention is available). Be alert to delayed and progressive signs of systemic toxicity.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with acrolein. Wear self contained breathing apparatus and appropriate personal protective clothing. Move intact container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. Avoid taking positions along container ends. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water may be used to dilute acrolein pools to non-flammable concentrations.

SPILL RESPONSES

General Information: Proceed with caution. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Eliminate ignition sources. Use explosion-proof equipment where necessary. Note that acrolein is a highly flammable, toxic, and volatile substance in planning a response. Choose equipment where possible that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Acrolein spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ACROLEIN
Division 6.1 (Poisonous Material)

AIR SPILL *(CONTINUED)*

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acrolein vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of acrolein from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of acrolein vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid acrolein may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid acrolein may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained acrolein may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ACROLEIN
Division 6.1 (Poisonous Material)

LAND SPILL *(CONTINUED)*

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substance.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gasses present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

ACROLEIN
Division 6.1 (Poisonous Material)

WATER SPILL *(CONTINUED)*

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

July 1994

ACRYLAMIDE*
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Pure acrylamide is a white, odorless crystalline powder, but is typically shipped as an aqueous solution. While the properties of the pure crystalline form are fairly well defined, the solution behavior will depend largely on the nature of the solvent carrier. Typically, acrylamide is found in a 50% aqueous (water) solution. Since acrylamide can polymerize, such solutions are usually treated with copper salts and stored in the presence of oxygen to inhibit polymerization. Other solvents can be used to carry acrylamide depending on the ultimate use of the product. Acrylamide is not particularly flammable and will likely polymerize when heated. Ignition in aqueous solutions is possible after the water has evaporated. Flammability in other solvent carriers will depend on the nature of the solvent. The principal source of danger is due to its toxicity. On direct contact, it is a strong irritant to skin, eyes and other mucous membranes and can be absorbed through intact skin. Consequently, adequate protective measures should be implemented.

Because acrylamide is soluble in water, it will disperse in water bodies and will readily dissolve in runoff from firefighting operations. Contaminated solutions will present a risk of exposure to personnel. Vapors from spills of acrylamide solids and aqueous solutions are not likely to pose a significant source for personnel exposures. If acrylamide is shipped in a solvent other than water, the solvent should be identified to determine the risk added by the solvent. Acrylamide has numerous commercial uses as treatments for paper products, adhesive preparations, and is found in water and sewage treatment products.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble (215.5 gm/100ml @ 30°C (86°F))

Solubility in Other Chemicals: Soluble in methanol, ethanol, and acetone. Slightly soluble in ethyl acetate, chloroform, and benzene.

Specific Gravity (solid): 1.122 gm/cc @ 30°C (86°F)

VaporDensity(Air=1): Unavailable.

Boiling Point: 125°C @ 25 mmHg (257°F)

Melting Point: 84.5°C (184.1°F)

Freezing Point: 84.5°C (184.1°F)

Molecular Weight: 71.08

Heat of Combustion: Unavailable.

VaporPressure: 6.75 mmHg @ 25°C (77°F) (solid)

Flash Point: Unavailable.

Autoignition Temperature: Unavailable.

Burning Rate: Unavailable.

Stability: Stable at normal environmental temperatures, however, may violently polymerize when heated to melting point (84.5°C, 184.1°F). Readily polymerizes on exposure to ultraviolet light. Stabilized with oxygen and copper salts or antioxidants such as hydroquinone; t-butylpyrocatechol; n-phenyl-2-napthylamine.

Corrosiveness: Non-corrosive but avoid contact with iron, copper, aluminum, brass, and bronze.

Reactivity with Water: Not water reactive, dissolves.

Reactivity with Other Chemicals: Reacts in the presence of Uv light to polymerize, possibly violently. Incompatible with oxidizers, acids, bases, iron, copper, aluminum, brass, and bronze.

IDENTIFICATION

Shipping Names: Acrylamide, acrylamide solution.

Synonyms and Tradenames: 2-propenamide; propenamide; acrylic amide; ethylenecarboxamide; vinyl amide; propenoic acid amide; CAS 76-06-1.

Chemical Formula: $CH_2CHCONH_2$

Constituent Components (% each): 100% acrylamide in solid form; 50% solution with water, inhibited.

UN/NA Designation: UN2074

IMO Designation: 6.1, poisonous material.

Physical State as Shipped: Solid, liquid inhibited.

Physical State as Released: Solid, liquid inhibited.

Color of the Shipped Material: Colorless.

Odor Characteristics: Odorless.

Common Uses: Synthesis of dyes, adhesives, soil conditioning agents, sizing for paper and textiles, waste treatment chemicals and permanent press fabrics.

*Reportable Quantity (RQ) established Refer to appendix I.

ACRYLAMIDE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: No threshold odor concentration is reported for acrylamide. In liquid form, odor may be characteristic of the solvent carrying acrylamide.

Unusual Hazards: Acrylamide is readily absorbed through the skin and will produce neurotoxic effects. Direct contact with acrylamide should be avoided.

Short Term Exposure Limits (STEL): None reported in the U.S.

Time Weighted Average (TLV-TWA): 0.03 mg/m^3 (0.0102 ppm) (Skin), OSHA final PEL,

Conditions to Avoid: Contact with water, or incompatible materials; runoff to sewers or water; inhalation of dusts, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major public health risk is from direct contact with acrylamide or acrylamide solutions. Exposures are likely through contaminated foods, contaminated water, or direct contact with spilled material. Inhalation is unlikely unless acrylamide dusts become airborne. Direct exposures can produce irritation and neurotoxic effects. Highly toxic. May cause central nervous system paralysis.

Hazards of Skin and Eye Contact: Acrylamide is readily absorbed through intact skin which is the major route of exposure. Exposure will produce local irritation, and if the dose is sufficient, neurotoxic symptoms will develop. These include tremor, dizziness, numbness, loss of coordination and vision changes. Symptoms may be delayed depending on the severity of exposure.

Hazards of Inhalation: Acrylamide will likely cause irritation of the mucous membranes in the respiratory tract on inhalation of acrylamide dusts. It is readily absorbed through the respiratory tract and will produce neurotoxic effects. While a possible route of exposure, inhalation is unlikely unless conditions permit acrylamide to become airborne.

Hazards of Ingestion: Small doses are not likely to produce symptoms. In cases where large doses have been ingested, symptoms are likely to include sweating of the hands and feet, numbness, loss of equilibrium, and a tingling sensation in the extremities.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Heating will likely contribute to the polymerization of acrylamide. Polymerization of solid acrylamide may be violent when heated to melting point. While ignition of acrylamide is unlikely, exposure to fire from other fuel sources may result in thermal decomposition. Aqueous acrylamide solution is non-flammable.

Hazardous Combustion Products: May produce oxides of carbon such as carbon monoxide, and ammonia.

EXPLOSION HAZARDS

Explosiveness: Solid will polymerize violently if in sealed container and heated sufficiently to induce polymerization.

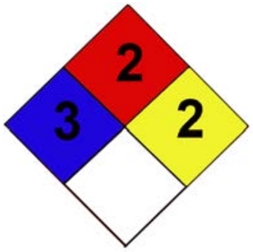
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Personal protective equipment should be selected to prevent direct skin or eye contact with acrylamide solutions or solid. For acrylamide solutions, equipment should be selected which is compatible with the solvent as well as acrylamide. For solid spills and aqueous solutions, equipment constructed of polyethylene, butyl, neoprene or nitril butadiene rubber has been reported as suitable. Gloves, chemical goggles, protective boots and protective coveralls should be used where potential for direct contact exists.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills. If acrylamide is in a solvent other than water, selection of respiratory protection should include consideration for solvent properties.

2074

ACRYLAMIDE
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Remove victim from source of contamination. Remove contaminated clothing and wash contaminated skin with water or soap and water. Watch for signs of neurological impairment and seek medical assistance immediately.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit.)

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Watch for signs of neurological impairment and seek medical assistance immediately.

First Aid for Ingestion: If victim is conscious, give water or milk and induce vomiting. Never give anything by mouth to, or induce vomiting in an unconscious person. Observe for signs of neurotoxic effects. Seek medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water is appropriate where acrylamide is involved. However, if acrylamide is involved in fire, it is likely that another material is providing the fuel. Select extinguishing materials appropriate to the buming material.

Extinguishing Techniques: Techniques selected should be appropriate for the burning material. Acrylamide is highly soluble and will dissolve in alcohol foams and water streams. Runoff will likely be contaminated.

SPILL RESPONSES

General Information: Restrict access to the area and avoid direct contact with spilled product. Prevent liquids and solids from entering sewers and waterways. If waterways are threatened, notify proper authorities, water and sewage treatment plant operators, and other down stream users of the potential for contaminated water. Protect spills, if possible, from contact with firefighting streams or other water sources to prevent solids from dissolving and becoming more mobile.

AIR SPILL

TECHNIQUE

COVER SPILLED SOLIDS . . . Air dispersion is not a significant problem with spills of solutions. Dusts from spilled solids may become airborne given sufficient wind velocity. Plastic tarps or other suitable covers can be used to protect the spill from wind erosion.

CONSEQUENCE

Tarps or other covering materials will become contaminated and require cleaning or disposal.

MITIGATION

Arrange for cleaning or disposal of contaminated cover materials.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of acrylamide solution on land may be contained by building dikes or barriers using soil, sand, or other materials. Where solids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

ACRYLAMIDE
Division 6.1 (Poisonous Material)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Acrylamide solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as firehose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking product.

CONSEQUENCE

Acrylamide solutions may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as firehose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools or dry solids may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION . . . Spilled liquids can be absorbed and immobilized with inert materials such as sand, earth, saw dust, vermiculite or compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with acrylamide solution and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL . . . Spilled acrylamide solids and contaminated soil may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use, with soap and water. Use equipment which is compatible with spilled product. Store recovered contaminated materials in a safe and secure location.

ACRYLAMIDE
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alterative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels..

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

September 2003

ACRYLIC ACID, STABILIZED

Class 8 (Corrosive Material)

GENERAL INFORMATION

Acrylic acid is a colorless liquid organic acid with a sharp, acrid, rancid odor that may be sweet but unpleasant. It is fully soluble and is shipped with an inhibitor, such as hydroquinone. The majority of acrylic acid manufactured is used to produce acrylic esters, such as methyl acrylate, butyl acrylate, ethyl acrylate and 2-ethylhexyl acrylate, which are later used to manufacture coatings, textiles, adhesives, paints and plastics. Reported flash points in the range of 118-138°F indicate that acrylic acid must be moderately heated or exposed to high ambient temperatures before ignition may occur easily. Nevertheless, accumulations of vapors in confined spaces such as sewers or buildings may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat (see below also) for sufficient time duration. The product weighs approximately 8.8 pounds per gallon.

Acrylic acid does not react with water or many other common materials but is corrosive to carbon steels, copper alloys, lead compounds and other substances. Although it is shipped containing an inhibitor, the product is not considered stable in normal transportation, since it may self-polymerize in a reaction that may violently or explosively rupture its container. Polymerization may occur at elevated temperatures or upon contact with acids, amines, ammonia, iron salts and various other chemicals. Polymerization may also occur if the product is permitted to freeze and then thaw without proper mixing to redistribute the inhibitor. The freezing point of acrylic acid is a relatively high 55.8°F. Toxicity of the product is high due to its corrosivity. Products of combustion may be toxic.

If container of acrylic acid is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in alcohol, chloroform and ether. Slightly soluble in acetone and benzene.

Specific Gravity (Liquid): 1.051 at 68°F (20°C)

Vapor Density: 2.5

Boiling Point: 285.8 - 287.6°F (141 - 142°C) at 1 atm

Melting Point: 53.6 - 57.2°F (12 - 14°C)

Freezing Point: 55.8°F (13.2°C)

Molecular Weight: 72.06

Heat of Combustion: - 4552 cal/g

Vapor Pressure: 3.1 mm Hg (0.06 psia) at 68°F (20°C) (Note: One manufacturer gives 8.7 mm Hg (0.168 psia))

Flash Point: 122°F (50°C), closed cup; 118 - 138°F (47.8 - 58.9°C), open cup

Autoignition Temperature: 774 - 820°F (412 - 438°C)

Burning Rate: 1.6 mm/minute

Flammable Limits: 2.4% (LFL) - 8% (UFL)

Stability: Normally unstable but will not detonate in normal transportation.

Polymerization Potential: Polymerization may occur if contaminated, heated, in low oxygen atmosphere or not inhibited. Light may promote polymerization once started.

pH: 2.6 (according to one source)

Corrosiveness: Corrosive to carbon steels, copper alloys, iron and lead compounds.

Reactivity with Water: No reaction

Reactivity and Incompatibility: May react with amines, alkalis, ammonia, acids, iron salts, azo and diazo compounds, hydrazines, caustics, cyanides, certain metals, nitrides, peroxides, phenols, explosives, cresols, inorganic sulfides and a wide variety of other substances.

IDENTIFICATION

Shipping Name(s): Acrylic acid, stabilized (USDOT & IMO)

Synonyms and Tradenames: Propenoic acid; Propene acid; Acroleic acid; Ethylene carboxylic acid; 2-Propenoic acid; Vinyl formic acid; Glacial acrylic acid; GAA.

CAS Registry No.: 79-10-7

Chemical Formula: $CH_2CHCOOH$

Constituent Components (% each): 94% to 99.5% pure with small amount of water and inhibitor like monomethylether of hydroquinone

UN/NA Designation: UN2218

IMO Designation: 8, Corrosive substances

RTECS Number: AS4375000

NFPA 704 Hazard Rating: 3 (Health): 2 (Flammability): 2 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid, but will solidify at 56°F

Color of the Shipped Material: Colorless

Odor Characteristics: sharp; acrid; rancid; sweet but unpleasant

Reportable Quantity: See appendix I

Common Uses: Mfg. of plastics, paints, leather and paper coatings, rubber, photographic chemicals; soil conditioner or binder; fiber sizing.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ACRYLIC ACID, STABILIZED

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1.04 (reported by one source)

Unusual Hazards: Product is normally unstable and may self-polymerize in a violent reaction under appropriate conditions. There is a special hazard upon freezing and thawing. (See General Information section for details.)

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 2 ppm (6 mg/m^3) (ACGIH)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Exposure to temperatures less than 59°F or greater than 77°F; contact with excessive heat, ignition sources, or incompatible materials; runoff to water or sewers; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Acrylic acid is corrosive and toxic to tissue via all routes of exposure.

Hazards of Skin or Eye Contact: Contact with liquid acrylic acid may cause moderate to severe burns of the skin or eyes within moments. The skin may be sensitized and a rash may occur. Absorption through the skin may cause systematic illness with nausea and vomiting as symptoms.

Hazards of Inhalation: Vapors of acrylic acid are very irritating to the eyes, skin and mucous membranes of the respiratory tract.

Hazards of Ingestion: Ingestion of acrylic acid may cause severe intestinal burns and damage to the gastrointestinal tract.

FIRE HAZARDS

Lower Flammable Limit: 2.4%

Upper Flammable Limit: 8%

Behavior in Fire: Combustible liquid. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well defined; may include toxic fumes carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

Lower Explosive Limit: 2.4% (technical); 2% (glacial)

Upper Explosive Limit: 8.0% (glacial)

Explosive Potential: Explosion may result if vapors of warm liquid are ignited in a confined area. Loss of inhibitor or excessive heat may cause violent container rupture due to spontaneous violent polymerization. Polymerization may also occur in presence of amines, acids, ammonia, iron salts and various other chemicals, or if the product is improperly thawed after freezing.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

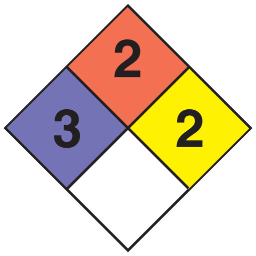
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Compatible materials include chlorinated polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

2218

ACRYLIC ACID, STABILIZED

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation of eyes, skin or mucous membranes.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, alcohol-resistant foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Remove all sources of heat, sparks, or open flames. Choose equipment that is not corroded or otherwise damaged by the spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Avoid contact with spilled product. Keep unprotected personnel upwind of spill area. Take into account that acrylic acid may polymerize under the conditions described in the General Information section.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Acrylic acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of acrylic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

ACRYLIC ACID, STABILIZED
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acrylic acid vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain acrylic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of acrylic acid vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid acrylic acid may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid acrylic acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Acrylic acid may be contained by building dikes using soil, dry sand or other materials.

CONSEQUENCE

Contained acrylic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

ACRYLIC ACID, STABILIZED
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

ACRYLIC ACID, STABILIZED
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

September 2003

ACRYLONITRILE, STABILIZED

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Acrylonitrile is a colorless liquid with a pungent odor resembling onion, garlic or peach pit kernels. It is used to make plastics, fibers, surfactants, rubber, adhesives and other chemicals and products and also has uses as a pesticide. It is moderately soluble in water and lighter, so may be expected to form a floating surface slick that dissolves fairly rapidly. Its flash point of 30°F indicates that it is easily ignited under many ambient temperature conditions. The product is moderately volatile and may at times (when warm) evolve vapors that are somewhat heavier than air. These may travel to a source of ignition and flash back. Accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 6.7 pounds per gallon.

Acrylonitrile does not react with water and is stable in normal transportation when inhibited against self-polymerization. Nevertheless, potentially violent polymerization may occur in containers upon exposure to excessive heat, alkaline materials or acids. The product attacks copper, copper alloys and aluminum and is capable of penetrating leather shoes or gloves. It is a highly toxic material that resembles hydrogen cyanide in toxic effects. Products of combustion may include toxic hydrogen cyanide gas and oxides of nitrogen.

Initial downwind evacuation should be considered if acrylonitrile is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Moderately soluble, 8 g/100 g water at 70°F (21.1°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene and ether.

Specific Gravity (Liquid): 0.8074 at 68°F (20°C)

Vapor Density: 1.8

Boiling Point: 171.3 – 172.2°F (77.4 – 77.9°C) at 1 atm

Melting Point: – 118.3°F (– 83.5°C)

Freezing Point: – 118.3°F (– 83.5°C)

Molecular Weight: 53.06

Heat of Combustion: – 7930 cal/g

Evaporation Rate (butyl acetate=1): One source reports 10

Vapor Pressure: 83 mm Hg (1.60 psia) at 68°F (20°C); 100 mm Hg (1.93 psia) at 73°F (22.8°C)

Flash Point: 30°F (– 1.1°C), closed cup; 31 – 32°F (–.6 to 0°C), open cup

Autoignition Temperature: 898°F (481.1°C)

Burning Rate: Unavailable

Flammable Limits: 3.0% (LFL) - 17% (UFL)

Stability: Stable when inhibited in normal transportation.

Polymerization Potential: May polymerize spontaneously without inhibitor or when heated or in presence of strong alkali.

Corrosiveness: Corrosive to copper, copper alloys, brass and aluminum.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with strong acids, sodium hydroxide, potassium hydroxide, ammonia, other strong bases and amines.

IDENTIFICATION

Shipping Name(s): Acrylonitrile, stabilized (USDOT & IMO)

Synonyms and Tradenames: 2-propenenitrile; Cyanoethylene; Vinyl cyanide; Propene nitrile; Acritet; Acrylon; Acrylonitrile monomer; Carbacryl; Fumigrain; Millers Fumigrain; Ventox; ACN; AN; VCN.

CAS Registry No.: 107-13-1

Chemical Formula: CH_2CHCN

Constituent Components (% each): 98–100% pure with trace of inhibitor like methylhydroquinone.

UN/NA Designation: UN1093

IMO Designation: 3, Flammable liquids

RTECS Number: AT5250000

NFPA 704 Hazard Rating: 4 (Health): 3 (Flammability): 2 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless or light yellow.

Odor Characteristics: Mild, pungent, like onion, garlic or peach pit kernels.

Reportable Quantity: See appendix I

Common Uses: Pesticide; mfg. of plastics, fibers, rubber, adhesives, pharmaceuticals, dyes, surfactants and other products and chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ACRYLONITRILE, STABILIZED

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.0031–50.4 ppm; reported values vary

Unusual Hazards: May polymerize violently if heated or contaminated. Recognized as having carcinogenic potential for humans. May emit highly toxic hydrogen cyanide gas when heated or burned. Vapors are uninhibited and may form polymers in vents or flame arrestors, resulting in blockage.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): (Skin) 2 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Ceiling (C) Limit: 10 ppm

IDLH: 85 ppm

Conditions to Avoid: Heat, fire and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of vapors in air. Ingestion and physical contact are also to be strictly avoided. Product is suspected of being carcinogenic in long-term exposures based on animal studies.

Hazards of Skin or Eye Contact: Prolonged skin contact with liquid acrylonitrile, as may occur by contact with contaminated leather or clothing, may result in formation of large blisters after several hours. Although there is little or no pain, affected skin resembles second degree burn. Effects are minor if the liquid is allowed to evaporate from exposed skin. Contact with the eyes may cause severe irritation. (Note: Acrylonitrile may also be absorbed through the skin in toxic amounts with symptoms similar to those of inhalation.)

Hazards of Inhalation: Vapors of acrylonitrile may cause eye irritation, headache, sneezing, nausea, weakness, flushed face, shallow breathing, salivation, sensitivity to light and vomiting. High concentrations may cause profound weakness, asphyxia, collapse and possibly death. Effects resemble serious hydrogen cyanide poisoning and may be delayed for several hours. Concentrations of 500 – 600 ppm are lethal to various animals within 4 hours in laboratory experiments.

Hazards of Ingestion: Ingestion may cause nausea, vomiting, abdominal pain and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 3.0%

Upper Flammable Limit: 17%

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas, and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable and toxic vapors upon release.

Hazardous Combustion Products: May include hydrogen cyanide, nitrogen oxides and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Loss of inhibitor or excessive heat or light may cause spontaneous violent polymerization resulting in violent container rupture. Violent polymerization may also occur in the presence of alkaline materials or acids.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

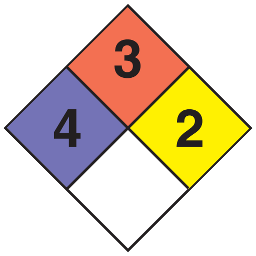
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber which is reported to have a greater than 8 hour breakthrough time. Tychem® QC, Tychem® SL, Tychem® 7500, Tychem® 9400, Tychem® BR, Tychem® 10,000 and Tychem® TK are reported to have greater than 8 hour normalized breakthrough times. Do not use leather items.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister (100 ppm or less) or an organic vapor cartridge respirator with a full facepiece (100 ppm or less) within the use limitations of these devices.

1093

ACRYLONITRILE, STABILIZED

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Eye irritation and other symptoms of inhalation, ingestion or physical contact. Keep victim under medical surveillance for delayed effects of cyanide poisoning (48–72 hours).

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious or breathing difficult, administer artificial respiration. For cyanide poisoning, administer amyl nitrite by crushing pearl in a cloth and lightly holding under nose for 15 seconds. Repeat 5 times at 15 second intervals. Use a fresh pearl every 5 minutes as necessary for 3–4 pearls. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Administer amyl nitrite as described above if victim is unconscious.)

Note to Physician: Use Amyl nitrate capsules if symptoms develop. Medical personnel trained in cyanide poisoning should be available.

FIRE RESPONSE

Extinguishing Agents: Alcohol foam, dry chemical, carbon dioxide, water fog. Water may be ineffective but large quantities may be used to dilute spills to nonflammable mixtures. Note that 2% solution still has a flash point of 70°F.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Acrylonitrile may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Acrylonitrile is a highly flammable liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that acrylonitrile is a moderately volatile, highly flammable, and highly toxic substance with limited solubility in water. Acrylonitrile may float on top of water. Violent polymerization may occur under conditions described in the General Information section.

ACRYLONITRILE, STABILIZED

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of acrylonitrile from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Alcohol resistant foam applied to the surface of liquid pools may slow the release of acrylonitrile vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Acrylonitrile may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained acrylonitrile may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ACRYLONITRILE, STABILIZED

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

ACRYLONITRILE, STABILIZED
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels. (Note: Oil spill containment and cleanup techniques may be useful in the early stages of the response before acrylonitrile dissolves in water.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ADIPIC ACID

Class 9 (Miscellaneous Hazardous Material)

GENERAL INFORMATION

Adipic acid is a white, odorless, crystalline solid used to make plastics, foams, food additives, and other products. Its flash point is generally given to be in the high range of 376-385°F, but its dust may form explosive mixtures in air. The product is slightly soluble and heavier than water and will therefore sink and slowly dissolve to form an acidic solution. The density of adipic acid is slightly less than 85 pounds per cubic foot.

Adipic acid does not react with water, may be mildly corrosive to certain materials, and is incompatible with a variety of other chemicals. It is relatively stable in normal transportation and of generally low toxicity, although it is an irritant via direct contact or inhalation. Products of combustion are irritating and may include cyclopentane and carbon monoxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 1.9 g/l00g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether (slight), and acetone.

Specific Gravity (Liquid): 1.07 at 338°F (170°C); solid is 1.36 at 77°F (25°C)

Boiling Point: Decomposes at about 626°F (330°C) at 1 atm.

Melting Point: 303.8-307.4°F (151-153°C)

Freezing Point: 304°F (151°C)

Molecular Weight: 146.14

Heat of Combustion: –4579 cal/g

Vapor Pressure: 0.073 mm Hg (0.001 psia) at 65°F (18.5°C)

Flash Point: 376-385°F (191.1-196.1°C)

Autoignition Temperature: 788°F (420°C)

Burning Rate: Not pertinent.

Stability: Relatively stable.

Corrosiveness: May be mildly corrosive to industrial equipment.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with cyanides, dithiocarbamates, inorganic fluorides or sulfides, strong oxidizing agents, certain metals, nitrides, strong reducing agents, explosives, alcohols and glycols, aldehydes, epoxides, polymerizable compounds, amines, azo and diazo compounds, hydrazines, caustics, nitriles, and isocyanates.

IDENTIFICATION

Shipping Names: Environmentally Hazardous Substances, Solid, N.O.S. (USDOT) Adipic acid (Canada)

Synonyms and Tradenames: Hexanedioc acid; adipinic acid; 1,4-butanedicarboxylic acid; acifloctin; acinetten; adilactetten; 1,6-hexanedioc acid; molten adipic acid

Chemical Formula: $HOOC(CH_2)_4COOH$

Constituent Components(% each): 99.5-99.8% pure; rest mainly water

UN/NA Designation: UN3077 (USDOT)

IMO Designation: Not listed.

Physical State as Shipped: Monoclinic crystals (needles) or powder

Physical State as Released: Solid

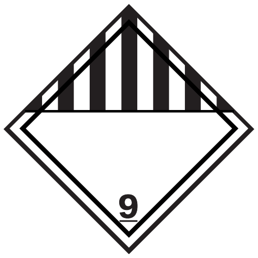
Color of the Shipped Material: White

Odor Characteristics: Essentially odorless

Common Uses: Mfg. of nylon, plastics, urethane foam, synthetic resins, adhesives and elastomers; food additive (acidulant).

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ADIPIC ACID
Class 9
(Miscellaneous Hazardous Material)



POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Dust of adipic acid can form explosive mixtures at concentrations at or above 10-15 mg per liter in air.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Dust concentrations in air within explosive limits; exposure to excessive heat or fire; runoff to water or sewers; contact with incompatible materials; excessive inhalation of dusts; direct physical contact with eyes or skin.

HEALTH HAZARDS

Public Health Hazards: General hazard is low unless there are excessive concentrations of dust in air or direct physical contact is permitted.

Hazards of Skin or Eye Contact: Contact with adipic acid may cause some degree of irritation of the eyes or skin. Skin effects due to working with this chemical commonly occur in areas of wrists, neck, and ankles.

Hazards of Inhalation: Breathing adipic acid dust may cause irritation or burns to the membranes of the nose and throat.

Hazards of Ingestion: Adipic acid is considered to be of low toxicity by ingestion in single doses. It is used as a food additive.

FIRE HAZARDS

Lower Flammable Limit: 10-15 mg dust per liter of air

Upper Flammable Limit: Unavailable

Behavior in Fire: Will burn but difficult to ignite. Very high temperatures will melt and possibly decompose adipic acid. Products of decomposition include volatile acidic vapors of valeric acid and other substances.

Hazardous Combustion Products: Irritating; may include cyclopentane, carbon monoxide, and other products.

EXPLOSION HAZARDS

Lower Explosive Limit: 10-15 mg dust per liter of air

Upper Explosive Limit: Unavailable

Explosiveness: Dust may form explosive mixtures with air at certain concentrations. Contact with alcohols and glycols, aldehydes, epoxides and polymerizable compounds may result in possibly violent polymerization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, aprons, dust-tight safety goggles, and other impervious and resistant clothing for handling finely divided solids. Compatible materials may include neoprene, nitrile rubber, polyvinyl chloride, natural rubber, and several other substances.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For normal exposure in dusty conditions, a particulate respirator with either a full or half facepiece.

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, and mucous membranes of the nose and throat.

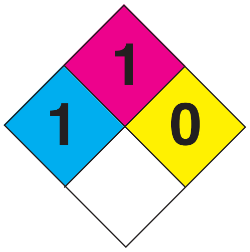
First Aid for Inhalation: Remove victim to fresh air. Get medical attention.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation develops.

First Aid for Ingestion: Information unavailable. Product is of low oral toxicity but seeking of immediate medical attention is prudent.

3077

ADIPIC ACID
Class 9
(Miscellaneous Hazardous Material)



FIRE RESPONSE

Extinguishing Materials: Water fog, carbon dioxide, dry chemical, alcohol foam.

Extinguishing Techniques: Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Do not extinguish burning cargo unless flow can be stopped safely. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Keep unprotected personnel upwind of spill area. Protect sewers and waterways from contamination. Avoid contact with spilled product. Take into account while planning the response that the dust of adipic acid may form explosive mixtures with air.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Adipic acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of adipic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid adipic acid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Solid adipic acid or its solutions in water may be contained by building dikes using earth, sand or similar materials.

CONSEQUENCE

Solutions in water may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Protect solid product from becoming wet. Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments.Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain solid adipic acid or its solution in water.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

ADIPIC ACID

Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of liquid solutions may be controlled by absorbing liquid with sand, earth, clay, fly ash, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed material may result in future spread of contamination. Agitation of dry solid product may cause flammable or explosive dust concentrations in air.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water and slowly dissolve. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spreading of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

ADIPIC ACID
Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where spilled product has accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

ADIPONITRILE*

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Adiponitrile is a high boiling, odorless and colorless poisonous liquid derived from the chlorination of butadiene to dichlorobutylene, which is reacted with 35% sodium cyanide solution to yield 1,4-Dicyanobutylene, which is hydrogenated to adiponitrile. Adiponitrile may also be produced from the electroorganic synthesis from acrylonitrile. Adiponitrile is generally used as a chemical intermediate in the manufacturing process for hexamethylenediamine to make nylon, corrosion inhibitors, and rubber accelerators. It is also used to produce adipoguanamine resins.

The typical concentration of adiponitrile is 99.9%. Adiponitrile is a skin, eye, nose and throat irritant. The most common route of exposure is through skin contact. It is highly toxic by skin absorption, inhalation and ingestion. Poisoning by adiponitrile resembles poisoning by hydrocyanic acid. Although the metabolic fate of this compound is not completely known, some nitriles are partially metabolized to hydrogen cyanide. Personnel exposed may need to be treated for cyanide poisoning.

The fire potential for adiponitrile is moderate, however, when heated the material may release ignitable vapors and form explosive mixtures with air. Polymerization will not occur. The products of combustion may be more hazardous than the material itself. When heated to decomposition, the burning material may generate extremely hazardous gases such as hydrogen cyanide and carbon monoxide. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for working in atmospheres where adiponitrile is present. Runoff may be toxic. Adiponitrile is water soluble. Adiponitrile is normally stable, however it is incompatible with strong oxidizers such as acids, acid salts, chlorates and nitrates.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble
Solubility in Other Chemicals: alcohol, chloroform, chloroalkanes and aromatics.
Specific Gravity (Liquid): 0.97 @ 20°C (68°F)
Vapor Density (Air=1): 3.73
Boiling Point: 295°C (563°F)
Melting Point: 1°C (34°F)
Freezing Point: 2.3°C (36°F)
Molecular Weight: 108.16
Heat of Combustion: -14,230 BTU/LB = -7910 CAL/G
Vapor Pressure: 0.01 mm Hg at 40°C (104°F)
Flash Point: 163°C (325°F)
Autoignition Temperature: 550°C (1022°F)
Flammable Limits: 1.0% (LEL) - 5.0% (UEL)
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with strong oxidizers such as acids, acid salts, chlorates, and nitrates.
Other Characteristics: Vapor forms explosive mixtures with air. When heated to decomposition, material releases vapors containing hydrocyanic acid.

IDENTIFICATION

Shipping Name(s): Adiponitrile (USDOT & IMO)
Synonyms and Tradenames: Hexanedinitrile, Adipic Nitrile, Adipic Acid Dinitrile, Adipic Acid Nitrile, 1,4-Dicyanobutane, ADN, Hexanedioic Acid Dinitrile Tetramethylene Cyanide, Tetramethylene Dicyanide. CAS Registry No: 111-69-3
Chemical Formula: $NC(CH_2)_4CN$
Molecular Formula: $C_6H_8N_2$
Constituent Components (% each): adiponitrile (99.9), water (0.05) and other organics (0.2).
UN/NA Designation: UN2205
IMO Designation: 6.1
RTECS Number: NIOSH/AV2625000
OHMTADS Number: 7216576
NFPA 704 Hazard Rating: 4 (Health): 2 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless/clear
Odor Characteristics: Odorless
Common Uses: Chemical intermediate used in the manufacture of hexamethylenediamine to make nylon, corrosion inhibitors, rubber accelerators and resins.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ADIPONITRILE
Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: <1 ppm

Unusual Hazards: Products of combustion may be more hazardous than the material itself. Material is immediately irritating to the eyes when released into the atmosphere. Personnel should not wear contact lenses when working in contaminated areas.

Time Weighted Average (TLV-TWA): 2 ppm

Short Term Exposure Limit (STEL): Unavailable.

IDLH: Unavailable.

Conditions to Avoid: Heat, sparks, flame, incompatible materials, such as strong oxidizers, runoff to sewers and waterways, skin contact, inhalation and ingestion. Material may not be stored near food stuffs.

HEALTH HAZARDS

Potential Health Effects: Adiponitrile is a skin, eye, nose and throat irritant. May be fatal if absorbed through the skin or inhaled in toxic amounts. Liquid and vapor can penetrate skin and mucous membranes. May cause severe allergic respiratory reaction. Gross overexposure may be fatal. Individuals with preexisting diseases of the cardiovascular system or bone marrow may have increased susceptibility to the toxicity of excessive exposures. Although the metabolic fate of this compound is not completely known, some nitriles are partially metabolized to cyanide. Symptoms may be delayed. If over exposed, treatment for cyanide intoxication may be indicated.

Hazards of Skin and Eye Contact: Skin contact may cause skin irritation with discomfort or rash. Evidence suggests that skin permeation can occur in amounts capable of producing systemic toxicity. Prolonged exposures may lead to skin burns or ulceration. Eye contact may cause irritation, tearing, or blurred vision. Prolonged exposure can cause skin burns or ulceration, and eye corrosion with corneal and conjunctival ulceration.

Inhalation Hazards: Inhalation may cause central nervous system (CNS) effects such as nausea, headache, dizziness or general weakness. Irritation of the upper respiratory tract and temporary alteration of the heart’s electrical activity with irregular pulse, palpitations, or inadequate circulation may also occur.

Ingestion Hazards: Ingestion may cause irritation and potential ulceration of the respiratory tract, followed by headache, nausea, vomiting and cyanosis.

FIRE HAZARDS

Lower Flammable Limit: 1.0%

Upper Flammable Limit: 5.0%

Behavior in Fire: Although it will not readily ignite, adiponitrile will burn if exposed to sources of heat and flame.

Hazardous Decomposition Products: When heated to decomposition, adiponitrile releases vapors containing hydrocyanic acid. Hazardous gases and vapors produced in fire situations also include unsaturated nitriles and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Vapors may form explosive mixtures with air. Containers may explode violently in the heat of fire.

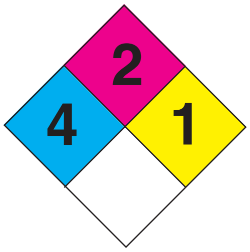
PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Fully encapsulating, vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are teflon and butyl rubber. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits.

FIRST AID

Nonspecific Symptoms: Direct skin contact can produce irritation, inflammation, burns, and ulceration of tissue. Central nervous system (CNS) effects may include nausea, headache, dizziness or general weakness. The material is known to be a mucous membrane irritant. Other symptoms may include vertigo, cyanosis of the mucosa, tachypnea, hypotension, mydriasis, and clonic



convulsions of the extremities.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCTATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Remove contact lenses if in place. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. DO NOT GIVE SYRUP OF IPECAC. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Special Medical Treatment Information for Physicians: Due to the possibility that some nitrile compounds metabolize to cyanide, treatment for cyanide intoxication may be required in some situations. Rapid support of respiration and circulation is essential to the successful treatment of cyanide intoxication. Immediate attention should be directed towards assisted ventilation, administration of 100% oxygen, insertion of intravenous (IV) lines, and institution of cardiac monitoring. Obtain an arterial blood gas immediately and correct any severe metabolic acidosis (pH below 7.15). If the patient is conscious but symptoms (i.e., nausea, difficulty breathing, dizziness, etc.) are evident, administer oxygen. If consciousness is impaired (i.e., non-responsiveness, slurred speech, confusion, drowsiness, etc.), or the patient is unconscious but breathing, give oxygen and amyl nitrite by means of a respirator. Administer oxygen continuously. Guard against the ampoule entering the patient's mouth. If the patient is not breathing, give oxygen and amyl nitrite immediately by means of a positive pressure respirator. Treat what you see is a good rule of thumb. Mildly symptomatic patients may be managed by supportive care only.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray, AFFF multi-purpose foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water spray to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be poisonous and/or toxic.

SPILL RESPONSES

General Information: Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and down wind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways and storm drains. Underflow dams are not an effective means to dike material since it mixes with water. As a result, recovery efforts from water borne releases are difficult. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...If released into the atmosphere, adiponitrile is expected to exist almost entirely in the vapor phase. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

FOAM...Aqueous Film Forming Foam (AFFF) or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, storm drains and waterways. Contain foam runoff and treat as hazardous waste.

ADIPONITRILE

Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material readily mixes with water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms are not an effective means to recover spilled material since the material is water soluble. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material is water soluble and the material does not float on the surface of the water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

ADIPONITRILE

Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering storm and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

September 2003

ALCOHOL ETHOXYLATES

Class 9 (Miscellaneous hazardous material)

GENERAL INFORMATION

Alcohol ethoxylates (AEs) are nonionic surfactants composed of an alkyl chain (typically 12 to 15 carbons) combined with some ethylene oxide (EO) units. Alcohol ethoxylate solutions contain a mixture of varying length carbon chain alcohol ethoxylate molecules (the number of carbon atoms contained in the longest direct line). The solution is named for the predominant AE carbon chain length and will be reported as a range, such as alcohol C12-C15 poly (1-3) ethoxylate. Because this guide covers a variety of alcohol ethoxylates, many of the physical properties are reported as ranges.

Alcohol ethoxylates are clear to milky white (possibly yellow) liquids that are often reported to be viscous or semi-solid at room temperature and have a slight, ether-like odor. AEs are soluble in water, however, solubility decreases with increasing carbon chain length while increasing with higher EO percent. The greatest use of AEs are in the formation of consumer and industrial detergents, wetting or foaming agents, dispersants and penetrants and personal care products. Product is a marine pollutant, the toxicity of which is dependent on the alkyl chain length and the number of EOs. AE's will not readily ignite but may burn if preheated. Ethylene oxide vapors may evolve and collect in enclosed containers and may be flammable. Contact with strong oxidizing agents and acids should be avoided. The product weighs approximately 7.7 to 8.5 pounds per gallon.

Alcohol ethoxylates are not expected to evolve large amounts of vapor as they have a low vapor pressure and a high boiling point. Main routes of exposure are expected to be skin or eye contact, however, consideration should be given to the fact that the product may contain flammable and toxic ethylene oxide. Vapors are heavier than air. If container of alcohol ethoxylates is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): .925 to 1.02 at 77°F (25°C)
Vapor Density: Varies, heavier than air. Generally reported in the range of 11 to 19.
Boiling Point: No definitive values reported. Reported values have been >212°F (100°C) and >500°F (260°C).
Melting Point: See freezing point
Freezing Point: 25-75°F (-4 to 24°C)
Molecular Weight: Varies
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): Unavailable
Vapor Pressure: < 0.1 mm Hg at 100°F (38°C)
Flash Point: Approximately 320°F (160°C)
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Flammable Limits: Unavailable
Stability: Stable under normal conditions
Polymerization Potential: Will not occur
pH: 5 - 7
Corrosiveness: May react with aluminum (metal) at temperatures above 122°F (50°C) resulting in metal corrosion.
Reactivity with Water: None
Reactivity and Incompatibility: Avoid strong oxidizing agents; in presence of strong acids may undergo acid catalyzed dehydration of the alcohol to produce alkenes and cleavage of the ether bonds.

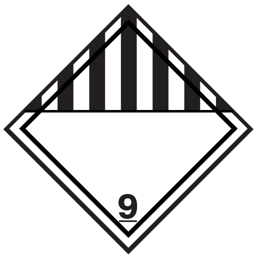
IDENTIFICATION

Shipping Name(s): The technical name (or chemical name) that appears in parenthesis immediately following the shipping description (Environmentally hazardous substances, liquid, n.o.s.) for any of the alcohol ethoxylates will be within the numerical range of alcohol C-12-C-17 poly (1-6) ethoxylate. Example: Environmentally hazardous substances, liquid, n.o.s. (Alcohol (C12-C15) poly (1-3) ethoxylate) (USDOT & IMO)
Synonyms and Tradenames: Ethoxylated alcohols; NEODOL®; BIO-SOFT®
CAS Registry No.: Products fall under a variety of CAS numbers. Some include 63393-82-8; 66455-14-9; 68131-39-5 or 68551-12-2
Chemical Formula: Varies, $CH_3(CH_2)_a(CH_2CH_2O)_bOH$
Constituent Components (% each): Generally 90% or greater pure
UN/NA Designation: UN3082
IMO Designation: 9, Miscellaneous dangerous substances and articles
RTECS Number: TH3675000
NFPA 704 Hazard Rating: 2 (Health): 1 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid, possibly viscous
Physical Form as Released: Liquid, possibly viscous
Color of the Shipped Material: Clear to slightly hazy, may be yellow
Odor Characteristics: Slight, ether like
Common Uses: Basic surface active agent for detergents. Formulation of products where wetting and biodegradability are essential, i.e., specialty formulations for textile processing, hard surface abrasives and metal descaling.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ALCOHOL ETHOXYLATES

Class 9 (Miscellaneous hazardous material)



POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Product is a marine pollutant. Alcohol ethoxylates may contain residual amounts of ethylene oxide, a flammable and toxic gas, which can accumulate in the container headspace and be released. The process is enhanced by agitation of the product, such as loading and unloading.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable for alcohol ethoxylates. However, alcohol ethoxylates may contain residual amounts of ethylene oxide. OSHA regulates occupational exposure to ethylene oxide from all sources, including products containing residual EO. The current OSHA PEL is 1 ppm for ethylene oxide.

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: May cause irritation to the eyes, skin and respiratory system.

Hazards of Skin or Eye Contact: Severely irritating to the eyes causing pain, redness, swelling and blurred vision.

Hazards of Inhalation: May cause irritation of the nose and throat, headache and drowsiness.

Hazards of Ingestion: Ingestion may produce gastrointestinal disturbances including irritation, nausea and diarrhea.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: May burn if preheated but will not readily ignite. When ethoxylates are vigorously mixed in the presence of air or oxygen at temperatures > 325° F, they can cause exothermic oxidative degradation which may result in self-heating and autoignition. Ethylene oxide, an extremely flammable and toxic gas may evolve and collect in enclosed containers.

Hazardous Combustion Products: Toxic levels of carbon monoxide, carbon dioxide, irritating aldehydes and ketones may be formed.

EXPLOSION HAZARDS

Explosive Potential: Product is not expected to present an explosion hazard.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

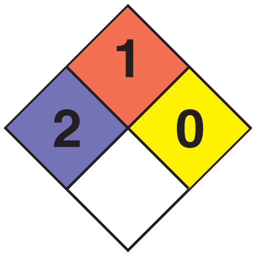
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use of limitations of these devices. If occupational exposure may exceed 1 pmm ethylene oxide, a respirator is required.

3082

ALCOHOL ETHOXYLATES

Class 9 (Miscellaneous hazardous material)



FIRST AID

Nonspecific Symptoms: Irritation of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately if breathing is difficult or has stopped or if irritation persists. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician if skin irritation develops or persists. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Ethoxylates are combustible liquids. Appropriate extinguishing agents may include dry chemical, carbon dioxide, water spray or alcohol resistant foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool.

SPILL RESPONSES

General Information: Alcohol ethoxylates are marine pollutants that may cause environmental contamination. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment where necessary. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. NOTE: Alcohol ethoxylates may contain residual amounts of ethylene oxide, a flammable and toxic material, spills should be monitored for the presence of ethylene oxide.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists. NOTE: Residual amounts of ethylene oxide may be present in alcohol ethoxylate solutions, and as such, continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

ALCOHOL ETHOXYLATES

Class 9 (Miscellaneous hazardous material)

TECHNIQUE

WATER FOG OR SPRAY . . . Vapor generation from alcohol ethoxylate spills may not be sufficient to warrant fog or spray applications. If vapors or fumes present a threat, water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of toxic vapors from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Vapor generation from alcohol ethoxylate spills may not be sufficient to warrant foam applications. Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Alcohol ethoxylates may be confined by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Confined liquid may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

ALCOHOL ETHOXYLATES
Class 9 (Miscellaneous hazardous material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination. NOTE: Alcohol ethoxylates are marine pollutants.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ALCOHOL ETHOXYLATES

Class 9 (Miscellaneous hazardous material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1994

ALLYL ALCOHOL*
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Allyl alcohol is a colorless liquid with a sharp, pungent, mustard-like odor that is highly irritating. Its vapors can bring tears to the eyes even at fairly low concentrations in the air. Allyl alcohol can be easily ignited under warm ambient temperature conditions. Under these conditions, vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings and sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration.

Allyl alcohol is completely soluble in water. It does not react with water or other common materials but it is incompatible with oxidizing materials. As with most organic materials, contact with oxidizing agents may cause ignition. Allyl alcohol is stable in normal transportation and is not subject to violent polymerization.

Allyl alcohol is toxic by all routes of exposure and is rapidly absorbed through the skin in harmful amounts. It is considered highly toxic by ingestion and will produce systemic effects. As with most alcohols, target organs include liver, kidneys, and nervous system. Toxic fumes are evolved upon heating of the product.

If allyl alcohol is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris should the container rupture violently.

Allyl alcohol is used to make a variety of products including flavoring agents, glycerin, pharmaceuticals, herbicides and fungicides. It weighs approximately 7.1 pounds per gallon.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in alcohol, chloroform, ether, and petroleum ether.

Specific Gravity (liquid): 0.85 at 68°F (20°C)

Vapor Density (Air = 1): 2.0

Boiling Point: 204.8 to 208.4°F (96 - 98°C)

Melting Point: - 200°F (- 129°C)

Freezing Point: - 200°F (- 129°C)

Molecular Weight: 58.08

Heat of Combustion: - 7620 cal/g

Vapor Pressure: Approximately 17.2 mm Hg (0.3325 psia) at 68°F (20°C)

Flash Point: 70 to 75°F (21.1 - 23.9°C), CC; 90°F (32.2°C), OC

Autoignition Temperature: 713°F (378°C)

Burning Rate: 2.7 mm/minute.

Stability: Stable at ordinary temperatures and pressures.

Corrosiveness: Non-corrosive to steel but may attack some forms of plastics, rubber, and coatings. Not compatible with certain metals listed below.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: May react with carbon tetrachloride, sodium, potassium, sulfuric acid, chlorosulfonic acid, nitric acid, oleum, sodium hydroxide, diallyl phosphite, phosphorus trichloride, tri-n-bromomelamine, oxidizing agents, magnesium and aluminum and their alloys, metal alkyls, and reactive metal halides such as aluminum chloride and ferric chloride.

IDENTIFICATION

Shipping Names: Allyl alcohol (USDOT and IMO).

Synonyms and Tradenames: 2-propen-l-ol; 1-propenol-3; propen-l-ol-3; allylic alcohol; propenyl alcohol; vinyl carbinol; hydroxypropene; propenol; CAS 107-18-6.

Chemical Formula: CH_2CHCH_20H

Constituent Components (% each): 98% or more pure with small amounts of propanol, water, and propionaldehyde.

UN/NA Designation: UN1098.

IMO Designation: 6.1, poisonous material.

Physical State as Shipped: Liquid.

Physical State as Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Pungent; mustard-like; sharp, causes tears.

Common Uses: Manufacture of allyl compounds, military poison gas, resins, plasticizers, pharmaceuticals, herbicides, fungicides, and other organic chemicals. Also used as a flavoring agent in making glycerin.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

ALLYL ALCOHOL
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.75 - 0.8 ppm (1.875 - 2 mg/m^3)

Unusual Hazards: A toxic, volatile, and flammable liquid. Allyl alcohol is toxic by all routes of exposure. Vapors may travel some distance to a source of ignition and flash back, particularly at warmer temperatures. The product is subject to slow polymerization and may form a thick, viscous liquid upon storage for several years.

Short Term Exposure Limits (STEL): (Skin) 4 ppm (10 mg/m^3). (OSHA)

Time Weighted Average (TLV-TWA): (Skin) 2 ppm (5 mg/m^3) over each 8 hours of a 40 hour work week. (OSHA)

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Allyl alcohol is toxic by all routes of exposure. Vapors are toxic and highly irritating. Increasing ambient temperature will increase the rate of vapor evolution. Ingestion may result in systemic poisoning effects particularly targeting liver function. Allyl alcohol is readily absorbed through intact skin.

Hazards of Skin and Eye Contact: Allyl alcohol exposures to skin tissues may result in a delayed effect which produces deep pain several hours after exposure. This is usually followed by blister formation and localized swelling coupled with muscle spasms. The liquid is rapidly absorbed through intact skin and may result in additional toxic effects involving the kidneys and liver. Eye exposures to allyl alcohol may result in a moderate to severe irritation reaction with transient opacity of the cornea. Recovery is usually prompt except in severe exposures.

Hazards of Inhalation: Vapors of allyl alcohol are highly irritating to the eyes, nose, and throat and may cause delayed eye pain and increased sensitivity to light. High concentrations in air may cause nausea, vomiting, and lung irritation or hemorrhage leading to delayed pulmonary edema. Liver injury and death are possible in severe exposures. Other symptoms may include alcoholic intoxication, decrease in blood sugar, decrease in body temperature, convulsions, coma, slowed breathing, and unconsciousness. Effects may be delayed and progressive.

Hazards of Ingestion: Allyl alcohol is considered highly toxic by ingestion. Target organs of toxic action include liver, heart, spleen, and kidneys. In cases involving high exposures, symptoms of alcohol intoxication may develop, however, symptoms may grow progressively worse resulting in coma and possible death. Other symptoms may include nausea, vomiting, and signs of central nervous system depression.

FIRE HAZARDS

Lower Flammable Limit: 2.5%

Upper Flammable Limit: 18%

Behavior in Fire: Flammable, toxic vapors may travel some distance to a source of ignition and flash back, particularly at warmer temperatures. Containers may rupture violently in fire.

Hazardous Combustion Products: Toxic fumes are evolved upon heating of allyl alcohol.

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire. Mixtures with tri-n-bromomelamine may result in a delayed explosion.

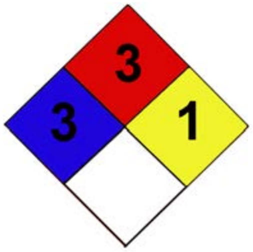
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin and eye contact with liquid allyl alcohol, repeated or prolonged skin contact with allyl alcohol vapor and any reasonable probability of eye contact with the liquid. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. A maker of allyl alcohol reports that neoprene may be compatible.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style, front or back mounted organic vapor canister or a chemical cartridge respirator with a full facepiece, within the use limitations of these devices.

1098

ALLYL ALCOHOL
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, skin, or respiratory system; symptoms of alcohol intoxication.

First Aid For Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Watch for signs of deepening depression and increased difficulty in breathing. Symptoms may be delayed with pulmonary edema developing some time after exposure.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with water for at least. 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing. In severe exposures, observe for signs of systemic intoxication as allyl alcohol is readily absorbed through intact skin.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting not be induced if immediate medical attention is available). Observe for signs of progressive intoxication. Symptoms such as loss of consciousness, deepening depression, or coma may develop some time after exposure has occurred. Systemic effects particularly target kidney and liver functions.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective but may be used to dilute spill to non-flammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with allyl alcohol. Wear self contained breathing apparatus and appropriate personal protective clothing. Move intact container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. Avoid taking positions along container ends. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water may be used to dilute allyl alcohol pools to non-flammable concentrations.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment where possible that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take into account when planning the response that allyl alcohol is a toxic and flammable liquid.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Allyl alcohol spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

ALLYL ALCOHOL
Division 6.1 (Poisonous Material)

AIR SPILL *(CONTINUED)*

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to allyl alcohol vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of allyl alcohol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of allyl alcohol vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid allyl alcohol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Allyl alcohol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained allyl alcohol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

ALLYL ALCOHOL
Division 6.1 (Poisonous Material)

LAND SPILL *(CONTINUED)*

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substance.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gasses present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

ALLYL ALCOHOL
Division 6.1 (Poisonous Material)

WATER SPILL *(CONTINUED)*

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

ALLYLAMINE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Allylamine is a colorless to light yellow poisonous liquid with a strong irritating odor resembling ammonia. It is used in making pharmaceuticals and other chemicals and in improving the process by which textiles are dyed. The product is completely soluble in water and will mix freely and rapidly. Its flash point of -20°F indicates that it may be easily ignited under virtually all ambient temperature conditions. Vapors may be heavier than air at first and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.3 pounds per gallon.

Allylamine is stable in transportation, may attack cork and some types of rubber, and is best handled in equipment constructed of stainless or carbon steel. It is incompatible with acids and oxidizing agents that may cause its ignition. Toxicity of the product is high by all routes of exposure, including absorptions through the skin, and direct contact may result in severe irritation or burns of bodily tissues. Products of combustion include toxic oxides of nitrogen, carbon monoxide, and other toxic constituents.

If allylamine is leaking (not on fire), downwind evacuation of the spill area should be considered until properly equipped responders have evaluated the hazard. If a fire becomes uncontrollable or a bulk container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol, ether, and chloroform.
Specific Gravity (Liquid): 0.76 at 68°F (20°C)
Boiling Point: 131 – 136.4°F (55 - 58°C) at 1 atm.
Melting Point: Unavailable
Freezing Point: Unavailable
Molecular Weight: 57.1
Heat of Combustion: Unavailable
Vapor Pressure: 193 mm Hg (3.731 psia) at 68°F (20°C)

Flash Point: -20°F (-28.9°C), closed cup
Autoignition Temperature: 705°F (374°C)
Burning Rate: Unavailable
Stability: Stable
Corrosiveness: Attacks cork and some types of rubber. Zinc, galvanized steel, copper and copper alloys not satisfactory. Use stainless steel or carbon steel.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Incompatible with acids and oxidizing agents.

IDENTIFICATION

Shipping Names: Allylamine (USDOT and IMO)
Synonyms and Tradenames: 2-Propen-1-amine; 3-aminopropene; 3-aminopropylene; 2-propenylamine; 2-propenamine; monoallylamine
Chemical Formula: $CH_2CHCH_2NH_2$
Constituent Components (%each): Marketed in chemically pure and technical grades; expected to be relatively pure with some amount of water.

UN/NA Designation: UN2334
IMO Designation: 6.1, Poisonous substances
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to light yellow
Odor Characteristics: Like ammonia; strong; irritating
Common Uses: Making of pharmaceuticals and other chemicals; improving textile dyeing.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ALLYLAMINE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Recognizable at 2.5 ppm

Unusual Hazards: Volatile, highly flammable, and highly toxic liquid.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and downwind. Direct physical contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid allylamine may result in sever irritation or burns and the substance may be rapidly absorbed through the skin in toxic amounts. Contact with the eyes may cause severe irritation, burns, and possibly permanent eye damage.

Hazards of Inhalation: Vapors allylamine are extremely irritating to the eyes, nose, mouth, respiratory tract, and lungs and are intolerable to humans at a concentration of 14 ppm in air. Excessive or extended exposures may result in irregular respiration, cyanosis, excitement, convulsions, chemical pneumonia, possible liver and kidney injury, possible inflammation of the wall muscle of the heart, and death. Some effects may be delayed in onset. Note that exposure to 286 ppm in air for four hours was sufficient to kill 50% of rats in laboratory experiments.

Hazards of Ingestion: Allylamine is highly toxic if ingested. Although specific details are unavailable, irritation or burns of the mouth, throat, and stomach may be expected, as well as various symptoms of inhalation. It may be possible that aspiration into the lungs during vomiting may cause delayed pulmonary edema and chemical pneumonia with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit (LFL): 2.2%

Upper Flammable Limit (UFL): 22%

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable gas or vapor upon release.

Hazardous Combustion Products: Not well-defined; may include toxic oxides of nitrogen, carbon monoxide, and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

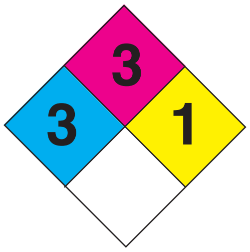
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with allylamine. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene according to one authority and butyl rubber according to another.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing appratus (SCBA) with full facepiece (or the equivalent).

2334

ALLYLAMINE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective but may be used to dilute spill to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the volatile, flammable, and toxic nature of allylamine into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION...Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Allylamine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport, and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY...Water fog or spray applied to allylamine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of allylamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ALLYLAMINE
Division 6.1 (Poisonous Material)

TECHNIQUE

DILUTION…The addition of a relatively large amount of water to liquid allylamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-house runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM...There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of allylamine vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Allylamine may be contained by building dikes using soil, sand, or other materials.

CONSEQUENCE

Contained allylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line connection area with compatible impervious materials.

TECHNIQUE

EXCAVATION...A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION...Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

ALLYLAMINE

Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION...Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION...Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL...Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice when necessary.

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES...Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ALLYLAMINE

Division 6.1 (Poisonous Material)

TECHNIQUE

ADSORPTION...Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION...Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION...Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July 1994

ALLYL BROMIDE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Allyl bromide is a clear, colorless to light yellow liquid with a pungent, irritating odor. It will cause tearing in the eyes and, with a flash point of -1°C, (30.2°F) is flammable under most circumstances. It is easily ignited by flame, sparks, or static discharges. The vapors are denser than air and will travel considerable distances to a source of ignition. Allyl bromide is practically insoluble in water and is heavier than water. As a result, when mixed with water, allyl bromide will tend to sink to the bottom of the mixture. Aside from its flammability, allyl bromide is fairly stable and not prone to hazardous polymerization reactions. On heating, it may decompose, producing toxic hydrogen bromide gas. It is toxic by ingestion, inhalation, and absorption. On direct contact, allyl bromide will produce strong irritation or burns to the skin, eyes or other mucous membranes. If vapors are inhaled, allyl bromide will cause irritation to the respiratory tract.

Allyl bromide is used in the manufacture of a variety of materials including intermediates for perfume manufacture and the manufacture of industrial resins.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble.
Solubility in Other Chemicals: Completely soluble in: alcohol, ether, chloroform, carbon disulfide, carbon tetrachloride.
Specific Gravity (Liquid): 1.39 - 1.43
Vapor Density (Air=1): 4.2
Boiling Point: 71.3°C (160.34°F)
Melting Point: *- 119.4°C (- 182.92°F)*
Freezing Point: - 119.4°C (- 182.92°F)
Molecular Weight: 120.99
Heat of Combustion: - 3700 cal/gm
Vapor Pressure: 133.92 mmHg @ 21.1°C (70°F)
Flash Point: - 1°C (30.2°F)
Autoignition Temperature: 295°C (563°F)
Burning Rate: 3.5 mm/min
Stability: Normally stable, may decompose on heating to produce hydrogen bromide gas.
Corrosiveness: Corrosive to tissues.
Reactivity with Water: May produce some heating in contact with water.
Reactivity with Other Chemicals: Incompatible with strong oxidizers. May react violently.

IDENTIFICATION

Shipping Names: Allyl bromide.
Synonyms and Tradenames: 3-bromopropene; bromoallylene; 3-bromo-l-propene; 3-bromopropylene; bromallyene; CAS 106-95-6.
Chemical Formula: $H_2C{:}CHCH_2BR$
Constituent Components (% each): 90 - 100% allyl bromide.
UN/NA Designation: UN1099
IMO Designation: 3.2, flammable material.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Colorless to light yellow liquid.
Odor Characteristics: Irritating, unpleasant, pungent odor.
Common Uses: Organic synthesis, preparation of resins, preparation of perfume intermediates.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

ALLYL BROMIDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Allyl bromide is a highly flammable liquid. It is a strong irritant to skin and mucous membranes and is toxic by all routes of exposure. When ignited or exposed to heating, the combustion and decomposition products include toxic hydrogen bromide gas. Above the flashpoint, allyl bromide is explosive within the limits of flammability.

Short Term Exposure Limits (STEL): None determined.

Time Weighted Average (TLV-TWA): None determined.

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Allyl bromide is toxic and irritating by all routes of exposure. It is a strong irritant to skin and eyes and may produce severe burns to exposed tissues. The primary health risks are from direct contact with liquids or strong vapor concentrations in the vicinity of the spill.

Hazards of Skin and Eye Contact: Allyl *l* bromide will cause strong irritation or burns to the skin and the eyes. Contact lenses may be damaged by exposure to allyl bromide. This could contribute to additional eye injury. *Allyl* bromide can also be absorbed through intact skin which will contribute to systemic poisoning reactions.

Hazards of Inhalation: Allyl bromide is a strong irritant to the mucous membranes of the respiratory tract. Inhalation exposures can result in severe damage to tissues of the respiratory system. Given sufficient exposure, allyl bromide can be absorbed through the respiratory system to produce systemic poisoning.

Hazards of Ingestion: Allyl bromide is toxic by ingestion. It will produce severe burns to tissues of the mouth, throat, esophagus, and other tissues.

FIRE HAZARDS

Lower Flammable Limit: 4.4%

Upper Flammable Limit: 7.3 %

Behavior in Fire: Extremely flammable. Maybe ignited by static electrical discharges from transfer equipment or sparks from tools. Allyl bromide will produce flammable vapors on release. Heat will intensify vapor generation. Vapors are denser than air and may travel a considerable distance to ignition source and flash back. Contact with strong oxidizers may produce fire. Sealed containers exposed to heating, may rupture.

Hazardous Combustion Products: Products include highly toxic hydrogen bromide gas as well as carbon monoxide and carbon dioxide gasses. Decomposes when heated, releasing hydrogen bromide gas.

EXPLOSION HAZARDS

Explosiveness: May rupture container on heating. Generally stable except at elevated temperatures where it tends to decompose if not ignited. Sparks or static discharges from transfer equipment can ignite allyl bromide.

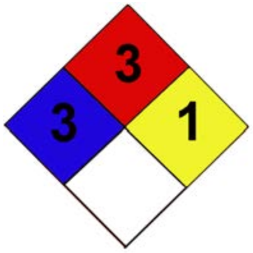
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with allyl bromide liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully encapsulating suits made of compatible material are appropriate for most large spill situations.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

1099

ALLYL BROMIDE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or burns to skin, eyes, or mucous membranes depending on point of contact. Symptoms may include dizziness and headache. Inhalation exposures may result in coughing, wheezing, laryngitis, shortness of breath, nausea and vomiting. Severe inhalation exposures may present respiratory spasms, laryngeal, bronchial and pulmonary edema, and chemical pneumonia. Edema of the respiratory tract may result in spasmodic breathing with loss of consciousness progressing to death by suffocation.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse, following acute exposure, resulting in increased respiratory distress with time. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance immediately.

First Aid for Ingestion: If victim is conscious, give water or milk and induce vomiting. Never give anything by mouth to, or induce vomiting in an unconscious person. Seek medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, compatible mufti-purpose foam, carbon dioxide, or dry chemical extinguishing agents. Water may not be effective except when applied as a blanket.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with allyl bromide. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water may be effective if applied in a manner which entirely covers the surface of a spilled liquid (a blanket). In forming a blanket, water should be applied in a gentle manner which does mix or disperse the allyl bromide pool. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam is appropriate for fires involving allyl bromide.

SPILL RESPONSES

General Information: Allyl bromide is highly flammable and easily ignited. Response strategies should account for the fact that flammable vapors are heavier than air and may travel some distance to a source of ignition. Intact containers containing allyl bromide may rupture violently if exposed to extreme heat or fire. When spilled in water, allyl bromide is only slightly soluble and will tend to settle to the bottom of the water column depending on velocity of water flow. All spill responses should consider that until the product is removed to safe containers, ignition is possible. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of allyl bromide may result in explosion. Use only spark proof tools when working around allyl bromide. Be sure lighting systems are of explosion proof design (intrinsically safe). Be alert to sources of ignition and static electrical discharge. Ground all transfer equipment to prevent static charge buildup.

ALLYL BROMIDE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Allyl bromide spills may expose downwind areas to toxic or flammable concentrations over considerable distances, in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment is available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY**. . .** Water fog applied to allyl bromide vapors or fumes may accelerate their dispersal in the atmosphere. This technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain a small amount (if any) of allyl bromide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of allyl bromide vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with allyl bromide.

TECHNIQUE

WATER APPLICATION . . . Application of water to the surface of liquid allyl bromide pools may reduce the emission of vapors or fumes. Water, if applied carefully (as a blanket), without disturbing the spilled liquid pool, will float on the spill surface slowing the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will add to the spill volume.

MITIGATION

Contain increased volume and remove spill as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of allyl bromide on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

ALLYL BROMIDE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Allyl bromide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination. Collected allyl bromide will still pose a significant fire risk.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material. Take steps to protect pooled liquids from ignition sources.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking product.

CONSEQUENCE

Allyl bromide may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Allyl bromide is highly flammable and explosion proof (intrinsically safe) equipment must be used.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION . . . Spilled liquids can be absorbed and immobilized with inert materials such as sand, earth, saw dust, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with allyl bromide and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by-removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with allyl bromide may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines. Explosion proof (intrinsically safe) equipment must be used due to the high flammability of allyl bromide.

ALLYL BROMIDE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Removed materials may pose a continued risk of fire or contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

CONTAINMENT . . . Spilled allyl bromide is denser than water and will tend to sink to the bottom, depending on the velocity of the water body. Use natural deep water pockets, excavated lagoons, or barriers to trap material on the bottom and limit spread of contamination.

CONSEQUENCE

Material will likely continue to migrate downstream despite containment measures. Excavations are difficult and are not 100% effective.

MITIGATION

Monitor downstream users and test for signs of contamination. Excavate as a last resort. Take steps to remove trapped pockets of ally1 bromide as soon as possible.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic or flammable vapors.

MITIGATION

Consult qualified experts. Decontaminate equipment after use. Arrange to store and dispose of recovered materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

January 1989

ALLYL CHLORIDE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Allyl chloride is a colorless or straw-colored to brownish liquid with a sharp, irritating, and somewhat garlic like odor. It is used for making other chemicals, pharmaceuticals, insecticides, and a variety of other products. Allyl chloride is slightly soluble in water and slightly lighter, so it will generally float on water and slowly dissolve. The product produces hydrogen chloride upon storage and may also undergo slow hydrolysis in water to form allyl alcohol and hydrochloric acid. Its flash point of –25°F indicates that allyl chloride can easily be ignited under virtually all ambient temperature conditions. Its normal boiling point of 113°F indicates that it may boil at high ambient temperatures or otherwise evaporate rapidly producing large amounts of vapor. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited and containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weights approximately 7.8 pounds per gallon.

Allyl chloride does not react with many common materials but is mildly to moderately corrosive to several metals, rubbers, and plastics. Although it is relatively stable in normal transportation, elevated temperatures as in fire conditions can cause self-polymerization in a reaction that may cause violent container rupture. Violent or explosive reactions can also occur in contact with acids, caustics, certain metallic chlorides, and a variety of other chemicals. Toxicity by all routes, including skin absorption, is high. Products of combustion may include toxic hydrogen chloride gas, phosgene, carbon monoxide and other substances that may cause lung damage.

Downwind evacuation should be considered if allyl chloride is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the containers should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.36% by weight at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and ligroin.
Specific Gravity (Liquid): 0.938 at 68°F (20°C)
Boiling Point: 113°F (45°C) at 1 atm.
Melting Point: –210.1°F (–134.5°C)
Freezing Point: –210.1°F (–134.5°C)
Molecular Weight: 76.53
Heat of Combustion: –5416 cal/g
Vapor Pressure: 294.3 mm Hg (5.69 psia) at 68°F (20°C)
Flash Point: –25°F (–31.7°C), closed cup; –20°F (–28.9°C), open cup.
Autoignition Temperature: min. 737°F (391°C); max. 905°F (485°C); reported values vary.
Burning Rate: Unavailable
Stability: Relatively stable in normal transportation. May polymerize under conditions described above.
Corrosiveness: Corrodes carbon steel appreciably in presence of water. Will attack some forms of plastics, rubber, and coatings. Avoid contact with galvanized steel.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with acids, caustics, amines, ammonia, active metals, metal alkyls, metal halides, strong oxidizers, peroxides, ethyleneimine, and benzene or toluene in presence of certain metal alkyls or halides.

IDENTIFICATION

Shipping Names: Allyl chloride (USDOT and IMO)
Synonyms and Tradenames: 3-Chloropropene; chlorallylene; 1-chloro-2-propene; 3-chloropropylene; 1-chloroproprene-2; 3-chloropropene-1; alpha-chloropropylene; 2-propenyl chloride; 3-chloro-1-propene.
Chemical Formula: CH_2CHCH_2Cl
Constituent Components each): 97% min. purity
49 STCC: 49 074 12
UN/NNA Designation: UN1100
IMO Designation: 3.1, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to straw or dark brown; purple on occasion.
Odor Characteristics: Sharp, penetrating; irritating; pungent and unpleasant; garlic like.
Common Uses: Mfg. of resins, **pharmaceuticals,** insecticides, glycerine, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

ALLYL CHLORIDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

***Threshold Odor* Concentration:** 0.2–3 ppmppm

Unusual Hazards: Highly volatile, flammable, and toxic liquid with heavier than air vapors that may persist in low areas. Heat or chemical contaminants may promote violent self-polymerization.

Short Term Exposure Limits (STEL): 2 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 1 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Contact with heat, ignition sources and incompatible materials; runoff to sewers or water; all exposures to vapor or liquid.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation or possibly high vapor concentrations in air. Other hazards include skin contact and ingestion.

Hazards of Skin or Eye Contact: Skin contact may cause painful irritation, blistering, and deep-seated pain that becomes apparent several hours later. The liquid can be absorbed through the skin in toxic amounts. Eye contact may produce painful irritation and transient injury.

Hazards of Inhalation: Breathing vapors may cause irritation of the upper respiratory tract. High concentrations in air may cause headache, dizziness, nausea, unconsciousness and possibly death. Lung injuries may appear several hours after exposure. Inhalation of only 49 ppm in air for 10 minutes is lethal to some mice. Rats can only survive up to 4 hours at 290 ppm.

Hazards of Ingestion: Ingestion may cause heart, liver, and kidney damage.

FIRE HAZARDS

Lower Flammable Limit: 3.3%

Upper Flammable Limit: 11.15%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distances to a source of ignition and flash back. Containers may rupture violently. Exposure to heat may result in violent polymerization.

Hazardous Combustion Products: *Toxic* hydrogen chloride, phosgene, carbon monoxide, and others that may cause lung damage.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Excessive heat may cause violent polymerization resulting in container rupture. Violent polymerization may also occur in presence of acids, metal chlorides, and other substances. Contact with some chemicals may result in formation of explosive mixtures.

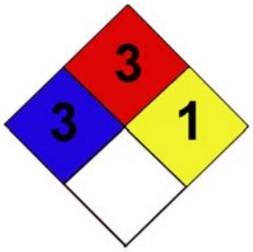
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or smoke concentrations in air. Compatible materials include polyvinyl alcohol and butyl rubber.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 1 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1100

ALLYL CHLORIDE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms:

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious and not very drowsy, administer two glasses of water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Water spray, alcohol foam, dry chemical, and carbon dioxide.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Avoid contact with spilled product. Keep unprotected personnel upwind of spill area. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of product may result in damage or explosion of boilers or industrial process equipment. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Use explosion-proof equipment where necessary. Choose equipment that is not corroded or otherwise damaged by the spilled product. Note that oil spill response equipment may only be effective in early stages of response. Floating allyl chloride will slowly dissolve in water. Take into account while planning the response that allyl chloride is a highly volatile, toxic, and flammable substance. It may polymerize violently under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Allyl chloride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ALLYL CHLORIDE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to allyl chloride vapors or fumes may accelerate their dispersal in the atmosphere. ,

CONSEQUENCE

Water runoff may contain a small amount (if any) of allyl chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools will slow the release of allyl chloride vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Allyl chloride may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained allyl chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, clay, fly ash, cement powder, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ALLYL CHLORIDE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

ALLYL CHLORIDE
Class 3 (Flammable Liquid)

TECHNIQUE '

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating allyl chloride.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with allyl chloride may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to condition: that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated body of water and subsequent mixing may neutralize any hydrochloric acid that has formed in water.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

GENERAL INFORMATION

Aluminum chloride solution, also commonly known as aluminum chloride hexahydrate, has a range of reported colors from colorless to yellow, gray or light green with a strong pungent odor like hydrogen chloride while others report it having no odor. It is used as a cleaning compound as well as an engine cooling system and in the manufacturing of rubber, dyes and pharmaceuticals. It is shipped as a liquid and is corrosive to a variety of materials and bodily tissues. It has a low pH, between 1-2 with most reporting a value of 1, and is therefore a strong acid. Its high boiling point and low evaporation rate indicate that in most spill situations, without fire, it may not pose a large airborne hazard. It is soluble in water and may evolve heat in the process. Flammable and potentially explosive hydrogen gas may be generated upon contact of the product with metals, such as zinc or magnesium, or highly acidic solutions. The solution weighs approximately 10.7 pounds per gallon.

Aluminum chloride is highly toxic and can cause skin irritation, severe eye irritation and possible injury as well as severe respiratory and digestive tract irritation with possible burns.

Aluminum chloride solution is stable in normal transportation and hazardous polymerization will not occur. It is reactive with a variety of chemicals and forms hydrochloric acid with water, which is corrosive. It may fume in air due to hydrogen chloride formation.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Complete
Solubility in Other Chemicals: Soluble in alcohol, ether, glycerol, propylene glycol, benzene, methanol, and chloroform; slightly soluble in hydrochloric acid.
Specific Gravity: 1.27
Vapor Density: Unavailable
Boiling Point: 230ºF (110ºC)
Melting Point: Unavailable
Freezing Point: -31ºF (-35ºC)
Molecular Weight: 241.43
Heat of Combustion: Not flammable
Evaporation Rate (butyl acetate=1): Negligible
Vapor Pressure: Approximately 17.5 - 20 mmHg
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable Limits: Not flammable
Stability: Stable
Polymerization Potential: Will not occur.
pH: 1.0 - 2.0
Corrosiveness: Corrosive to metal and tissues.
Reactivity with Water: May react.
Reactivity and Incompatibility: Do not store in the presence of reactive metals, e.g. zinc or magnesium, or highly acidic solutions as hydrogen may be evolved which when mixed in air may result in fire or explosion if ignited. Considerable heat will be evolved if aluminum chloride solution comes in contact with strong bases. Avoid strong acids, nitrobenzene, alkenes, a mixture of benzoyl chloride and naphthalene, a mixture of aniline and ethyleneimine, ethylene oxide, a mixture of sodium peroxide and aluminum, oxygen difluoride, phenyl azide, perchloryl benzene, sodium borohydride, or water. Reacts with caustic, evolving heat and precipitating aluminum hydroxide.

IDENTIFICATION

Shipping Name(s): Aluminum chloride, solution (USDOT & IMO).
Synonyms and Tradenames: Aluminum chloride hexahydrate; Aluminum(III) chloride hexahydrate; Aluminum Trichloridehexahydrate; Trichloroabluminum hexahydrate; Aluminum trichloride; Trichloroaluminum.
CAS Registry No.: 7446-70-0 (anhydrous) 7784-13-6 (liquid)
Chemical Formula: $AlCl_3 \cdot 6H_2O$
Constituent Components (% each): Percentage of aluminum chloride in solution varies widely.
UN/NA Designation: UN2581
IMO Designation: 8, Corrosives
RTECS Number: BDO525000
NFPA 704 Hazard Rating: 3(Health): 0(Flammability): 2(Reactivity); Reacts with water.
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Reports vary. Clear liquid, may be water white to gray to light amber green in color.
Odor Characteristics: Pungent like hydrogen chloride, some sources report it having no odor.
Reportable Quantity: See appendix I.
Common Uses: It is reported to be used as a cleaning compound as well as an engine cooling system and in the manufacturing of rubber, dyes and pharmaceuticals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Reaction with some metals and acids evolves hydrogen gas which is corrosive.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 10 mg/m^3 (ACGIH); 15 mg/m^3 (OSHA PEL)

Ceiling (C) Limit: Unavailable

IDLH: Not determined

Conditions to Avoid: Contact with incompatible materials; fire or sparks where hydrogen may be present; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact of the skin with aluminum chloride solutions may cause skin irritation, and with greater exposure, severe burns with scarring. Similarly, contact with the eyes may result in irritation, severe burns, and possible blindness.

Hazards of Inhalation: Breathing of aluminum chloride mist may cause irritation and burns to the nose, throat, and respiratory tract.

Hazards of Ingestion: Ingestion this material may be harmful or fatal. Symptoms may include severe stomach and intestinal irritation (nausea, vomiting, diarrhea), abdominal pain, and vomiting of blood. This material may cause burns and destroy tissue in the mouth, throat, and digestive tract.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Some remote chance that containers may rupture in fire.

Hazardous Combustion Products: Decomposition by reaction with certain metals or strong acids may release flammable and explosive hydrogen gas. Fire or excessive heat may decompose material to hydrochloric acid.

EXPLOSION HAZARDS

Explosive Limit: Not flammable

Explosive Potential: Contact with metals or strong acids may generate hydrogen gas that may explode if ignited in confined spaces. Some remote chance that containers may rupture in fire.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing for liquids (as appropriate). One manufacturer recommends the use of Polytyvek as compatable clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with mist concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations a self-contained breathing apparatus (SCBA) with full facepiece. An air purifying respirator (APR) with an organic vapor cartridge or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels of their use. Protection by air purifying respirators is limited.

2581

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Reports vary on whether to administer water, milk or nothing as well as whether to induce vomiting; seek medical advice in this instance. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear self-contained breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources where hydrogen may be present. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that contact of material with some metals and acids may generate hydrogen gas. Use intrinsically safe equipment where necessary.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists. (Note: Solutions do not pose a problem unless an airborne mist is somehow generated. In the event a mist is generated, follow guidelines for water fog or spray below.)

CONSEQUENCE

Hazardous levels of aluminum chloride in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations toxic vapors.

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to aluminum chloride vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Note: Aluminum chloride has the potential to react with water, and should be used with caution and downwind from source of spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of aluminum chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may seep through dike material, which may result in loss of confined product and spread of contamination. There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. (Note: Aluminum chloride has the potential to react with water, and should be used with caution and downwind from source of spill.) Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination if some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. (Note: Aluminum chloride has the potential to react with water, and should be used with caution and downwind from source of spill.) Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled liquid pools confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid aluminum chloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ALUMINUM CHLORIDE, SOLUTION

Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

ALUMINUM SULFATE

Class 8 (Corrosive Material) or Class 9 (Miscellaneous Hazardous Material)

GENERAL INFORMATION

Aluminum sulfate may be shipped as lustrous white to grayish white crystals, granules, pieces or powders, or as liquid solutions in water that are variably described as colorless, clear light green, or amber in appearance. The product is odorless and not flammable. Solid forms are soluble in water and heavier, as are solutions. Numerous uses of aluminum sulfate include the making of aluminum compounds, antiperspirants, paper, pesticides, pigments, rayon, firefighting foams, and other products. It is also used to clarify fats, oils, and petroleum products; waterproof concrete and cloth; fireproof cloth; tan leather, dye textiles; and clarify and or purify sewage and water.

Solid aluminum sulfate dissolves in water while generating a limited amount of heat and then hydrolyzes to form some amounts of sulfuric acid. The product is simply reported as incompatible with strong bases and water-reactive materials (such as oleum) and apparently has the potential to react violently with some such materials. The solid is an irritant to bodily tissues, particularly in the presence of moisture, solutions are acidic and also irritating and potentially corrosive to such tissue. The solid may corrode metals, particularly iron and aluminum in the presence of moisture. Solutions contain sulfuric acid and may be corrosive to several metals while producing potentially flammable and explosive hydrogen gas. Products of thermal decomposition resulting from exposure of aluminum sulfate to very high temperatures include highly hazardous gases such as sulfur dioxide and sulfur trioxide.

There are several forms of aluminum sulfate of interest. The pure substance is anhydrous (i.e., does not contain any water), is hygroscopic, and will therefore gradually absorb water upon exposure to air. Also found in commerce are two hydrates of the substance known as the "tetradecahydrate" and the "octadecahydrate". The tetradecahydrate is best described as a molecule of anhydrous aluminum sulfate that has chemically attached to 14 molecules of water. Similarly, a molecule of the octadecahydrate is a molecule of the anhydrous product combined with 18 molecules of water. Solutions discussed in this guide may contain various amounts of these solids dissolved in water.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; but reported values vary. Most consistent data appear to include 36.4 g/100 g water at 68°F (20°C) for anhydrous solid; about 50 g/100 g for solid tetradecahydrate at unspecified temperature; 87 g/100 g water at 32°F (0°C) for solid octadecahydrate; solutions are soluble in all proportions. Solubilities of the solids generally increase with temperature.

Solubility in Other Chemicals: The anhydrous solid is reported as soluble in dilute acid.

Specific Gravity: Approx 2.7 at 68°F (20°C) for the anhydrous solid; about 1.6-1.7 for solid hydrates; about 1.34 at the above temperature for an apparently typical but otherwise unspecified solution.

Boiling Point: 214°F (101°C) at 1 atmosphere for a 45% solution of the tetradecahydrate in water; upon long boiling, an insoluble basic salt precipitates out of solutions according to one authority.

Melting Point: The anhydrous product decomposes at a high temperature variably reported as 1200°F (650°C) or 1400°F (770°C); the solid octadecahydrate melts and decomposes at about 188°F (86.6°C); data are unavailable for the other solid hydrate; apparently typical but otherwise unspecified hydrate solutions melt at temperatures on the order of 3.2°F (–16°C).

Freezing Point: See melting point

Molecular Weight: 342.1 for anhydrous solid; 594 for solid tetradecahydrate; 666.4 for solid octadecahydrate

Heat of Combustion: Not flammable

Vapor Pressure: Specific data unavailable; apparently very low or negligible for the solids and their solutions

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable with respect to any sort of hazardous activity in normal transportation. On exposure to air, the anhydrous product will gradually absorb moisture from the atmosphere. Hydrates of aluminum sulfate may lose some amounts of moisture when exposed to heat.

Corrosiveness: Solid aluminum sulfate may corrode metals in the presence of moisture according to several authorities, iron and aluminum are specifically mentioned as vulnerable. Solutions contain sulfuric acid, may be corrosive to several metals, and may generate hydrogen gas during the corrosion process.

Reactivity with Water: The solid dissolves in water with evolution of some heat and readily hydrolyzes to form some amounts of corrosive sulfuric acid. Some authorities therefore consider the product reactive with water; others do not.

Reactivity with Other Chemicals: Very little information is available; one data source reports the substance may react violently with strong bases; another lists alkalies (i.e., bases) and water reactive materials such as oleum as incompatible materials.

IDENTIFICATION

Shipping Names: Corrosive liquid, n.o.s. (USDOT and IMO for solutions); Enviromentally hazardous substance, solid, n.o.s. (USDOT and IMO for solid).

Synonyms and Tradenames: Aluminum alum; aluminum sulfate (2:3); aluminum trisulfate; dialuminum sulfate; dialuminum trisulfate; filter alum; paper maker's alum; pearl alum; pickle alum; sulfuric acid, aluminum salt; sulfuric acid, aluminum salt (3:2).

Chemical Formula: $Al_2(S0_4)_3$ for anhydrous solid; $Al_2(S0_4)_3.14H_20$ for the tetradecahydrate; $Al_2(S0_4)_3.18H_20$ for the octadecahydrate.

Constituent Components (% each): Several grades of the solid are commercially available, including the anhydrous product; some may be 98% or more pure. As best as can be determined, solutions typically contain 33 to 50% by weight of one of the solid forms (i.e., the anhydrous product or its hydrates).

UN/NA Designation: UN1760 (USDOT and IMO for solutions) UN3077 (USDOT and IMO for solids)

IMO Designation: 8, corrosive; 9, miscellaneous, dangerous substance

Physical State As Shipped: Solid crystals, pieces, granules or powder, liquid solution of solid in water

Physical State As Released: Same as shipped

Color of the Shipped Material:Solid is variously described as white and lustrous or grayish white; solutions are variably described as colorless or appearing as a clear light green or amber liquid.

Odor Characteristics: Odorless

Common Uses: Making aluminum compounds and resinate antiperspirants, agricultural pesticides, pigments, viscose rayon, and ingredients of firefighting foams; leather tanning; dyeing mordant; deodorizing and decoloring petroleum products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ALUMINUM SULFATE
Class 8 (Corrosive Material) or Class 9 (Miscellaneous Hazardous Material)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: An aluminum sulfate concentration as low as 5 ppm in water may cause an increase in the lead content of the drinking water where lead pipes are used for distribution. Forms corrosive sulfuric acid when dissolved in water.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: 2 mg/m^3 as aluminum (Al), for soluble salts of aluminum, over each 8 hours of a 40 hour work week (ACGIH TLV, 1990-91; OSHA PEL, 1989).

Conditions to Avoid: Generation of airborne dusts or mists; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion or direct physical contact; wetting of the dry product; exposure of the product to very high temperatures.

HEALTH HAZARDS

Public Health Hazards: The primary hazard of the product is the irritation and potential burns it may cause to bodily tissues upon direct contact in the presence of moisture.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with aluminum sulfate solutions may result in skin irritation, as may contact with the solid and its dusts, particularly if moisture is present. Open cuts are especially vulnerable. Repeated or prolonged skin contact (presumably of the hands) has been reported to cause numbness in the fingers. Contact of the eyes with aluminum sulfate dust may cause significant irritation, inflammation, and possibly burns; contact with concentrated liquid solutions or mists may possibly result in severe eye damage. One maker of the product generally observes that contact lenses should not be worn when working with chemicals because they may potentially contribute to the severity of an eye injury. It is not clear whether this precaution is specifically required for aluminum sulfate.

Hazards of Inhalation: Fine airborne dusts or mists of solid aluminum sulfate may irritate the eyes, nose, mouth, throat, and bronchial tubes of the lungs. Symptoms may include sore throat, tightness and pain in the chest, and coughing. High concentrations in air may cause congestion and constriction of the airways leading to difficult breathing in short-term exposures. Prolonged inhalation of 2 - 4 mg/m^3 of aluminum sulfate in air has been reported to cause scarring of upper lung tissue.

Hazards of Ingestion: Aluminum sulfate is of comparatively low oral toxicity. Nevertheless, ingestion of significant amounts of the solid product may result in irritation of the gastrointestinal tract, abdominal pain, nausea, and vomiting. Concentrated solutions (over 20%) can cause burns of the mouth and digestive tract, a bleeding stomach, incoordination, muscle spasms, and kidney injury. Since the solid will dissolve in moisture, some of these latter effects may also follow ingestion of the solid. Repeated ingestion of the product may result in a phosphate deficiency that can weaken bones. The LD_{50} for mice, the single dose expected to kill 50% of the animals, is in the range of 6.1 to 10.8 g/kg of body weight according to various authorities; that for the rat is listed as 1.93 g/kg by one source. A maker of the product provides an estimated human fatal dose of 30 grams, presumably for adults.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Not flammable. Although not reported elsewhere, there appears to be a possibility that exposure of well-sealed containers of aluminum sulfate solutions to excessive and prolonged heat may possibly cause generation of sufficient steam pressure to cause rupture of the containers. The rupture may possibly take place with violence if the container is of strong construction (such as a metal tank). There is a possibility that hydrated solids may also evolve water vapor or steam under such conditions. Very high temperatures will cause decomposition of the solid product.

Hazardous Combustion Products: At very high temperatures, variably reported as above 1200°F (650°C) or 1400°F (760°C), aluminum sulfate is said to generate toxic gases such as sulfur dioxide and/or sulfur trioxide. These gases are also oxidizers and corrosives; the trioxide is a fire hazard. Evolution of these gases leaves a caustic residue

1760

ALUMINUM SULFATE

Class 8 (Corrosive Material) or
Class 9 (Miscellaneous Hazardous Material)

See UN/NA Designation for
other ID numbers.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: See Behavior in Fire section directly above for a discussion of container rupture potential. Note that contact of some metals with corrosive solutions may result in the generation of potentially flammable and explosive hydrogen gas.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of eye contact and any reasonable probability of skin contact with the spilled product. This may include rubber boots, gloves, face shields, tight-fitting dust or splash-proof safety goggles as needed, and other appropriate protective clothing such as coveralls, aprons, long-sleeved shirts, and so forth. An acid resistant slicker suit is recommended by a maker of the product for response to liquid spill situations.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations of dusts or mists in air, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For other working conditions, a NIOSH-approved dust or mist respirator appropriate for the airborne contaminant levels present and used within the limitations of the device as determined by a suitably qualified individual.

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Rinse nose and mouth with water in the event of dust exposure. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim’s lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Authorities disagree over the proper course of treatment. The majority suggest that one or two glasses of water be administered immediately if the victim is conscious and that vomiting NOT be induced. It appears this decision is based on the generally low oral toxicity of aluminum sulfate and the conclusion that potential irritation or burns of the gastrointestinal tract are less hazardous than the risk associated with aspiration of possibly corrosive fluids into the lungs if vomiting is induced. It is probably best that the decision of whether or not to induce vomiting be made by a physician if one is readily available. In any case, if vomiting occurs naturally or otherwise, have the victim lean forward to reduce the risk of aspiration into the lungs and then repeat administration of water. Never attempt to make an unconscious person vomit. Get medical attention immediately.

ALUMINUM SULFATE

Class 8 (Corrosive Material) or Class 9 (Miscellaneous Hazardous Material)

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but be advised that some authorities recommend against use of water or foam on fires involving solid aluminum sulfate, where possible, since corrosive liquids containing sulfuric acid may be produced. Consequently, it appears prudent to use carbon dioxide or dry chemicals where supplies are adequate to safely extinguish the fire. Water and foam are best used for large fires or fires involving aluminum sulfate solutions. Note that solid aluminum sulfate and its solutions in water are not combustible or flammable.

Extinguishing Techniques: Stay upwind. Avoid bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use professional judgment to decide if sealed metal drums or other containers or tanks exposed to excessive heat or fire should be kept cool via use of water sprays to avoid the possibility of container rupture due to buildup and pressurization of gases or steam in the container. If deemed necessary, use water from side and from safe distance to keep containers cool until well after fire is out. For a massive fire in the cargo area under these circumstances, it may be prudent to use unmanned hose holders or monitor nozzles. In any case, stay away from the ends of tanks involved in fire, especially of solutions, but realize shrapnel may travel in any direction. See earlier discussions about the hazardous decomposition products of aluminum sulfate and its hydrates at elevated temperatures and attempt to prevent such decomposition. Keep any exposed solid product dry if possible and practical.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers and water bodies. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or other hazard to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Keep the solid product dry if practical to avoid spread of contamination. The anhydrous product should be kept in tightly closed containers to avoid absorption of water from the atmosphere if practical. Take the potential corrosivity of aluminum sulfate and its hydrates and solutions into account while planning the response. Give special attention to the hazardous products of thermal decomposition that may evolve at high temperatures.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Aluminum sulfate and its solutions will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in most cases to simply monitor the situation until the spilled product is removed. (Note: In order to pose a significant downwind inhalation hazard, fairly large quantities of fine aluminum sulfate dusts or mists must somehow become airborne. Consider downwind evacuation or an alternative protective action where necessary if this should occur.)

CONSEQUENCE

Hazardous levels of aluminum sulfate may possibly be found in air in the local spill area and immediately downwind, particularly if the solid product has been discharged in a finely, powdered form.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill and areas immediately downwind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid aluminum sulfate with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

ALUMINUM SULFATE

Class 8 (Corrosive Material) or Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to aluminum sulfate dusts or mists in air may knock them down and accelerate their dispersal in the atmosphere. Apply water at a point downwind if solid aluminum sulfate is exposed to prevent dissolution in water, generation of sulfuric acid, and spreading of contamination.

CONSEQUENCE

Water runoff may contain sulfuric acid and other substances from contact with dusts or mists of aluminum sulfate.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Aluminum sulfate and its solutions may be contained by building dikes or barriers using soil, sand or other compatible materials. Note that even very low levels of the product in soil may adversely affect the growth of plants and crops and act accordingly. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Keep solid aluminum sulfate dry to the extent possible. Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product particularly solutions.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of solutions may be controlled by absorbing the liquid with sand earth, clay, vermiculite, perlite, fly ash, cement powder, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessarv, neutralize sorbents under guidance of a qualified expert. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

ALUMINUM SULFATE

Class 8 (Corrosive Material) or Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product or its residues may be removed by brooms. shovels. motorized graders, scrapers, loaders, bulldozers, or draglines as appropriate.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause aluminum sulfate dust to become airborne.

MITIGATION

Select removal procedures that do not cause aluminum sulfate dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid aluminum sulfate will sink in water and dissolve at a fairly rapid rate, particularly if water is plentiful compared to the amount of aluminum sulfate spilled. Solutions of the product will dissolve freely in water. Note that this substance is reported to be harmful to aquatic life in very low concentrations. It is also reported that the natural alkalinity of receiving waters may result in precipitation of aluminum hydroxide. $Al(OH)_3$, also known as alumina trihydrate and aluminum hydrate. which is insoluble in water. Neutralization agents such as sodium bicarbonate or lime are also reported to precipitate this substance out of solution.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained or diverted to impoundment area by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier- than-water solids that have not dissolved and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

September 2000

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas) or Division 2.3 (Poison Gas)

GENERAL INFORMATION

Anhydrous ammonia and ammonia solution (containing greater than 50% ammonia) are colorless and have the pungent characteristic odor of ammonia. Both anhydrous ammonia and ammonia solution are shipped in the liquid state, the gas shipped under pressure as a liquid. It is used as a refrigerant and in making fertilizers, explosives, synthetic fibers, plastics, pharmaceuticals, household cleaners, dyes, and a wide variety of other chemicals and products. It is quite soluble in water and dissolves to form an alkaline ammonium hydroxide solution with the evolution of heat. Although it is considered nonflammable under conditions likely to be encountered, it can be ignited with an appropriate ignition source within a relatively narrow range of concentrations in air. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The liquid product weighs approximately 5.7 pounds per gallon at its low boiling point of -28°F.

The major hazard of anhydrous ammonia spills is that the product will boil or vaporize rapidly upon release to form a substantial vapor cloud or plume that may expose downwind areas to toxic concentrations in air over considerable distances. Also to be noted is that the product is corrosive to aluminum, tin, copper, lead, silver, zinc and other alloys; forms highly explosive products with calcium hypochlorite bleaches, gold, mercury, and silver; is otherwise reactive with a variety of chemicals, and is corrosive to bodily tissues.

Downwind evacuation should be considered if anhydrous ammonia is leaking but not on fire. Although ammonia does not meet the DOT definition of a flammable gas (for labeling purposes), it should be treated as one.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 51 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, chloroform, and ether.
Specific Gravity (Liquid): 0.682 at -28.1°F (-33.4°C)
Vapor Density: .6
Boiling Point: -28.0°F (-33.35°C)
Melting Point: -107.9°F (-77.7°C)
Freezing Point: See melting point.
Molecular Weight: 17.03
Heat of Combustion: -4440 cal/g
Evaporation Rate (butyl acetate=1): Faster than water if in solution.
Vapor Pressure: 5 atm at 40.5°F (4.7°C); 10 atm at 78.3°F (25.7°C); 8,500 mmHg at 68°F (20°C)
Flash Point: Not flammable under conditions likely to be encountered.
Autoignition Temperature: 1204°F (651°C)
Burning Rate: 1 mm/minute
Flammable Limits: 15%(LEL) - 28%(UEL)
Stability: Stable
Polymerization Potential: Will not occur.
pH: Unavailable
Corrosiveness: Attacks aluminum, tin, copper, lead, silver, zinc, and other alloys; some forms of plastics, rubber, and coatings; gold and mercury.
Reactivity with Water: Dissolves with evolution of heat to form ammonium hydroxide. Action upon contact is vigorous and also evolves ammonia vapors.
Reactivity and Incompatibility: Reacts with acids, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin, aldehydes, strong oxidizers, calcium hypochlorite bleaches, halogens, gold, silver, mercury, acrolein, and numerous other substances.

IDENTIFICATION

Shipping Name(s): Ammonia, anhydrous or Ammonia solution (USDOT & IMO)
Synonyms and Tradenames: Ammonia; Ammonia gas; Liquid ammonia; Nitro-sil; Spirit of hartshorn; Am-fol.
CAS Registry No.: 7664-41-7
Chemical Formula: NH_3
Constituent Components (% each): 99.5% or more pure
UN/NA Designation: UN1005(anhydrous) UN3318 (solution)
IMO Designation: 2.3, Toxic gases
RTECS Number: BO0875000
NFPA 704 Hazard Rating: 3(Health): 1(Flammability): 0(Reactivity)
Physical Form as Shipped: Compressed liquefied gas.
Physical Form as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Extremely pungent
Reportable Quantity: See appendix I.
Common Uses: Refrigerant; fertilizer; mfg. of explosives, fertilizers, synthetic fibers, explosives, plastics, pharmaceuticals, household cleaners, dyes, and other chemicals and products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas)
or Division 2.3 (Poison Gas)

or

or

* 1005 (Anhydrous) 3318 (Solution)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.037-20 ppm reported

Unusual Hazards: Highly volatile and toxic substance. Will boil or rapidly vaporize upon release producing large amounts of vapor.

Short Term Exposure Limit (STEL): 35 ppm (27 mg/m^3)

Time Weighted Average (TLV-TWA): 25 ppm (18 mg/m^3)

Ceiling (C) Limit: No data

IDLH: 300 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major public hazard is from inhalation of the high vapor concentrations in air that may occur in the local spill area and over considerable downwind distances. Contact with the liquid or highly concentrated vapors is also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of liquid ammonia with the skin may cause frost bite as well as first and second degree burns which are often severe and may be fatal if extensive. Vapors in air at 30,000 ppm or higher levels may cause a stinging sensation followed by skin burns and blisters. Contact of the liquid with the eyes may result in serious injury or blindness, as may prolonged contact with vapors in air above 700 ppm.

Hazards of Inhalation: Ammonia vapors may cause burning and tearing of the eyes, runny nose, coughing, chest pain, and irritation of the nose and throat. Severe exposures may result in difficult breathing, bronchospasm, bronchitis, pulmonary edema, pneumonia, and possibly death. Some of these effects may be delayed in onset and may be accompanied by pink frothy sputum. Note that 5000 ppm in air may be almost immediately fatal due to serious edema, strangulation, and asphyxia.

Hazards of Ingestion: Ammonia is not a systematic poison but is corrosive to the mouth, throat, and stomach.

FIRE HAZARDS

Lower Flammable Limit: 15%

Upper Flammable Limit: 28%

Behavior in Fire: Nonflammable compressed liquefied gas. Will burn but difficult to ignite. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of toxic gas or vapor upon release. Fire hazard increases in the presence of oil or other combustible materials.

Hazardous Decomposition Products: Not well-defined; may include nitrogen oxides, nitrogen gases and unburned ammonia. Hydrogen on heating over 850°F, if in the presence of certain metals such as nickel, temperature may be lowered to 575°F.

EXPLOSION HAZARDS

Explosive Limit: Not flammable

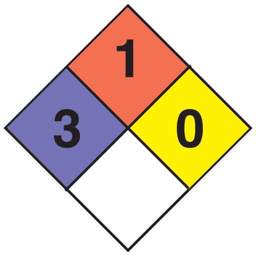
Explosive Potential: Containers may rupture violently in fire due to overpressure. Explosion may result if vapors are ignited in a confined area by a strong ignition source. Contact with certain other materials may result in formation of explosive mixtures.

1005

3318

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas)
or Division 2.3 (Poison Gas)



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Teflon (PTFE)® and butyl rubber are reported to provide more than 8 hours of protection. Other compatible materials may include natural rubber, neoprene, nitrile rubber, and polyvinyl chloride. Material found to be incompatible with ammonia was Saranax®.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with an ammonia cartridge (500 ppm or less) with a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Reports vary regarding removal of clothing, due to possibility of frostbite. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas. Forcible removal of clothing frozen to skin may tear skin. If appropriate, thaw clothing before removal.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical; water fog or foam for large fires, if necessary. See note below on water use.

Extinguishing Techniques: Take into consideration the highly toxic nature of ammonia to aquatic organisms while planning the response. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Unusual vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. Note that addition of water to pools of liquid anhydrous ammonia may vastly increase vapor evolution.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extreme volatility and low boiling point of the product into account while planning the response. Beware of possible heavy gas concentrations in pits, hollows, and depressions.

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas) or Division 2.3 (Poison Gas)

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to anhydrous ammonia vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact pools of liquid anhydrous ammonia as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of anhydrous ammonia from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of anhydrous ammonia vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if initial increase in vapor evolution may affect downwind populations.

TECHNIQUE

DILUTION . . . The addition of a flooding quantities of water to liquid anhydrous ammonia may slow the release of vapors into the atmosphere. This response is best suited to smaller spills.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Proceed with caution. Consult qualified experts.

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas) or Division 2.3 (Poison Gas)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may confine spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Confined substance may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

AMMONIA, ANHYDROUS or AMMONIA SOLUTION

Division 2.2 (Non-Flammable Gas) or Division 2.3 (Poison Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination. Consult qualified experts for advice.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to the water may reduce environmental hazards.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

AMMONIUM HYDROXIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Ammonium hydroxide (NH_40H) is a colorless to milkly colored liquid that is formulated by dissolving ammonia (NH_3) in water. Various grades generally (but not always) contain 15-29.4% ammonia by weight and are used as household cleaners, for fertilizer, and in making plastics, dyes, explosives, detergents, pesticides, nitric acid, and other products. All are fully soluble in water and are not considered flammable. Nevertheless, ammonia vapors may evolve and burn if these solutions are heated in fires. Accumulations of ammonia vapor in confined spaces within a narrow range of concentrations may occasionally result in explosions if exposed to a strong source of ignition. There is some limited potential for containers of ammonium hydroxide to rupture due to overpressurization if exposed to fire or excessive heat for sufficient time duration. Concentrated solutions may boil at higher ambient temperatures and many solutions are capable of evolving significant amounts of toxic ammonia vapors. A solution containing 20% ammonia weighs about 7.7 pounds per gallon.

Ammonium hydroxide mixes in water with mild liberation of heat. It is corrosive to some metals and reacts with various chemicals. Mixtures with halogens, calcium, mercury, silver oxide, or hypochlorites of calcium or sodium may be explosive. The liquid and its concentrated vapors may be irritating and corrosive to bodily tissues. Products of combustion may include nitrogen oxides and unburned ammonia.

Downwind evacuation should be considered on a case by case basis if a concentrated solution of ammonium hydroxide is leaking from its container.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Data unavailable
Specific Gravity (Liquid): 0.9592 (10% NH_3); 0.9245 (20% NH_3); both at 68°F (20°C).
Boiling Point: 81°F (27.2°C) at 1 atm for 29.4% solution
Melting Point: –98.3°F (–72.4°C)
Freezing Point: –98.3°F (–72.4°C)
Molecular Weight: 35.05 for NH_4OH; 17.03 for NH_3
Heat of Combustion: –4440 cal/g for NH_3 vapor
Vapor Pressure: 556.7 mm Hg (10.76 psia) at 70°F (21.1°C) for 28.8%; 221.4 mm Hg (4.28 psia) for 19.1% NH_3
Flash Point: Not flammable under conditions likely to be encountered.
Autoignition Temperature: 1204°F (651°C) for NH_3 vapor
Burning Rate: Not pertinent
Stability: Stable
Corrosiveness: Corrosive to aluminum, tin, copper, lead, silver, zinc, galvanized surfaces, and various alloys of these metals.
Reactivity with Water: Mild liberation of heat upon dissolution.
Reactivity with Other Chemicals: Reacts with strong mineral acids, silver nitrate, silver oxide, silver oxide and ethyl alcohol, calcium, mercury, hypochlorites of calcium or sodium, acrolein, acrylic acid, dimethyl sulfate, halogens, gold, hydrochloric acid, nitric acid, hydrofluoric acid; B-propiolactone, propylene oxide, or silver permanganate.

IDENTIFICATION

Shipping Names: Ammonium hydroxide (USDOT); ammonia solution (USDOT and IMO)
Synonyms and Tradenames: Ammonia monohydrate; aqueous ammonia; ammonia solution; ammonia water; household ammonia; aqua ammonia; water of ammonia; ammonium hydrate.
Chemical Formula: NH_4OH
Constituent Components(% each): 15-29.4% ammonia in water (generally, not always)
UN/NA Designation: UN2073; UN2672; UN3318
IMO Designation: 8, corrosive (depending on NH_3 concentration)
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless or milky white
Odor Characteristics: Like ammonia, pungent
Common Uses: Mfg. plastics, dyes, explosives, detergents, pesticides, nitric acid, rayon, rubber, pharmaceuticals, inks, ceramics, lubricants, household cleaners, fertilizers, and other chemicals; used in refrigeration, photography, and fireproofing wood.

CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

AMMONIUM HYDROXIDE

Class 8 (Corrosive Material)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.037-20 ppm reported for NH_3

Unusual Hazards: May evolve considerable amounts of ammonia vapors from concentrated solutions or if heated. Concentrated solutions may boil at higher ambient temperatures.

Short Term Exposure Limits(STEL): 35 ppm NH_3 for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 25 ppm NH_3 over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and strong ignition sources; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high ammonia concentrations that may result in air from larger spills or spills of concentrated ammonium hydroxide. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of liquid ammonium hydroxide with the skin or eyes may cause intense irritation and possibly severe burns. The hazard is proportional to the amount of NH_3 in solutions, but even those with only 10% ammonia by weight should be considered highly hazardous. Ammonia vapors in air at high concentrations may also cause burns and blisters of the skin or eyes.

Hazards of Inhalation: Ammonia vapors may cause burning and tearing of the eyes, runny nose, coughing, chest pain, and irritation of the nose and throat. Severe exposures may result in difficult breathing, bronchospasm, bronchitis, pulmonary edema, and possibly death. Some effects may be delayed in onset and may be accompanied by pink frothy sputum. Note that a level of 5000 ppm in air may be almost immediately fatal due to serious edema, strangulation, and asphyxia.

Hazards of Ingestion: Ingestion may cause burning pain in mouth, throat, stomach, and thorax, constriction of throat and coughing. This may be followed by vomiting of blood or passage of bloody stools. Breathing difficulties, convulsions, and shock may result. Ingestion of only 3-4 ml may be fatal.

FIRE HAZARDS

Lower Flammable Limit: 15.5% (for NH_3)

Upper Flammable Limit: 27% (for NH_3)

Behavior in Fire: May generate large quantities of vapor upon release. Vapors will burn but are difficult to ignite. Containers may rupture in fire due to overpressurization.

Hazardous Combustion Products: May include oxides of nitrogen and unburned ammonia.

EXPLOSION HAZARDS

Lower Explosive Limit: 16% (for NH_3)

Upper Explosive Limit: 25% (for NH_3)

Explosiveness: Containers may rupture in fire due to overpressurization. Vapors are difficult to ignite but may occasionally explode if ignited by a strong source within a confined area. Contact with certain other chemicals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/sytrene-butadiene rubber, nitrile rubber, nitrile rubber/polyvinyl chloride, polyethylene, chlorinated polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, Viton, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm NH_3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted ammonia canister (500 ppm NH_3 or less) or an ammonia cartridge respirator with a full facepiece 300 ppm NH_3 or less) within the use limitations of these devices.

2672

AMMONIUM HYDROXIDE
Class 8 (Corrosive Material)

See UN/NA Designation for other ID numbers.

FIRST AID

Nonspecific symptoms: Irritation or burns of any bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes diffficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation is present after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Unusual vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account that concentrated ammonium hydroxide is volatile, toxic, corrosive, and potentially flammable under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ammonium hydroxide spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm weather and/or the product is fairly concentrated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Ammonium hydroxide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled, the product is not very concentrated, and/or the weather is cold.

CONSEQUENCE

Hazardous levels of ammonia in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

AMMONIUM HYDROXIDE
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb ammonia vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain ammonium hydroxide from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid ammonium hydroxide may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid ammonium hydroxide may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . There is a possibility that special chemical hazard foam or certain high expansion foams applied to the surface of liquid pools may slow the release of ammonia vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ammonium hydroxide may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained ammonium hydroxide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

AMMONIUM HYDROXIDE
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

AMMONIUM HYDROXIDE
Class 8 (Corrosive Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

AMMONIUM NITRATE
Division 5.1(Oxidizer)

GENERAL INFORMATION

Ammonium nitrate is an odorless solid that may be colorless, white, grayish white, gray, or brown depending upon purity and the presence of other substances. Although this guide is primarily for relatively pure grades, the information contained herein may be applicable to several solid mixtures with minimal organic content. The material is used in explosives, fertilizers, and a variety of other products.

Ammonium nitrate is heavier than water and quite soluble so may be expected to sink in water and rapidly dissolve (although other mixture components may not). It is not flammable, but is an oxidizer that supports the burning of combustible materials. One key hazard is that ammonium nitrate is capable of detonation if heated under confinement or if subjected to strong shocks such as those from an explosive. Sensitivity to detonation is enhanced by the presence of organic and other easily oxidizable matter, particularly if these are finely divided, and mixtures with fuel oil are used as blasting agents. Self-ignition of mixtures with organic materials or finely divided metals is possible at moderately elevated temperatures. Products of combustion include toxic oxides of nitrogen.

Evacuation for a radius of at least one-half (1/2) mile should be undertaken if a fire involving relatively pure ammonium nitrate becomes uncontrollable. A radius of at least one-third (1/3) mile is necessary if various mixtures are on fire, involved in fire, and/or a fire becomes uncontrollable. If the material is in a mixed load shipment (small packages shipped with other small packages in the same outer packaging, railcar, container, or trailer) and exposed to fire or direct flame, evacuate for a radius of one-third (1/3) mile. If bulk container is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, approx. 200 g/100 g water at 70°F (21.1°C)

Solubility in Other Chemicals: Soluble in acetone; slightly soluble in alcohols.

Specific Gravity (Solid): 1.72 at 68°F (20°C)

Boiling Point: Decomposes

Melting Point: 337.3 (169.6°C)

Freezing Point: 337.8°F (169.9°C)

Molecular Weight: 80.05

Heat of Combustion: Not pertinent

Vapor Pressure: Unavailable; probably very low.

Flash Point: Not pertinent

Autoignition Temperature: Not pertinent

Burning Rate: Not pertinent

Stability: Decomposes if heated strongly, giving off toxic gases that support combustion. May detonate if heated under confinement.

Corrosiveness: Data unavailable; not very pertinent.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Incompatible and may react with acids; organic combustibles; powdered metals such as zinc, copper, or aluminum; flammable or combustible liquids; corrosives; chlorates; sulfur or phosphorus; charcoal, coke, cork, or sawdust; phosphorus; reducing agents; chlorides; and other chemicals.

IDENTIFICATION

Shipping Names: Ammonium nitrate (no organic coating) (USDOT); ammonium nitrate (organic coating) (USDOT); ammonium nitrate, solution (USDOT); ammonium nitrate fertilizer (USDOT); ammonium nitrate mixed fertilizer (USDOT); ammonium nitrate-phosphate (USDOT); ammonium nitrate-carbonate mixture (USDOT); ammonium nitrate (IMO); ammonium nitrate fertilizer, N.O.S (IMO); ammonium nitrate fertilizers (IMO).

Synonyms and Tradenames: Nitric acid, ammonium salt; Nitram.

Chemical Formula: NH_4NO_3

Constituent Components(% each): Various grades and mixtures.

UN/NA Designation: UN1942, UN2426, UN2067, UN2071, NA2072, NA2069

IMO Designation: 1.1, explosive; 5.1, oxidizing substance; or 9, misc. dangerous substance, depending on form.

Physical State as Shipped: Solid or solution

Physical State as Released: Solid or solution

Color of the Shipped Material: Colorless, white, grayish white, gray, or brown

Odor Characteristics: Odorless

Common Uses: Medical; explosives; fertilizers; matches and pyrotechnics; herbicides and insecticides; mfg. of nitrous oxide, freezing mixtures, solid rocket propellants; catalyst; nutrient for antibiotics to yeast; sorbent for nitrogen oxides.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

AMMONIUM NITRATE

Division 5.1(Oxidizer)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not pertinent

Unusual Hazards: May detonate under appropriate conditions. See General Information section.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat or fire; contact with incompatible materials; poorly ventilated confined spaces; water contamination; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Generally of limited health hazard when pure. Excessive contact, inhalation, or ingestion should nevertheless be avoided. Exposure may cause allergic reactions.

Hazards of Skin or Eye Contact: Ammonium nitrate may be irritating to the skin and eyes upon contact and may cause burns. It is not, however, considered to be a severe irritant.

Hazards of Inhalation: Dust of ammonium nitrate is irritating to the mucous membranes of the respiratory tract. Excessive exposure may result in urination and acidic urine, severe lung congestion, coughing, difficult breathing, systemic acidosis, and metheglobinemia (abnormal blood hemoglobin). Observe victim for delayed chemical pneumonitis or pulmonary edema.

Hazards of Ingestion: Ingestion may cause urination and acidic urine. Large amounts may cause systemic acidosis and metheglobinemia.

FIRE HAZARDS

Lower Flammable Limit: Not pertinent

Upper Flammable Limit: Not pertinent

Behavior in Fire: Decomposes when heated strongly to emit toxic gases that support combustion. May detonate if in a confined area permitting pressure buildup.

Hazardous Combustion Products: Include highly toxic nitrogen oxides.

EXPLOSION HAZARDS

Lower Explosive Limit: Not pertinent

Upper Explosive Limit: Not pertinent

Explosiveness: Capable of detonation if heated under confinement, exposed to strong shock, and or if contaminated with organic or other easily oxidizable matter such as fuel oil, charcoal, or other incompatible substances.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an approved particulate (dust) respirator may be adequate within the use limitations of these devices.

FIRST AID

Nonspecifc symptoms: Irritation of the eyes, nose, skin, or respiratory tract; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention.

First Aid for Ingestion: Data unavailable. Get medical attention immediately.

2426

See UN/NA Designation for
other ID numbers.

AMMONIUM NITRATE
Division 5.1(Oxidizer)

FIRE RESPONSE

Extinguishing Materials: Use flooding amounts of water but control runoff. Exercise caution when applying water to fused or molten material to avoid eruptive scattering and spread of fire.

Extinguishing Techniques: Special explosion hazard. Stay upwind and at protected location. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk and if cargo has not been exposed to heat. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Give special attention to the explosive properties of ammonium nitrate while planning the response

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Ammonium nitrate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of ammonium nitrate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid ammonium nitrate with a compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may reduce levels of ammonium nitrate dust in air.

CONSEQUENCE

Water runoff may contain varying amounts of ammonium nitrate from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

AMMONIUM NITRATE
Division 5.1(Oxidizer)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ammonium nitrate solutions may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained ammonium nitrate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. Keep solid product dry possibly by coverage with a compatible material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

AMMONIUM NITRATE

Division 5.1(Oxidizer)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

September 1992

AMMONIUM SULFATE
Non-Regulated

GENERAL INFORMATION

Ammonium sulfate is not designated as a hazardous material in transportation but nevertheless has potential to cause injury and/or environmental pollution if improperly handled. It is consistently ranked among the top 35 chemicals produced in the United States and may therefore be encountered comparatively frequently in transportation or other accidents resulting in a chemical discharge.

Ammonium sulfate is usually shipped as solid white to brownish-gray crystals or granules or as a clear liquid solution in water containing around 38% ammonium sulfate by weight. Neither the solid or its aqueous solutions are combustible. The vapor pressure of the pure solid is extremely low at room temperatures and the product is often odorless, though some grades may have a slight odor of ammonia. It is used as an agricultural fertilizer and has a variety of other diverse uses in commerce. Solid ammonium sulfate is highly but not completely soluble in water and heavier; aqueous solutions will mix freely with water in all proportions. The solid weighs about 110.5 pounds per cubic foot; a 38% solution weighs about 10 pounds per gallon.

Ammonium sulfate does not react with water and is stable in normal transportation. Reactions with strong oxidizing agents may result in fires or explosions under appropriate conditions and the substance is also reported to be incompatible with zinc and copper-containing metals, alkaline materials, and strong acids. In addition, ammonium sulfate exhibits corrosiveness towards concrete and cement. It may possibly attack some forms of plastics, rubber and coatings, but this could not be confirmed. Toxicity of the product is generally low by all routes of exposure but products of thermal decomposition at elevated temperatures include several that are toxic and/or irritating.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; about 75.4 g/100 g water at 68°F (20°C). This forms a 43% solution of ammonium sulfate in water by weight at this temperature.

Solubility in Other Chemicals: Insoluble in acetone, alcohol, ammonia, and carbon bisulfide.

Specific Gravity: 1.77 at 68°F (20°C) for solid; 1.2 for 38% solution in water. The bulk density of the solid (including air between particles) is reported by one authority to be about 0.89 at 59°F (15°C).

Boiling Point: Decomposes; see melting point

Melting Point: Several authorities report that ammonium sulfate decomposes at temperatures of 455°F (235°C) or above; several others indicate decomposition occurs at 536°F (280°C) or above; one says 662°F (350°C) or above. Two acknowledge decomposition at temperatures of 536°F or above but provide a melting point of 955°F (513°C). This property of ammonium sulfate is clearly not well defined in the literature.

Freezing Point: See melting point

Molecular Weight: 132.14

Heat of Combustion: Not combustible

Vapor Pressure: Negligible at 68°F (20°C)

Flash Point: Not combustible

Autoignition Temperature: Not combustible

Burning Rate: Not combustible

Stability: Stable at normal temperatures

Corrosiveness: Reported as incompatible with zinc-clad (e.g., galvanized) metals, copper, brass, bronze, and other copper-bearing materials, but reasons for these statements could not be determined. Increases the corrosiveness of water towards concrete. Sulfates in excess of 300 ppm in soil and water are detrimental to asbestos-cement and asbestos-concrete pipes. The product may possibly attack some forms of plastics, rubber and coatings, but this could not be confirmed.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Contact with strong oxidizing materials may result in fire or explosion under appropriate conditions. Additionally, ammonia gas may evolve if ammonium sulfate contacts alkaline materials. The product is reported as incompatible with zinc-clad, copper, brass, bronze, and other copper-bearing metals, as well as strong acids, but details are not provided as to the nature and/or severity of the incompatibility.

IDENTIFICATION

Shipping Names: No particular name is standard but "Chemicals, n.e.c." is a possibility. The shipper may or may not provide the specific chemical name of the product.

Synonyms and Tradenames: Ammonium hydrogen sulfate; diammonium sulfate; dolamin; sulfuric acid, diammonium salt; mascagnite. The word "sulphate" may be found in place of "sulfate" in the names of this product.

Chemical Formula: $(NH_4)_2S0_4$

Constituent Components (l each): The purest grades of the solid contain at least 99% ammonium sulfate. At least one maker of the product ships it as a 38% solution in water.

28 STCC: 28 191 55

UN/NNA Designation: Not established

IMO Designation: Not established

Physical State As Shipped: Solid crystals or granules; solutions in water.

Physical State As Released: *As* shipped

Color of the Shipped Material: White to brownish-gray crystals or granules depending on degree of purity; generally colorless solutions in water.

Odor Characteristics: Commonly odorless but some commercial products may have a slight smell of ammonia.

Common Uses: Used as agricultural fertilizer; used for making other chemicals, synthetic flavors, proteins, freezing mixtures, and viscose rayon and silk.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

AMMONIUM SULFATE
Non-Regulated

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless or with slight odor of ammonia. Threshold concentrations reported for ammonia range from 0.037 ppm to 20 ppm.

Unusual Hazards: Products of thermal decomposition are far more hazardous than ammonium sulfate itself with respect to inhalation hazards.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limits: 10 mg/m^3 (total dust) over each 8 hours of a 40 hour work week (ACGIH TLV, 1990–91); 15 mg/m^3 (as total dust) and 5 mg/m^3 (as respirable fraction) under similar circumstances (OSHA PEL, 1989); all as exposure limits for "nuisance dusts".

Conditions to Avoid: Excessive heat or fire; contact with incompatible materials or contamination of any kind; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Health hazards attributable to ammonium sulfate under normal conditions are comparatively minimal in the case of episodic spills into the environment, but it is always prudent to minimize unnecessary exposures to chemical substances.

Hazards of Skin or Eye Contact: Contact of the eyes with ammonium sulfate dust or mist may result in irritation but is not reported to injure eye tissue. Frequent or prolonged contact of the product with the skin is reported to cause a low level of irritation; a brief contact may cause some degree of dryness of the skin. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Inhalation of ammonium sulfate dust or mist, particularly at high concentrations in air, is reported to cause relatively slight irritation of the nose, throat, and lungs. Excessive exposures may cause some degree of coughing and chest discomfort.

Hazards of Ingestion: Ammonium sulfate is of generally low toxicity by ingestion. The LD50 for rats, the dosage reported to kill 50% of the animals in laboratory experiments, is 3 grams per kilogram of the animal's body weight. A human male estimated to have ingested 1.5 grams per kilogram of body weight is reported to have suffered diarrhea, nausea and/or vomiting, and other effects on the gastrointestinal tract. Various references report expected symptoms of ingestion to include irritation of the mouth, throat and stomach, digestive tract disorders and/or damage, abdominal pain, nausea, muscle contractions or spasticity, tremors, drowsiness, dilated pupils, and respiratory system stimulation.

FIRE HAZARDS

Lower Flammable Limit: Not combustible

Upper Flammable Limit: Not combustible

Behavior in Fire: Neither the solid product or its solutions in water are combustible.

Hazardous Combustion Products: Although ammonium sulfate is not combustible, it decomposes at high temperatures and evolves irritating and/or very highly toxic gases such as ammonia, sulfur dioxide, sulfur trioxide, and/or oxides of nitrogen. Certain sulfur oxides may combine with moisture in air to form sulfurous and sulfuric acid fumes. Certain nitrogen oxides may similarly form nitrous and nitric acid fumes. Yet other oxides of nitrogen may be strong oxidizing agents.

EXPLOSION HAZARDS

Lower Explosive Limit: Not combustible

Upper Explosive Limit: Not combustible

Explosiveness: Contact with other chemicals, particularly strong oxidizing agents, may result in explosions. See Behavior in Fire section directly above for a discussion of container rupture potential.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber or plastic gloves, long-sleeved shirts, trousers, safety shoes, rubber aprons, face shields, safety goggles, and other appropriate clothing as necessary to provide adequate protection under their circumstances of use. Compatible materials for ammonium sulfate may

PROTECTIVE CLOTHING AND EQUIPMENT (continued)

Protective Clothing Required (continued): include butyl rubber, natural rubber, neoprene, nitrile rubber, polyvinyl chloride (PVC), polyurethane, and styrene-butadiene rubber (SBR).

Respiratory Protection: For fire fighting or when in confined areas, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Where deemed necessary due to high concentrations of ammonium sulfate dust or mist in air, a NIOSH-approved dust or mist respirator appropriate for the airborne contaminant levels present and used within the limitations of these devices. Note that protection may not be necessary if the product has spilled in a non-fire situation and its dusts or mists have not become airborne.

FIRST AID

Nonspecific Symptoms: Irritation of the skin, eyes, nose, throat, or upper respiratory tract; coughing and/or chest discomfort; various symptoms of ingestion.

First Aid for Inhalation: Unlikely to be necessary unless victim has been exposed to the thermal decomposition products of ammonium sulfate. If necessary, remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have victim lean forward with head below hips to prevent aspiration of fluids into lungs. See the Emergency Action Guide for "Nitric Oxide" or "Nitrogen Tetroxide" for additional information where exposures to oxides of nitrogen may have occurred.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention if eye or skin irritation persists after washing.

First Aid for Ingestion: Ammonium sulfate is of relatively low toxicity by ingestion but may nevertheless have adverse effects if ingested in significant quantities. Conversely, entry into the lungs due to aspiration during vomiting may also have adverse effects due to the irritating nature of the product. Most authorities agree that the victim should be administered at least two glasses of water if conscious. Beyond this point, they are divided as to whether or not vomiting should be induced. Get immediate advice from a physician as soon as possible on this issue and/or get the victim immediate medical attention. Do not make an unconscious person vomit under any circumstances. If instructed to induce vomiting or vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: According to several authorities, most fire extinguishing agents may be used in fires involving ammonium sulfate.

Extinguishing Techniques: Stay upwind. Avoid bodily contact.' Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with concentrated gases or fumes from thermally decomposing ammonium sulfate may be:anticipated. Move container from fire area if no risk. Use professional judgment to decide if sealed metal drums or other containers or tanks exposed to excessive heat or fire should be kept cool via use of water sprays to avoid the possibility of container rupture due to buildup and pressurization of gases or steam in the container. If deemed necessary, use water from side and from safe distance to keep containers cool until well after fire is out. For a massive fire in the cargo area under these circumstances, it may be prudent to use unmanned hose holders or monitor nozzles. In any case, stay away from ends of tanks involved in a fire but realize that shrapnel may travel in any direction. See earlier discussions about the decomposition of ammonium sulfate at elevated temperatures and the highly toxic and irritating gases and fumes that may be evolved into the atmosphere. Such decomposition may possibly be reduced or eliminated if exposed solid ammonium sulfate is intentionally wet down with water and maintained in a wet condition, and if solutions are not permitted to evaporate to dryness. Although this action may lead to spread of contamination unless runoff can be contained, it may reduce overall risks to the public in some cases.

SPILL RESPONSES

***General* Information:** Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop discharge if safe to do so. Prevent substance from entering sewers and

SPILL RESPONSES (continued)

General Information (continued): water bodies. Protect sewers and waterways from contaminated runoff: Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or other hazard to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Consult environmental authorities for advice with respect to disposal options; the solid and its solutions may often be suitable for local use as agricultural fertilizers. Take the high toxic hazard of the thermal decomposition products of ammonium sulfate into account while planning the response if the substance may be exposed to fire or high temperatures. Note that ammonium sulfate can be toxic to some kinds of aquatic life at fairly low concentrations in water.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Ammonium sulfate and its solutions in water do not appear capable of generating significant amounts of hazardous airborne contaminants in most non-fire spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed. (Note: In order to pose a significant downwind inhalation hazard, large quantities of dusts or mists must somehow become airborne and/or toxic products of thermal decomposition must be evolved into the atmosphere.)

CONSEQUENCE

Some levels of ammonium sulfate dust or mist may possibly be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow gases and fumes to dissipate where thermal decomposition products of ammonium sulfate are evolved into the atmosphere. These products may be toxic over considerable downwind distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop thermal decomposition of the ammonium sulfate if safe to do so (see earlier "Extinguishing Techniques" section). When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid ammonium sulfate with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Where deemed necessary, water fog or spray applied to ammonium sulfate dust or mist in air may knock them down. Apply water at a point downwind if practical if solid ammonium sulfate is exposed to prevent dissolution in water and spreading of contamination.

CONSEQUENCE

Water runoff may contain varying amounts of ammonium sulfate from contact with the dust or mist.

TECHNIQUE (continued)

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination where deemed necessary. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of solid ammonium sulfate, its solutions, or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate means.

CONSEQUENCE

Any contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.,

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product, particularly solutions or contaminated runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Certain metals are incompatible with ammonium sulfate.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of liquids may be controlled by absorbing them with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil, spilled product, and its residues may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines where deemed necessary.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause

TECHNIQUE (continued)

CONSEQUENCE (continued)

ammonium sulfate dust to become airborne. Hot surfaces of motorized equipment may cause thermal decomposition of ammonium sulfate if contaminated, thus resulting in evolution of highly toxic and irritating gases and fumes.

MITIGATION

Select removal techniques that do not cause dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply appropriate precautions if use of motorized equipment may result in the heating and thermal decomposition of ammonium sulfate. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid ammonium sulfate will sink in water and dissolve at a fairly rapid rate, particularly if water is plentiful compared to the amount of product spilled. Aqueous solutions of ammonium sulfate will dissolve freely in water. Note that the pH of a solution consisting of 10 grams of ammonium sulfate mixed with 100 grams of water is about 5; the pH of a 0.1 molar solution is 5.5. Ammonium sulfate dissolved in water may be toxic to various species of aquatic life at relatively low to moderate concentrations in water. Chlorination of water containing ammonium sulfate causes formation of odorous chloramines, these being the substances that typically cause the "chlorine" smell in swimming pools.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap solid ammonium sulfate on bottom and limit spread of contamination where it appears an opportunity may exist to recover a portion of the material before it dissolves in water.

CONSEQUENCE

Excavation of a deep water pocket or lagoon downstream of the spill area may be difficult and may have adverse environmental impacts. The technique may only be effective where the flow of water is relatively low compared to the amount of solid spilled.

MITIGATION

Use professional judgment to determine if application of this technique is likely to be beneficial in product recovery. Excavate lagoons as a last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water solids that have not dissolved or contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION .

Consult qualified experts for guidance. Use compatible equipment.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

CHEMICAL TREATMENT . . . Application of appropriate chemical agent(s) to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating contaminated water via a processing system constructed on land.

March 1995

AMMONIUM SULFIDE SOLUTION

Class 8 (Corrosive Material)

GENERAL INFORMATION

True ammonium sulfide is only stable in the absence of moisture at temperatures below 32°F (0°C). Consisting of yellow crystals, the substance decomposes upon melting into several different compounds.

The ammonium sulfide shipped and used in commerce is largely ammonium hydrosulfide (also known as ammonium bisulfide) dissolved in water. Such solutions range from colorless to yellow to red or orange and have a strong odor of hydrogen sulfide (like rotten eggs) and ammonia, these being two gases that evolve from the product. Yellow solutions are actually colorless when first made but later yellow with age due to the formation of polysulfides. They usually correspond to about 16 - 20% solutions of ammonium sulfide, while red solutions correspond to about 30% strengths. All solutions are fully soluble in water and weigh on the order of 9 pounds per gallon. They are used to color brass and bronze, and in making textiles, photo developing fluids, synthetic flavors, and various other products.

The hazardous properties of these solutions are not well-defined in the general literature. They are classified as flammable liquids, however, and should be assumed to be volatile in the absence of more detailed information. Thus, be advised that these solutions may be easily ignited under a variety of environmental conditions. Vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is a possibility that containers may rupture violently if exposed to fire or excessive heat for sufficient time duration.

Ammonium sulfide solutions do not react with water or many other common materials and are considered stable in transportation (except for the fact that toxic hydrogen sulfide and ammonia gases may collect in enclosed spaces). Solutions are severely corrosive to copper and zinc and their alloys (including brass) and may otherwise react with a wide variety of other chemicals. Reactions with acids or their fumes, in particular, may evolve large quantities of hydrogen sulfide. The product is severely irritating and toxic via the various routes of exposure. Products of thermal decomposition or combustion include several highly toxic constituents. Please refer to the Emergency Action Guides for ammonia and hydrogen sulfide for further information on the hazardous properties of these gases in air.

If an ammonium sulfide solution is leaking (not on fire) and generating vapors or fumes, evacuation of the immediate spill area and downwind should be considered until properly equipped responders have evaluated the hazard. If a fire is prolonged or uncontrollable, or if a container is exposed to direct flame, evacuate for a radius of one-half ($^{1}/_{2}$) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: The solution is soluble in all proportions.

Solubility in Other Chemicals: True ammonium sulfide is soluble in alcohol, alkalies, and ammonia. Ammonium hydrosulfide is soluble in alcohol and ammonia.

Specific Gravity (Liquid): 0.99–1.01 at 68°F (20°C)

Boiling Point: 104°F (40°C) reported for unspecified composition; 91.9°F (33.3°C) for pure ammonium hydrosulfide.

Melting Point: Unavailable

Freezing Point: Unavailable

Molecular Weight: 68.14 for pure ammonium sulfide; 51.11 for ammonium hydrosulfide.

Heat of Combustion: Unavailable

Vapor Pressure: 400 mm Hg (7.732 psia) for pure ammonium hydrosulfide at 71.2°F (21.8°C)

Flash Point: 72°F (22.2°C), closed cup, reported for unspecified composition.

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable, but toxic hydrogen sulfide and ammonia gases may collect in enclosed spaces.

Corrosiveness: Severely corrodes copper, zinc, and their alloys including brass and bronze.

Reactivity with Water: No reaction but some amount of heat is generated when the pure compound is first dissolved in water.

Reactivity with Other Chemicals: Inompatible with strong oxidizers, alkalies, and aluminum. Contact of the solution with acids or acid fumes liberates toxic hydrogen sulfide gas. Reactions of ammonium salts in general with potassium chlorate or molten nitrite salts can be violent or explosive. Inorganic sulfides can also be considered strong reducing agents that are generally reactive with a wide variety of other chemicals.

IDENTIFICATION

Shipping Names: Ammonium sulfide solution (USDOT); ammonium sulphide, solution (IMO).

Synonyms and Tradenames: Ammonium mercaptan; ammonium bisulfide, ammonium hydrogen sulfide; ammonium hydrosulfide; ammonium sulfhydrate; diammonium sulfide.

Chemical Formula: $(NH_4)_2S$ for pure ammonium sulfide; NH_4HS for ammonium hydrosulfide.

Constituent Components (% each): Usually 20 –60% solution of ammonium sulfide in water.

UN/NA Designation: UN2683

IMO Designation: 8 corrosive

Physical State As Shipped: *Usually liquid*

Physical State As Released: Usually liquid

Color of the Shipped Material: Colorless to yellow, red or orange depending on age and concentration. Odor ***Characteristics:*** Strong odor of rotten eggs (sulfide) and ammonia.

Common Uses: Textile manufacture, trace metal analysis, coloring brass and bronze, photo developers, synthetic flavors, iron control in soda ash production.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

AMMONIUM SULFIDE SOLUTION

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: A toxic, flammable, and somewhat corrosive liquid that is of variable composition and for which available data are very limited.

Short Term Exposure Limits (STEL): Unavailable; 35 ppm for ammonia and 15 ppm for hydrogen sulfide for 15 minutes (ACGIH).

Time Weighted Average (TLV-TWA): Unavailable; 25 ppm for ammonia and 10 ppm for hydrogen sulfide over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the significant vapor or fume concentrations that may be present in air in the spill area and over some distance downwind. Direct physical contact and ingestion should also be strictly avoided.

Hazards of Skin or Eye Contact: Contact with ammonium sulfide solution causes softening of the skin and severe irritation and or burns. The liquid may be absorbed through the skin and cause hydrogen sulfide poisoning. Contact with liquid ammonium sulfide solution may cause severe burns of the eyes.

Hazards of Inhalation: Inhalation of 500 ppm of ammonium sulfide solution vapors or fumes in air for 30 minutes may cause headache, dizziness, coughing, difficult breathing, pulmonary edema (which may be delayed in onset) and/or bronchial pneumonia. Exposure to 600 ppm for 30 minutes may be fatal.

Hazards of Ingestion: Ammonium sulfide solution is considered to be highly toxic when ingested due to the nausea, irritation, and tissue corrosion caused by liberation of hydrogen sulfide. Mucous membranes and the stomach may be severely irritated or burned.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquid. May generate large quantities of flammable gas or vapor upon release. Vapors may travel some distance to a source of ignition and flash back. There is a possibility that containers may rupture violently in fire.

Hazardous Combustion Products: Decomposes at high temperatures and/or when burned into ammonia, hydrogen sulfide, polysulfides, sulfur oxides, nitrogen oxides, and other toxic compounds.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is a possibility that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with ammonium sulfide solution. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. A maker of ammonium sulfide solution indicates that compatible materials may include polyvinyl acetate.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2683 AMMONIUM SULFIDE SOLUTION

Class 8 (Corrosive Material)

FIRST AID

Nonspecifc Symptoms: Irritation or burns of bodily tissues, headache, dizziness, nausea, coughing, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, appropriate type of foam. Water may be ineffective but may be used to dilute spill to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture, explosion, or damage to boilers or industrial process equipment. Use explosion-proof and spark-proof equipment and tools where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the toxic, flammable, and corrosive nature of ammonium sulfide solution into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Ammonium sulfide solution spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled, the product is warm, and/or the solution is highly concentrated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

AMMONIUM SULFIDE SOLUTION

Class 8 (Corrosive Material)

TECHNIQUE

MONITOR THE SITUATION . . . Ammonium sulfide solutions may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of various toxic gases may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ammonium sulfide solution vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain ammonium sulfide or other chemicals from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid ammonium sulfide solutions may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of ammonium sulfide solution vapors into the atmosphere, but various sources disagree on which type of foam is most appropriate.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid ammonium sulfide solution may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques. Note that application of acid may generate large quantities of toxic hydrogen sulfide gas unless properly conducted.

AMMONIUM SULFIDE SOLUTION

Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Ammonium sulfide solutions may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained ammonium sulfide solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques. Note that application of an acid may generate large quantities of toxic hydrogen sulfide gas unless properly conducted.

AMMONIUM SULFIDE SOLUTION
Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land. Note that application of acid may generate large quantities of toxic hydrogen sulfide gas unless properly conducted.

March 1995

ANILINE OIL
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Aniline oil, also simply called aniline, is a colorless to brown liquid used in making dyes, solvents, vulcanizing agents, resins, pharmaceuticals, varnishes, perfumes, inks, nylon fiber, shoeblack, and a variety of other chemicals and products. It has a peculiar, musty or fishy odor, is barely heavier than water, and is somewhat soluble. Its flash point of 158°F indicates the product must be moderately heated before ignition may occur easily. The product weighs approximately 8.5 pounds per gallon .

Aniline oil does not react with water or many other common materials and is stable in normal transportation. It is reactive with various other chemicals and may be corrosive to copper, copper alloys, and brass. It is a highly toxic substance and is considered to be a poison. Products of combustion may be toxic and may include nitrogen oxides as well as unburned aniline oil.

Downwind evacuation should be considered if aniline oil is leaking from its container but not on fire. However, since the product is of low volatility, judgments are required on a case by case basis.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Somewhat soluble, 3.5 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and carbon tetrachloride.

Specific Gravity (Liquid): 1.022 at 68°F (20°C)

Boiling Point: 363.6°F (184.2°C) at 1 atm

Melting Point: 20.7°F (–6.3°C)

Freezing Point: 20.7°F (–6.3°C)

Molecular Weight: 93.13

Heat of Combustion: –8320 cal/g

Vapor Pressure: 0.6 mm Hg (0.012 psia) at 68°F (20°C)

Flash Point: 158°F (70°C), closed cup; 168°F (75.6°C), open cup.

Autoignition Temperature: 1418°F (770°C)

Burning Rate: 3.0 mm/minute

Stability: Stable

Corrosiveness: May attack copper, copper alloys, brass, and some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with nitrobenzene and glycerin, ozone, perchloric acid and formaldehyde, potassium or sodium peroxide, diisocyanates, strong acids or oxidizers, acetic anhydride, tri-or hexachloromelamine, perchromates, beta-propiolactone, and certain other chemicals.

IDENTIFICATION

Shipping Names: Aniline (USDOT & IMO).

Synonyms and Tradenames: Benzenamine; aniline; aminobenzene; phenylamine; aminophen; anilin; Blue oil; Anyvim; Kyanol.

Chemical Formula: $C_6H_5NH_2$

Constituent Components(% each): 99.5% pure in commercial grade

UN/NA Designation: UN1547

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid, freezes at 20.7°F

Physical State as Released: Liquid, freezes at 20.7°F

Color of the Shipped Material: Colorless to pale yellow or brownish

Odor Characteristics: Aromatic, amine-like; peculiar; musty, fishy, oily.

Common Uses: Dyes, varnishes, solvents, vulcanizing agent, resins, shoeblack, pharmaceuticals, perfumes, inks, sweetening agents, nylon fibers, photographic and agricultural chemicals, and other chemicals and products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ANILINE OIL

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.096-1.07 ppm

Unusual Hazards: Highly toxic substance that affects the ability of blood to carry oxygen. Readily absorbed through intact skin to cause toxic effects. Effects are more dangerous than readily apparent and may be delayed up to 4 hours.

Short Term Exposure Limits(STEL): 5 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 2 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Aniline oil is highly toxic by all potential routes of exposure.

Hazards of Skin or Eye Contact: Even small amounts of aniline oil can be rapidly absorbed through the skin to cause cyanosis (see below) with first symptom typically a headache. The liquid is mildly irritating to the skin or eyes, but eye contact may result in some degree of corneal damage.

Hazards of Inhalation: Causes cyanosis and thereby affects the ability of the blood to carry oxygen. Symptoms include bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, drowsiness, shortness of breath, unconsciousness, and possibly death if treatment is not prompt. Effects may be delayed up to 4 hours. Levels as low as 7-53 ppm in air may cause some symptoms.

Hazards of Ingestion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 1.3%

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite. May generate highly toxic vapors when hot.

Hazardous Combustion Products: May include toxic nitrogen oxides and unburned aniline.

EXPLOSION HAZARDS

Lower Explosive Limit: 1.3%

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from hot liquid are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

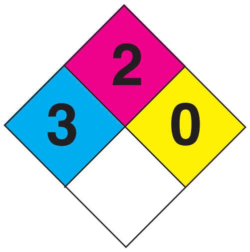
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, natural rubber, neoprene, nitrile rubber, polyethylene, chlorinated polyethylene, polyvinyl alcohol, styrene-butadiene rubber, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gasmask with chin-style or front or back mounted organic vapor canister (100 ppm or less) or an organic vapor cartridge respirator with a full facepiece (100 ppm or less) within the use limitations of these devices.

1547

ANILINE OIL

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific symptoms: Headache or other symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention as necessary to cleaning hair and scalp, finger and toenails, nostrils, and ear canals.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray.

Extinguishing Techniques: Unusual toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the special toxic properties of aniline oil fully into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Aniline oil spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts have spilled or the product is hot.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Aniline oil may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of aniline oil in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel

ANILINE OIL
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to aniline oil vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount of aniline oil from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of aniline oil vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Aniline oil may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained aniline oil may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

ANILINE OIL
Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contammation.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal .

ANILINE OIL
Division 6.1 (Poisonous Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 1992

ARGON
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Argon is a colorless, odorless, nonflammable and nontoxic element of nature that makes up about 0.93% of the atmosphere by volume and is handled as a compressed gas under high pressure or as a refrigerated liquid at extremely low temperatures. It is used as an inert gas in many industrial operations including arc welding, metal finishing, and growing high purity crystals for semiconductors, and is also employed in Geiger counting tubes, lasers, and certain types of electric lamps. Due to its very slight solubility in water and boiling point of approximately – 302°F, spills of liquefied argon on land or water or ruptures of compressed gas containers may quickly generate large quantities of heavier than air gas that may persist for a time in pits, hollows, and depressions. These may appear white at first due to condensation of water vapor in the air. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The refrigerated liquid weighs approximately 11.7 pounds per gallon at its normal boiling point temperature.

Due to the fact that the compressed gas is shipped at temperatures far in excess of its very low critical temperature, the pressure within containers of compressed gas is a function of the temperature of the container and the amount of argon it contains (such that the term "vapor pressure" no longer has meaning). These pressures can vary widely but are typically in the range of 121 to 409 atmospheres (1775 – 6000 psig) at room temperature within gas cylinders.

Argon is an inert substance that does not react with other materials and is fully stable. Although it is completely nontoxic, the large volumes of gas that may be generated in a major accident may cause suffocation by displacing oxygen in the air. The extremely low temperatures that may occur under certain conditions of release (primarily but not exclusively from discharges of liquid) may cause tissue damage and burns due to frostbite.

Note: Ordinary argon is composed of three stable isotopes. A fourth isotope, argon 37, is a radioactive gas that produces ionizing but not gamma radiation and which has a half-life of 35.1 days. This guide is solely intended for use with the more common non-radioactive argon isotopes.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 5.6 ml (gas)/ 100 ml water at 32°F (0°C); 3.36 ml (gas)/100 ml water at 68°F (20°C).

Solubility in Other Chemicals: Soluble as a gas to some extent in organic liquids

Specific Gravity (Liquid): 1.40 at normal boiling point

Boiling Point: – 302.6 to – 302.3°F (–185.9 to –185.7°C) at 1 atm.

Melting Point: – 308.9 to –308.6°F (–189.4 to –189.2°C)

Freezing Point: See melting point

Molecular Weight: 39.95

Heat of Combustion: Not flammable

Vapor Pressure: See General Information section above.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Noncorrosive; requires no special materials of construction so long as temperatures and pressures are tolerated.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: None; not known to combine with any other element; considered inert.

IDENTIFICATION

Shipping Names: Argon (USDOT and IMO); argon, refrigerated liquid (USDOT and IMO); argon, compressed (USDOT)

Synonyms and Tradenames: None, argon is one of the natural elements

Chemical Formula: Ar or A (monatomic gas)

Constituent Components (l each): More than 99.99% pure

49 STCC: 49 045 02 (argon or compressed argon);49 045 03 (refrigerated liquid)

UN/NADesignataon: UN1006 (argon or compressed argon); UN1951 (refrigerated liquid)

IMO Designation: 2.2, nonflammable gas

Physical State As Shipped: Compressed gas or refrigerated liquid

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Odorless

Common Uses: Arc welding; filling electric lamps; flushing and blanketing agent in metal refining; in Geiger counting tubes, lasers, and thermometers; furnace brazing; growing high purity crystals for semiconductors; general use as inert gas.

ARGON
Division 2.2 (Nonflammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Large volumes of nontoxic and nonflammable gas generated upon release may cause suffocation via displacement of oxygen in air at high concentrations. Extreme cold of liquid or vapors may cause tissue damage or burns due to frostbite. There is a possibility that temperatures may be low enough under some conditions to condense and liquefy some amount of oxygen from air on the surface of equipment containing liquid argon. Heavier than air gas may persist for a time in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable; see below

Time Weighted Average (TLV-TWA): Unavailable; listed as simple asphyxiant.

Conditions to Avoid: Entry into any area in which oxygen levels may be reduced unless a self-contained breathing apparatus (SCBA) is worn. Contact with cold liquid, gas, or containment equipment. Use of equipment not suitable for the temperatures and pressures that may be encountered.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from asphyxiation due to the high gas concentrations that may be present in air in the immediate spill area. Contact with extremely cold liquid, gas, or containment equipment should be avoided to prevent tissue damage and burns due to frostbite.

Hazards of Skin or Eye Contact: Contact with liquid argon or very cold argon gas may cause extensive tissue damage or burns due to the extremely low temperatures involved. Blistering and deep tissue freezing may occur from excessive contact.

Hazards of Inhalation: High concentrations of argon gas in air may cause suffocation by diluting the concentration of oxygen in air below levels necessary to support life. Lack of oxygen may produce dizziness, nausea, errors in judgment, fatigue, accelerated pulse, gasping, confusion, vomiting, headache, loss of consciousness and death, possibly in seconds and without warning. Dangers increase as oxygen levels drop below 18 percent by volume in air.

Hazards of Ingestion: Ingestion of liquid argon is highly unlikely.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable compressed gas or refrigerated liquid. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of gas upon release.

Hazardous Combustion Products: Not flammable; will not decompose.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Not flammable but containers may rupture violently in fire due to overpressurization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with excessively cold liquid argon, gas, or containment equipment. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Note that gas masks or cartridge type respirators will not function in oxygen depleted environments and may lead to suffocation.

FIRST AID

Nonspecific Symptoms: Symptoms of oxygen deficiency or frostbite.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration and get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove frozen clothing after thawing. Wash affected body areas with large amounts of water. Get medical attention immediately. Do not use hot water on or rub frostbitten areas.

1006

ARGON
Division 2.2 (Nonflammable Gas)

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid bodily contact with cold liquid or gas. Wear breathing apparatus and appropriate protective clothing where necessary. Move container from fire area if no risk. Be alert to container rupture potential due to overpressurization. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent entrapment of liquid in closed systems. Use oxygen monitoring equipment to test for oxygen deficient atmospheres where necessary. Vent argon to atmosphere slowly in well ventilated outdoor location if this method of disposal is selected. Since the boiling point of argon is somewhat less than that of oxygen, there is a possibility that cold liquid argon in exposed piping may cause some amount of oxygen in air to condense and liquefy. Consequently, it is best that any insulating materials used be compatible with oxygen if possible. Only metals and materials compatible with extremely low temperatures and/or high pressures should be used, thus excluding use of metals or other materials that may become brittle at the low temperatures that may be encountered. Take the heavier than air and potentially cold nature of argon into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Argon discharges may not generate hazardous airborne contaminant concentrations over significant distances in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the product is removed or depleted, particularly if less than bulk amounts have been released in outdoor locations.

CONSEQUENCE

Hazardous levels of argon in air may be found in the local spill area and immediately downwind.

MITIGATION

Restrict access to the local spill area and areas immediately downwind by unprotected personnel until flow is stopped or the container empties. Check for oxygen levels in air.

TECHNIQUE

EVACUATION . . . Where necessary due to the possibility of massive releases in populated areas, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

ARGON
Division 2.2 (Nonflammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid argon, where necessary due to vulnerable surroundings, may be contained by building dikes or barriers using soil, sand or other materials. Note that any spilled liquid will boil vigorously at first and continue to vaporize rapidly.

TECHNIQUE

EXCAVATION . . . Where necessary, a trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Where necessary and possible, accumulated liquid pools may possibly be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks due to the high pressures and low temperatures that may be encountered.

MITIGATION

Use suitable equipment. Consider allowing liquid argon to boil or evaporate until naturally depleted or use a light water spray to accelerate boil-off.

WATER SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Any liquid argon contacting a water body will rapidly boil off. Traces of argon remaining in the water (if any) are completely harmless.

ARSENIC ACID, LIQUID

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Arsenic acid liquid, sometimes called orthoarsenic acid, is a pale yellow, green or transparent liquid which may be odorless, have a slight sweet odor or have an acrid odor. It is a toxic liquid with a boiling point of around 100 - 160ºF. It is a non-flammable liquid, but may react with metals to produce flammable hydrogen gas. It is used in the manufacture of arsenates, glass making, wood treating process, defoliant (regulated), dessicant for cotton and sterilant. It is completely soluble in water and heavier. Vapor density is unknown but may be heavier than air and may persist for a time in pits, hollows, and depressions. Containers of liquid may rupture violently and possibly explode if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 14.2 to 16.7 pounds per gallon.

Arsenic acid liquid is stable, however, excessive heat such as found in fire situations may make it unstable and it may generate toxic arsenical fumes. The product may react with many metals forming flammable hydrogen gas and basic materials to form arsenate salts. Reducing agents, alcohol, wood, turpentine, metal powders and hydrogen sulfide should also be avoided. Decomposition products may include arsenic pentoxide, arsenic trioxide and arsenates. Toxic arsine gas can be generated in the presence of aluminum and zinc reducing agents.

Product is highly toxic by all routes of exposure. Arsenic acid is a known carcinogen.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble.
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 1.713 - 2.0
Vapor Density: Unavailable
Boiling Point: Varies based on concentration; approximately 212 - 320ºF (100 - 160ºC)
Melting Point: Approximately 95ºF (35ºC)
Freezing Point: Unavailable
Molecular Weight: 141.94
Heat of Combustion: Not flammable
Evaporation Rate (butyl acetate=1): Unavailable, but one source reports it to be slower than ether.
Vapor Pressure: 17.5 mmHg at 68ºF (20ºC)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable Limits: Not flammable
pH: Weakly acid.
Stability: Stable; avoid heat.
Polymerization Potential: Will not occur.
Corrosiveness: Corrosive to tissues and metals.
Reactivity with Water: Not reactive.
Reactivity and Incompatibility: Reacts with steel, aluminum, zinc, galvanized metals and brass to evolve toxic arsine fumes. Reacts with basic materials to form arsenate salts. Avoid reducing agents, alkaline chemicals, alcohol, wood, turpentine, metal powders and hydrogen sulfide. Reaction with metals may produce flammable hydrogen gas.

IDENTIFICATION

Shipping Name(s): Arsenic acid, liquid (USDOT & IMO)
Synonyms and Tradenames: Orthoarsenic acid
CAS Registry No.: 7778-39-4
Chemical Formula: H_3AsO_4
Constituent Components (% each): Percentage of arsenic acid varies greatly, many solutions contain 2-5% nitric acid.
UN/NA Designation: UN1553
IMO Designation: 6.1, Toxic substances
RTECS Number: CG0700000
NFPA 704 Hazard Rating: 3(Health): 0(Flammability): 1(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Reports vary; pale yellow or green to a transparent liquid
Odor Characteristics: Reports vary; odorless, a light sweet odor or an acrid odor.
Reportable Quantity: See appendix I.
Common Uses: Manufacture of arsenates, glass making, wood treating process, defoliant (regulated), dessicant for cotton and sterilant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ARSENIC ACID, LIQUID

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Arsenic compounds are known human carcinogens and are highly toxic.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.2 mg/m^3 (ACGIH)

Ceiling (C) Limit: 0.002 mg/m^3 (NIOSH for arsenic solid)

IDLH: 5 mg/m^3

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Dangerous by all routes of exposure. The major hazard is from inhalation or ingestion.

Hazards of Skin or Eye Contact: Contact of liquid with the skin may be corrosive and may result in severe burns and tissue destruction. Contact with the eyes may be extremely irritating and corrosive and may result in burns.

Hazards of Inhalation: Inhalation is highly toxic and may cause intense irritation of the eyes, mucous membranes, and respiratory tract.

Hazards of Ingestion: Ingestion is highly toxic and may cause burns of the mouth, throat, and stomach.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Non-flammable liquid. May generate toxic arsenical fumes in fire situations. Concentrated material may be a strong oxidizer and its heat of reaction with reducing agents or combustibles may cause ignition.

Hazardous Combustion Products: Decomposition products may include arsenic pentoxide, arsenic trioxide and arsenates. Toxic arsine gas can be generated in the presence of aluminum and zinc reducing agents.

EXPLOSION HAZARDS

Explosive Potential: Concentrated material reacts explosively with combustible organic or readily oxidizable (especially if there is a nitric acid content) materials such as: alcohols, turpentine, charcoal, organic refuse, metal powder, hydrogen sulfide, etc. Reacts with most metals to release hydrogen gas which can form explosive mixtures with air.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with hazardous vapor or fume concentrations in air under accident conditions.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues and the respiratory tract; intense irritation of the eyes; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek medical attention immediately if skin irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

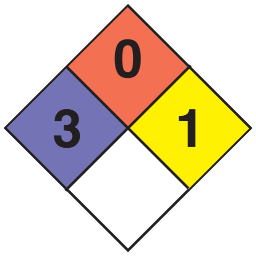
First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

1553

ARSENIC ACID, LIQUID

Division 6.1 (Poisonous Materials)



FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, water spray or foam.

Extinguishing Techniques: Unusual and toxic vapor hazard. Stay upwind. Avoid all bodily contact. Wear self-contained breathing apparatus. Wear full chemical protective suit if contact with material or fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture if exposed to fire conditions such as from a direct flame. Use water from a safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Take into consideration the highly toxic nature of arsenic acid while planning the response. Downwind evacuation should be considered. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Use intrinsically safe equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product, and which will not initiate a reaction. Take potential reactivity and high toxicity of arsenic acid into account when planning the response.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists, particularly if small amounts have spilled in cold weather.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind. Note that even very low concentrations may be irritating to the eyes and respiratory system.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Apply water at a point downwind. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

ARSENIC ACID, LIQUID
Division 6.1 (Poisonous Materials)

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts. Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid product may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Liquid product may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

ARSENIC ACID, LIQUID

Division 6.1 (Poisonous Materials)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with activated carbon, sand, or other nonreactive and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

ARSENIC ACID, LIQUID

Division 6.1 (Poisonous Materials)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

ARSENIC TRICHLORIDE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Arsenic trichloride is a colorless or pale yellow or yellow-brown nonflammable fuming liquid with an acrid, pungent, and unpleasant odor. It is used in the ceramics industry and for making various arsenic compounds used in the manufacture of pharmaceuticals, insecticides, and other products. The substance reacts with water to form hydrogen chloride, hydrochloric acid, and arsenic compounds while generating heat, which also explains its fuming in moist air. The hydrochloric acid generated can react with most common metals to liberate flammable and potentially explosive hydrogen gas. Liquid arsenic trichloride itself weighs approximately 18 pounds per gallon.

Arsenic trichloride is stable in normal transportation, but besides reacting with water or moisture, is decomposed by ultraviolet light and certain active metals (which promote fuming) and may explode upon impact when mixed with certain other metals. It is highly toxic and corrosive by all routes of exposure and is considered to be a poison. Involvement in a fire may produce irritating and toxic fumes and vapors of hydrogen chloride, hydrochloric acid, and arsenic and its compounds.

Downwind evacuation should be considered when arsenic trichloride is leaking from its container until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Decomposes; see below

Solubility in Other Chemicals: Soluble in or solvent for hydrogen bromide or chloride, alcohol, chloroform, carbon tetrachloride, ether, iodine, phosphorus, sulfur, alkali iodides, and oils and fats.

Specific Gravity (Liquid): 2.16 at 68°F (20°C)

Boiling Point: 266.4°F (130.2°C) at 1 atm.

Melting Point: –0.4 to 16.7°F (–18 to –8.5°C); reported values vary.

Freezing Point: See melting point

Molecular Weight: 181.3

Heat of Combustion: Not flammable

Vapor Pressure: 10 mm Hg (0.193 psia) at 74.3°F (23.5°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Corrodes metal; stainless steel, coated steel, or polyethylene containers can be used for short term storage. Requires glass for long term storage.

Reactivity with Water: Reacts exothermically with water to form arsenic hydroxide ($As(OH)_3$) and hydrogen chloride (HCl) or hydrochloric acid fumes. Further dilution results in precipitation of arsenic trioxide (As_20_3).

Reactivity with Other Chemicals: Incompatible with reducing agents and active metals such as iron and zinc. Can explode upon impact when mixed with metallic sodium, potassium, or aluminum. Decomposes when exposed to ultraviolet light.

IDENTIFICATION

Shipping Names: Arsenic trichloride, (USDOT and IMO)

Synonyms and Tradenames: Arsenic (III) trichloride; arsenic chloride; arsenous chloride; arsenious chloride; caustic arsenic chloride; butter of arsenic; fuming liquid arsenic; caustic oil of arsenic.

Chemical Formula: $AsCl_3$

Constituent Components (% each): Unavailable; one maker states its product is more than 95% pure; another says 100%.

UN/NA Designation: UN1560

IMO Designation: 6.1, poisonous substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid (may solidify at low temperatures)

Color of the Shipped Material: Colorless or pale yellow or yellow-brown oily liquid.

Odor Characteristics: Acrid; unpleasant; pungent

Common Uses: Used in the ceramics industry, in making arsenic compounds containing chlorine, and in making organic arsenicals used in pharmaceuticals and insecticides.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ARSENIC TRICHLORIDE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic product that reacts with water or moisture in air to evolve hydrochloric acid fumes and vapors. Vapors and fumes generated when the product is involved in a fire may also contain highly toxic arsenic compounds. Any hydrochloric acid formed may react with metals to evolve flammable and potentially explosive hydrogen gas.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.2 mg/m^3 as Arsenic over each 8 hours of a 40 hour work week (ACGIH).

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the vapors or fumes of arsenic trichloride or its decomposition products that may be present in significant concentrations in air in the spill area and downwind. Direct contact and ingestion are also to be strictly avoided. There is evidence to suggest that inorganic arsenic compounds are skin and lung carcinogens in humans.

Hazards of Skin or Eye Contact: Contact of the skin with arsenic trichloride may cause local irritation, blisters, and severe burns, and the product may be rapidly absorbed through the skin in toxic amounts. Exposure of the eyes to vapors may cause spasm of the eyelids, tearing, pain, and reddening. Contact with the liquid may cause severe eye burns. Do not wear contact lenses when working with this product.

Hazards of Inhalation: Arsenic trichloride is poisonous if inhaled and causes irritation of the nose and throat. Symptoms of possible arsenic poisoning may be delayed. A concentration of 338 ppm was lethal to some mice after 10 minute exposures in laboratory experiments; cats died after one hour exposure to approximately 13.3 ppm (100 mg/m^3).

Hazards of Ingestion: Ingestion of arsenic trichloride causes severe irritation of the mouth and stomach. Symptoms of poisoning usually appear one-half to one hour after ingestion and include sweetish metallic taste, garlicky odor on the breath and stools, throat constriction, difficulty in swallowing, abdominal pain, vomiting, cold sweat, diarrhea, bluing of the skin, weak pulse, dizziness, headaches, coma, convulsions, and possibly death. The fatal human dose is 70–180 mg depending on the weight of the victim.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Non-flammable liquid. There is a rather limited possibility that containers may rupture violently in fire due to overpressurization. May generate large quantities of highly toxic and corrosive vapors and fumes upon release.

Hazardous Combustion Products: Not flammable but irritating and toxic hydrogen chloride and hydrochloric acid fumes and vapors and toxic fumes and vapors of arsenic and its compounds may form in fires.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

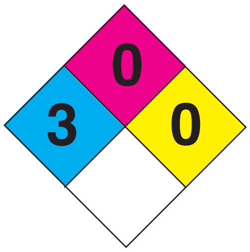
Upper Explosive Limit: Not flammable

Explosiveness: Mixtures with other substances such as sodium, potassium, or aluminum may explode upon impact. Contact of hydrochloric acid (formed in reactions with moisture or water) with most common metals produces hydrogen gas that may explode if ignited in confined spaces.

1560

ARSENIC TRICHLORIDE

Division 6.1 (Poisonous Material)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with arsenic trichloride. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. A maker of arsenic trichloride indicates that compatible materials may include polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid-type canister within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; symptoms of arsenic poisoning.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Although some authorities recommend induction of vomiting due to the high toxicity of arsenic, at least one recommends against it, probably due to the possibility of serious injury upon possible aspiration of acid into the lungs. Seek immediate medical advice on this issue if possible.)

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire. Note that arsenic trichloride reacts with water to produce hydrogen chloride and hydrochloric acid fumes but water spray or fog will help control these fumes.

Extinguishing Techniques: Toxic and corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes/smoke anticipated. Move container from fire area if no risk. Remove and isolate contaminated clothing at the site. Dike fire control water for later disposal. Do not scatter the material.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that some amounts of hydrogen gas may be liberated upon contact of hydrochloric acid with most common metals. Use explosion-proof and spark-proof equipment and tools where necessary. Take the reactive, highly toxic and corrosive nature of arsenic trichloride into account when planning the response.

ARSENIC TRICHLORIDE
Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Arsenic trichloride spills or fires involving this product may expose downwind areas to toxic concentrations over considerable distances if large quantities of vapors or fumes are evolved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to arsenic trichloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain various hazardous chemicals from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to arsenic trichloride may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to arsenic trichloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Arsenic trichloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained arsenic trichloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

ARSENIC TRICHLORIDE

Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

ARSENIC TRICHLORIDE

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Where feasible and necessary, stream or lake beds may be dredged to remove heavier-than-water precipitates containing arsenic and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore as slurry.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage.

MITIGATION

Consult qualified experts for guidance.

March 1995

ARSENIC TRIOXIDE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Arsenic trioxide is a white powder that is usually considered to be odorless but may have a garlic-like odor. It is used for making lead-based alloys, rust inhibitors, preservatives, insecticides, herbicides, and a variety of other products. It is slightly soluble in water and considerably heavier so may be expected to sink and slowly dissolve. The product is not flammable and weighs approximately 231 pounds per cubic foot.

Arsenic trioxide does not react with water or common materials and is stable in normal transportation. It is incompatible with acids, sodium chlorate, mercury, and a variety of relatively unusual chemicals. The product is highly toxic by inhalation or ingestion and can be absorbed through the skin. In a fire situation, arsenic trioxide may emit highly toxic arsenic oxides or arsine upon decomposition.

If the material is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. If the material is on fire or involved in a fire, toxic combustion products may be formed; downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 1.82 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in hydrochloric acid, glycerol, and aqueous solutions of sodium hydroxide, sodium carbonate, and potassium hydroxide.

Specific Gravity (Solid): 3.7 at 68°F (20°C)

Boiling Point: Approx. 855°F (457°C) at 1 atm. (sublimes)

Melting Point: Approx. 599°F (315°C); some forms sublime

Freezing Point: Approx. 599°F (315°C); some forms sublime

Molecular Weight: 197.82

Heat of Combustion: Not flammable

Vapor Pressure: 1 mm Hg (0.019 psia) at 414.5°F (212 .5°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Corrosive to some metals (including copper and aluminum) in the presence of moisture.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with chlorine trifluoride, fluorine, hydrogen fluoride, oxygen difluoride, sodium chlorate, mercury, acids, water solutions of active metals, Rb_2C_2, zinc filings (may explode if heated), and aluminum.

IDENTIFICATION

Shipping Names: Arsenic trioxide, (USDOT and IMO);

Synonyms and Tradenames: Arsenous acid; arsenous acid anhydride; arsenous oxide; arsenic sesquioxide; white arsenic; arsenic oxide; arsenous anhydride; diarsenic trioxide; arsenious oxide; arsenic (III) oxide; arsenious trioxide; arsenite; arsenolite; crude arsenic; claudetite; arsodent.

Chemical Formula: As_20_3

Constituent Components(% each): crude 95%; refined, 98-99.999%; rest mostly Sb_20_3 and traces of other metals.

UN/NA Designation: UN1561

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Solid

Physical State as Released: Solid

Color of the Shipped Material: White

Odor Characteristics: Usually odorless but may have garlic-like odor

Common Uses: Mfg. of lead-based alloys, rust inhibitor, glass, wood and leather preservatives, paints insecticides, herbicides, rodenticides, other arsenic compounds, and textiles.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

ARSENIC TRIOXIDE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Arsenic trioxide is highly toxic by ingestion or inhalation. It is suspected of being a carcinogen.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 0.2 mg/m^3 arsenic over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Entry into sewers or water; contact with incompatible materials; exposure of spilled product to heat or fire; inhalation of dust in air or fumes from material in fire; ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Arsenic trioxide is highly toxic by ingestion or inhalation. It is a recognized carcinogen of the lungs, liver, and skin and may also be carcinogenic to other organs.

Hazards of Skin or Eye Contact: Arsenic trioxide is capable of being absorbed through the skin in toxic amounts and of sensitizing the skin and causing inflammation. Prolonged eye contact may cause discomfort, edema of the lids, corneal injury and opacity.

Hazards of Inhalation: Breathing of arsenic trioxide dust may result in irritation of the stomach, intestine, and throat; diarrhea; anorexia; bloody stools or vomit; weak rapid pulse; cold sweats; liver damage; ulceration and perforation of the nasal septum; and coma. Large doses may be fatal.

Hazards of Ingestion: Ingestion may cause severe gastritis or gastroenteritis leading to collapse, shock, and death. Symptoms may include vomiting, headache, vertigo, muscle spasm, stupor, delirium, mania, and others. First symptoms may be delayed several minutes or even hours.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May emit highly toxic arsenic oxides or arsine upon decomposition in fire situation.

Hazardous Combustion Products: Decomposes to toxic arsenic oxides and/or arsine.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Generally not flammable or explosive.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, hood or hat, coveralls, and other impervious and resistant clothing for fine solids.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For low level exposures, a full or half mask respirator with replaceable dust or fume filter.

FIRST AID

Nonspecific symptoms:

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

1561

ARSENIC TRIOXIDE

Division 6.1 (Poisonous Material)

FIRE RESPONSE

Extinguishing Materials: Water, dry chemicals, carbon dioxide, foam, or dry ground dolomite for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible. that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Arsenic trioxide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of arsenic trioxide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access of unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid arsenic trioxide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose of or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to arsenic trioxide dust in air may reduce hazardous conditions.

CONSEQUENCE

Water runoff may contain varying amounts of arsenic trioxide.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Arsenic trioxide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Rain or other sources of liquid may permit arsenic trioxide to percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. If possible, protect arsenic trioxide from becoming wet.

ARSENIC TRIOXIDE

Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed with shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause toxic dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be diffcult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

ARSENIC TRIOXIDE

Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

Chemical treatment . . . Application of appropriate chemical agents to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some of the agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

September 2000

ASPHALT

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

The term asphalt is used to describe a number of dark brown to black liquids containing a complex mixture of heavy hydrocarbons, kerosene or other light oils, and various impurities. These thick semisolid liquids have a tarry or smoky odor and are used in paving or sealing road surfaces and as a base for various coatings and paints. They are generally considered insoluble in water and may either float or sink depending on specific composition. Flash points may vary from 50-550ºF and indicate that some products may be very difficult to ignite while others must be considered flammable liquids. It is noteworthy that some of the higher flash point liquids may be shipped in a heated condition and may therefore evolve flammable vapors when first spilled. Asphalt becomes molten at about 200°F. Under appropriate conditions, vapors may travel to a source of ignition. There is a limited potential for containers of more volatile grades to rupture violently if exposed to fire or excessive heat for sufficient time duration. Asphalts weigh approximately 6.7-10.0 pounds per gallon depending on composition with the lighter liquids usually the most flammable and fluid. Fire hazard is greater as liquid tenperature rises above 85°F.

Asphalts do not react with water but water or foam may cause frothing under fire conditions. They do not react with many other common substances and are primarily incompatible with strong oxidizing materials. Toxicity is generally low to moderate in acute exposures via the various potential routes of exposure. Products of combustion may include sulfides and other toxic gases.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Essentially insoluble, but a little will dissolve.
Solubility in Other Chemicals: Soluble in oil, benzene, turpentine, carbon disulfide, ether, trichloromethane, and other organic solvents.
Specific Gravity (Liquid): 0.8-1.2
Vapor Density: Unavailable
Boiling Point: Varies; Approximately 270 - 662ºF (132 - 350ºC) depending on grade.
Melting Point: Varies
Freezing Point: Varies
Molecular Weight: Varies
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): Unavailable
Vapor Pressure: Varies; Approximately 2 mmHg and maybe as high as 20 mmHg depending on grade
Flash Point: 50 - 550ºF (10 - 288ºC) depending on grade
Autoignition Temperature: 400 - 905ºF (204 - 485ºC) depending on grade
Burning Rate: Unavailable
Flammable Limits: 5% (LEL) - 20% (UEL)
Stability: Stable
Polymerization Potential: Will not occur.
Corrosiveness: Relatively noncorrosive.
Reactivity with Water: No reaction.
Reactivity and Incompatibility: Reacts with strong oxidizing materials.

IDENTIFICATION

Shipping Name(s): Asphalt (USDOT); Asphalt, cut backs (USDOT); Tars, liquid (USDOT & IMO)
Synonyms and Tradenames: Bitumen; Tar; Cut back asphalt; Asphaltic road materials; Petroleum pitch; Asphaltum; Judean pitch; Mineral pitch; Asphalt pavement surface sealer.
CAS Registry No.: 8052-42-4
Chemical Formula: Complex mixture
Constituent Components (% each): Complex mixture derived from petroleum or coal.
UN/NA Designation: UN1999; NA1999
IMO Designation: 3.2 or 3.3, Flammable liquids
RTECS Number: CI990000
NFPA 704 Hazard Rating: 0(Health): 3(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Dark brown to black
Odor Characteristics: Tarry, smoky
Reportable Quantity: See appendix I.
Common Uses: Paving or sealing road surfaces and roofs; base for sealers, paints, coatings, adhesives, and synthetic turf.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ASPHALT

Class 3 (Flammable Liquid) or Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Some constituents of fumes may be carcinogenic in long term exposures, particularly those from coal tars or pitch.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: 5 mg/m^3

IDLH: Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Potential Health Hazards: Major hazard is from prolonged inhalation of the concentrated fumes from hot asphalt. Direct contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Contact with hot asphalt may result in thermal burns of the skin or eyes. Prolonged contact at ambient temperatures may result in irritation or inflammation. Allergic skin reactions may occur on occasion and the skin may become sensitized to sunlight if the product is made from coal.

Hazards of Inhalation: Asphalt fumes are irritating to the eyes and the mucous membranes of the respiratory tract and may cause nausea, dizziness, and headache. The fumes of products made from coal are suspected of being carcinogenic in long term occupational exposures.

Hazards of Ingestion: Data unavailable. Ingestion is generally considered unlikely.

FIRE HAZARDS

Lower Flammable Limit: 5%

Upper Flammable Limit: 20%

Behavior in Fire: Some asphalts are flammable liquids that are easily ignited while others are difficult to ignite. Upon ignition, they burn with a bright flame. There is a limited potential for containers of some of the more volatile asphalts to rupture violently in fires. Application of water may cause frothing if the asphalt is very hot.

Hazardous Combustion Products: Hazardous combustion products include hydrogen sulfide, sulfur dioxide and other toxic gases.

EXPLOSION HAZARDS

Explosive Potential: There is a limited potential for containers of the more volatile asphalts to rupture violently in fires. Vapors from such products may explode if ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

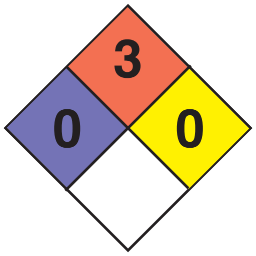
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices. (Note: The devices should also include a fume or high efficiency particulate filter.)

1999

ASPHALT

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; headache, nausea, or dizziness.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water or other appropriate cleanser. Get medical attention if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention if irritation persists after rinsing.

First Aid for Ingestion: If victim is conscious, administer water or milk. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam, water spray. Note that foam or water may cause frothing if asphalt is very hot.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources where necessary. Prevent flammable liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water or asphalt may result in damage to boilers or industrial process equipment. Use intrinsically safe equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that even small amounts of oils dissolving in water may cause odor, taste, and other problems. Some products may sink, some may float, and some may separate and do both. Take special precautions where flammable liquids are involved.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of chemicals in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to asphalt vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of asphalt from contact with airborne vapors or fumes and will accumulate in low lying areas.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Proceed with caution if asphalt is hot. Frothing may occur if water contacts the liquid.

ASPHALT
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of asphalt vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed cautiously if asphalt is hot and frothing may occur.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Asphalt may be confined by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Confined asphalt may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product. Hot liquids may solidify upon cooling and plug lines or equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Use judgment where spilled product may solidify upon cooling.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

ASPHALT

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product. (Note: Use only for floating materials.)

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow. (Note: Use only for floating materials.)

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

ASPHALT

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating asphalt.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment if the asphalt has a low flash point.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with asphalt may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment if the asphalt has a low flash point.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONFINEMENT . . . Some asphalts will sink in water. Use natural deep-water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep-water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 2006

BENZENE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Benzene is a colorless, fairly volatile liquid with an aromatic odor resembling gasoline and is widely used in the United States. It is a component of motor fuel, has wide uses as a solvent, and is used to make detergents, explosives, dyes, plastics, pesticides, and other chemicals. It is only slightly soluble in water and lighter, so may be expected to form a floating surface slick. Its flash point of 12°F indicates that the product can be easily ignited under a wide range of ambient temperature conditions. Vapors of benzene may be heavier than air and may travel to a source of igniton and flash back. Accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.3 pounds per gallon.

Benzene does not react with water or many other common materials and is stable in normal transportation. It is, however, reactive with a variety of chemicals and can be expected to attack some forms of plastics, rubber and coatings. The product is generally considered to be of low to moderate toxicity in acute exposures, but long term occupational exposures are suspected to induce cancer. In the air, benzene reacts with other chemicals and breaks down within a few days, however, in water and soil breaks down more slowly. Products of combustion include carbon dioxide, carbon monoxide, irritating aldehydes and ketones.

If benzene is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.07%

Solubility in Other Chemicals: Soluble in acetone, alcohol, chloroform, carbon disulfide oils, carbon tetrachloride, glacial acetic acid, diethyl ether and ether.

Specific Gravity (Liquid): 0.88 at 68°F (20°C)

Vapor Density: 2.7

Boiling Point: 176.2°F (80.1°C)

Melting Point: 41.9°F (5.5°C)

Freezing Point: 41.9°F (5.5°C)

Molecular Weight: 78.12

Heat of Combustion: –9698 cal/g

Evaporation Rate (butyl acetate=1): Not available

Vapor Pressure: 75 mmHg at 68°F (20°C)

Flash Point: 12°F (–11.1°C), closed cup

Autoignition Temperature: 928°F (498°C)

Burning Rate: 6.0 mm/minute

Flammable (Explosive) Limits: 1.2% (LEL) – 7.1–7.8% (UEL)

Stability: Stable

Polymerization Potential: Will not occur

pH: Not applicable

Corrosiveness: May attack some forms of plastics, rubber and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with chlorine, oxygen, ozone, permanganates, many fluorides, nitric acid, sulfuric acid, peroxides, perchlorates, strong oxidizing agents, bromine with iron, and certain other chemicals.

IDENTIFICATION

Shipping Names: Benzene (USDOT & IMO)

Synonyms and Tradenames: Benzol; Phenyl hydride; Coal naphtha; Phene; Cyclohexatriene; Pyrobenzol; Pyrobenzole; Benzole; Annulene.

CAS Registry No.: 71-43-2

Chemical Formula: C_6H_6

Constituent Components(% each): 85% to more than 99% pure with remainder being toluene, xylene, and other substances.

UN/NA Designation: UN1114

IMO Designation: 3, flammable liquids

RTECS Number: CY1400000

NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 0 (Instability)

Physical State as Shipped: Liquid

Physical State as Released: Liquid (freezes below 42°F)

Color of the Shipped Material: Colorless to light yellow

Odor Characteristics: Pleasant aromatic; like gasoline

Reportable Quantity: See Appendix I

Common Uses: Component of motor fuels; solvent for paint remover and oils; mfg. of detergents, explosives, dyestuffs, plastics, pesticides, and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

BENZENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reported to be detectable at 2–5 ppm, caution should be used in relying on odor alone as a warning of potentially hazardous exposures.

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back. Suspected to be a human carcinogen. Vapors may persist for a time in pits, hollows and depressions. There is the potential that flowing product may be ignited by self-generated static electricity.

Short Term Exposure Limits (STEL): Potential occupational carcinogen, 1 ppm (NIOSH); 5 ppm (OSHA)

Time Weighted Average (TLV-TWA): Potential occupational carcinogen, 0.1 ppm (NIOSH); 1 ppm (OSHA)

Ceiling (C) Limit: Unavailable

IDLH: Potential occupational carcinogen (500 ppm)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations in air that may be present but all exposures should be avoided due to the potential carcinogenicity of the product.

Hazards of Skin or Eye Contact: Benzene has a relatively strong irritating effect on the skin and may cause redness or blistering; prolonged or repeated contact may cause dry, scaly skin, possibility of secondary infection, and possibility of absorption through the skin in significant amounts. Contact with the eyes may cause primary irritation.

Hazards of Inhalation: Benzene vapors may irritate the skin and eyes. High concentrations may result in depression of the central nervous system with symptoms including euphoria, headache, dizziness, nausea, convulsions, coma, and possibly death.

Hazards of Ingestion: Ingestion may cause gastrointestinal irritation, nausea, diarrhea and vomiting. Aspiration into the lungs during vomiting or swallowing may result in pulmonary edema (possibly delayed) and lung hemorrhage.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 1.2%

Upper Flammable (Explosive) Limit: 7.8%

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable vapor upon release.

Hazardous Combustion Products: Carbon dioxide, carbon monoxide, irritating aldehydes and ketones.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Certain reactions with incompatible materials may cause explosions.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

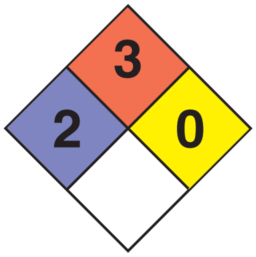
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 3; Tychem® CPF 4; Tychem® TK; Tychem® Responder®; Tychem® Responder® CSM; Tychem® F; Tychem® Reflector®; Tychem® ThermoPro; Barricade® coated suits; CPF3® suits; polyvinyl alcohol (gloves); Viton 890® gloves, 4H® and Silver Shield® brand gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Teflon® and Viton®. The following materials are ***not*** recommended for use: Tychem® CPF 2, Tychem® SL, neoprene, latex or rubber, butyl and nitrile latex.

Respiratory Protection: For unknown concentrations, fire fighting, or concentrations (above 0.1 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.

1114

BENZENE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes or skin; central nervous system depression and other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of water until all traces of material are gone, at least 20 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water and administer large quantities of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Foam, dry chemical, carbon dioxide or water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Benzene may float on water. Do not use direct stream of water as product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable vapors. Note that benzene has a flash point of 12°F.

SPILL RESPONSES

General Information: Benzene is a highly flammable and volatile liquid that may cause environmental contamination even though it is expected to biodegrade to a moderate extent when released into the soil or water. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of benzene may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that benzene is a highly flammable substance that may evaporate rapidly and float on water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

BENZENE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Benzene may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of benzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to benzene vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. Benzene may float on water. Do not use direct stream of water as product may be carried across water surface spreading fire or carrying product to source of ignition. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain benzene from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of benzene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Benzene may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained benzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

BENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

BENZENE
Class 3 (Flammable Liquid)

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through the dam under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating benzene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with benzene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Note that only a negligible amount of benzene is expected to dissolve, therefore, this technique may not be needed. Should some benzene dissolve other techniques such as adsorption (activated charcoal) or aeration may be useful.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

March 1995

BENZOYL PEROXIDE

Division 5.2 (Organic Peroxide)

GENERAL INFORMATION

Benzoyl peroxide is a white granular crystalline solid that may be shipped as a paste or liquid mixture with water or other liquids to reduce its hazards. It is a highly flammable solid when dry that is either odorless or with a faint odor of benzaldehyde. The product is used as a bleaching agent for flour, fats, oils, and waxes; as a drying agent for oils and polymerization catalyst; and in making pharmaceuticals, cosmetics, rubber, acetate yarns, cheese, embossed vinyl flooring, and printing pastes and inks. It is slightly or sparingly soluble in water and heavier, so may be expected to sink and dissolve at a very slow rate. The product weighs approximately 83.2 pounds per cubic foot as a pure solid.

Benzoyl peroxide does not react with water. It is an extremely strong oxidizer, however, that is highly sensitive and may explode if exposed to shock, heat, or friction, and which may ignite or decompose violently at or above 176°F or 217°F (reported values vary). The product burns rapidly once ignited, strongly supports the combustion of other materials, and is difficult to extinguish. Contact with a variety of other chemicals and even ordinary combustible substances such as paper and wood may result in a fire or explosion. Various sources report that benzoyl peroxide should never be mixed unless at least 33% water is present while others note that mixtures with 30% or more water or unreactive organic solvents are substantially safer than the pure dry product. The toxicity of benzoyl peroxide is relatively low, but the substance can cause irritation by all routes of exposure. Products of combustion include "suffocating" dense white smoke containing benzoic acid, phenyl benzoate, terphenyls, biphenyls, benzene, and carbon monoxide. Corrosivity of the product is comparable to that of dilute hydrochloric or benzoic acids.

If a cargo of benzoyl peroxide is on fire or involved in a fire, evacuate for a radius of one-half mile for protection from the effects of potenial explosions. (Note: This guide discusses the properties and hazards of pure benzoyl peroxide except where noted otherwise.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; less than 1 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Said to be soluble in benzene, acetone, ether, chloroform, and nearly all other organic solvents, but note that benzoyl peroxide is a strong oxidizer.

Specific Gravity (Solid): 1.334 at 59°F (15°C)

Boiling Point: Ignites or decomposes explosively at or above 176°F (80°C) or 217°F (103°C); reported values vary.

Melting Point: See boiling point

Freezing Point: See boiling point

Molecular Weight: 242.2

Heat of Combustion: - 6406 cal/g

Vapor Pressure: 0.1 mm Hg (0.00193 psia) at 68°F (20°C)

Flash Point: Highly flammable solid when dry

Autoignition Temperature: See boiling point

Burning Rate: Not pertinent

Stability: See General Information section above.

Corrosiveness: Similar to that of dilute hydrochloric or benzoic acid.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Benzoyl peroxide is a strong oxidizer that may cause fires and or explosions in contact with ordinary combustible materials, including wood and paper, as well as some types of rubber, plastics and coatings, lithium aluminum hydride, methyl methacrylate, dimethylaniline, alcohols, amines, metallic naphenates, various acids, alkalies, and a wide variety of other easily oxidizable materials.

IDENTIFICATION

Shipping Names: Organic peroxide type B,C, D, or E, solid

Synonyms and Tradenames: Benzoic acid, peroxide; benzoyl superoxide; dibenzoyl peroxide; Dry and Clear; Epi-Clear; Lucidol; Oxylite; Panoxyl; Persadox; BPO; BP; Incidol; Acetoxyl; Acnegel; Benoxyl; and other trade names.

Chemical Formula: $(C_6H_5CO)_2O_2$ or $C_6H_5CO\text{-}OO\text{-}COC_6H_5$

Constituent Components (% each): 96-98% or more pure (dry, technically pure); also, various pastes or mixtures with water or liquid plasticizers such as tricresyl phosphate, silicone oil, or phthalate ester. Pastes or mixtures may pose less of a hazard.

UN/NA Designation: UN3102, UN3104, UN3106, UN 3107, UN3108, UN3109

IMO Designation: 5.2 organic peroxide

Physical State As Shipped: Solid, paste, or liquid mixture

Physical State As Released: Solid, paste, or liquid mixture

Color of the Shipped Material: White, granular, crystalline solid; may be in paste form or in liquid mixture when shipped.

Odor Characteristics: Odorless or having faint odor of benzaldehyde.

Common Uses: Bleaching agent for flour, fats, oils, and waxes; polymerization catalyst; drying agent for oils; pharmaceuticals and cosmetics; rubber vulcanization without sulfur; burn out agent for acetate yarns; making cheese; embossing vinyl flooring; printing pastes and inks.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

BENZOYL PEROXIDE

Division 5.2 (Organic Peroxide)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: May explode if subjected to heat, shock, or friction, particularly when dry. The material burns rapidly, is a strong oxidizer, and may cause fire or explosion upon contact with a wide variety of other substances.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average(TLV-TWA): 5 mg/m^3 over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Drying of wet peroxide; heat, fire, and sparks or static electricity of any kind; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: No systemic effects of toxicity have been reported in humans. Benzoyl peroxide is primarily an irritant of mucous membranes and may cause primary irritation and possibly sensitization dermatitis (an allergic reaction of the skin).

Hazards of Skin or Eye Contact: Contact of the skin with benzoyl peroxide may cause primary irritation. Prolonged contact may cause inflammation, while repeated contact may result in an allergic skin rash. In one set of experiments, the application of benzoyl peroxide to animal eyes caused superficial opacities in the cornea and inflammation of the conjunctiva. In other experiments, however, no injury resulted from single application of 93% pure powder or a 50% paste in dimethyl phthalate to rabbit eyes.

Hazards of Inhalation: The vapors and dust of benzoyl peroxide in air may cause irritation of the eyes, nose, throat, and skin. Workers exposed to a concentration of 12.2 mg/m^3 in air over an unspecified period of time experienced pronounced irritation. No specific systemic effects of exposure to humans have been reported, but one source lists decreased pulse and temperature, difficult breathing, and stupor as possible effects of overexposure.

Hazards of Ingestion: Benzoyl peroxide is of relatively low oral toxicity. No systemic effects of exposure to humans have been reported, but ingestion of large quantities has resulted in fatalities among animals in laboratory experiments.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Highly flammable solid and strong oxidizer. Burns rapidly. Strongly supports combustion of other materials. Difficult to extinguish once ignited. Prolonged exposure to fire or heat may cause containers to explode.

Hazardous Combustion Products: Decomposition produces suffocating dense white smoke containing benzoic acid, phenyl benzoate, terphenyls, biphenyls, benzene, CO and CO_2.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: The relatively pure peroxide is highly sensitive and may explode if exposed to shock, heat, or friction. Contact with a variety of other chemicals and even ordinary combustible materials may result in fire or explosion.

3102

BENZOYL PEROXIDE
Division 5.2 (Organic Peroxide)

See UN/NA Designation for
other ID numbers.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, aprons and other impervious and resistant clothing. Materials generally compatible with peroxides may include butyl, neoprene and nitrile rubber, polyurethane, polyvinyl chloride, and Viton. When handling the pure material, use clothing that is fire resistant and which does not generate static electricity. Conductive footwear should also be worn where necessary to prevent buildup of static electricity.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency particulate filter respirator with a full facepiece containing non-oxidizable sorbents (250 mg/m^3 or less); any fume or high efficiency particulate respirator or any dust and mist respirator (except single-use or quarter-mask units) containing non-oxidizable sorbents (50 mg/m^3 or less); or any dust and mist respirator (except single-use units) containing non-oxidizable sorbents (25 mg/m^3 or less). Note that some cartridges and canisters may contain activated charcoal, an oxidizable material, and should not be used.

FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray or fog. Large fires should be handled with large quantities of water.

Extinguishing Techniques: Dangerous explosion hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Be alert to potential explosion hazard if benzoyl peroxide has been subjected to heat, fire, or contamination. Do not move cargo or vehicle if cargo has been exposed to heat. If fire can be controlled, cool container with water from unmanned hose holder or monitor nozzles until well after fire is out. If this is impossible, withdraw from area and let fire burn. Note that the cargo will become more susceptible to ignition and decomposition or explosion as it dries out.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment. Take the flammability, explosivity, and reactivity characteristics of benzoyl peroxide into account when planning the response. Do not subject material to friction shock, heat, or contamination with other chemicals or combustible substances. Handle in as small quantities as possible. Prohibit heating facilities or electrical installations in storage areas. Ground all handling equipment; consider use of conductive flooring and personal protective equipment to reduce electrical spark ignition hazard. Do not load unload during electrical storms. Avoid all other sources of sparks or heat.

BENZOYL PEROXIDE
Division 5.2 (Organic Peroxide)

AIR SPILL

TECHNIQUE

WATER SPRAY . . . Benzoyl peroxide has a very low vapor pressure. For both fire prevention and dust suppression purposes, water spray can be applied as necessary to keep the spilled product wet.

CONSEQUENCE

Any water runoff may contain some amount of benzoyl peroxide.

MITIGATION

Contain spilled product and water runoff to prevent spread of contamination. Remove spilled product and other contaminated materials as soon as possible.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid benzoyl peroxide with a plastic sheet (polyethylene, e.g.) or other compatible material to prevent airborne dust. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated and pose a hazard.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly and carefully.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Solid benzoyl peroxide or pastes or liquid mixtures containing the product may be contained by building dikes using soil, sand, clay or other noncombustible materials.

CONSEQUENCE

Wetted pastes or liquid mixtures may percolate into soil or seep through dike materials. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with a compatible impervious material (polyethylene sheeting, e.g.).

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Where possible, line collection basin with compatible impervious material (polyethylene sheeting, e.g.).

TECHNIQUE

ABSORPTION . . . Wet spilled product down with water spray. Mix with wetted vermiculite, perlite, or other damp noncombustible inert material of weight at least equal to weight of spilled product. Sweep or scoop up and place in compatible plastic containers for immediate disposal.

CONSEQUENCE

Use of spark-generating metals or cellulosic materials such as paper, wood, straw, etc. for sweeping or handling spill material may result in fire or explosion under some conditions, particularly if the product is permitted to dry.

MITIGATION

Handle spilled materials only with noncombustible spark-proof materials and equipment. Use compatible plastic containers (polyethylene, e.g.).

BENZOYL PEROXIDE

Division 5.2 (Organic Peroxide)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Benzoyl peroxide will sink in water and dissolve very slowly, maintaining an equilibrium concentration in the water body.

Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, suitable hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Dredged or pumped materials brought to the surface and allowed to dry may pose a fire or explosion hazard. Equipment may become contaminated.

MITIGATION

Consult qualified experts for guidance. Keep the several hazardous properties of benzoyl peroxide in mind while implementing this response. Properly decontaminate all equipment after use. Store recovered materials in compatible plastic containers (polyethylene, e.g.).

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse.

Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

BENZOYL PEROXIDE

Division 5.2 (Organic Peroxide)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment. Any spilled product allowed to dry may pose a fire or explosion hazard.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary. Keep contaminated sorbent materials wet. Use compatible storage containers.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

BORON TRICHLORIDE
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Boron trichloride is a nonflammable colorless fuming liquid with a pungent, sharp, irritating, and acrid odor having a relatively low boiling point of 54.3 - 54.5°F. It is used to make boron fibers, semi-conductors, other chemicals and soldering fluxes, in the purification and treatment of various metals, and as an extinguishing agent for magnesium fires. The substance reacts vigorously with water to form hydrochloric and boric acids while generating heat, which also explains its fuming in moist air. The hydrochloric acid generated can react with most common metals to liberate flammable and potentially explosive hydrogen gas. Liquid boron trichloride itself weighs approximately 11.3 pounds per gallon. Due to its volatility, containers exposed to fire or excessive heat for sufficient time duration may rupture violently.

Boron trichloride is stable in normal transportation, but besides reacting with water or moisture, is also reactive with a variety of other materials. It is noncorrosive to metals when dry but may vigorously attack a variety of elastomers and packing materials. The hydrochloric acid produced in reactions with water, however, is corrosive to most metals, particularly to iron and aluminum, and may generate flammable and potentially explosive hydrogen gas during the corrosion process. Spills of boron trichloride may generate large quantities of heavier-than-air gases and fumes which are toxic and highly corrosive to bodily tissues. Any contact with the liquid may result in acid burns.

If boron trichloride is leaking and generating gases or fumes, downwind evacuation should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 1.35 at 59°F (15°C)
Boiling Point: 54.3 – 54.5°F (12.4 –12.5°C) at 1 atm.
Melting Point: –161.1°F (–107.3°C)
Freezing Point: See melting point
Molecular Weight: 117.2
Heat of Combustion: Not flammable
Vapor Pressure: 1.305 atm (19.17 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable in normal transportation
Corrosiveness: Noncorrosive to metals when dry but presence of moisture forms hydrochloric acid which is corrosive to many metals. Vigorously attacks many kinds of elastomers and packing materials.
Reactivity with Water: Reacts vigorously to form hydrochloric acid and boric acid while generating heat.
Reactivity with Other Chemicals: Reacts with aniline, nitrogen peroxide, phosphine, fat or grease, oxygen, organic matter, hexafluoroisopropylidene amino lithium, nitrogen dioxide, and alkaline materials.

IDENTIFICATION

Shipping Names: Boron trichloride (USDOT and IMO)
Synonyms and Tradenames: Trichloroborane; boron chloride
Chemical Formula: BCl_3
Constituent Components (% each): 99% or more pure; may contain small amounts of chlorine, phosgene, and silicon compounds.
UN/NA Designation: UN1741
IMO Designation: 2.2, nonflammable gas
Physical State As Shipped: Compressed liquefied gas (boils at 54.3 – 54.5°F)
Physical State As Released: Gas, liquid, or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent; choking, sharp; irritating; acrid
Common Uses: Catalyst for organic reactions; making of semi-conductors, other chemicals, and soldering fluxes; purification of metal alloys; treatment of aluminum; extinguishing agent for magnesium; and making of boron fibers.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

BORON TRICHLORIDE

Poison Gas
(Division 2.3)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly volatile, toxic, corrosive, and reactive substance which may generate large quantities of fumes and vapors upon release.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-C): Unavailable; but note that both boron tribromide and boron trifluoride are assigned 1 ppm absolute ceiling limits. (ACGIH)

Conditions to Avoid: Heat or fire; contact with moisture or incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentrations of vapors, gases, and fumes likely to be present in air in the spill area and over potentially considerable distances downwind. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Boron trichloride or excessive exposure to its fumes may cause skin irritation or burns with severe pain, redness, possible swelling, and rapid tissue destruction and scarring. Contact with the eyes may cause irritation, lesions, severe burns, and possible loss of vision. Do not wear contact lenses when working with this product.

Hazards of Inhalation: Fumes or gases evolved from boron trichloride may cause lung irritation, tearing of the eyes, coughing, excessive salivary and sputum formation, difficult breathing, pneumonitis, pulmonary edema, and possibly death. Note that pulmonary edema may be delayed in onset. Exposure to 20 ppm for 7 hours in contaminated cages was fatal to most rodents in laboratory experiments. All survived two 7-hour exposures at 50 ppm in cages cleaned every two hours but many succumbed at 100 ppm.

Hazards of Ingestion: Available data are limited. Expect severe burns of the mouth and stomach with possible severe consequences.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Non-flammable liquid that boils at 54.3 - 54.5°F. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of toxic and corrosive gases and fumes upon release.

Hazardous Combustion Products: Evolves toxic and corrosive fumes when heated to decomposition or in fires but is not itself flammable.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Containers may rupture violently in fire due to overpressurization. Contact of hydrochloric acid (formed in reactions with moisture or water) with most common metals produces hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with liquid boron trichloride. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1 ppm or so), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1741

BORON TRICHLORIDE

Poison Gas
(Division 2.3)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; coughing, choking, or other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Note that one authority indicates that adrenaline should not be used as a stimulant in cases of boron trichloride poisoning.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, or dry sand. Water spray or fog may be used on large fires with caution but try to avoid wetting of liquid boron trichloride since it may react vigorously or violently with water to produce acid fumes and heat.

Extinguishing Techniques: Toxic and corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Note that hydrogen gas may be liberated upon contact of hydrochloric acid with most common metals. Use explosion-proof and spark-proof equipment and tools where necessary. Take the volatile, corrosive, toxic, and reactive nature of boron trichloride into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Boron trichloride spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

BORON TRICHLORIDE
Poison Gas
(Division 2.3)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to boron trichloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point down wind in this response and do not allow it to contact liquid boron trichloride as this may increase vapor and fume evolution.

CONSEQUENCE

Water runoff may contain various acids from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid boron trichloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid boron trichloride may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid boron trichloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained boron trichloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

BORON TRICHLORIDE
Poison Gas
(Division 2.3)

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause
overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may
lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2006

BROMINE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Bromine is a dark red to reddish brown fuming liquid that is used in a variety of industrial processes and for making other chemicals. It is slightly soluble in water and is expected to sink in water and slowly dissolve. Its boiling point of 137.8°F and considerable vapor pressure indicate it will rapidly vaporize under high ambient temperature conditions, thus evolving relatively large amounts of vapors that are heavier than air and may accumulate and persist in low areas. Although bromine itself is nonflammable, it is a strong oxidizer that may cause fires or explosions in contact with common combustibles or other readily oxidizable materials. Containers may rupture if exposed to fire or excessive heat for sufficient time duration due to increasing pressure. Bromine weighs approximately 26 pounds per gallon.

Although stable in normal transportation, bromine reacts violently or explosively with a wide variety of materials including aluminum. Even a small amount of moisture can render it corrosive to other common metals. The product must be considered highly toxic by all routes of exposure. Excessive inhalation can cause severe injury or death and is a key hazard due to the high volatility of the material. Symptoms of exposure may be delayed.

If bromine is involved in an incident, as an immediate precautionary measure, isolate spill or leak area in all directions for at least 150 feet (50 meters) for liquids and at least 75 feet (25 meters) for solids. In the event bromine is released to the environment, consider the following evacuation distances. For **small** spills, isolate area for a radius of 200 feet (60 meters) in all directions with a downwind evacuation of 0.3 miles (0.5 kilometers) for daytime and 1.1 miles (1.8 kilometers) for nighttime. For **large** spills, isolate area for a radius of radius of 1100 feet (330 meters) in all directions with a downwind evacuation of 2.1 miles (3.3 kilometers) for daytime and 4.6 miles (7.3 kilometers) for nighttime. These distances should be adjusted when taking into consideration the amount of material spilled, location, local weather conditions and other factors. If a bulk container of bromine is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. Bromine is very toxic to humans, the environment and to aquatic organisms.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 3.6 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, carbon bisulfide, chloroform, carbon tetrachloride and ether.
Specific Gravity (Liquid): 3.12 at 68°F (20°C)
Vapor Density: 5.5
Boiling Point: 137.8°F (58.8°C) at 1 atm.
Melting Point: 19.0°F (–7.2°C)
Freezing Point: 19.0°F (–7.2°C)
Molecular Weight: 159.81
Heat of Combustion: Not flammable
Evaporation Rate (butyl acetate=1): Not available
Vapor Pressure: 173 mmHg (3.34 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable (Explosive) Limits: Not flammable
Stability: Stable
Polymerization Potential: One source reports that bromine undergoes violent polymerization in reaction with acrylonitrile.
Corrosiveness: Attacks most metals when moisture is present. Will corrode iron, steel, stainless steel and copper. Reacts with aluminum. Attacks most plastics that are not highly fluorinated.
Reactivity with Water: One source reports it may react with water producing corrosive hydrobromic acid and fumes of hydrogen bromide.
Reactivity and Incompatibility: Reacts with alcohols, aluminum, potassium, ferrous salts, mercury and its salts, aqueous ammonia and other alkali hydroxides, titanium, acetaldehyde, arsenates, ammonia, acetylene, acetone, acrylonitrile, calcium nitride, methyl alcohol, phosphorus, sodium, sodium carbide, tin, phosphorus oxide, and a wide variety of other substances. May cause ignition of ordinary combustibles and organic substances.

IDENTIFICATION

Shipping Name(s): Bromine or Bromine solutions (USDOT & IMO)
Synonyms and Tradenames: Molecular bromine
CAS Registry No.: 7726-95-6
Chemical Formula: Br_2
Constituent Components (% each): 99.8% or more pure with traces of chlorine, organic halogens, water, etc.
UN/NA Designation: UN1744
IMO Designation: 8, corrosive substances; 6.1, toxic substances
RTECS Number: EF9100000
NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 0 (Instability): Oxidizer
Physical Form as Shipped: Liquid (above 19°F)
Physical Form as Released: Liquid (above 19°F)
Color of the Shipped Material: Dark red or reddish brown
Odor Characteristics: Sharp, harsh, irritating, suffocating
Common Uses: Mfg. of pharmaceuticals, dyes, pesticides, fire retardents, germicides, water purifiers, other chemicals, perfumes, fumigants, bleaching agents, ethylene dibromide (fuel anti-knock agents), and military chemical agents. Also used for gold extraction.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

BROMINE

Class 8 (Corrosive Material)

and

and

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.05–3.5 ppm

Unusual Hazards: Highly volatile, reactive, and corrosive substance with heavier than air vapors. Contact with wood or other ordinary combustibles or organic substances can result in fire. Many reactions with other chemicals are violent or explosive. Extremely toxic to the environment and aquatic organisms.

Short Term Exposure Limits (STEL): 0.3 ppm (2 mg/m^3) (NIOSH)

Time Weighted Average (TWA): 0.1 ppm (0.7 mg/m^3) (NIOSH & OSHA)

Ceiling(C) Limit: Not Available

IDLH: 3 ppm

Conditions to Avoid: Contact with incompatible materials; runoff to water; any direct physical contact; inhalation of vapors; ingestion of liquid bromine or its solutions.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to highly corrosive vapors in air. Contact with liquid bromine may cause destructive burns. Bromine is also toxic by ingestion.

Hazards of Skin or Eye Contact: After mild cooling sensation at first, skin contact with liquid is highly corrosive and may cause skin discoloration, pain, serious burns, blistering and slow healing ulcers. Liquid bromine immediately affects eyes and may cause blurred vision, redness, pain, severe tissue burns and eye damage.

Hazards of Inhalation: Excessive inhalation of vapors may be very irritating and damaging to the respiratory tract and lungs. Symptoms may include headache, dizziness, cough, nosebleed, vertigo, pulmonary edema followed some hours later by abdominal pain, diarrhea and possibly a measles-like rash. Severe breathing difficulties involving pulmonary edema and pneumonia may be delayed complications. Overexposure may be lethal.

Hazards of Ingestion: Bromine should be considered a highly toxic poison. Ingestion may cause burns of the mouth, throat, and stomach. Symptoms may include sore throat, vomiting and abdominal spasms. One source reports the estimated lethal dose at l4 mg/kg.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Not flammable

Upper Flammable (Explosive) Limit: Not flammable

Behavior in Fire: Non-flammable liquid but will accelerate the burning of combustibles. Containers may rupture violently in fire due to over-pressurization. Will generate large quantities of toxic vapor or fumes upon release.

Hazardous Decomposition Products: Thermal decomposition products may include corrosive fumes of hydrogen bromide.

EXPLOSION HAZARDS

Explosive Potential: Not flammable but containers may rupture violently in fire due to overpressure. Contact with several other substances may result in formation of explosive mixtures (see Chemical/Physical Data section).

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include polyvinyl chloride and certain rubbers. Teflon® is reported to have a 4 hour breakthrough time.

1744

BROMINE

Class 8 (Corrosive Material)

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 3 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (3 ppm or less), the following styles of respiratory protection will work when equipped with a non oxidizable sorbent (not charcoal) and eye protection needed: any air-purifying full-facepiece respirator equipped with cartridge(s) providing protection against bromine; any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against bromine; any powered air-purifying respirator with a tight-fitting facepiece and cartridge(s) providing protection against bromine; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece. For lesser concentrations (2.5 ppm or less), the following styles of respiratory protection will work when equipped with a non oxidizable sorbent (not charcoal) and eye protection needed: any supplied-air respirator operated in a continuous-flow mode; or any powered air-purifying respirator with cartridge(s) providing protection against bromine. NOTE: For all respirators only nonoxidizable sorbents allowed (not charcoal).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin and respiratory tract.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of water until all traces of material are gone, or at least for 20 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

NOTE: Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, CO_2, alcohol-resistant foam or water spray. Do not use water stream.

Extinguishing Techniques: Toxic and corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the corrosiveness and reactivity of bromine with many common metals when deciding on the appropriate response and equipment. Note that bromine will sink in water and slowly dissolve. Take into account while planning the response that bromine is highly volatile and toxic with heavier than air vapors that may persist for a time in low areas. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust. Consult a qualified specialist on neutralization techniques; however, some sources suggest neutralizing small spills with sodium thiosulfate solution and releasing anhydrous ammonia gas, with caution and control, to neutralize bromine vapors in the air. (Do not use aqueous ammonia, because violent reactions with liquid bromine may occur.) Other sources suggest neutralizing liquid bromine with solutions of potassium carbonate, sodium carbonate or sodium bicarbonate. To help control vapor production, a thin layer of water can be applied over a pool of liquid bromine by using water spray or fogging techniques.

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of the material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

BROMINE

Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid bromine may eventually slow the release of vapors or fumes into the atmosphere. Some sources suggest neutralizing small spills with sodium thiosulfate solution and releasing anhydrous ammonia gas, with caution and control, to neutralize bromine vapors in the air. (Do not use aqueous ammonia, because violent reactions with liquid bromine may occur.) Other sources suggest neutralizing liquid bromine with solutions of potassium carbonate, sodium carbonate or sodium bicarbonate.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce additional hazards.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Bromine may be confined by building dikes using soil, sand or other non-combustible materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize confined product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

BROMINE
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes, motorized graders, scrapers, bulldozers and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may spread contaminate.

MITIGATION

Excavate as last resort, unless adverse environmental impacts can be minimized.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottoms sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

March 1995

BROMOACETONE
Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Bromoacetone is a colorless or violet liquid with a pungent odor that is usually shipped in lead-lined containers, cylinders, or bottles or cans packed in wooden boxes. It is used as a military tear gas and for riot control when dispersed in air and also for synthesis of organic chemicals. It is slightly soluble in water and heavier, so may be expected to sink and dissolve very slowly. Although information on specific flammability characteristics are unavailable, the product is designated by some authorities as a flammable liquid. Consequently, be advised of the possibility that accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. Cylinders of liquid may rupture violently and rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 13.6 pounds per gallon.

Information on whether bromoacetone reacts with water was unavailable but this is unlikely given its other properties. The liquid should be considered highly irritating and corrosive to the skin and eyes, potentially causing painful burns. Low concentrations of vapors in air are very irritating to the eyes, explaining use of the product as a tear gas, while higher concentrations or prolonged exposures to low concentrations can be highly toxic via inhalation. Products of combustion include highly toxic and irritating fumes containing bromine and bromine compounds.

If the material is leaking (not on fire), downwind evacuation of the immediate spill area should be considered on a case-by-case basis until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble
Solubility in Other Chemicals: Soluble in alcohol, acetone, benzene, and ether.
Specific Gravity (Liquid): Approximately 1.63
Boiling Point: 290°F (143.3°C); at 1 atm; reported to partially decompose.
Melting Point: – 65.2°F (– 54°C) or – 33.7°F (– 36.5°C); reported values vary.
Freezing Point: See melting point
Molecular Weight: 137.0
Heat of Combustion: Unavailable
Vapor Pressure: 9 mm Hg (0.174 psia) at 68°F (20°C)
Flash Point: Unavailable, but designated as flammable liquid
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Stable
Corrosiveness: Unavailable
Reactivity with Water: Unavailable, but not likely to be reactive.
Reactivity with Other Chemicals: Incompatible with oxidizing agents.

IDENTIFICATION

Shipping Names: Bromoacetone, liquid (USDOT); bromoacetone (IMO)
Synonyms and Tradenames: Bromo-2-propanone; acetonyl bromide; acetyl methyl bromide; 1-bromo-2-propanone.
Chemical Formula: CH_3COCH_2Br
Constituent Components (% each): Unavailable
UN/NA Designation: UN1569
IMO Designation: 6.1, poisonous substance
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless to pale yellow liquid when pure, but turns violet rapidly even in absence of air. Further decomposes to black resinous mass on long standing.
Odor Characteristics: Pungent
Common Uses: Military tear gas used in war and for riot control; also used in organic synthesis.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

BROMOACETONE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.5 mg/m^3 reported as recognition level in air.

Unusual Hazards: A highly poisonous and intensely irritating compound used as a tear gas when dispersed in air.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact of any kind with the liquid or its vapors.

HEALTH HAZARDS

Public Health Hazards: In the absence of specific details, and given the uses and classifications of this product, all exposures should be strictly avoided.

Hazards of Skin or Eye Contact: Bromoacetone is said to be intensely irritating and corrosive to the skin and eyes, causing painful burns, but more specific details are unavailable. The substance has been used as a tear gas and has caused permanent dense opacification of the cornea when splashed in the eye as a liquid. Only minor and temporary injury has resulted, however, from contact with a few fine droplets.

Hazards of Inhalation: Although symptoms of exposure are not specified, beyond the notation that excessive exposure may cause pulmonary edema (which is usually a delayed effect), various authorities consider bromoacetone vapors to be poisonous and intensely irritating to the eyes and respiratory system. A 10 minute exposure to 572 ppm in air is reported to have caused a human death.

Hazards of Ingestion: Specific data are unavailable, but note that bromoacetone is considered to be a poison.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquid. Containers may rupture violently in fire. May generate large quantities of flammable, toxic and irritating vapors upon release when heated.

Hazardous Combustion Products: Emits highly toxic and irritating fumes containing bromine and bromine compounds when heated to decomposition.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Designation as flammable liquid and vapor pressure of product suggests possibility that an explosion may result if vapors from warm liquid are ignited in a confined area. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: Self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). One authority suggests that the SCBA be approved for chemical warfare agents.

1569 BROMOACETONE

Division 6.1 (Poisonous Materials)

FIRST AID

Nonspecifc Symptoms: Excessive tearing of the eyes; other irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing and isolate them as necessary to prevent further exposures. Wash affected body areas with large amounts of soap and water until all traces of the chemical are removed. Get medical attention immediately if eye contact has occurred or skin irritation persists after washing.

First Aid for Ingestion: Data unavailable. Keep victim warm and at rest and seek immediate medical advice and attention.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray or fog.

Extinguishing Techniques: Unusual toxic gas or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or its fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Dike contaminated fire-control water for later disposal; do not scatter the material.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid all contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Bromoacetone may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if only small amounts have discharged.

CONSEQUENCE

Hazardous levels of bromoacetone in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access of unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Bromoacetone spills may expose downwind areas to toxic or irritating concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather or otherwise been vaporized.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

BROMOACETONE
Division 6.1 (Poisonous Materials)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to bromoacetone vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of bromoacetone from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that application of firefighting foam to the surface of liquid pools may slow the release of bromoacetone vapors into the atmosphere. Since foam is recommended for fire control purposes, it may also serve to reduce vapor evolution from such pools.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

COVERAGE WITH WATER . . . Application of a layer of water to the surface of contained liquid pools may possibly reduce emissions of vapors or fumes. Since bromoacetone is only slightly soluble in water and heavier, a layer of water applied as a light spray may serve to blanket the surface.

CONSEQUENCE

Addition of water will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Bromoacetone may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained bromoacetone may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

BROMOACETONE
Division 6.1 (Poisonous Materials)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, diatomaceus earth and sodium carbonate mixture, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water and dissolve very slowly. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

BROMOACETONE
Division 6.1 (Poisonous Materials)

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have acumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble iarge quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

BUTADIENE
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Butadiene is a colorless gas shipped under pressure as a liquid and having a mildly aromatic odor. It is used to make synthetic rubber, plastics, and other chemicals. Barely soluble in water and lighter, little of the product will dissolve before it boils or evaporates from the surface of a water body. Its very low flash point and its boiling point of 24.1°F indicate that the product may be easily ignited under all ambient temperature conditions and that large amounts of gas or vapor will be evolved from spills. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in low areas. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited and there is some known potential for explosions involving unconfined vapor clouds. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). Liquid butadiene weighs approximately 5.2 pounds per gallon.

Butadiene does not react with water or many common materials but does react with variety of other chemicals. The product is stable in normal transportation when shipped with an inhibitor, but prolonged exposure to air or exposure to excessive heat may initiate explosive self-polymerization in containers. Vapors of butadiene are of relatively low toxicity in acute exposures but contact with the liquid may result in frost bite. Products of combustion may include toxic constituents.

Downwind evacuation should be considered if butadiene is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.05 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and other organic solvents.
Specific Gravity (Liquid): 0.621 at 68°F (20°C)
Boiling Point: 24.1°F (–4.4°C) at 1 atm.
Melting Point: –164°F (–108.9°C)
Freezing Point: –164°F (–108.9°C)
Molecular Weight: 54.09
Heat of Combustion: –10560 cal/g
Vapor Pressure: 1.2 atm (17.6 psia) at 68°F (20°C)
Flash Point: –105°F (– 76.1°C) (est.)
Autoignition Temperature: 788 –842°F (420 –450°C)
Burning Rate: 8 mm/minute
Stability: Stable when inhibitors present in normal transportation. May polymerize under conditions described above.
Corrosiveness: Unsafe in acetylide forming materials like monel, copper, or copper alloys (forms explosive compounds).
Reactivity with Water: *No* reaction
Reactivity with Other Chemicals: Reacts with copper or its alloys, monel, strong oxidizers, phenols, crotonaldehyde, caustics, amines, alkanolamines, halogenated compounds, alcohols, glycols, glycol ethers, alkylene oxides, ammonia, halogens, ether, and acid anhydrides.

IDENTIFICATION

Shipping Names: Butadiene, inhibited (USDOT); butadiene (IMO)
Synonyms and Tradenames: 1,3-Butadiene; alpha-, gamma-, or trans-butadiene; biethylene; bivinyl; divinyl; buta-l,3-dime; erythrene; pyrrolylene; vinylethylene.
Chemical Formula: $CH_2 = CHCH = CH_2$
Constituent Components (% each): 98% or more pure with 0.01 –0.02% tert-butylcatechol as inhibitor.
49 STCC: 49 057 03; 49 057 04; 49 057 05
UN/NA Designation: UN1010
IMO Designation: 2.1, flammable gas
Physical State as Shipped: Liquefied compressed gas
Physical State as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Mildly aromatic
Common Uses: Mfg. of synthetic rubber, plastics, and organic chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

BUTADIENE
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.16 –0.17 ppm

Unusual Hazards: Extremely volatile and flammable substance. May violently polymerize if exposed to excessive heat or if peroxides form in presence of air and iron. Vapors are heavier than air, may travel a considerable distance to a source of ignition and may persist in pits, hollows, and depressions. Vapors are uninhibited and may form polymers that result in stoppage of vents or flame arrestors.

Short Term Exposure Limits (STEL): 1250 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): *1000* ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers; inhalation of vapor or direct physical contact with liquid.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of very high vapor concentrations that may be present in air and may persist in pits or depressions. Contact with the liquid is also to be avoided. The product is suspected of being carcinogenic in long-term exposures based on animal experiments.

Hazards of Skin or Eye Contact: Contact of liquid butadiene with the skin or eyes may result in irritation or a freezing burn due to frostbite. Delayed burns may result from the wearing of contaminated clothing.

Hazards of Inhalation: High levels of butadiene in air (8000 ppm) have been tolerated by humans for 8 hours with only slight irritation of the eyes and upper respiratory tract. Very high levels may be narcotic with symptoms including fatigue, headache, drowsiness, lightheadedness, unconsciousness, respiratory paralysis, and possibly death. Concentrated vapors may also cause asphyxiation via displacement of air.

Hazards of Ingestion: Ingestion of butadiene is unlikely but may result in frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 2%

Upper Flammable Limit: 11.5%

Behavior in Fire: Flammable compressed liquefied gas. Will generate large quantities of flammable gas upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire or heat may result in violent polymerization.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Loss of inhibitor or excessive heat may cause spontaneous violent polymerization resulting in container rupture. Contact with monel, copper, or copper alloys may result in formation of explosive mixtures. There is some known potential for explosions involving unconfined vapor clouds.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing providing protection from cold surfaces as well as from direct contact with the spilled product.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 20000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with front or back mounted canister *(*20000 ppm or less) providing protection against butadiene or a similar device with chin-style canister *(*5000 ppm or less) within the use limitations of these devices.

1010

BUTADIENE
Division 2.1 (Flammable Gas)

FIRST AID

Nonspecific symptoms: Irritation of the eyes or respiratory tract; other symptoms of inhalation or direct contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing. (Note: Do not use hot water for flushing. If clothing is frozen to skin, warm area in tepid water before removal.)

***First Aid for* Ingestion:** Give warm water to drink. Get medical attention.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective and may increase vapor evolution from liquid pools. `

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to liquid butadiene may vastly increase vapor evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled liquid. Eliminate ignition sources. Use explosion-proof equipment where necessary. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water, if appropriate. Note that intake of highly contaminated water may result in damage, rupture, or explosion of boilers or industrial process equipment under certain conditions. Note that piping carrying butadiene may be plugged by a rubbery polymer under appropriate conditions and that monel, copper, and copper alloy equipment such as brass should not be used. Take into account that butadiene is extremely volatile and flammable with heavier than air vapors that may persist in pits and depressions.

AIR SPILL .

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Butadiene spills may expose downwind areas to flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

BUTADIENE
Division 2.1 (Flammable Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to butadiene vapors or fumes may accelerate their dispersal in the atmosphere. Water should be applied at a point downwind of the spill and should not be permitted to contact liquid pools of butadiene as this may vastly increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of butadiene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of quiescent liquid pools may slow the release of butadiene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. Vapor evolution may temporarily increase when foam is added.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid butadiene may be contained by building dikes or barriers using soil, sand or other materials or by excavating a trench or ditch.

CONSEQUENCE

Contained butadiene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity..

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

BUTADIENE
Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination if significant amounts of butadiene may have dissolved in water. (Note: This is unlikely in many cases as butadiene will rapidly vaporize.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment techniques.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1991

BUTANE
Class 2.1 (Flammable Gas)

GENERAL INFORMATION

Butane, which may be also transported in the U.S. with the shipping name "liquefied petroleum gas", or LPG for short, is a colorless and flammable liquefied gas with a boiling point of approximately 31°F in the open environment. It may be odorless in air at low concentrations, have a mild petroleum-like odor, or possibly be treated with a foul (skunk-like) additive for leakage warning purposes. The substance is used as a fuel gas, solvent, refrigerant, aerosol propellant, and food additive. It is also used for making various organic chemicals, high octane liquid fuels, and synthetic rubber.

Butane is practically insoluble in water and lighter. Due to its relatively low boiling point temperature, any spilled liquid will boil or otherwise rapidly vaporize under all but the very coldest environmental conditions. Thus, spills have the potential to generate large amounts of vapor that may be heavier than air, may accumulate and persist in pits, hollows and depressions, and that may travel a considerable distance to a source of ignition and flash back or even explode. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5 pounds per gallon at its boiling point temperature.

Butane does not react with water or many other common materials and is primarily known to be incompatible with oxidizing materials that may cause its ignition. It is not corrosive to common metals but may attack some types of plastic and rubber. Toxicity of the product is low by all routes of exposure but contact with very cold liquid or gas may result in frostbite or freeze burns. Products of combustion may include toxic constituents.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if butane is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket. If a cylinder is so threatened, evacuate for a radius of one-third (1/3) mile. (Note: The data and information presented below are for pure n-butane. The properties of n-butane may be altered if it is shipped or stored as a mixture with other substances.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 30 ppm at 59°F (15°C)

Solubility in Other Chemicals: Soluble in alcohol, chloroform, ether, and many other hydrocarbons and their derivatives.

Specific Gravity (Liquid): 0.60 at 32°F (0°C); 0.579 at 68°F (20°C)

Boiling Point: 31.1°F (–0.50°C) at 1 atm.

Melting Point: *–217*°F (–138.4°C)

Freezing Point: See melting point

Molecular Weight: 58.12

Heat of Combustion: –10,840 cal/g

Vapor Pressure: Approx 2.05 atm (30.1 psia) at 68°F (20°C)

Flash Point: – 76°F (– 60°C), closed cup

Autoignition Temperature: 550 to 806°F (287.8 to 430°C); reported values vary in this range.

Burning Rate: 7.9 mm/minute

Stability: Stable

Corrosiveness: Not corrosive to common metals; may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react vigorously, ignite, or explode in contact with strong oxidizing agents or materials. Has potential to explode in the presence of nickel carbonyl and oxygen.

IDENTIFICATION

Shipping Names: Butane (USDOT and IMO); butane mixtures (IMO); liquefied petroleum gas (USDOT)

Synonyms and Tradenames: n-Butane; normal-butane; butyl hydride; diethyl; methylethylmethane; may be shipped in the U.S. as liquefied petroleum gas (LPG).

Chemical Formula: $CH_3CH_2CH_2CH_3$

Constituent Components (l each): Shipments of "butane" are likely to be 9410 or more pure with the remainder consisting of some amounts of isobutane, propane, pentanes, and similar hydrocarbons. Some grades may be less pure. Butane mixtures are likely to contain substances with generally similar hazards.

49 STCC: 49 057 06 (butane); 4905702 (butane, impure, for further refining); 4905752 (liquefied petroleum gas)

UN/NA Designation: UN1075 (USDOT for butane and LPG); UN1075 (IMO for LPG); UN1011 (USDOT & IMO for butane and butane mixtures)

IMO Designation: 2.1, flammable gas

Physical State As Shipped: Liquefied compressed gas

Physical State As Released: Boiling liquid, vaporizing liquid, gas, or mixture or gas and aerosols (small liquid droplets) depending on environmental and release conditions; the boiling point of the product is about 31.1°F.

Color of the Shipped Material: Colorless, but very cold gas may appear white at first due to condensation of water vapor in the atmosphere.

Odor Characteristics: Odorless or mild petroleum or gasoline odor; some shipments may contain a skunk-like odorant for leakage warning purposes.

Common Uses: Fuel gas; organic synthesis; raw material for synthetic rubber and high octane liquid fuels; solvent; refrigerant; aerosol propellant; food additive.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

BUTANE
Class 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Although one authority reports the odor of butane itself is recognizable at a 2582 ppm concentration in air, most sources indicate that its odor is not detectable in air below 5000 ppm. It may, however, be recognizable in water at levels on the order of 6 ppm according to some sources.

Unusual Hazards: Extremely flammable heavier than air gas or vapor may travel a considerable distance to a source of ignition and flash back. Vapors and gases may persist in pits, hollows, and depressions. Unconfined as well as confined vapor clouds may explode if ignited.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: 800 ppm over each 8 hours of a 40 hour work week (ACGIH TLV, 1990–91; OSHA PEL, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff of liquid to sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the very high concentrations of butane gas or vapor that may be present in air at the spill site and directly downwind. Direct contact with the liquid or very cold gas or equipment should also be avoided.

Hazards of Skin or Eye Contact: Contact with very cold liquid butane or concentrated gas streams may cause frostbite or freeze burns. Frostbite may also occur from contact with the surface of a very cold container of the product. One authority reports that liquid butane splashed in the eyes may cause stinging, watering, inflammation and cloudiness. Another reports that a spray of liquid butane into the eyes from a cigarette lighter only caused temporary blurring of vision in one reported incident.

Hazards of Inhalation: High concentrations of butane gas or vapor in air may cause central nervous system depression. For example, exposure to 10,000 ppm (1%) for 10 minutes is said to cause drowsiness. Very high concentrations of butane gas or vapor in air may cause suffocation by diluting the concentration of oxygen in air below levels necessary to fully support life. Progressively lower levels of available oxygen may produce dizziness, headache, nausea, errors in judgment, excitation, fatigue, accelerated pulse, gasping, confusion, vomiting, and loss of consciousness and death, possibly in seconds and without warning if oxygen levels drop too low. Experiments have also shown that butane may be a weak cardiac sensitizer that can cause abnormal heartbeats in animals under stress.

***Hazards of* Ingestion:** Due to its low boiling point temperature, ingestion of butane is unlikely. If it should occur, frostbite of the lips, mouth, and other contacted tissues may be possibly expected.

FIRE HAZARDS

Lower Flammable Limit: Most sources report 1.8 –1.9%; the NFPA says 1.6%

Upper Flammable Limit: 8.4 –8.5%

Behavior in Fire: Liquefied flammable gas. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently and possibly rocket in a fire.

Hazardous Combustion Products: Not well-defined; include carbon monoxide and carbon dioxide and possibly other toxic constituents. One authority reports that acrid smoke and fumes are generated upon thermal decomposition of butane.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently and possibly rocket in a fire. Explosion may result if vapors or gases are ignited in a confined area. There is known potential for explosions involving unconfined vapor clouds.

1011

BUTANE
Class 2.1 (Flammable Gas)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: *Equipment* should prevent any reasonable probability of eye contact with the spilled material and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, polyurethane, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Dizziness, drowsiness, or other symptoms of central nervous system depression or oxygen deficiency; frostbite or freeze burns of bodily tissues.

***First Aid for Inhalation*:** Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. Butane may be a weak cardiac sensitizer; it may not be prudent to administer epinephrine to the victim.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.)

First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately if frostbite or freeze burns have occurred. (Note: Do not use hot water or rub frozen areas.)

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or liquid or let fire burn if discharge is appreciable. Use carbon dioxide or dry chemical on small fires in the open involving smaller containers that can be safely extinguished and isolated from other flammables. Use water spray or foam on large fires to cool surroundings.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may rupture violently, suddenly release massive amounts of product and possibly rocket when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Note that contact with water may increase the rate of vapor evolution from any exposed pools of liquid butane.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the high volatility and flammable nature of butane into account while planning the response. Beware of possible heavy gas accumulations in low areas.

BUTANE
Class 2.1 (Flammable Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Butane discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases, particularly if the discharge is large.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to butane vapors or fumes in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid butane pools with water may increase vapor evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid butane.

TECHNIQUE

FOAM . . . There is a possibility that application of firefighting foam to the surface of liquid butane pools may slow the release of vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if any increases in vapor evolution may affect downwind populations or operational safety.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid butane may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. Any remaining traces of butane on the ground will vaporize with time.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as nitrogen or carbon dioxide to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of the product into equipment.

WATER SPILL

Liquid butane will boil or rapidly vaporize from the water surface with negligible dissolution in the majority of cases.

January 1988

BUTYL ACETATE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

This guide is for normar-butyl acetate, this being one of three isomers of butyl acetate with slightly different but mostly similar properties and hazards. The normal (n-) isomer is considered somewhat more irritating via inhalation than the sec- and tert-isomers. The sec-isomer is slightly more flammable than the others. Nevertheless, most of the information herein is generally applicable to all three isomers.

Butyl acetate (normal isomer) is a colorless liquid with an odor that is fruity and agreeable in low concentrations in air but not very pleasant at higher levels. It is used as a solvent in lacquers, leather and airplane dopes, perfumes, and other products. The liquid is slightly soluble in water and lighter, so may be expected to float while slowly dissolving. Its lowest reported flash point of 72°F (62°F for sec-) indicates that it may be easily ignited at warmer ambient temperatures. At or above such temperatures, vapors are somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.3 pounds per gallon.

Butyl acetate does not react with water or many other common materials and is stable in normal transportation. It is reactive with various chemicals, however, and will dissolve many plastics and resins. Toxicity is low to moderate via the various potential routes of exposure. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.68–1.0 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, benzene, and ether
Specific Gravity (Liquid): 0.875 at 68°F (20°C)
Boiling Point: 259°F (126°C) at 1 arm.
Melting Point: See freezing point
Freezing Point: –100°F (– 73.5°C)
Molecular Weight: 116.16
Heat of Combustion: – 7294 cal/g
Vapor Pressure: 10 mm Hg (0.193 psia) at 68°F (20°C)
Flash Point: 72–81°F (22.2–27.2°C), closed cup; 85–99°F (29.4–37.2°C), open cup.
Autoignition Temperature: 760–797°F (404–425°C)
Burning Rate: 4.4 mm/minute
Stability: Stable; hydrolyzes to acetic acid and n-butyl alcohol upon standing
Corrosiveness: Will dissolve many plastics and resins.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with nitrates, strong oxidizers, strong alkalis, and strong acids.

IDENTIFICATION

Shipping Names: Butyl acetate (USDOT); butyl acetates (IMO)
Synonyms and Tradenames: Acetic acid, butyl ester; butyl ethanoate; n-butyl acetate.
Chemical Formula: $CH_3C0_2(CH_2)_3CH_3$
Constituent Components(% each): Various grades, 90–99.5% pure
49 STCC: 49 091 28
UN/NA Designation: UN1123
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Pysical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Fruity and agreeable; disagreeable in higher concentrations
Common Uses: Solvent for lacquers, airplane dopes, paper coatings, perfumes, plastics, oils, rubber, leather coatings, other products; used in making safety glass, flavorings, adhesives, shoe polishes, and stain removers.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

BUTYL ACETATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.006–20 ppm; report values vary

Unusual Hazards: Flammable liquid. Not highly volatile but vapors may be heavier than air and travel to a source of ignition at warmer temperatures.

Short Term Exposure Limits (STEL): 200 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 150 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to the high vapor concentrations that may be present in air in the local spill area and immediately downwind.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid butyl acetate may cause dryness and irritation of the skin due to the mild defatting action of the product. Contact with the eyes may result in marked but temporary irritation.

Hazards of Inhalation: Vapors of butyl acetate are irritating to the eyes, nose, throat, and upper respiratory system at concentrations in air of 200–300 ppm or more. Higher concentrations are expected to cause narcosis and central nervous system depression with symptoms including headache, drowsiness, and nausea. Severe effects have followed exposure to 2000 ppm for one hour.

Hazards of Ingestion: Data unavailable. Product is of relatively low oral toxicity in animal experiments.

FIRE HAZARDS

Lower Flammable Limit: 1.38–1.7%

***Upper Flammable Limit*:** 7.6% (9.8% for sec- butyl acetate)

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. There is some limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

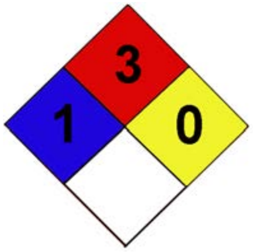
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include chlorinated polyethylene, polyurethane, polyvinyl alcohol, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 7500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (7500 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1123

BUTYL ACETATE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, respiratory system, or skin; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical (keep outside of tanks), various foams, water spray. (Note: Water may be ineffective on sec-isomer.)

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources as necessary. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of butyl acetate may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that butyl acetate is a flammable liquid that slowly dissolves in water.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Butyl acetate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of butyl acetate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to butyl acetate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of butyl acetate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

BUTYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

FOAM . . . Regular firefighting foam or alcohol foam applied to the surface of liquid pools may slow the release of butyl acetate vapors into the atmosphere. (Note: Alcohol foams are most effective.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Butyl acetate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained butyl acetate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE .

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

BUTYL ACETATE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating butyl acetate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

BUTYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with butyl acetate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

BUTYL ACRYLATE
Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Butyl acrylate is a clear colorless liquid with a sharp, biting characteristic odor. It is used for making paints, coatings, caulks, sealants, adhesives, other chemicals, and a variety of other products. The substance is very slightly soluble in water and somewhat lighter so may be expected to form a slowly dissolving surface slick. Its flash point of 105°F indicates that butyl acrylate must be moderately heated or exposed to high ambient temperatures before ignition may occur easily. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions if ignited. The product weighs approximately 7.5 pounds per gallon.

Butyl acrylate does not react with water or other common materials and is considered stable in normal transportation. Although shipped with an inhibitor, excessive heat as in a fire situation may cause self-polymerization resulting in violent rupture of the container. Self-polymerization may also be initiated by acids, alkalies, caustics, light, and other substances. Contact with explosives may cause an explosion. The product is moderately toxic and irritating via the various routes of exposure. Products of combustion may include toxic constituents.

If a container of butyl acrylate is exposed to direct flame or excessive heat, or if a fire becomes uncontrollable, evacuate for a radius of at least 1500 feet for protection from flying debris of the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.16 - 0.20 g/ 100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, and acetone.

Specific Gravity (Liquid): 0.90 at 68°F (20°C)

Boiling Point: 293 - 298.4°F (145 - 148°C) at 1 atm.

Melting Point: - 84.3°F (– 64.6°C)

Freezing Point: – 84.3°F (– 64.6°C)

Molecular Weight: 128.17

Heat of Combustion: – 7700 cal/g

Vapor Pressure: 3.3 - 4.0 mm Hg (0.064 - 0.077 psia) at 68°F (20°C)

Flash Point: 105°F (40.6°C), closed cup; 116 - 118°F (46.7 - 48°C), open cup.

Autoignition Temperature: 534 - 559°F (279 - 293°C)

Burning Rate: 4.7 mm/minute

Stability: Stable when inhibited in normal transportation. May polymerize under conditions described above.

Corrosiveness: Brass, bronze, or lead compounds not acceptable from a color and contamination standpoint.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with oxidizing agents, acids, alkalies, heat, sunlight, x-ray and ultraviolet radiation, azo and diazo compounds, hydrazines, caustics, cyanides, nitrides, organic peroxides and hydroperoxides, phenols and cresols, inorganic sulfides, dithiocarbamates, and alkali and alkaline earth metals.

IDENTIFICATION

Shipping Names: butylacrylate (USDOT and IMO)

Synonyms and Tradenames: n-butyl acrylate; butyl 2-propenoate; 2-propenoate; acrylic acid, butyl ester; 2-propenoic acid, butyl ester.

Chemical Formula: $CH_2{=}CHCOO(CH_2)_3CH_3$

Constituent Components(% each): 99+% pure with inhibitor such as methyl ether of hydroquinone (15 - 100 ppm) or hydroquinone (40-60ppm)

UN/NA Designation: UN2348

IMO Designation: 3.3, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sharp, biting, characteristic, acrylic odor

Common Uses: Resin and paint mfg; organic chemical mfg; emulsifier; polymers for solvent coatings, caulks, sealants, adhesives, and binders.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (202)483-7616 OR
THE AAR BUREAU OF EXPLOSIVES(202)639-2222

BUTYL ACRYLATE

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Excessive heat may cause self-polymerization with violent rupture of container. This may also be initiated by contamination with certain chemicals. Vapors are uninhibited and may form polymers in vents or flame arrestors, resulting in stoppage.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contamination by incompatible materials; runoff to sewers; water pollution; inhalation, physical contact, and ingestion.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to vapor in air. Additional hazards are posed by ingestion or physical contact with the product.

Hazards of Skin or Eye Contact: Prolonged contact of liquid butyl acrylate with the skin may result in moderate irritation and the liquid may be absorbed via the skin to a limited extent. Contact with the eyes may cause irritation and possible corneal damage.

Hazards of Inhalation: Breathing higher concentrations of acrylic monomers in air may cause salivation, eye irritation, and pronounced pulmonary irritation or edema.

Hazards of Ingestion: Ingestion of butyl acrylate may cause severe irritation of the mouth and digestive system. Ingestion of acrylic monomers in general may cause collapse, severe respiratory difficulties, and stimulation of the central nervous system.

FIRE HAZARDS

Lower Flammable Limit: 1.3-1.5%

Upper Flammable Limit: 9.4-9.9%

Behavior in Fire: Combustible liquid. Exposure of containers to fire may result in violent polymerization.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Loss of inhibitor or excessive heat or light may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in presence of acids, alkalies, caustics, and other substances.

PROTECTIVE CLOTHING AND EQUIPMENT

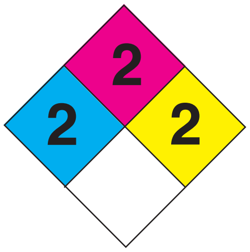
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials include (but are not limited to) neoprene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use of limitations of these devices.

2348

BUTYL ACRYLATE

Class 3 (Flammable Liquid) or Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of eyes, nose, mucous membranes, and/or skin depending on route of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer two glasses of water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, and possibly alcohol foam. Water spray may be effective on fires in open containers.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Avoid contact with spilled product. Prevent liquid from entering sewers and confined areas. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of butyl acrylate may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that butyl acrylate may polymerize under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Butyl acrylate may not evolve significant amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of butyl acrylate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to butyl acrylate vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of butyl acrylate from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

BUTYL ACRYLATE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FOAM ... Firefighting foam applied to the surface of liquid pools may slow the release of butyl acrylate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Butyl acrylate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained butyl acrylate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, fly ash, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

BUTYL ACRYLATE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS ... Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS ... Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

BUTYL ACRYLATE
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

DIVERSION ... Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING ... Oil spill skimming devices may be deployed to recover floating butyl acrylate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION ... Straw, hay, peat, or commercial sorbent materials compatible with butyl acrylate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause over flow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

BUTYL ALCOHOL
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Butyl alcohol is a colorless liquid with a strong and pleasant, alcoholic, or pungent and camphor-like odor depending on the specific isomer of concern. Although this guide is primarily intended for the normal (n-) isomer, it is also mostly applicable to the sec- and tert-butyl alcohol isomers. Significant differences are highlighted below.

Although solubilities of the isomers vary, all are lighter than water and dissolve rapidly under most conditions. Flash points in the range of 52-84°F indicate that ignition may occur easily under a variety of ambient temperature conditions. In warm weather, vapors may travel a relatively short distance to a source of ignition and flash back, particularly if the more volatile tert-isomer has spilled. Accumulations of vapors in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The products weigh 6.5-6.8 pounds per gallon.

All of these alcohols are stable in normal transportation and do not react with water or many other common materials. They are incompatible with certain strong acids or oxidizers, however; will attack some forms of plastics, rubber, and coatings; and the normal isomer is known to react with aluminum at high temperatures. Toxicity is low to moderate via the various routes of exposure. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 7.7 g/100 g water (n-); 15.4 (sec-); fully soluble (tert-); all at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, and benzene.

Specific Gravity (Liquid): 0.81 at 68°F (20°C)

Boiling Point: 243.9°F (117.7°C)(n-); 211°F (99.5°C) (sec-); 181°F (82.6°C) (tert-); all at 1 atm.

Melting Point: See freezing point

Freezing Point: -129°F (-89.3°C)(n-); -174.5°F (-114.7#C)(sec); 78.3#F (25.7#C)(tert)

Molecular Weight: 74.12

Heat of Combustion: -7906 cal/g(n-); -8600(sec-); -7780 (tert-)

Vapor Pressure: 4.2 mm Hg (0.081 psia)(n-); 12.5 (0.242)(sec-); 31 (0.6) (tert-); all at 68°F (20°C)

Flash Point: 84°F (28.9°C)(n-); 75°F (23.9°C)(sec-); 52°F (11.1°C)(tert-); all closed cup

Autoignition Temperature: 650°F (343.3°C)(n-); 763°F (406.1°C)(sec-); 896°F (480°C)(tert-)

Burning Rate: 3.1-3.4 mm/minute

Stability: Stable

Corrosiveness: Attack some forms of plastics, rubber, and coatings. Normally reacts with aluminum at high temperatures; others may also.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: React with strong oxidizers and strong mineral acids; aluminum at high temperatures.

IDENTIFICATION

Shipping Names: Butanols (USDOT or IMO)

Synonyms and Tradenames: Normal is butanol, 1-butanol, 1-hydroxybutane, or n-propylcarbinol; sec- is 2-butanol, butylene hydrate, sec-butanol, 2-hydroxybutane, or methylethylcarbinol; tert is 2-methyl-2-propanol, tert-butanol, or trimethylcarbinol.

Chemical Formula: $C_4H_{10}O$

Constituent Components(% each): 99% or more pure

UN/NA Designation: UN1120

IMO Designation: 3.3 (n- and sec-) or 3.2 (tert); flammable liquids

Physical State as Shipped: Liquid

Physical State as Released: Liquid (tert freezes at 78.3°F)

Color of the Shipped Material: Colorless

Odor Characteristics: Strong, pungent, like alcohol, wine, or fuel oil (n-); strong, pleasant (sec-); pungent, like camphor (tert)

Common Uses: Many uses as solvents; mfg. of pharmaceuticals, other chemicals, artificial leather, safety glass, glues, shellac, raincoats, films, perfumes, and plastics.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

BUTYL ALCOHOL
Flammable Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 2.5-15 ppm (n-); 43 ppm (sec-); 73 ppm (tert-)

Unusual Hazards: Flammable alcohols of low to moderate volatility.

Short Term Exposure Limits(STEL): 150 ppm of sec- or tert- for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 100 ppm of sec- or tert- over each 8 hours of a 40 hour work week. Normal has 50 ppm absolute ceiling limit. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to high vapor concentrations in air as may occur near the spill and immediately downwind. Contact and ingestion should also be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact may result in drying and cracking of the skin due to the defatting action of these products. Contact with the eyes may cause mild to severe irritation with some chance of more severe injury.

Hazards of Inhalation: Vapors of butyl alcohols are irritating to the eyes, nose, and throat. High concentrations in air may cause narcosis and central nervous system depression with symptoms including headache, dizziness, drowsiness, and blurred vision.

Hazards of Ingestion: Data unavailable; expect irritation and some symptoms of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 1.4%(n-); 1.7%(sec-); 2.35%(tert-)

Upper Flammable Limit: 11.2%(n-); 9%(sec-); 8%(tert-)

Behavior in Fire: Flammable liquid. Vapors may travel to a source of ignition and flash back. There is some potential that containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

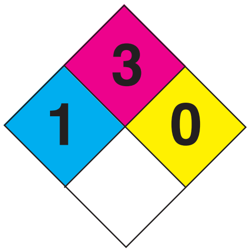
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials (for n-butyl alcohol) include butyl rubber, neoprene, nitrile rubber, polyethylene, chlorinated polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, viton, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 8000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (5000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1120

BUTYL ALCOHOL

Flammable Liquid



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, or skin; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after vomiting.

First Aid for Ingestion: If victim is conscious, induce vomiting. Do not make an unconscious persom vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol foam, water spray. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that butyl alcohols are flammable and that the tert isomer solidifies at temperatures below 78.3°F.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Butyl alcohol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of butyl alcohol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to butyl alcohol vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of butyl alcohol from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rain water that may add to spill volume and overfill impoundments.

BUTYL ALCOHOL
Flammable Liquid

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid butyl alcohol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... Alcohol foam applied to the surface of liquid pools may slow the release of butyl alcohol vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short-term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Butyl alcohol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained butyl alcohol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

BUTYL ALCOHOL
Flammable Liquid

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the over all volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment techniques.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1991

BUTYLAMINE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

The shipping name "butylamine" is applied to a substance technically referred to as normal- or n-butylamine, a colorless, corrosive and flammable liquid with a fishy. and sour odor resembling ammonia. It is used for making a variety of products such as emulsifying agents, pharmaceuticals, insecticides, dyes, tanning agents, textiles, and rubber, among others. The product is fully soluble in water and will dissolve freely. Its low flash point indicates that it can be easily ignited under most ambient temperature conditions. Vapors may be heavier than air, may travel a considerable distance to a source of ignition and flash back, and/or may persist in pits, hollows, and depressions Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. Liquid n-butylamine weighs approximately 6.2 pounds per gallon.

n-Butylamine does not react with water or many other common materials and is stable in normal transportation. It is incompatible with acids and oxidizing agents, and as an aliphatic amine, is reactive with a variety of other chemical substances. Corrosive to several metals, the product also attacks some types of plastics and rubber and is extremely corrosive to all bodily tissues. Products of combustion include highly toxic oxides of nitrogen as well as other toxic constituents.

Besides n-butylamine, two other closely related substances may at times be referred to as "butylamine". These are isomers of the product and are technically and commonly referred to as secondary- or sec-butylamine, or tertiary- or tert-butylamine. Both are more volatile than n-butylamine and therefore pose potentially greater fire, explosion, and downwind toxic hazards, with the tertiary product being the most volatile.

If one of the butylamines of interest is leaking from its container but is not on fire, downwind evacuation or an alternative protective action should be considered based on the amount of material spilled, location, and weather conditions. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket. Note that the rupture hazard is greatest for tert-butylamine which is the most volatile of these butylamines.

CHEMICAL/PHYSICAL DATA

Solubility **in** ***Water:*** Soluble in all proportions

Solubility in Other Chemicals: The isomers may be soluble in many organic solvents including acetone, benzene, ethanol, ether, and others. Some authorities report that these substances may react violently with alcohols.

Specific Gravity (Liquid): 0.739–0.741 for n-butylamine; 0.720–.725 for sec-; 0.690–0.696 for tert-; all at 68°F (20°C)

Boiling Point: 170.6–172.4°F (77–78°C) for n-; 143.6–154.4°F (62–68°C) for sec-; 111.2–116.6°F (44–47°C) for tert-; all at 1 atm.

Melting Point: –58.9 to – 56.2°F (– 50.5 to – 49°C) for n-; –156.1 to –155.2°F (–104.5 to –104°C) for sec-; – 98.9 to – 88.6°F (– 72.7 to – 67°C) for tert

Freezing Point: See melting point

Molecular Weight: 73.14 or 73.16

Heat of Combustion: –9775 cal/g for n-; –9780 cal/g for sec-; –9790 cal/g for tert

Vapor Pressure: 68–82 mm Hg (1.314–1.585 psia) at 68°F (20°C) for n-; approx. 136 mm Hg (2.629 psia) at 68°F (20°C) for sec-; approx 225 mm Hg (4.349 psia) at 68°F (20°C) and approx 340 mm Hg (6.572 psia) at 77°F (25°C) for tert-; available data are limited and vary.

Flash Point: Reported values vary; most sources give 10°F (–12.2°C) on a closed-cup basis for n-butylamine, but 6°F and 26°F (–14.4°C and –3.33°C) are also reported; open-cup values range from 30°F to 45°F (–1.11° to 7.22 C). For the sec- isomer, most list a closed-cup value of 16°F (–8.9); the only open-cup value found was –9°F (–23°C). For the tert- isomer, sources give values ranging from less than –40°F (–40°C) to 16°F (–8.9°C) to 50°F (10°C).

Autoignition Temperature: 594°F (312°C) for n-; 712°F (378°C) for sec-; 707–716°F (375–380°C) for tert

Burning Rate: 5.79 mm/minute for n-butylamine; 6.18 mm/min for sec-; 7 mm/min for tert

Stability: Stable

Corrosiveness: n-Butylamine is reported to corrode metals such as aluminum, copper, copper alloys such as brass and bronze, zinc, zinc alloys, and galvanized surfaces in the presence of water; aqueous solutions are reported capable of attacking glass. All butylamines attack many forms of plastics and rubber.

Reactivity with Water: No reaction but heat is generated as butylamines dissolve in water. The resulting solutions are strongly alkaline; O.1M solutions are computed to have a pH of 11.8.

Reactivity with Other Chemicals: In general, contact of these butylamines with oxidizing agents are reported to potentially result in fire; reactions with acids may be violent and result in spattering; reactions with alcohols, glycol ethers, and monomers may be violent.

IDENTIFICATION

Shipping Names: Butylamine (USDOT); n-butylamine (IMO for normal isomer). Some shippers may use "flammable liquid, n.o.s." or "flammable liquid, poisonous, n.o.s."

Synonyms and Tradenames: 1-Aminobutane; 1-butanamine; butylamine; monobutylamine; mono-n-butylamine; MNBA; and normal-butylamine for n-butylamine.

Chemical Formula: $CH_3(CH_2)_3NH_2$ for the normal isomer; $CH_3CH_2CH(NH_2)CH_3$ for the sec- isomer; $(CH_3)_3CNH_2$ for the tert- isomer.

Constituent Components (% ***each):*** Limited data available; it appears that these products are available in purities ranging from 90010 up to about 100%.

49 STCC: 49 081 20 for n-butylamine; not established for sec-butylamine; 04909134 for tert-butylamine

UN/NA Designation: UN1125 (USDOT for "butylamine" and IMO for "n-butylamine"); UN1992 (USDOT for "flammable liquid poisonous, n.o.s." and also for similar IMO shipping name); UN1993 (USDOT for "flammable liquid, n.o.s." and also for similar IMO shipping name).

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Almost always liquid. Punctures into the vapor space of its containers under such conditions may discharge some amounts of pressurized gas.

Color of the Shipped Material: Colorless; solutions in water may be slightly yellow at times.

Odor Characteristics: Fishy; sour; like ammonia or amine

Common Uses: Making emulsifying agents, pharmaceuticals, insecticides, dyes, synthetic tanning agents, rubber and other polymers, antioxidants for gasoline, developing materials in photography, corrosion inhibitors for some metals, and desizing agents for textiles.

BUTYLAMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Values between 0.08 ppm and 125 ppm have been reported for the normal isomer. Most data suggest the odor is perceptible between 0.08 and 0.3 ppm in air, is considered slight at about 1 ppm and is noticeable at 1 to 2 ppm.

Unusual Hazards: Fairly volatile and corrosive flammable liquids with vapors that may be heavier than air at times and persist in low areas.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Ceiling (C) Limit: (Skin) 5 ppm absolute ceiling limit (ACGIH, 1990–91; OSHA, 1989) for normal isomer; not established for other isomers.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and over potentially considerable distances downwind. Direct physical contact and ingestion are also to be strictly avoided. Except where noted otherwise, the three butylamines of interest are presumed to pose comparable health hazards.

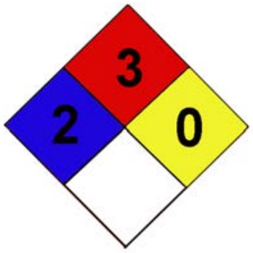
Hazards of Skin or Eye Contact: Undiluted liquid n-butylamine or 10% or 50% solutions of the product in water are expected to cause severe (second degree) skin burns and blisters with resultant death of skin tissue. The burns occur rapidly and are not greatly helped by prolonged washing, even if this occurs within 15 seconds of contact. Prolonged skin contact has the potential to result in absorption of toxic amounts of the liquid through the skin; symptoms such as headache, nausea, vomiting, faintness, anxiety and shock may occur due to subsequent effects on the nervous system. Experiments with animals suggest that skin absorption might be a greater hazard with n-butylamine than its other isomers. Vapors of volatile amines are generally known to cause eye irritation with lachyrmation, redness, and corneal edema (i.e., swelling). This can sometimes result in a temporary (day or so) and non-painful visual disturbance called "blue haze" or "halo vision" which occurs after about one to three hours of exposure to relatively low concentrations of vapors in air and causes foggy or blurred vision in which items appear blue-tinted and halos appear around lights. It is not specifically known whether butylamines can cause this effect but it is a distinct possibility. Contact of undiluted n-butylamine or 10% or 50% solutions of the product with the eyes can very rapidly cause burns that may result in serious permanent injury and possibly blindness. Contact lenses should not be worn when working with these chemicals. (Note: Repeated or prolonged skin contact with some amines can cause allergic skin sensitization; it is not known whether this may occur with the butylamines but it is a possibility.)

Hazards of Inhalation: Vapors of n-butylamine are irritating to the eyes, nose, throat, and lungs. Levels above permissible exposure limits are known to cause mild headaches and flushing of the skin and face. High levels in air may cause sore throat, nausea, vomiting, headache, faintness, coughing, chest pain, difficult breathing, anxiety, unconsciousness, and death. Non-lethal acute exposures may result in delayed pulmonary edema with possibly severe consequences, including death. n-Butylamine concentrations of 10 to 25 ppm are unpleasant and even intolerable to some people in exposures lasting more than a few minutes; all rats exposed to 3000 to 5000 ppm in laboratory experiments experienced an immediate irritant response, difficult breathing, pulmonary edema, and death within minutes to hours. A concentration of 1270 ppm of tert-butylamine was fatal to 50% of rats exposed for 4 hours. Note that the saturated vapors concentrations of n-, sec-, and tert-butylamine at 68°F are respectively and approximately 89,475 to 107,900 ppm, 178,950 ppm, and 296,050 ppm. In chronic exposure situations, airborne amines have been known to cause allergic respiratory system sensitization; it is not known whether butylamines can cause this response but it is a possibility.

***Hazards of* Ingestion:** Ingestion of n-butylamine may cause irritation and burns of the mouth, throat, and digestive tract. Symptoms may include headache, nausea, vomiting, faintness, anxiety, loss of coordination, sedation, nasal discharge, gasping, salivation, pulmonary edema, and eventually death. Due to the properties and effects of the product, it can be presumed that aspiration into the lungs during vomiting might also cause pulmonary edema with possibly severe consequences. The lowest reported oral LD$_{50}$'s, the doses found to be lethal to 50% of the animals, for n-, sec- and tert-butylamine were respectively 366 mg/kg, 152 mg/kg, and 44 mg/kg of body weight in experiments involving rats.

BUTYLAMINE

Class 3 (Flammable Liquid)



FIRE HAZARDS

Lower Flammable Limit: 1.7% for n- or sec-; 1.5% or 1.7% (at 212°F) for tert-butylamine
Upper Flammable Limit: 9.8% or 10% for n- or sec-; 8.9% (at 212°F) or 9.2% for tert-butylamine; reported values vary
Behavior in Fire: Flammable liquid. May generate significant quantities of flammable vapors upon release. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. There is some potential for containers to rupture violently and possibly rocket in a fire.
Hazardous Combustion Products: Carbon dioxide, carbon monoxide, various hydrocarbons, highly toxic oxides of nitrogen, and possibly some amounts of ammonia and other substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential for containers to rupture violently and possibly rocket in a fire. Reactions with certain other chemicals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof or vapor-tight safety goggles as appropriate, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases to prevent contact with high vapor or fume concentrations in air. Note that few materials have been confirmed as compatible with the butylamines of interest and several have been shown to be quickly attacked and destroyed (e.g., natural latex, neoprene, and disposable PVC) in limited experiments. It has only been reported with some certainty that Teflon may be resistant to n-butylamine and that at least one type of nitrite-butadiene rubber may resist breakthrough of tert-butylamine for more than one hour. Seek expert advice before using protective clothing under potentially dangerous circumstances involving direct contact with these butylamines.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 ppm) of nbutylamine, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister providing protection against butylamine (250 ppm or less) or a chemical cartridge respirator with a full facepiece providing protection against butylamine (250 ppm or less) within the use limitations of these devices. Canisters or cartridges should be of the ammonia/amine variety according to one maker of n-butylamine. Specific data are unavailable for other isomers. Use a SCBA as described above unless additional information becomes available for these materials from an expert or otherwise reliable source.

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues; headache, dizziness, coughing, nausea, difficult breathing, or other symptoms of exposure.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.
First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Keep victim warm and at rest. Get medical attention immediately. If vomiting occurs naturally or otherwise, have the victim lean forward and keep head below hips to reduce risk of aspiration of liquid into the lungs. NOTE: Some references, including a 1981 publication from NIOSH, suggest that an attempt be made to induce vomiting in conscious victims after water has been administered. Numerous others, however, including some recent publications from several major chemical companies, recommend that no attempt be made to induce vomiting. The problem is that induction of vomiting runs the risk of aspiration into the lungs and the development of pulmonary edema. Conversely, if medical attention is not immediately available, not inducing vomiting runs the risk of absorption of the chemical into the body and the development of the toxic effects discussed above, which also include pulmonary edema. Neither course of action is perfect, but it appears for the time being that professional opinions tilt towards diluting the chemical in the digestive tract and leaving it there until qualified medical attention is obtained. Seek the advice of a physician on this question immediately when possible if the need arises.

BUTYLAMINE
Class 3 (Flammable Liquid)

FIRE RESPONSE.

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear fully encapsulating protective suit where necessary if contact with concentrated vapors is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may rupture violently, possibly rocket, and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, it may be prudent to use unmanned hose holder or monitor nozzles. It this is impossible, it may also be prudent to withdraw and let fire burn, particularly if the more volatile isomers are involved. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take into account while planning the response that the butylamines of interest are highly corrosive to bodily tissues and are volatile flammable liquids with potentially heavier than air vapors that may persist in low areas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Butylamine discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to butylamine vapors in air may absorb some amount of the vapors and/or accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain butylamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of butylamine vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

BUTYLAMINE
Class 3 (Flammable Liquid)

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid butylamine may slow the release of vapors into the atmosphere. Use the coldest water available since heat will be generated upon mixing and this heat may actually increase vapor evolution for an initial period of time.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Proceed with caution where a temporary increase in vapor evolution may pose a threat to downwind populations or on operational safety. It may be best to truly flood" the area with water as rapidly as possible.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid butylamine may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained butylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite perlite, fly ash, cement powder, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of afire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

BUTYLAMINE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Butylamines will freely dissolve in water and form strongly alkaline solutions. These are known to be harmful to aquatic life in relatively low concentrations and may remain flammable until well diluted.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1997

BUTYLENE
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Butylene, also shipped as liquefied petroleum gas, is a colorless gas that is transported as a liquid under pressure and has a sweet and mildly aromatic odor. It is used for making a number of organic chemicals and is insoluble in water and lighter. With a flash point of -80°C (-112°F) and a boiling point of -6°C (21°F), and depending on the ambient temperature, there is a potential that large amounts of flammable gas will evolve from spills. The gas is heavier than air, may travel very considerable distances to a source of ignition and flash back, and may persist in pits, depressions and hallows. Accumulations of gas in confined spaces such as buildings or sewers may result in explosions if ignited, and there is also a possibility of explosions involving unconfined vapor clouds. Containers may rupture violently if exposed to prolonged fire or excessive heat. The liquid weighs approximately 5 pounds per gallon at ambient temperatures.

Butylene does not react with water or many common materials, but will react with oxidizers. It is stable in normal transportation. However, it is reactive with oxidizing materials and possibly other chemicals. The gas is not significantly toxic by inhalation, but high concentrations may be anesthetic or may cause asphyxiation via displacement of air. Liquid butylene and concentrated cold gas pose a frostbite hazard. Products of combustion may include toxic constituents.

Downwind evacuation should be considered if butylene is leaking but not on fire. If fire becomes uncontrollable or container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible
Solubility in Other Chemicals: Soluble in benzene, diethyl ether and ethanol.
Specific Gravity: .630
Vapor Density: 2.0 at 21°C (70°F)
Boiling Point: -6°C (21°F)
Melting Point: See freezing point
Freezing Point: -185°C (-301°F)
Molecular Weight: 56.11
Heat of Combustion: -10826 cal/g
Evaporation Rate: High
Vapor Pressure: 3257.00 mm Hg at 38°C (100°F)
Flash Point: -80°C (-112°F)
Autoignition Temperature: 385°C (725°F))
Burning Rate: 8.8 mm/minute
Flammable Limits: 1.6% (LEL) - 9.3 to 15% (UEL)
Stability: Stable
Polymerization Potential: Will not occur.
Corrosiveness: Not corrosive
Reactivity and Incompatibility: Oxidizers, halogens and acids.
Reactivity with Water: No reaction

IDENTIFICATION

Shipping Name(s): Butylene (USDOT & IMO); Liquefied petroleum gas (USDOT)
Synonyms and Tradenames: 1-Butene; Butene; alpha-Butylene; alpha-Butene; Ethylethylene
CAS Registry No: 25167-67-3
Chemical Formula: $CH_3CH_2CH=CH$
Constituent Components (% each): Mostly 1-Butene or Butene
UN/NA Designation: UN1012 (Butylene); UN1075 (Liquefied petroleum gas)
IMO Designation: 2.1
RTECS Number: EM2893000
NFPA 704 Hazard Rating: 1 (Health): 4 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Gas or liquid under pressure
Physical Form as Released: Gas or fuming liquid
Color of the Shipped Material: Colorless (gas may appear white at first)
Odor Characteristics: Sweet, mildly aromatic
Reportable Quantity: See appendix I
Common Uses: Mfg. of various organic chemicals, fuel, gasoline component, intermediate for polybutylenes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

BUTYLENE

Division 2.1 (Flammable Gas)

* Also 1075

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 69 ppb-12.5 ppm; reported values vary.

Unusual Hazards: Extremely volatile substance. Evolves large amounts of flammable heavier than air gas that may travel to a source of ignition and flash back. Gas may persist in low areas.

Short Term Exposure Limit (STEL): 1250 ppm for LPG for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 1000 ppm

Ceiling (C) Limit: Unavailable

IDLH: 2000 ppm for LPG (based on 10% of the LEL for safety considerations even though the relevant toxicological data indicates that irreversible health affects or impairment of escape exists only at higher concentrations).

Conditions to Avoid: Heat, fire and sparks; contact with incompatible materials; entry to sewers or confined spaces; inhalation; contact with cold product or equipment.

HEALTH HAZARDS

Potential Health Hazards: Major hazard is from inhalation of the high gas concentrations that may be present in the spill area and downwind. Contact with cold product may cause frostbite.

Hazards of Skin or Eye Contact: Contact with venting gas or liquid butylene may result in frostbite type burns.

Hazards of Inhalation: High concentrations of butylene gas in air may be anesthetic and may cause dizziness or unconsciousness. Very high concentrations may cause asphyxiation and death due to displacement of air.

Hazards of Ingestion: Ingestion is unlikely but may result in frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 1.6%

Upper Flammable Limit: 9.3-15%

Behavior in Fire: Material is extremely flammable. It will readily ignite if exposed to sources of heat and flame. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Containers exposed to prolonged heat or fire may rupture violently.

Hazardous Decomposition Products: Carbon dioxide and carbon monoxide. Runoff may be flammable and/or toxic.

Hazardous Combustion Products: Not well defined, may include toxic constituents.

EXPLOSION HAZARDS

Explosive Potential: High. Can readily form explosive mixtures with air. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. There is a possibility that unconfined gas clouds may also explode if ignited. Containers exposed to prolonged heat or fire may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Full fire retardant structural firefighting clothing meeting NFPA standards is recommended for handling spills when fire is the major concern.

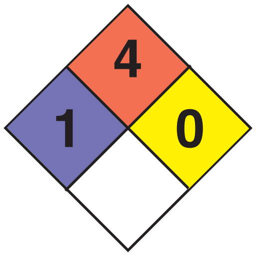
Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a positive-pressure, self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

1012

1075

BUTYLENE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Frostbite from contact; headache or dizziness from excessive inhalation.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact:Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. If burning or irritation persists after washing, provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Drink warm water to relieve frostbite, but do not induce vomiting without medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog) or foam.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases. Note that addition of water to liquid pools of butylene may increase gas evolution.

SPILL RESPONSES

General Information: Butylene is a highly flammable gas that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and storm drains. Runoff may be flammable and/or toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

BUTYLENE

Division 2.1 (Flammable Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Need to notify, organize, transport and house evacuees.

TECHNIQUE

MONITOR THE SITUATION . . . Butylene is expected to exist almost entirely in the vapor phase when released into the atmosphere. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Continue periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the generation of vapors.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

BUTYLENE
Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor for presence of flammable vapors. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor for presence of flammable vapors. Decontaminate equipment.

BUTYLENE

Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Booms may be an effective means to recover spilled material since the material is not water soluble and is lighter than water. Barriers of suitable material may be used to confine the spill to a limited area to prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions. Confined vapors will generate flammable vapors.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Continually monitor areas to identify hazardous areas.

TECHNIQUE

CONTAINMENT DIKES . . . If released into water sources, butylene should undergo volatilization. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION . . . Material is not water soluble. Overflow dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Some material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

SURFACE SKIMMING . . . Surface skimming may be effective since the material is not water soluble and is lighter than water.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

1,4-BUTYNEDIOL*

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

1,4-Butynediol is a colorless to pale yellow poisonous material with a musty odor which may be found as a crystalline solid or a liquid (aqueous solution). It is manufactured from the high-pressure synthesis of acetylene and formaldehyde. 1,4-Butynediol is used as a chemical intermediate, corrosion inhibitor, electroplating brightener, defoliant, stabilizer for chlorinated hydrocarbons, and as a cosolvent for paint and varnish removal.

1,4-Butynediol is extremely irritating to the eyes and skin. It may penetrate the skin and cause severe irritation and burns. The most common route of exposure is through skin contact. It is highly toxic by skin absorption, inhalation and ingestion. May cause irritation of the mouth and throat, nausea and vomiting, possibly leading to convulsions.

Although the fire potential for 1,4-butynediol is moderate, it will release ignitable vapors when heated. Polymerization will not occur. When heated to decomposition, the burning material may generate extremely acrid and irritating fumes. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for working in atmospheres where 1,4-butynediol is present. Runoff may be toxic. 1,4-Butynediol is water soluble. This material is normally stable, however it is incompatible with materials such as mercury salts and strong acids.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble.
Solubility in Other Chemicals: Alcohol, acetone and aqueous Acids.
Specific Gravity (Liquid): 1.1
Vapor Density (Air=1): 3.0
Boiling Point: 141°C (286°F)
Melting Point: 7°C (45°F)
Freezing Point: Unavailable.
Molecular Weight: 86.09
Heat of Combustion: Unavailable.
Vapor Pressure: 15 mm Hg at 142°C (288°F)
Flash Point: 128°C (263°F)
Autoignition Temperature: Unavailable.
Flammable Limits: 1.1% (LEL) - 3.0% (UEL)
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with mercury salts, strong acids, alkali earth hydroxides and halides at high temperatures.
Other Characteristics: When heated to decomposition, material emits acrid fumes.

IDENTIFICATION

Shipping Name(s): 1,4-Butynediol (USDOT & IMO)
Synonyms and Tradenames: 1,4-Dihydroxy-2-Butyne, 2-Butyne-1,4-Diol, 2-Butynediol, BIS (Hydroxymethyl) Acetylene, Butynediol, Butynediol-1,4, 1,4-Butindiol, 2-Butin-1,4-Diol and Butynediol Technical Flakes, CAS Registry No: 110-65-6
Chemical Formula: $HOCH_2CH:CHCH_2OH$
Molecular Formula: $C_4H_6O_2$
UN/NA Designation: UN2716
IMO Designation: 6.1
RTECS Number: NIOSH/ES0525000
OHMTADS Number: Unavailable.
NFPA 704 Hazard Rating: 2 (Health):1 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid (35% aqueous solution) / crystalline solid
Physical Form as Released: Liquid / crystalline solid
Color of the Shipped Material: Colorless to pale yellow
Odor Characteristics: Musty odor
Reportable Quantity: None established.
Common Uses: Product is used as a chemical intermediate, corrosion inhibitor, electroplating brightener, defoliant, stabilizer for chlorinated hydrocarbons and as a cosolvent for paint and varnish removal.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1,4 BUTYNEDIOL

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: <1 ppm

Unusual Hazards: Material is immediately irritating to the eyes and skin.

Time Weighted Average (TLV-TWA): 1 ppm

Short Term Exposure Limit (STEL): 2 ppm

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, moisture, incompatible materials such as mercury salts, strong acids, acid fumes, alkali earth hydroxides, halides at high temperature, skin/eye contact, inhalation and ingestion. Material may not be stored near food stuffs.

HEALTH HAZARDS

Potential Health Effects: 1,4-Butynediol is severely irritating to the eyes and skin. May be fatal if absorbed through the skin or inhaled in toxic amounts. Material can penetrate skin and mucous membranes and cause burns. May cause severe allergic respiratory reaction. Gross overexposure may be fatal. Individuals with preexisting diseases of the cardiovascular system may have increased susceptibility to the toxicity of excessive exposures. Symptoms of exposure may be delayed.

Hazards of Skin and Eye Contact: Skin contact may cause skin irritation with rash, redness, swelling and dermatitis. Prolonged exposures may lead to skin burns or blistering and ulceration of soft tissue. Eye contact may cause irritation, tearing, or inflammation of conjunctiva.

Inhalation Hazards: Inhalation may cause central nervous system (CNS) effects such as nausea, headache, dizziness or general weakness. Irritation of the upper respiratory tract and wheezing may also occur.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, vomiting and convulsions.

FIRE HAZARDS

Lower Flammable Limit: 1.1%

Upper Flammable Limit: 3.0%

Behavior in Fire: Although 1,4-Butynediol will not readily ignite, it will burn if exposed to sources of heat and flame. Vapors may form explosive mixtures with air.

Hazardous Decomposition Products: When heated to decomposition, material releases acrid fumes. Toxic, irritating vapors may be liberated in fire situations.

EXPLOSION HAZARDS

Explosive Potential: Moderate, however containers exposed to heat and flame may explode and violently rupture.

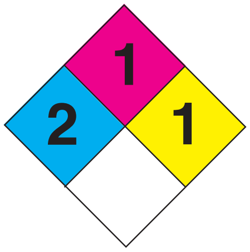
PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Fully encapsulating, vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are neoprene. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits.

2716

1,4 BUTYNEDIOL
Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Direct skin contact can produce irritation, inflammation, redness and burns. Central nervous system (CNS) effects may include nausea, headache, dizziness or general weakness. The material is known to be a mucous membrane irritant. Other symptoms may include vertigo, dermatitis, arrhythmia and convulsions.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray, or alcohol-resistant foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water spray to cool fire-exposed containers, disperse vapors, and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may contain toxic concentrations of material.

SPILL RESPONSES

General Information: Secure potential sources of heat, sparks, flame, impact, friction, electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways and storm drains. Underflow dams are not an effective means to dike material since it mixes with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

1,4 BUTYNEDIOL

Division 6.1 (Poisonous Materials)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...If released into the atmosphere, 1,4-butynediol is expected to exist almost entirely in the vapor phase. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of combustible and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

FOAM...Alcohol-resistant foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways, and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

1,4 BUTYNEDIOL
Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material readily mixes with water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms are not an effective means to recover spilled material since the material is water soluble and heavier than water. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material is water soluble and the material does not float on the surface of the water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

1,4 BUTYNEDIOL

Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Cover solid form of material with a plastic sheet or other compatible material. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering sewers, waterways and storm drains. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

January 1988

BUTYRALDEHYDE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Butyraldehyde is a fairly volatile colorless liquid with a pungent, sweet and rancid odor. It is used in tanning and in making rubber, paper, plastics, dyes, drugs, and other chemicals. It is moderately soluble in water and lighter, so may be expected to form a floating surface slick that dissolves fairly rapidly. Its flash point of 15–20°F indicates that it can be easily ignited under a wide range of ambient temperature conditions. Vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs 6.7–6.8 pounds per gallon.

Butyraldehyde is stable in normal transportation and does not react with water or many other common materials. It reacts with various chemicals, however, and may self-polymerize violently in the presence of heat, acids, or alkalies. Products of combustion may include toxic constituents.

Downwind evacuation should be considered if butyraldehyde is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 7.1. g/100 g water at 77°F (25°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.803–0.8084 at 68°F (20°C)
Boiling Point: 167–168.3°F (74.8–75.7°C) at 1 atm.
Melting Point: –146.2°F (– 99°C)
Freezing Point: –142°F(–96.4°C)
Molecular Weight: 72.11
Heat of Combustion: –8450 cal/g
Vapor Pressure: 91.5 mm Hg (1.77 psia) at 68°F (20°C)
Flash Point: 20°F (6.7°C), closed cup; 15°F (– 9.4°C), open cup.
Autoignition Temperature: 446°F (230°C)
Burning Rate: 4.4 mm/minute
Stability: Stable, but readily oxidizes to butyric acid in presence of air. May polymerize under conditions described above.
Corrosiveness: Mild steel is corroded by butyric acid formed in presence of air.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with acids, alkalis, strong oxidizers, strong reducing agents, and possibly peroxides.

IDENTIFICATION

Shipping Names: Butyraldehyde (USDOT and IMO)
Synonyms and Tradenames: Butanal; butyric aldehyde; butyl aldehyde; butal; butaldehyde; butalyde; butyral; butyrylaldehyde. (Note: Any name may be preceded by n-.)
Chemical Formula: $CH_3CH_2CH_2CH0$
Constituent Components(% each): 97–99.5% pure with rest mostly water.
49 STCC: 49 081 19
UN/NA Designation: UN1129
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent and intense; sweet and rancid.
Common Uses: Tanning; mfg. of rubber, paper, plastics, dyes, drugs, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

BUTYRALDEHYDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.0046 ppm

Unusual Hazards: Volatile flammable liquid. May self-polymerize violently in the presence of heat, acids, or alkalis.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from high vapor concentrations that may evolve from a spill. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Contact of liquid butyraldehyde with the skin may result in irritation. Contact with the eyes may cause burns.

Hazards of Inhalation: Butyraldehyde vapors may cause coughing, watering of the eyes, irritation, nausea, vomiting, headache, and loss of consciousness as a result of central nervous system depression. A level of 200 ppm in air is the lowest causing observable toxic effects in acute exposures.

Hazards of Ingestion: Ingestion may cause severe damage to mucous membranes. The product is of low to moderate toxicity by this route of exposure.

FIRE HAZARDS

Lower Flammable Limit: 2.5%

Upper Flammable Limit: 10.6%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable vapor upon release.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Violent polymerization may occur in presence of heat, acids, or alkalis.

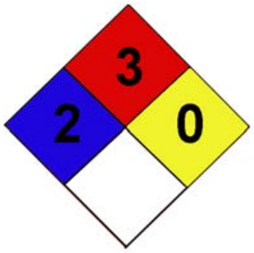
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, neoprene, polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, nitrile-butadiene rubber, and Buna-N.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1129

BUTYRALDEHYDE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, or skin; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol foam, water spray. Water may be ineffective but may possibly be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that fires are difficult to control due to ease of reignition.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that butyraldehyde is a relatively volatile flammable liquid with potentially toxic vapors. Note also that oil spill containment and cleanup methods are suggested by some sources for early stages of water spill response before the slick dissolves in water. Polymerization may occur under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Butyraldehyde spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

.

BUTYRALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb butyraldehyde vapors and accelerate their dispersal in the atmosphere. the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of butyraldehyde from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of butyraldehyde vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . . Butyraldehyde can be contained by building dikes using earth, soil, or other materials.

CONSEQUENCE

Contained butyraldehyde may percolate into soil or seep through dike material. This may lead to loss of contained product and spreading of contamination. Groundwater contamination is also a possibility.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments, reinforce dike walls as needed.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product

BUTYRALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . . Spreading of butyraldehyde may be controlled by absorbing liquid with sand, earth, commercial sorbents and similar substances compatible with butyraldehyde.

CONSEQUENCE

Once needed; sorbent materials pose the same hazards as the spilled product. Although sorbents will immobilize the spill and help control spreading, they do not alter the hazardous nature of the spilled product. Their use adds to the volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

.

BUTYRALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

CALCIUM CARBIDE

Division 4.3 (Dangerous When Wet)

GENERAL INFORMATION

Calcium carbide is a grayish to bluish black solid that has an odor somewhat resembling garlic. It is used to generate acetylene gas for welding; in the making of neoprene, vinyl acetate, lampblack, and various chemicals; and as a reducing agent. The substance decomposes immediately and vigorously upon contact with water or moisture to produce acetylene gas and calcium hydroxide (slaked lime). Acetylene is highly flammable and may ignite spontaneously. Accumulations of acetylene in confined spaces such as buildings or sewers may result in explosions. Calcium carbide weighs approximately 137.3 pounds per cubic foot.

Calcium carbide reacts with copper and brass to form an explosive compound, and is also reactive with acids (producing acetylene) and alkalis (producing acetylides). [Acetylene is a relatively non-toxic gas considered to be a simple asphyxiant. Lime can be irritating and somewhat corrosive to bodily tissues. Products of acetylene combustion are carbon monoxide, carbon dioxide, and water.]

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below. (Acetylene is 1173 ppm soluble at 77°F (25°C).)

Solubility in Other Chemicals: Data unavailable

Specific Gravity (Solid): 2.2 at 64.4°F (18°C)

Boiling Point: Not pertinent

Melting Point: 4172°F (2300°C) (approx.)

Freezing Point: See melting point

Molecular Weight: 64.10

Heat of Combustion: Not flammable (–11526 cal/g for acetylene)

Vapor Pressure: Not pertinent

Flash Point: Not flammable

Autoignition Temperature: Not flammable (581°F for acetylene)

Burning Rate: Not pertinent

Stability: Stable when dry.

Corrosiveness: Calcium hydroxide is mildly corrosive. Reacts with copper and brass.

Reactivity with Water: Reacts vigorously to form acetylene and calcium hydroxide (slaked lime).

Reactivity with Other Chemicals: Reacts with acids sulfur, magnesium, silver nitrate, selenium, lead fluoride, Na_20_2, and $SnCl_2$. Acetylene forms explosive compounds with copper and its compounds, brass, silver or mercury and their salts, halogens, nitric acid, sodium hydride, cobalt, potassium, rubidium hydride, and cesium hydride.

IDENTIFICATION

Shipping Names: Calcium carbide (USDOT and IMO)

Synonyms and Tradenames: Acetylenogen; calcium acetylide; calcium dicarbide; carbide; ethyne, calcium deriv.

Chemical Formula: CaC_2 (acetylene is C_2H_2; slaked lime is $Ca(OH)_2$)

Constituent Components(% each): 70-80% pure with 20-30% CaO (calcium oxide)

UN/NA Designation: UN1402

IMO Designation: 4.3, Dangerous When Wet

Physical State as Shipped: Solid

Physical State as Released: Solid

Color of the Shipped Material: Gray to bluish black

Odor Characteristics: Resembles garlic

Common Uses: Source of acetylene for welding; mfg. of neoprene, vinyl acetate, lampblack, graphite, and various chemicals; reducing agent.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

CALCIUM CARBIDE

Division 4.3 (Dangerous When Wet)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Vigorously reacts with water or acid to produce highly flammable acetylene gas that may ignite spontaneously.

Short Term Exposure Limits(STEL): Unavailable Time

Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Contact with water, acids, or other incompatible materials; entry to sewers or confined spaces where moisture may be present; inhalation of dust, ingestion, or direct physical contact; heat, fire, or sparks where acetylene may be present.

HEALTH HAZARDS

Public Health Hazards: Calcium carbide may be irritating and corrosive to bodily tissues.

Hazards of Skin or Eye Contact: Dry calcium carbide reacts with body moisture to form lime that may irritate or burn the skin or eyes.

Hazards of Inhalation: Breathing calcium carbide dust may cause coughing and irritation of the respiratory tract. Acetylene gas acts as a simple asphyxiant by diluting oxygen in air. Levels of 10% in air may cause slight intoxication.

Hazards of Ingestion: Ingestion of calcium carbide may result in irritation of the mouth and throat as well as the possible formation of ulcers on the lips.

FIRE HAZARDS

Lower Flammable Limit: Not flammable (2.5% for acetylene)

Upper Flammable Limit: Not flammable (80% for acetylene)

Behavior in Fire: Contact with firefighting water or foam generates flammable gas.

Hazardous Combustion Products: Carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Contact with water results in formation of flammable acetylene gas. Explosion may result if acetylene is ignited in a confined area. Contact with certain other materials may form explosive mixtures. (See Reactivity with Other Chemicals section.)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing.

Respiratory Protection:For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an approved dust respirator within the use limitations of such devices. (Note: Use SCBA where high acetylene concentrations may be present.)

1402

CALCIUM CARBIDE
Division 4.3 (Dangerous When Wet)

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues; headache, dizziness, incoordination, increased respiration, or other symptoms of narcosis or asphyxiation due to acetylene gas.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Symptomatic and supportive treatments as necessary. No permanent effects have been reported to date.

FIRE RESPONSE

Extinguishing Materials: Smother with suitable dry powder such as dry sand, graphite, soda ash, sodium chloride, lime, or let fire burn. Do not use water, foam or vaporizing liquids. CO_2 may be ineffective.

Extinguishing Techniques: Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing as necessary. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture, or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Keep calcium carbide as dry as possible to reduce fire, explosion, and other hazards. Note the potentially explosive reaction that may occur in the presence of copper or brass.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Calcium carbide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, especially if the calcium carbide is kept dry.

CONSEQUENCE

Hazardous levels of acetylene or calcium carbide dust may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid calcium carbide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

CALCIUM CARBIDE

Division 4.3 (Dangerous When Wet)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to acetylene gas in air may accelerate its dispersal in the atmosphere. Apply water at a point downwind and do not permit water to contact solid calcium carbide as this may increase evolution of acetylene.

CONSEQUENCE

Water runoff may contain a small amount (if any) of chemicals from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Calcium carbide or lime solutions may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained chemicals may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause calcium carbide dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generatlon. Do not operate motorized removal equipment where flammable gas concentrations may be present in air.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CALCIUM CARBIDE
Division 4.3 (Dangerous When Wet)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

CONTAINMENT . . . Lumps of product may sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit flammable vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

January 1990

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

GENERAL INFORMATION

Calcium hypochlorite, as discussed in this guide, is shipped as white powder, granules, flakes, pellets, or tablets having an odor like chlorine. Never truly pure, but usually mixed with a variety of other substances, the product is used as an algicide, bactericide, fungicide, deordorant, bleaching agent and oxidizing agent, but is probably best known for its use as the dry "chlorine" added to swimming pools for sanitation purposes. The solid is heavier than water and can be expected to sink, dissolve, and undergo a complex reaction described below. Powders, granules, and flakes will dissolve rapidly when spilled into large amounts of water. Some products, however, particularly those in the form of large pellets or tablets, are purposely formulated to dissolve slowly over a period of days. Calcium hypochlorite is stable in normal transportation when not exposed to heat, moisture, organic substances, or other incompatible substances. Exposure of calcium hypochlorite to prolonged heat may result in vigorous or violent decomposition of the product with the potential to rupture containers and possibly explode. Although calcium hypochlorite is not itself combustible, it is a strong oxidizing agent that will evolve oxygen and highly toxic chlorine and possibly chlorine monoxide gases at elevated temperatures while accelerating the burning of combustible materials. Contact with organic materials as well as a wide variety of other substances may result in fire or explosion. An explosion may result and chlorine gas may evolve upon contact of the product with acids or acid fumes. In the presence of moisture, calcium hypochlorite is corrosive to most metals, highly corrosive to bodily tissues, and again capable of evolving some amounts of chlorine gas. The solid product weighs approximately 146.6 pounds per cubic foot. Downwind evacuation should be considered until properly equipped responders have evaluated the hazard if spills of calcium hypochlorite evolve significant quantities of toxic chlorine gas due to circumstances of the event. If a bulk container of the product is exposed to high heat or a fire becomes uncontrollable, evacuate for a radius of one (1) mile.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very soluble; decomposes; some components of mixture may leave a residue.

Solubility in Other Chemicals: Unavailable Specific

Gravity (Solid): 2.35 at 68°F (20°C) for anhydrous; hydrate similar but varies.

Boiling Point: Decomposes above 212°F (100°C) or 350°F (177°C); reported values vary. Decomposition products include chlorine gas and oxygen.

Melting Point: See boiling point

Freezing Point: See boiling point

Molecular Weight: 142.99 for pure substance; hydrate varies with water content.

Heat of Combustion: Not flammable

Vapor Pressure: Unavailable

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable when dry and not exposed to heat or organic materials. Moderately explosive when heated in solid form. Traces of water may initiate the reaction.

Corrosiveness: Corrosive to most metals in presence of moisture.

Reactivity with Water: The reaction is complex. Calcium hypochlorite essentially forms weak hypochlorous acid in water which in turn primarily decomposes to chlorine, oxygen, and chloric acid in a reaction which is not hazardous in most cases when calcium hypochlorite is added to large amounts of water but may be hazardous under other circumstances. Reaction of the organic content of natural waters with hypochlorous acid and its products of decomposition forms chlorides. Water added to dry calcium hypochlorite may result in some evolution of chlorine gas.

Reactivity with Other Chemicals: Contact with organic substances of natural or synthetic origin (e.g., wood, straw, fuels, organic chemicals) may result in fire or explosion under a wide variety of circumstances. Emits highly toxic chlorine fumes and may explode on contact with acids or acid fumes. May explode in contact with amines, carbon tetrachloride, iron oxide (rust), manganese oxide, damp sulfur, urea, or mixture of sodium hydrogen sulfate, starch and sodium carbonate. Also incompatible with nitrogen containing compounds, dry chemical extinguishing agents containing ammonium compounds, and reducing agents. Hypochlorous acid may explode on contact with ammonia.

IDENTIFICATION

Shipping Names: Calcium hypochlorite, hydrated (USDOT and IMO); calcium hypochlorite mixture (USDOT); bleaching powder (USDOT and IMO); chlorinated lime (USDOT); chloride of lime (USDOT); calcium hypochlorite, hydrated mixtures (IMO); calcium hypochlorite, dry (IMO); calcium hypochlorite mixtures, dry (IMO)

Synonyms and Tradenames: Hypochlorous acid, calcium salt; calcium chlorohydrochlorite; calcium hypochloride; lime chloride; calcium oxychloride; and many tradenames such as HTH and Sentry for products used in swimming pools.

Chemical Formula: $Ca(C10)_2$ for anhydrous calcium hypochlorite

Constituent Components (% each): Commercial products contain various amounts of calcium hypochlorite in a mixture with sodium chloride, calcium chlorate, calcium chlorite, calcium oxychloride, calcium chloride, calcium hydroxide, and calcium carbonate.

49 STCC: 49 187 15 (dry, mixture, more than 39% available chlorine); 49 187 95 (hydrated, more than 39% available chlorine); 49 453 08 (powder, 39% or less available chlorine); 49 453 07 (powder or solution, 39% or less available chlorine); 49 323 32 (solution of chlorinated lime)

UN/NA Designation: UN1748 (dry or mixtures with more than 39% available chlorine); UN2880 (hydrated or hydrated mixtures); UN2208 (dry mixtures with 39% or less available chlorine)

IMO Designation: 5.1, oxidizer

Physical State As Shipped: Solid

Physical State As Released: Solid

Color of the Shipped Material: White powder, granules, flakes, pellets, or tablets.

Odor Characteristics: Like chlorine

Common Uses: Algicide; bactericide; fungicide; deordorant; bleaching agent; oxidizing agent; dry "chlorine" used in swimming pools.

**FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)**

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

See "UN/NA Designation" for more UN numbers

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** 0.02 – 3.5 ppm based on chlorine

Unusual Hazards: Highly reactive oxidizing agent. May cause ignition or explosion in contact with numerous combustible substances and other chemicals. May evolve chlorine gas upon heating and under various other spill conditions. Corrosive in presence of moisture.

Short Term Exposure Limits (STEL): 3 ppm for 15 minutes as chlorine gas in air. (ACGIH)

Time Weighted Average (TLV-TWA): 1 ppm over each 8 hours of a 40 hour work week as chlorine gas in air. (ACGIH)

Conditions to Avoid: Heat and fire; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact. Any action that may result in evolution of chlorine gas.

HEALTH HAZARDS

Public Health Hazards: Due to its highly corrosive nature to bodily tissues, all significant exposures to solid calcium hypochlorite should be avoided. Keep in mind, however, that this substance is a consumer product in widespread use by swimming pool owners and can be handled safely. It is only under unusual circumstances that a significant hazard may be encountered such as when large quantities of dust become airborne for one reason or another or when exposure of the product to heat or incompatible substances causes major evolution of chlorine gas into the atmosphere or a fire or explosion. See the Emergency Action Guide for chlorine for information where necessary.

Hazards of Skin or Eye Contact: Contact of calcium hypochlorite with the skin has the potential to cause severe irritation and/or burns with redness, swelling, and scab formation. Prolonged contact may impair regeneration of the skin at the site of contact. Contact with the eyes has the potential to cause severe irritation and/or burns as well as impairment of vision and corneal damage. If washed away promptly, however, particles in the eye will only cause minor and reversible injury in many cases.

Hazards of Inhalation: Calcium hypochlorite dust in air may be irritating to the eyes, nose, mouth, throat, and lungs. Inhalation of high concentrations may cause burns to the respiratory tract, laryngitis, and pulmonary edema which may possibly be delayed in onset and which may result in shortness of breath, wheezing, choking, chest pain, and impairment of lung function. Excessive exposures can result in permanent lung damage with possibly severe consequences. Based on the acute toxicity of chlorine, it has been estimated that exposure to 1700 mg/m^3 of calcium hypochlorite dust in air for one hour would be lethal to 50% of exposed rats.

***Hazards of* Ingestion:** Ingestion of a sufficient quantity of calcium hypochlorite may result in damage to the teeth as well as irritation and/or burns of the mouth, pharynx, esophagus, and the entire gastrointestinal tract including the stomach and intestines. Effects may include nausea, vomiting, diarrhea, abdominal pain, bleeding, edema and obstruction of the pharynx, glottis and larynx, circulatory collapse with cold and clammy skin, cyanosis, shallow respiration, confusion, delirium, coma, and perforation of the esophagus or stomach. Penetration of vital areas can result in peritonitis, mediastinitis, and death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable
Upper Flammable Limit: Not flammable

Behavior in Fire: Not combustible but may accelerate the burning of other materials by evolving oxygen at elevated temperatures. Exposure to prolonged heat may result in vigorous or violent decomposition with the potential to rupture containers. One authority reports that the bulk material may ignite or explode in storage and that traces of water may initiate the reaction.

Hazardous Combustion Products: Evolves chlorine, oxygen, and possibly chlorine monoxide at elevated temperatures. Reported data imply that decomposition begins at 212°F (100°C) and becomes rapidly exothermic at temperatures above 350°F (177°C).

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable
Upper Explosive Limit: Not flammable

Explosiveness: Contact with a wide variety of other chemicals may result in the formation of explosive mixtures. One authority reports that the bulk material may ignite or explode in storage and that traces of water may initiate the reaction. High temperatures may cause a rapid exothermic reaction that may possibly result in violent rupture of containers.

1748

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

See “UN/NA Designation” for more UN numbers

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing. Note that fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high concentrations of chlorine fumes or vapors in air where these may be generated in large quantities under accident or fire conditions. A manufacturer of calcium hypochlorite indicates that neoprene and polyvinyl chloride (PVC) may be compatible materials for handling the solid product. Compatible materials for chlorine may include neoprene, chlorinated polyethylene, PVC, Viton, and Saranex.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations of calcium hypochlorite dust in air (or levels of chlorine gas above 25 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For handling of solid under normal conditions, an approved respirator with a full facepiece, chlorine cartridges, and a dust/mist filter. For lesser concentrations of chlorine gas in air, a gas mask with chin-style or front or back mounted chlorine canister (25 ppm or less) or a chemical cartridge respirator with a full facepiece (25 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water is preferred, particularly for fires involving products containing more than 39% available chlorine. Do not use carbon tetrachloride (or other Halons to be safe) under any circumstances since an explosion may result. Similarly, do not use dry chemical agent containing monoammonium phosphate, which is also known as MAP, and is commonly found in dry chemical extinguishers having an ABC rating.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Where high concentrations of chlorine gas or fumes may be present, wear full chemical protective suit if contact with dense fumes or smoke is anticipated. Move container from fire area if no risk. Be alert to the possibility that containers may rupture violently when exposed to high heat. Stay away from ends of tanks or containers involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after the fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the corrosive and highly reactive nature of calcium hypochlorite into account while planning the response.

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow dusts, vapors, or fumes to dissipate. Calcium hypochlorite spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if conditions favor the evolution of large quantities of chlorine gas or fumes and/or the product is involved in a fire.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow dusts, vapors, and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Calcium hypochlorite may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the dry solid has spilled in a non-fire situation and is unlikely to encounter an incompatible substance.

CONSEQUENCE

Hazardous levels of calcium hypochlorite dust or chlorine gas in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid calcium hypochlorite with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to airborne vapors, fumes, or dusts evolved from calcium hypochlorite spills may absorb vapors, knockdown dusts or fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain various chemicals from contact with airborne vapors, dusts, or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Dry or wet calcium hypochlorite may be contained by building dikes or barriers using soil, sand or other compatible materials.

CONSEQUENCES

Contaminated liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may wet the spilled product or overfill impoundments. Where possible, line collection basins with compatible impervious material.

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify final remaining residues of the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for excessive chlorination. (Note: Solid calcium hypochlorite will sink to the bottom of the water body at first and undergo the complex reaction with water described above. Products of reaction are toxic to fish and other aquatic life at very low concentrations. The residue remaining after the reaction, especially in the case of granulated or powdered product, may later rise to the water surface for a time. The chlorine demand of natural waters, as well as exposure of the water to sunlight, is often sufficient to deplete the chlorine level of the water to safe levels after several days if not sooner.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CALCIUM HYPOCHLORITE
Division 5.1 (Oxidizer)

TECHNIQUE

CONTAINMENT DIKES... Water with dissolved chemical may be contained (or diverted to an impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: Under some spill conditions, it may be advisable to attempt to use natural deep water pockets, excavated lagoons, or sand bag barriers to trap the solid material on the bottom, particularly if the amount spilled is large compared to the volume of the water body or the product is intentionally formulated into relatively large and slow dissolving tablets or pellets.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries. Excavation of a deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental effects. Rapid reaction of the product with water, particularly if it is in granular, powder or flake form, may negate effectiveness of the latter response.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Excavate as a last resort.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments, particularly in cases where the calcium hypochlorite may have spilled under conditions in which it will not dissolve and react with water rapidly and time permits this response. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

August 1996

CAPROLACTAM*

Class 9 (Miscellaneous Hazardous Materials)

GENERAL INFORMATION

Caprolactam is a colorless to white solid that may be shipped as flakes, crystals, or another solid form. Alternatively, it may be shipped as a hot molten liquid at a temperature above the melting point of the material or in a solution with water or possibly another liquid. It is ranked among the top chemicals produced in the United States. Generally described as being odorless or having a mild odor, the substance is used in the making of a variety of products including synthetic fibers and leather, bristles, coatings, film, paints, and plastics. It is very soluble in water, has a low vapor pressure at ambient temperatures, a melting point in the range of 154°F to about 160°F, and a very high boiling point. The flash point of caprolactam is reported as 282°F. This indicates that the solid product will be difficult to ignite unless preheated or in the form of a powder or dust and that even the molten liquid may require substantial heating to attain its flash point temperature. Direct application of foam or water onto burning caprolactam may possibly result in frothing and spattering which may potentially be violent, yet use of these agents is among preferred methods of fire control or extinguishment. Solid caprolactam is reported to weigh about 68.6 pounds per cubic foot. The molten liquid weighs about 8.5 pounds per gallon at a temperature of 177°F, while a 70% solution in water weighs about 8.8 pounds per gallon at 77°F.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; 82 grams/l00 gal. water at 68°F (20°C) or 525 grams/l00 gal. water at 77°F (25°C). These data appear mutually inconsistent but nevertheless indicate a high degree of solubility.

Autoignition Temperature: 707°F (375°C)

Burning Rate: 2.4 mm/minute

Stability: Stable in normal transportation; may polymerize slowly and non-violently at temperatures at or above 212°F (l00°C).

Solubility in other Chemicals: Soluble in alcohols, benzene, chlorinated solvents, chloroform, dimethylformamide, ether, petroleum distillates, or cyclohexene.

Specific Gravity: 1.1 at 68°F (20°C) for solid; 1.02 at 171°F (77°C) for molten liquid; 1.05 at 77°F (25°C) for 70% solution in water.

Boiling Point: 515 - 518°F (268.3 - 270°C) at 1 atm for pure substance.

Melting Point: 154 - 159.8°F (68 - 71°C)

Molecular Weight: 113.16

Heat of Combustion: 7640 cal/gal.

Vapor Pressure: 0.001 mm Hg (0.00002 Pia) at 68°F (20°C)

Flash Point: 282°F (139°C) closed cup

Corrosiveness: Data unavailable; presumed to be compatible with most common metals. Based on chemical formula, presumed capable of attacking certain types of plastics, rubber, and coatings

Reactivity with Water: No reaction but the dry substance is hygroscopic and will therefore absorb some amount of moisture from the air if exposed to the atmosphere. See the Unusual Hazards section for phenomena associated with very hot molten caprolactam

Reactivity with other Chemicals: Reported as being incompatible with strong oxidizing materials which presumably have some potential to cause a vigorous reaction fire, and/or explosion upon mixture or contact with the product.

IDENTIFICATION

Shipping Names: Environmentally hazardous substance, N.O.S. or Other Regulated Materials N.O.S.

Synonyms and Tradenames: 6-Aminocaproic acid lactam; amino caproic lactam; 6-aminohexanoic acid cyclic lactam; 1-A.A.-2-cycloheptanone; 2-azacycloheptanone and e-caprolactam.

Chemical Formula: $HNCH_2(CH_2)_4CO$

Constituent Component (% each): Based on limited data, caprolactam appears to typically be 99% or more pure as a solid or molten liquid product in commerce.

UN/NA Designation: UN3082 or NA3082

IMO Designation: Class 9

Physical State As Shipped: Flakes or crystals. Hot molten liquid at or above the melting point temperature of caprolactam, or a solution in water. (Note: Solutions in liquids other than water are not addressed in this Guide.)

Physical State As Released: Same as shipped; molten liquid will solidify as it cools down.

Color of the Shipped Material: Colorless or white solid. Clear colorless molten liquid. Aqueous solutions are presumed to be colorless.

Odor Characteristics: Odorless or mild

Common Uses: Making of synthetic fibers such as nylon 6; making of amino acid lysine bristles, coatings, film, plastics, plasticizers, polyurethanes, and synthetic leather.

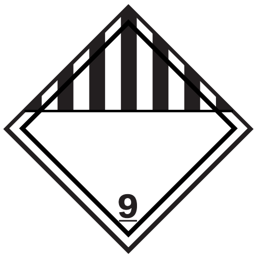
---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CAPROLACTAM

Class 9 (Miscellaneous Hazardous Materials)



POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold odor Concentration: 0.063 ppm (equivalent to 0.3 mg/m^3) is only available value.

Unusual Hazards: By analogy to other substances, there is a possibility that pressure relief devices (if any) on tanks of the molten liquid may be susceptible to plugging with solid and subsequent malfunction. Introduction of water or another volatile liquid into very hot molten caprolactam or hot tanks may potentially cause violent steam generation leading to tank rupture or personnel burns when temperatures are sufficiently above 212°F. Caprolactam may remain molten under a solid crust for extended periods; check carefully before walking on such crusts.

Short Term Exposure Limit (STEL): 10 ppm for vapor (3 mg/m^3 for dust) for 15 minutes (ACGIH, 1991-92; OSHA, 1989).

Time Weighted Average (TWA) Limit: 5 ppm for vapor (1 mg/m^3 for dust) over each 8 hours of a 40 hour work week (ACGIH, 1991 - 92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact. Contact with hot surfaces that can cause thermal decomposition of caprolactam.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may initially be present in air in the immediate vicinity and directly downwind of a spill of molten caprolactam. High levels of dusts or mists also pose a hazard if they somehow become airborne, as may gases, vapors, or fumes generated from burning or thermally decomposing caprolactam. Direct contact or ingestion of the product should also be avoided.

Hazards of Skin or Eye Contact: Hot molten caprolactam may cause severe thermal burns upon contact with the skin or eyes. Contact of solid caprolactam or its aqueous solutions with the eyes is reported to cause moderate to severe irritation. Skin contact with these forms is reported to cause mild irritation (if any) unless the contact is prolonged and confined, in which case the exposure may cause serious burns. Exposure to airborne dust at a concentration of 5 mg/m^3 causes skin irritation in some people but this is reported not to occur at a level of 1 mg/m^3. Some amounts of caprolactam may be absorbed through intact skin but the toxic hazard by this of exposure is apparently low, requiring large and prolonged exposures to have an effect.

Hazards of Inhalation: Inhalation of caprolactam dust, vapors, or mists is reported to cause irritation of the nose and throat, coughing, and chest discomfort. Inhalation of high concentrations may cause headaches, nausea, vomiting, and coma. Very high concentrations or prolonged exposures may cause unconsciousness. The saturated vapor concentration over a pool of molten caprolactam is about 3950 ppm at a pool temperature of 212°F. High concentrations may also be experienced where caprolactam dusts or mists become airborne due to various circumstances.

Hazards of Ingestion: Caprolactam is considered moderately toxic by ingestion. Intake of relatively large quantities is reported to cause nausea and vomiting. A maker of the product reports that when caprolactam is administered in large doses to animals, it is a convulsive poison, a powerful respiratory system stimulant, and a mild circulatory system depressant that also causes reduced body weight.

FIRE HAZARDS

Lower Flammable Limit: 1.4% to 1.84%

Upper Flammable Limit: 8%

Behavior in Fire: Combustible solid product may require substantial preheating prior to ignition but powder or dust may be more easily ignited. Molten liquid may also require significant preheating since the flash point of caprolactam is quite a bit higher than its melting point.

Hazardous Combustion Products: Burning caprolactam is reported to produce irritating and toxic gases and aerosols which may contain oxides of nitrogen, hydrogen cyanide, carbon monoxide, carbon dioxide, and possibly other hazardous substances. Thermal decomposition at high temperatures may also cause evolution of some or all of these materials. Be advised that oxides of nitrogen and hydrogen cyanide are very highly toxic. The combustion and thermal decomposition products of caprolactam may require special attention and precautions beyond those associated with caprolactam itself.

EXPLOSION HAZARDS

Explosiveness: Explosion potential is limited unless caprolactam is heated above its flash point and its vapors are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with hot molten caprolactam. Otherwise, for “cool” solids or liquids containing caprolactam, equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, dust or splash-proof safety goggles as appropriate, and other impervious and resistant clothing. Be advised that handling of hot molten caprolactam may require clothing that provides protection against high temperatures. Handling of "cool" solids may possibly be accomplished using any of a wide range of clothing or glove materials. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with the smoke and fumes generated by burning or thermally decomposing caprolactam.

Respiratory Protection: For fire fighting or when vapors are being generated from hot caprolactam, a self contained breathing apparatus (SCBA) with full face piece (or the equivalent). For situations in which the vapor pressure of the product is low (e.g.,when the spilled product is at ambient temperature or consists of a solution of caprolactam in water), a gas mask with chin-style or front or back mounted organic vapor canister and dust/mist filter or a chemical cartridge respirator with a half or full face piece, organic face piece, organic vapor cartridge(s), and dust/mist filter(s) may be adequate within the use limitations of these devices. Be advised that some non-fire outdoor incidents may not require any respiratory protection whatsoever. Use professional judgment as necessary or seek the advice of qualified experts.

FIRST AID

Nonspecific Symptoms: Eye, skin, nose or throat irritation; headache, coughing, nausea, vomiting, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention if eye irritation persists after washing or a burn has occurred. If molten caprolactam contacts the skin, immediately flush the skin with large amounts of water, remove contaminated clothing, and get medical attention immediately. Note that removal of solidified molten material from the skin (or vicinity of the eyes) may require qualified medical assistance if the solid is not fully dissolved by the water. In other cases, promptly wash affected skin with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: This is a common recommendation but some authorities do not recommend that vomiting be induced after water is administered. Seek qualified medical advice on this issue if possible.) If vomiting is induced or occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs and then repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, foam, carbon dioxide. Authorities disagree as to whether regular or alcohol foam should be used; possibly both are effective to some degree. Solid streams of water may be ineffective. A few authorities recommend against the use of water on burning caprolactam because of the potential for violent frothing and or spattering of the product. It may be prudent to apply water as a fine spray with caution at first and to also be cautious when initially applying foam.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with fumes or smoke from burning caprolactam is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Be advised that introduction of water into a tank of very hot molten caprolactam may possibly result in frothing, boil over, and/or violent steam generation. Do not depend on pressure relief devices to limit pressure in, tank of molten liquid; these may possibly become plugged with solid.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Discharge of a carbon dioxide fire extinguisher at the point of leakage of hot molten caprolactam has the potential to solidify the caprolactam and stop the leak in some cases, at least temporarily. Other means of attempting to solidify the leaking caprolactam via cooling may also work. Whether or not the "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the tank and its temperature. It may become necessary to repeat the procedure sever al times until the leak can be patched or to ultimately abandon the effort. Use professional judgment in attempting this type of response action. Give special attention to the dangerous products of combustion or those of thermal decomposition that may evolve at high temperatures. Use professional judgment with respect to which precautionary measures listed above and others are most suitable for a given situation. The caprolactam may be molten, a solid, or a solution in water (or in another liquid, in which case additional hazards not addressed in this Guide may be present). Hazards will vary somewhat in severity and type depending on the form and temperature of the material.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION…Caprolactam may not evolve significant amounts of hazardous airborne contaminants in many outdoor spill situations, especially if it is discharged as a "cool" non-dusty solid or solution in water. It may be advisable in such cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of caprolactam may be found in air in the local spill area and immediately downwind if its dusts or mists become airborne.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas and areas immediately downwind as necessary.

TECHNIQUE

EVACUATION…Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors allow vapors to dissipate. Caprolactam discharges may expose certain downwind areas to toxic concentrations in some cases, particularly and especially if large quantities of the very hot molten liquid have been discharged. Burning or thermally decomposing caprolactam may also evolve highly toxic gases, vapors, and fumes into the atmosphere.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary. Note that the vapor pressure of the molten product and its vapor emission rate will decrease as it solidifies and cools in the ambient environment or if various means (see below) are used to accelerate its rate of cooling.

TECHNIQUE

PROTECTION FROM WIND…Where deemed necessary, cover spilled solid caprolactam with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY…Where deemed necessary, water fog or spray applied to caprolactam vapors in air may absorb them or accelerate their dispersal in the atmosphere. Similarly, this response may knock down any mists or dusts in air. Cooling of spills of molten caprolactam with water spray may solidify and cool the product, thus reducing its temperature and vapor emission rate. Maintenance of a layer of water on top of a contained pool of molten caprolactam that has solidified on its surface may greatly reduce vapor emissions.

CAPROLACTAM

Class 9 (Miscellaneous Hazardous Materials)

CONSEQUENCE

Water runoff may contain varying amounts of caprolactam. As discussed earlier, there is a possibility that contact of very hot molten caprolactam with a water spray may result in potentially violent frothing and spattering of the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Apply water spray with caution to hot molten caprolactam at first.

TECHNIQUE

FOAM…Where deemed necessary, foam applied to the surface of liquid pools of the molten liquid may slow the release of caprolactam vapors into the atmosphere. Note that authorities disagree as to whether regular or alcohol foam is most suitable; both may be effective to some degree.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. As discussed earlier, there is a possibility that contact of very hot molten caprolactam with foam may result in potentially violent frothing and spattering of the product.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply foam with caution to hot molten caprolactam at first.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES…Caprolactam in most forms may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained caprolactam solutions or contaminated water used for cooling or other purposes may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible and deemed necessary, line collection basins with a compatible impervious material.

TECHNIQUE

EXCAVATION…A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION…Accumulated liquid pools of contaminated water or caprolactam solutions may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. This response is unlikely to be appropriate for molten caprolactam since cooling of the product may result in its solidification and subsequent plugging or clogging of transfer or storage equipment.

CONSEQUENCE

Equipment that is incompatible with the liquid being recovered may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the liquid being recovered.

CAPROLACTAM

Class 9 (Miscellaneous Hazardous Materials)

TECHNIQUE

ABSORPTION…Spreading of caprolactam solutions or contaminated water may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATLON

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Non-combustible sorbents are preferred in order to reduce the hazard the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL…Contaminated soil or spilled product or its residues may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines as appropriate.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or combustible dusts present in the area may be ignited by motorized removal equipment, particularly in the case of very hot molten caprolactam or where caprolactam dust is present. Improper removal techniques may cause caprolactam dust to become airborne where the solid product has spilled. Hot surfaces of motorized equipment may cause thermal decomposition of caprolactam if contaminated, thus resulting in evolution of highly toxic and irritating gases and fumes.

MITIGATION

Select removal procedures that do not cause caprolactam dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable or combustible atmospheres. Eliminate ignition sources. Take precautions not to handle solid caprolactam in a manner that generates airborne dusts. Apply appropriate precautions if use of motorized equipment may result in the heating and thermal decomposition of caprolactam. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE…Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Caprolactam will readily dissolve in water. Available data indicate that the substance is of low toxicity to at least some types of fish. A concentration of one ppm can affect the self-purification of water, however, and nitrification decreases from 100 ppm onwards. No information could be found on water treatment or product recovery methods for spills of caprolactam into water. It does appear, however, that the substance may biodegrade if the water is treated with appropriate bacteria adapted to the material.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES…Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Consult qualified experts for suitable treatment or disposal options

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Mitigation Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

March 1995

CARBOLIC ACID or PHENOL

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Carbolic acid, more commonly known as phenol, is a colorless solid or light pink to reddish liquid with an acrid, sweet, tarry, medicinal odor. It is of relatively low volatility and is used to make adhesives, coatings, plastics, agricultural chemicals, pharmaceuticals, and a wide variety of other chemicals and products. It is moderately soluble in water and slightly heavier, so may be expected to sink while dissolving fairly rapidly. Its flash point of 175°F indicates that the product must be preheated before ignition may occur easily. The product weighs approximately 8.9 pounds per gallon.

Phenol does not react with water or many other common materials and is stable in normal transportation. It is reactive with various chemicals, however, and may be corrosive to lead, aluminum and its alloys, and certain plastics, rubber, and coatings. Hot liquid phenol will additionally attack magnesium and zinc metals. Phenol is highly toxic by all routes of exposure and is considered a poison. Products of combustion may contain unburned phenol and possibly other toxic constituents.

If the material is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 8.4 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, hot benzene, carbon disulfide and tetrachloride, chloroform, and ether.
Specific Gravity (Liquid): 1.072 at 68°F (20°C)
Boiling Point: 359.2°F (181.8°C) at 1 Atm.
Melting Point: 109.4°F (43°C)
Freezing Point: 105.6°F (40.9°C)
Molecular Weight: 94.11
Heat of Combustion: -7445 cal/g
Vapor Pressure: 0.36 mm Hg (0.007 psia) at 68°F (20°C)
Flash Point: 175°F (79.4°C), closed cup; 185°F (85°C), open cup.
Autoignition Temperature: 1319°F (715°C)
Burning Rate: 3.5 mm/minute
Stability: Stable
Corrosiveness: Corrosive to lead, aluminum and its alloys, and some forms of plastics, rubber, and coatings. Hot liquid phenol will also attack magnesium and zinc metals.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizers (especially calcium hypochlorite), aluminum chloride, nitrobenzene, butadiene, and alkaline materials.

IDENTIFICATION

Shipping Names: Phenol, solid (USDOT and IMO); carbolic acid (USDOT and IMO); phenol, solution (USDOT and IMO)
Synonyms and Tradenames: Hydroxybenzene; phenic acid; phenylic acid; benzenol; oxybenzene; monohydroxybenzene; phenyl alcohol; phenyl hydrate; phenyl hydroxide; phenylic alcohol; benzophenol.
Chemical Formula: C_6H_5OH
Constituent Components(% Each): 90-99% pure solid; 60-85% pure liquid with water; or 82-92% grade with 8-18% cresol.
UN/NA Designation: UN1671 (USDOT and IMO) solid; UN2312 (USDOT and IMO, molten); UN2821 (USDOT and IMO solutions)
Imo Designation: 6.1, poisonous substance
Physical State as Shipped: Solid or liquid
Physical State as Released: Solid or liquid
Color of the Shipped Material: Colorless to light pink to red depending on purity
Odor Characteristics: Sweet, tarry, acrid, pugent, medicinal
Common Uses: Mfg. adhesives, coatings, plastics, resins, pharmaceuticals, dyes, perfumes, fungicides, surfactants, disinfectants, and other chemicals and products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CARBOLIC ACID or PHENOL

Division 6.1 (Poisonous Material)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.047-0.5 ppm

Unusual Hazards: Highly toxic substance that is rapidly absorbed through the skin. Vapors may deaden the sense of smell. Contaminated leather shoes and clothes have been a source of poisoning. Phenol vapors can contaminate cigarettes.

Short Term Exposure Limits(STEL): (Skin) 10 ppm for 15 minutes.(ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 5 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Phenol may cause systemic poisoning from any route of exposure, especially after skin contact. Vapor readily penetrates the skin with an absorption efficiency equal that for inhalation.

Hazards of Skin or Eye Contact: Contact of the skin with phenol does not cause pain but may result in whitening of the exposed area followed by a severe burn or systemic poisoning if the material is not removed promptly. Contact with the eyes may cause severe damage and blindness.

Hazards of Inhalation: Vapors of phenol are irritating to the eyes, nose, and throat. Systemic effects of over exposure may include difficulty in breathing, coughing, lung damage, twitching, cyanosis, convulsions, sudden collapse, coma, and death. Chronic poisoning may also cause vomiting, difficult swallowing, diarrhea, headache, dizziness, mental disturbances, and other effects.

Hazards of Ingestion: Ingestion of lethal amounts (as little as 1 gram) causes severe burns of the mouth and throat, abdominal pain, cyanosis, weakness, collapse, coma, and death; tremors, convulsions, or muscle twitching have also been observed but were not severe. Nausea, vomiting, and jaundice are also possible symptoms.

FIRE HAZARDS

Lower Flammable Limit: 1.5-1.7%

Upper Flammable Limit: 8.6%

Behavior in Fire: Combustible. Will burn but difficult to ignite unless heated.

Hazardous Combustion Products: Not well-defined, likely to include unburned phenol and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of heated phenol are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/natural rubber, polyethylene, and chlorinated polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full face piece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister and dust and mist filter (100 ppm or less) or an organic vapor cartridge respirator with a full face piece and dust and mist filter(s) (100 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, or throat; other symptoms of overexposure, especially sudden collapse.

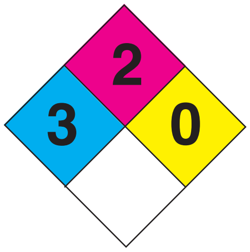
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

1671

CARBOLIC ACID or PHENOL
Division 6.1 (Poisonous Material)



See UN/NA Designation for
other ID numbers.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense smoke/fumes anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid all contact with the spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Take into account while planning the response that phenol is rapidly absorbed through the skin.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Phenol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of phenol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND ... If necessary, cover solid phenol with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog/spray applied to phenol vapors or dust may absorb vapors, knock down dust, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of phenol from contact with its vapors or dust.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rain water that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM ... Firefighting foam applied to the surface of liquid pools may slow the release of phenol vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam break down will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

CARBOLIC ACID or PHENOL
Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Phenol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained phenol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose run off or rain water that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled liquid may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

CARBOLIC ACID or PHENOL

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUES

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT ... Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination. (Note: phenol may dissolve in water at an appreciable rate. This response may only be effective under appropriate circumstances.)

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING ... Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery. (Note: This response may only be effective under conditions such that phenol does not rapidly dissolve in water.)

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Ion exchange resins may also be effective.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

CARBON DIOXIDE
Nonflammable Gas

GENERAL INFORMATION

Carbon dioxide is a colorless, odorless, non combustible gas that is shipped in tanks as a liquid under pressure but only exists as dry ice or gas at ordinary atmospheric pressure. It is used in fire extinguishers, as a refrigerant, for the carbonation of beverages, and in a variety of other processes and products. It is slightly soluble in water but does not pose a significant water pollution hazard in typical transportation accidents. The liquid weighs approximately 8.5 pounds per gallon. The gas is heavier than air and may persist in low areas. It can asphyxiate by the displacement of air. Low temperatures pose a frostbite hazard due to contact with venting liquid, solid, or gas. Containers may rupture due to over pressurization if exposed to fire or excessive heat for sufficient time duration.

Carbon dioxide is stable in normal transportation. It forms a weak carbonic acid in water. It does not react with many other common materials, but the liquid or solid may attack some forms of plastics, rubber, and coatings. (Note: Carbon dioxide is designated as hazard class ORM-A by the USDOT when shipped in its solid form.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.14 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone and alcohol.
Specific Gravity (Liquid): 1.02
Boiling Point: Not pertinent, dry ice sublimes
Melting Point: –109.3°F (–78.5°C)
Freezing Point: –109.3°F (–78.5°C)
Molecular Weight: 44.0
Heat of Combustion: Not flammable
Vapor Pressure: 60 atm (881.4 psia) at 72.3°F (22.4°C); 1 atm at –108.8°F (–78.2°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: May attack some forms of plastic, rubber, or coatings.
Reactivity with Water: Forms weak carbonic acid in nonhazardous reaction.
Reactivity with Other Chemicals: Contact with chemically active metals like sodium, potassium, or hot titanium may cause fire. May react with alkaline or amine compounds or compounds of active metals.

IDENTIFICATION

Shipping Names: Carbon dioxide, refrigerated liquid (USDOT, IMO); carbon dioxide, solid (USDOT); dry ice (USDOT); carbonice (USDOT); carbon dioxide (IMO).
Synonyms and Tradenames: Carbonic acid gas; carbonic anhydride, carbon oxide.
Chemical formula: CO_2
Constituent Components(% each): 99.5% or more pure
UN/NA Designation: UN2187 (refrigerated liquid); UN1013; UN1845 (solid)
IMO Designation: 2.2, Nonflammable gas; 9, misc. dangerous substance
Physical State as Shipped: Liquefied compressed gas or solid
Physical State as Released: Gas and/or dry ice
Color of the Shipped Material: Colorless, but may appear white
Odor Characteristics: Odorless
Common Uses: Refrigeration; carbonation; fire extinguishant; aerosol propellant; water treatment; used in welding, inerting and purging of equipment, making of aspirin, white lead, weak acids, dry ice, and other chemicals; used in food preservation and medicine.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CARBON DIOXIDE
Nonflammable Gas

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Heavier than air gas may cause asphyxiation via displacement of air and may persist in low areas. Cold product may cause frostbite.

Short Term Exposure Limits(STEL): 15000 ppm for 15 minutes.(ACGIH)

Time Weighted Average(TLV-TWA): 5000 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Contact with incompatible materials; inhalation of high gas concentrations; physical contact with cold product in any form.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high gas concentrations that may be present in air and that may persist in pits or depressions. Frostbite from direct contact is also to be avoided.

Hazards of Skin or Eye Contact: Skin or eye contact with cold carbon dioxide discharged from a container in any form may result in frostbite.

Hazards of Inhalation: Carbon dioxide gas is an asphyxiant, a potent respiratory stimulant, and both a stimulant and depressant of the central nervous system. Levels near 10% in air may cause coma and asphyxiation in a few minutes. At 5% there may be shortness of breath and headache. Levels of 2% cause similar symptoms within several hours upon mild exertion. Additional symptoms may include dizziness, restlessness, sweating, malaise, and increased heart rate and blood pressure. Very high concentrations cause convulsions.

Hazards of Ingestion: Solid carbon dioxide may cause frostbite in contact withthe mouth, throat, or other bodily tissues.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to over pressurization. Will generate large quantities of gas upon release.

Hazardous Combustion Products: Not flammable

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may rupture violently in fire due to over pressurization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct frostbite due to contact with carbon dioxide or equipment containing the product. This may include boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Shortness of breath, dizziness, headache, or other symptoms of inhalation; frostbite due to contact with cold product or surfaces.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately.

First Aid for Skin, Mouth, and Eye Contact: Stop exposure. Get medical attention immediately if eye contact has occurred with freezing product or if there is evidence of frostbite.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with very cold product. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. Note that addition of water to solid or liquid carbon dioxide may increase gas evolution rate in some cases.

1013

See UN/NA Designation for
other ID numbers.

CARBON DIOXIDE
Nonflammable Gas

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that carbon dioxide only exists as a gas or solid once discharged from its container. Note also that concentrated gas may persist inpits and depressions and that high pressures may be developed in sealed equipment containing carbon dioxide.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Carbon dioxide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed. (Note: Large spills in warm weather may require some degree of evacuation.)

CONSEQUENCE

Hazardous levels of carbon dioxide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY... Water fog or spray applied to carbon dioxide gas may accelerate its dispersal in the atmosphere. Apply water from a point downwind and do not allow it to contact solid product as this may increase gas evolution.

CONSEQUENCE

Water run off may contain a small amount (if any) of carbon dioxide from contact with airborne gas.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose run off or rain water that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines if necessary. Otherwise, carbon dioxide may simply be permitted to evaporate.

CONSEQUENCE

High pressure may develop in sealed containers.

MITIGATION

Store contaminated materials in safe and secure location with adequate ventilation.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent maybe used to neutralize soil or water acidified by carbon dioxide where such treatment is found necessary.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water intake for contamination if carbon dioxide in water can adversely affect their operations. Solid carbon dioxide will sink in water and generate bubbles of gas until completely vaporized. Some gas will dissolve in water to form a weakly acidic solution.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CARBON DIOXIDE
Nonflammable Gas

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: Carbonated water is toxic to various aquatic organisms.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques and the need for such treatment.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

CARBON DISULFIDE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Carbon disulfide is a volatile, colorless and flammable liquid with a faint sweetish disagreeable odor like decaying cabbage. It is used as a solvent, as a fumigant, and for making rayon, cellophane, pharmaceuticals and a variety of other products and chemicals. It is heavier than water and only slightly soluble, so may be expected to sink and dissolve at a slow rate. Its flash point is -22ºF with a wide flammable range that indicates that the product can be ignited under all ambient temperature conditions, while its unusually low autoignition temperature of 194-212ºF suggests that ignition is easily accomplished by even a lighted electric bulb. The product is highly volatile and generates heavier than air vapors. These may travel a considerable distance to a source of ignition and flash back, and may persist in low areas. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat. The product weights approximately 10.5 pounds per gallon.

Carbon disulfide does not react with water or many other common materials and is stable in normal transportation. It is incompatible with aluminum, zinc, and a variety of other substances, however, and will attack some plastics, rubber, and coatings. Its toxic hazard is high by most routes of exposure. Products of combustion may include toxic sulfur oxide and carbon monoxide gases.

Downwind evacuation should be considered if carbon disulfide is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.2 g/100 g water at 68ºF (20ºC)
Solubility in Other Chemicals: Soluble in alcohol, chloroform, and ether.
Specific Gravity (Liquid): 1.26 at 68ºF (20ºC)
Vapor Density: 2.67
Boiling Point: 115ºF (46.3ºC) at 1 atm.
Melting Point: See freezing point.
Freezing Point: -168.9ºF (-111.6ºC)
Molecular Weight: 76.14
Heat of Combustion: -3230 cal/g
Evaporation Rate (butyl acetate=1): 22.6
Vapor Pressure: 300 mmHg (5.8 psia) at 68ºF (20ºC)
Flash Point: -22ºF (-30ºC), closed cup
Autoignition Temperature: 194 - 212ºF (90 - 100ºC)
Burning Rate: 2.7 mm/minute
Flammable Limits: 1.3% (LEL) - 50% (UEL)
Stability: Stable, but decomposes upon standing in air.
Polymerization Potential: Will not occur.
Corrosiveness: Slightly corrosive to some metals; will attack some plastics, rubber, and coatings. Incompatible with zinc and aluminum.
Reactivity with Water: No reaction
Reactivity and Incompatibility: Reacts with aluminum, strong oxidizers, chemically active metals, azides, amines, bases, chloride, imines, fluorine, nitrogen oxides, acid and permanganates, chlorine, and certain other compounds of active metals. May form explosive salts in contact with azides.

IDENTIFICATION

Shipping Name(s): Carbon disulfide (USDOT); Carbon disulphide (IMO).
Synonyms and Tradenames: Dithiocarbonic anhydride; Carbon bisulfide; Carbon bisulphide; Carbon sulfide; Sulphocarbonic anhydride.
CAS Registry No.: 75-15-0
Chemical Formula: CS_2
Constituent Components (% each): Close to 100% pure.
UN/NA Designation: UN1131
IMO Designation: 3.1, Flammable liquids
RTECS Number: FF6650000
NFPA 704 Hazard Rating: 3(Health): 4(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, disagreeable, like decaying cabbage, but faint.
Reportable Quantity: See appendix I.
Common Uses: Solvent; fumigant; mfg. of rayon, cellophane, pharmaceuticals, pesticides, soil conditioner, paper, matches, optical glass, rubber, dyes, and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CARBON DISULFIDE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.0011-7.7 ppm, reported values vary.

Unusual Hazards: Highly volatile, toxic, and flammable liquid with heavier than air vapors. Can be ignited by relatively low temperature ignition sources.

Short Term Exposure Limit (STEL): 10 ppm (30 mg/m^3) (can be absorbed through skin)

Time Weighted Average (TLV-TWA): 1 ppm (3 mg/m^3) (can be absorbed through skin).

Ceiling (C) Limit: 30 ppm

IDLH: 500 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations that may be present. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Skin contact with liquid carbon bisulfide or concentrated vapors may cause irritation, blisters, and/or burns depending on length of exposure. The product can be absorbed via skin in toxic amounts. Splashes of liquid in the eyes cause immediate and severe irritation.

Hazards of Inhalation: Vapors of carbon bisulfide irritate the eyes and nose and may cause headache, nausea, nervous system excitation, drop in blood pressure, dizziness, unconsciousness, and death in acute exposures. Concentrations of 1150 ppm in air cause serious symptoms; 4800 ppm for 30 minutes may be fatal. Repeated low level exposures may result in a variety of nervous system, reproductive, ocular, cardiovascular, and other effects.

Hazards of Ingestion: Ingestion may cause vomiting, diarrhea, headache, convulsions, coma, and possibly death due to respiratory paralysis.

FIRE HAZARDS

Lower Flammable Limit: 1-1.3%

Upper Flammable Limit: 50%

Behavior in Fire: Flammable liquid. Vapors are flammable and heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable vapors upon release.

Hazardous Combustion Products: Includes toxic sulfur oxide, carbon dioxide and carbon monoxide gases.

EXPLOSION HAZARDS

Explosive Limit: Unavailable

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Contact with oxides may result in formation of explosive mixtures.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

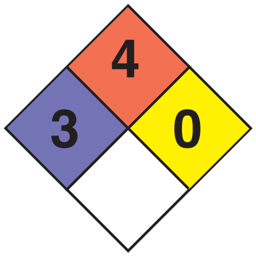
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Polyvinyl ACL (PVAL) and Viton® are reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge (500 ppm or less).

1131

CARBON DISULFIDE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If patient is conscious and can swallow, give 16 ounces of water and induce vomiting. Do not make an unconscious person vomit. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, other inert gas, foam. Foam may be ineffective. Water may possibly be used as a blanket over contained liquid.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of carbon disulfide may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment. Take into account while planning a response that carbon disulfide is highly volatile, flammable, toxic, and easily ignited.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may produce large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

CARBON DISULFIDE

Class 3 (Flammable Liquid)

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to carbon disulfide vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments and will accumulate in low lying areas.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

FOAM . . . Foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications and monitor the area until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

COVERAGE WITH WATER . . . Coverage of confined carbon disulfide with a blanket of water may slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may confine spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

CARBON DISULFIDE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CARBON DISULFIDE

Class 3 (Flammable Liquid)

TECHNIQUE

CONFINEMENT . . . Spilled product will sink in water. Use natural deep-water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep-water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

CARBON MONOXIDE

Division 2.3 (Poison Gas)

GENERAL INFORMATION

Carbon monoxide is a colorless and odorless product shipped as a compressed or liquefied compressed gas. The gas or vapor is highly toxic and is well known to interfere with the ability of the blood to convey oxygen to bodily tissues. It is used in gaseous fuels and in the making of other chemicals. Being only slightly soluble in water and lighter, little of the liquid product will dissolve before it boils or rapidly evaporates from the surface of a water body, yet even relatively small amounts dissolved in water can be harmful to aquatic organisms. Its very low boiling point and wide range of flammability indicate that large amounts of gas or vapor may evolve from spills, especially if the liquid product is involved, and may be easily ignited under all ambient temperature conditions. Vapors may be heavier than air when cold, may persist in low areas until warmed, and in any case may travel a considerable distance to a source of ignition and flash back. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. Liquid carbon monoxide weighs approximately 6.6 lbs/gal at its boiling point temperature. Carbon monoxide does not react with water or many common materials and is stable in transportation, but does react in a vigorous or violent fashion with a variety of other chemicals. Contact with the liquid or very cold gas may cause frostbite burns of the skin or eyes. Products of combustion include carbon, carbon dioxide, and possibly other oxides of carbon. Downwind evacuation should be considered if carbon monoxide is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a fire involving a bulk container becomes uncontrollable or the container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently. If a cylinder is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.00448/1008 water at 32°F (0°C)

Solubility in Other Chemicals: Soluble in alcohol, benzene, ammonium hydroxide, ethyl acetate, acetic acid, and trichloromethane.

Specific Gravity (Liquid): 0.79 at boiling point.

Vapor Density: .97

Boiling Point: -312.7°F (-191.5°C) at 1 atm.

Melting Point: -340.6°F (-207°C) to -326.2°F (-199°C); reported values vary.

Freezing Point: See melting point

Molecular Weight: 28.0

Heat of Combustion: -2412 cal/g

Evaporation Rate (butyl acetate=1): Not applicable

Vapor Pressure: Usually above critical temperature when compressed gas; maximum pressure allowed in a cylinder is 113.3 atm (1650 psig).

Flash Point: Flammable gas

Autoignition Temperature: 1128°F (609°C) or 1206°F (652°C); reported values vary.

Burning Rate: Unavailable

Flammable Limits: 12% (LEL) - 75% (UEL)

Stability: Stable

Polymerization Potential: Will not occur.

Corrosiveness: Non-corrosive to metals at pressures below 500 psig. May react with iron, nickel, and certain other metals at higher pressures to form carbonyls.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reactions with bromine trifluoride, chlorine trifluoride, lithium and water, nitrogen trifluoride, oxygen difluoride, liquid oxygen (with liquid CO), potassium, or sodium (with liquid ammonia) may result in explosions under appropriate conditions. Iodine heptafluoride or cesium monoxide may burn in carbon monoxide. Incompatible with oxidizing agents in general.

IDENTIFICATION

Shipping Name(s): Carbon monoxide, compressed gas (USDOT & IMO); Carbon monoxide, refrigerated liquid (USDOT).

Synonyms and Tradenames: Carbonic oxide; carbon oxide; Flue gas, Monoxide.

CAS Registry No.: 630-08-0

Chemical Formula: CO

Constituent Components (% each): 97.5% or more pure depending on grade.

UN/NA Designation: NA9202 (refrigerated liquid); UN1016 (compressed gas)

IMO Designation: 2.3, Toxic gas

RTECS Number: FG3500000

NFPA 704 Hazard Rating: 3(Health): 4(Flammability): 0(Reactivity)

Physical Form as Shipped: Compressed gas or liquefied compressed gas

Physical Form as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Odorless

Reportable Quantity: See appendix I.

Common Uses: Organic synthesis; fuels (gaseous); metallurgy; zinc white pigments; mfg. of metal carbonyls.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CARBON MONOXIDE

Division 2.3 (Poison Gas)

* 1016 (Compressed) 9202 (Refrigerated liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Highly toxic and flammable product with extremely low boiling point. Wide range of flammability. Cold vapors and gases may be heavier than air and persist in pits, hollows, and depressions.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 35 ppm (40 mg/m^3)

Ceiling (C) Limit: 200 ppm (229 mg/m^3)

IDLH: 1200 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact with very cold liquid, gas, or containers.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high gas concentrations that may be present in the spill area and over considerable downwind distances. Direct contact with the very cold product and cold containers is also to be avoided.

Hazards of Skin or Eye Contact: Exposure of the skin or eyes to liquid carbon monoxide or very cold gas may cause frostbite-type burns.

Hazards of Inhalation: Carbon monoxide readily combines with blood hemoglobin, thus interrupting the normal oxygen supply to bodily tissues. Symptoms of exposure include headache, dizziness, weakness, rapid breathing, visual disturbances, nausea, vomiting, incoordination, acidosis, coma, convulsions, brain damage, and possibly death with the skin first becoming pale and later cherry red in color. High concentrations may cause collapse and coma with little warning. Some permanent effects of excessive overexposure may be evident even after resuscitation. Levels of 600 - 700 ppm usually cause minor effects in one hour, but 1500 - 2000 ppm is dangerous. Levels of 4000 ppm and above are fatal in less than one hour. Heavy smokers and those with heart or other diseases may be at greater risk. Effects are aggravated by heavy work, high temperatures, and high altitudes.

Hazards of Ingestion: Due to its properties, ingestion of liquid carbon monoxide is considered highly unlikely.

FIRE HAZARDS

Lower Flammable Limit: 12%

Upper Flammable Limit: 75%

Behavior in Fire: Flammable compressed or liquefied compressed gas. Will generate large quantities of toxic and flammable gas upon release. Vapors may be heavier than air when cold and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Flames may be violet or bright blue and/or with little color.

Hazardous Decomposition Products: Decomposes into carbon, carbon dioxide, and possibly other oxides of carbon.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with other chemicals listed in the reactivity section may result in formation of explosive mixtures.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Protective clothing and equipment should prevent the skin or eyes from becoming frozen from contact with liquid carbon monoxide, cold gas streams, or cold vessels containing the product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

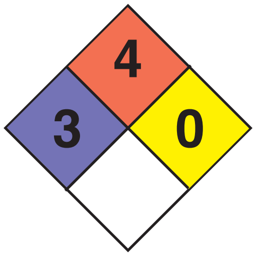
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge may suffice.

1016

9202

CARBON MONOXIDE

Division 2.3 (Poison Gas)



FIRST AID

Nonspecific Symptoms: Frostbite, dizziness, weakness, nausea, headache, rapid breathing and other symptoms of carbon monoxide exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious, administer artificial respiration. Administer oxygen if victim remains unconscious or breathing is difficult. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Reports vary regarding removal of clothing, due to possibility of frostbite. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Ingestion is highly unlikely.

FIRE RESPONSE

Extinguishing Agents: Stop flow if possible or else allow fire to burn itself out while cooling adjoining equipment with water spray. Dry chemical, carbon dioxide, water spray or halon may be used for extinguishment when reignition of escaping gas is no longer a possibility.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay way from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water where such contamination has occurred. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Take the highly toxic, flammable, and volatile nature of carbon monoxide into account when planning the response. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows, and depressions.

AIR RELEASE

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CARBON MONOXIDE

Division 2.3 (Poison Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to carbon monoxide vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of carbon monoxide from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Liquid carbon monoxide may be confined by building dikes or barriers using soil, sand or other materials. Note that any spilled liquid will boil vigorously at first and continue to vaporize rapidly.

CONSEQUENCE

Confined carbon monoxide may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CARBON MONOXIDE

Division 2.3 (Poison Gas)

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: Carbon monoxide is toxic to various aquatic organisms at low concentrations in water.)

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert to conditions that may lead to overflow or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

This page may be used for notes.

March 1995

CARBON TETRACHLORIDE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Carbon tetrachloride is a colorless liquid with the sweet, pungent, or ethereal odor of chlorinated solvents. It is used as a grain fumigant, as a solvent, and in making other chemicals and products. It is very slightly soluble in water and heavier, so may be expected to sink and dissolve extremely slowly. It is not flammable and has been used as a fire extinguishing agent in the past. Containers may rupture due to overpressure if exposed to fire or excessive heat for sufficient time duration. The liquid product weighs approximately 13.2 pounds per gallon. Vapors are heavier than air and may persist in low areas.

Carbon tetrachloride does not react with water or many other common materials. It is stable in normal transportation but may explode or react violently in contact with burning wax, burning aluminum, burning magnesium, burning calcium hypochlorite, and certain other materials. An unusual hazard is that aluminum and this product may detonate when heated or shocked, especially if the aluminum is powdered. The product is considered to be highly toxic by ingestion or inhalation, somewhat less toxic by skin absorption, and is suspected of being a carcinogen. At high temperatures, or in contact with hot metal, carbon tetrachloride may decompose to emit highly toxic gases and vapors such as hydrogen chloride, chlorine, phosgene, and carbon monoxide.

Downwind evacuation should be considered on a case by case basis if carbon tetrachloride is leaking from its container.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.08 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, ether, solvent naphtha and most fixed and volatile oils.

Specific Gravity (Liquid): 1.584-1.587 at 68°F (20°C)

Boiling Point: Approx. 170.2°F (76.8°C) at 1 atm.

Melting Point: – 8.7 To – 9.4°F –22.6 to –23°C)

Freezing Point: – 9.4°F (– 23°C)

Molecular Weight: 153.8

Heat of Combustion: Not flammable

Vapor Pressure: 91.3 mm Hg (1.77 psia) at 68°F (20°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable at moderate temperatures when dry.

Corrosiveness: Corrodes iron and certain other metals when in contact with water and especially at high temperatures. May react with aluminum to form explosive mixture. Will attack some forms of plastics, rubbers, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with burning aluminum, magnesium, wax, calcium hypochlorite, plutonium, uranium, and borane. Also reactive with allyl alcohol, aluminum, triethyl aluminum sequichlorides, aluminum triethyl, barium, disilane, disiloxane, lithium, magnesium powder, liquid oxygen, trisilane, tetrasilane, potassium and its alloys, sodium, zirconium, and several other substances.

IDENTIFICATION

Shipping Names: Carbon tetrachloride (USDOT and IMO)

Synonyms and Tradenames: Tetrachloromethane; perchloromethane; methanetetrachloride; necatorina; necatorine; benzinoform; carbona; carbon chloride; carbon tet; Freon 10; Halon 104; tetrachlorocarbon; tetrafinol; tetraform; tetrasol; univerm; vermoestricid; fasciolin; flukoids

Chemical Formula: CCl_4

Constituent Components(% each): Technical grade is 99.9+% pure

UN/NA Designation: UN1846

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Like chloroform; sweet, pungent; ethereal odor like other chlorinated solvents.

Common Uses: Grain fumigation; general solvent use; mfg. of fluorocarbons, resins, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CARBON TETRACHLORIDE

Division 6.1 (Poisonous Material)

USDOT: No placard is required
(49 CFR §§172-336 (b) and 172-500).

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10-50 ppm (approx.)

Unusual Hazards: Product is a suspected occupational carcinogen. Reacts violently or explosively with numerous materials (see General Information section). Decomposition products are highly toxic. Vapors are heavier than air.

Short Term Exposure Limits(STEL): (Skin) 20 ppm for 15 minutes.(ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 5 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Contact with incompatible materials and excessive heat or flame; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Carbon tetrachloride is toxic by ingestion orinhalation, slightly toxic via skin absorption. It is suspected to be a carcinogen.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact may cause moderate irritation, defatting of skin, and dermatitis. Liquid can be absorbed through the skin in toxic amounts. Contact of liquid with eyes may cause pain, severe irritation, redness, tearing and blurred vision but apparently minimal injury.

Hazards of Inhalation: Excessive inhalation may cause irritation, dizziness, weakness, fatigue, nausea, headache, incoordination, unconsciousness, and possibly death. Delayed effects may include severe damage to heart, liver, and kidneys up to 10 days later.

Hazards of Ingestion: Ingestion may result in gastrointestinal irritation, nausea, vomiting, and diarrhea. See effects of inhalation also.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture in fire due to overpressurization.

Hazardous Combustion Products: May decompose to toxic substances like hydrogen chloride, chlorine, phosgene, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Not flammable but containers may rupture in fire due to over pressurization. Contact with a variety of substances may result information of explosive mixtures (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

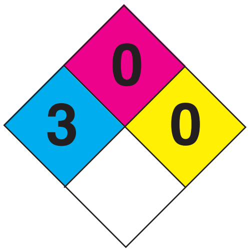
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include nitrile rubber, polyvinyl alcohol, polyurethane, Viton, nitrile rubber-PVC blend, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1846

CARBON TETRACHLORIDE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of skin, eyes, or respiratory tract. Dizziness, fatigue, weakness, nausea, vomiting, diarrhea, headache, incoordination, or unconsciousness.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Do not administer epinephrine or ephedrine as this may adversely affect the heart.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large amounts ofwater or a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: If ignites (unlikely), use carbon dioxide, drychemical, water spray or foam.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes/smoke from decomposition products anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Protect sewers and waterways from runoff. Take into account while planning the response that carbon tetrachloride is a moderately volatile and toxic liquid. Note the possibility of explosions in the presence of aluminum, especially if this metal is powdered.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Carbon tetrachloride may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of carbon tetrachloride in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Carbon tetrachloride spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CARBON TETRACHLORIDE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to carbon tetrachloride vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount of carbon tetrachloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM ... There is some possibility that firefighting foam applied to the surface of liquid pools may slow the release of carbon tetrachloride vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Carbon tetrachloride may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained carbon tetrachloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

CARBON TETRACHLORIDE
Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, orother compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT ... Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING ... Stream or lake beds may be dredged to remove heavier than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

CARBON TETRACHLORIDE

Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1996

CHLORINE*

Division 2.3 (Poison Gas)

GENERAL INFORMATION

Chlorine is a greenish yellow gas shipped under pressure as a liquid. It has a pungent suffocating odor like the odor of bleach and on inhalation will cause severe irritation to the respiratory passages. Liquid chlorine and high chlorine gas concentrations in air may cause severe eye and skin burns upon contact.

Chlorine is slightly soluble in water and heavier than water. When spilled in water, chlorine will sink and violently boil, releasing chlorine gas above the water's surface. Some chlorine will be dissolved in water. Due too its low boiling point, all chlorine discharges to the environment will result in the generation of large quantities of gas which is heavier than air. The gas is highly corrosive and toxic and may persist in pits, hollows, depressions and other confined or low lying areas. Although chlorine is not flammable, the product is a very strong oxidizer and most combustible materials will ignite and/or burn in chlorine atmospheres.

Chlorine is stable in normal transportation. On release, it is a highly reactive substance which may form potentially explosive mixtures with a wide variety of other chemicals and materials (see Explosion Hazards section). Containers of liquid may rupture due to over pressurization if exposed to fire or excessive heat for sufficient time duration. Downwind evacuation should be considered if chlorine is leaking from a container. Note that large spills may require evacuation over significant distances.

Chlorine is used to purify drinking water, to bleach paper, wood pulp and textiles, and for making a wide variety of other chemicals and products. The liquid weighs approximately 13 pounds per gallon near its boiling point temperature.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.65 gm/100 gm
Solubility in Other Chemicals: Soluble in alkalies.
Specific Gravity (Liquid): 1.424 at 59°F (15°C) Vapor
Density (Air = 1): 2.5
Boiling Point: -30.3 to -29.4°F (-34.1 to -34.6°C) at 1 atm.
Melting Point: -150° F (-101°C)
Freezing Point: -150° F (-101°C)
Molecular Weight: 70.91
Heat of Combustion: Not flammable.
Vapor Pressure: 4788 mmHg (6.3 atm) at 68° F (20°C)
Flash Point: Not flammable.
Autoignition Temperature: Not flammable.
Burning Rate: Not flammable.
Stability: Stable.
Corrosiveness: Highly corrosive in presence of moisture. Reacts with most metals at high temperatures. Copper may burn spontaneously.
Reactivity with Water: Forms a corrosive solution of hypochlorous acid (ClHO) which decomposes to chlorine, oxygen, and chloric acid.
Reactivity with Other Chemicals: Reacts with combustible substances and chemicals, finely divided metals, aluminum, certain plastics and rubbers, carbon, and a wide variety of metal compounds.

IDENTIFICATION

Shipping Names: Chlorine (USDOT and IMO).
Synonyms and Tradenames: Molecular chlorine; liquid chlorine; CAS 007782 50 5.
Chemical Formula: Cl_2
Constituent Components (% each): 99.95-100% pure with trace of inert ingredients.
UN/NA Designation: UN1017
IMO Designation: 2.3, poison gas.
Physical State as Shipped: Liquefied compressed gas.
Physical State as Released: Gas or boiling liquid.
Color of the Shipped Material: Greenish yellow.
Odor Characteristics: Pungent, choking, irritating, like bleach.
Common Uses: Used in water and sewage treatment; manufacture of pulp, paper, bleaches, disinfectants, dyes, rubber, plastics, inorganic and organic chemicals, and in other products and processes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

---

*Reportable Quantity (RQ) established. Refer to appendix I.

CHLORINE

Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.02-3.5 ppm (0.058 - 10.15 mg/m^3)

Unusual Hazards: Extremely corrosive, toxic, volatile, and reactive substance. Will evolve large amounts of gas that may be toxic over considerable downwind distances. Gas is heavier than air and may persist in pits and depressions.

Short Term Exposure Limits (STEL): 0.3 ppm (0.8 mg/m^3). (OSHA)

Time Weighted Average (TLV-TWA): 0.1 ppm (0.25 mg/m^3) over each 8 hours of a 40 hour work week. (OSHA)

Conditions to Avoid: Contact with heat, water streams, or incompatible materials; runoff to sewers or water; inhalation, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of gas. Chlorine may disperse downwind in toxic concentrations over considerable distances. Direct physical contact will result in severe burns to exposed tissues.

Hazards of Skin or Eye Contact: Liquid chlorine may cause severe burns to skin or eyes upon contact. Symptoms may also include frostbite of exposed areas where liquid contact is involved. In high concentrations, chlorine gas irritates or burns the skin and may cause burns, inflammation, and blister formation. Eye contact may result in irritation, burns and in severe exposures, permanent eye damage.

Hazards of Inhalation: Chlorine gas may cause severe irritation of the eyes and respiratory tract with tearing, headache, runny nose, sneezing, coughing, choking, dizziness, and chest pain. Severe breathing difficulties may be delayed in onset and may involve tracheobronchitis, pulmonary edema, and pneumonia. A level of 1000 ppm may be fatal after a few deep breaths. Even 50 ppm may be dangerous in short exposures.

Hazards of Ingestion: Ingestion of chlorine is unlikely due to its physical characteristics.

FIRE HAZARDS

Lower Flammable Limit: Not flammable.

Upper Flammable Limit: Not flammable.

Behavior in Fire: Containers may rupture violently in fire due to over pressurization. Releases will generate large quantities of toxic gas. Although chlorine is not flammable, combustible materials will burn in chlorine gas atmospheres. Fire exposed containers may rupture due to over pressurization suddeenly releasing large volumes of liquid and gas.

Hazardous Combustion Products: Toxic products are evolved when combustibles burn in chlorine. These may include hydrogen chloride, free chlorine gas, and chlorine compounds formed with fuel combustion products.

EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently in fire due to over pressurization. Contact with other chemicals such as alcohols, hydrocarbons, hydrogen, pulverized metals, turpentine, acetylene, rubber, ether, ammonia, wax, fuel gas, polypropylene, and others may result in the formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

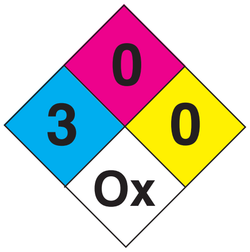
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene, chlorinated polyethylene, polyvinyl chloride, Viton, and Saranex.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style, front or back mounted chlorine canister, or a chlorine cartridge respirator with a full facepiece, within the use of limitations of these devices.

1017

CHLORINE

Division 2.3 (Poison Gas)



FIRST AID

Nonspecific Symptoms: Irritation or burns of any exposed bodily tissues. Coughing, wheezing and other symptoms of inhalation exposure. Frostbite and chlorine burns to tissues exposed to liquified chlorine.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit).

First Aid for Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Wash affected body areas with large amounts of water (do not use hot water or rub affected areas). Remove contaminated clothing after thawing. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Ingestion is unlikely due to the physical properties of chlorine.

FIRE RESPONSE

Extinguishing Materials: Chlorine is non flammable. Use materials appropriate to the fuel involved. Note that water contacting liquid chlorine or liquid chlorine pools may greatly increase the rate of vapor generation. Water spray may be used to protect personnel attempting shutoff of flow.

Extinguishing Techniques: Vapors are toxic and extremely corrosive. Avoid contacting chlorine liquid or chlorine liquid pools with fire fighting streams or runoff. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if without risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account the highly volatile, toxic, and reactive nature of chlorine when planning the response. Call CHEMTREC to activate CHLOREP (chlorine emergency response team). Note that the heavy gas may persist in pits, depressions, and other low lying or confined areas.

AIR SPILL

TECHNIQUE

EVACUATION…Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Chlorine spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Call CHEMTREC for specially available assistance from the chlorine industry.

TECHNIQUE

WATER FOG OR SPRAY…Water fog or spray applied to chlorine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact pools of liquid chlorine as this may increase gas evolution.

CONSEQUENCE

Water runoff may contain chlorine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

CHLORINE
Division 2.3 (Poison Gas)

TECHNIQUE

FOAM…Fluoroprotein foam or special chlorine foam applied to the surface of liquid pools may slow the release of chlorine vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if an initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES…Liquid chlorine may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained chlorine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION…A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION…Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines. The response is best suited to removing final traces of a spill where necessary.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

CHLORINE

Division 2.3 (Poison Gas)

WATER SPILL

TECHNIQUE

TOP USE…Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION ... Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

August 1997

CHLOROACETIC ACID, SOLID

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Chloroacetic acid is a colorless to white or light brown hygroscopic crystalline solid with a strong odor resembling vinegar. It is used as a herbicide, preservative, disinfectant and in the manufacturing of various dyes and other chemicals. Its minor uses are as an intermediate to produce glycolic acids and their esters, caffeine and barbiturates and other pharmaceuticals. It is very soluble (becomes acidic pH=1.93) and will dissolve rapidly generating some amount of heat. It is corrosive to cast iron, steel, some stainless steel, copper, brass, aluminum, silver and lead. It is stable although it will react with alkalis, strong oxidizing agents, strong reducing agents and active metals. It is heavier than water. Its vapors are heavier than air but have a low vapor pressure. A flash point of 126°C (259°F) or greater indicates that the material is difficult to ignite. The solid weighs approximately 98.6 pounds per cubic foot.

Toxicity of the product is mostly related to its highly corrosive action on bodily tissues and it is important to note that the substance has a low vapor pressure. It is due to this characteristic that the hazards to health are mainly limited to direct skin or eye contact and ingestion, and not inhalation. However, inhalation is still a hazard especially in the form of dust. Products of decomposition or combustion are of special concern and include highly toxic and/or irritating hydrogen chloride, phosgene, carbon dioxide and carbon monoxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely; 421g/100g H_2O

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, carbon disulfide, carbon tetrachloride, chloroform, diethyl ether, ethanol, ether and methanol.

Specific Gravity: 1.41, 1.58 (both reported)

Vapor Density: 3.26

Boiling Point: 188-190°C (370-373°F)

Melting Point: 61-63°C (141.8-145.4°F)

Freezing Point: See melting point

Molecular Weight: 94.50

Heat of Combustion: -1843.2 kcal/g

Evaporation Rate (Butyl Acetate=1): 1

Vapor Pressure: 1 mm Hg (0.0193 psia) at 43°C (109°F)

Flash Point: 126-150°C (259-302°F)

Autoignition Temperature: 470°C (878°F), also reported to be greater than 500°C (932°F)

Burning Rate: Unavailable

Flammable Limits: 8%(LEL) - Unavailable

Stability: Stable

Polymerization Potential: Will not occur

pH: 1.93 (.1M Solution)

Corrosiveness: Corrosive to cast iron, steel, some stainless steel, copper, brass, aluminum, silver and lead.

Reactivity and Incompatibility: Reacts with alkalis, strong oxidizing agents, strong reducing agents and active metals.

Reactivity with Water: No reaction however solid generates heat while dissolving.

Other Characteristics: This substance is hygroscopic (readily absorbs moisture from the air). Pure chloroacetic acid exists in 4 crystalline forms (alpha, beta, gamma and delta). The alpha form is most stable and is most important in industry.

IDENTIFICATION

Shipping Name(s): Chloroacetic acid, solid (USDOT & IMO)

Synonyms and Tradenames: Acetic acid, chloro-; Chloracetic acid; MCAA; Chloroethanoic acid; MCA; Monochloracetic acid; Monochloroethanoic acid; Monochloroacetic acid.

CAS Registry No: 79-11-8

Chemical Formula: $ClCH_2COOH$

Constituent Components (% each): Greater than 97.5% pure.

UN/NA Designation: UN1751

IMO Designation: 6.1

RTECS Number: AF8575000

NFPA 704 Hazard Rating: 3 (Health): 1 (Flammability): 0 (Reactivity)

Physical Form as Shipped: Solid

Physical Form as Released: Solid

Color of the Shipped Material: Colorless to white to light brown crystals

Odor Characteristics: Vinegar odor

Reportable Quantity: See appendix I

Common Uses: Herbicide, preservative, disinfectant, mfg. of various dyes and other chemicals. Minor use as an intermediate to produce glycolic acids and their esters, caffeine and barbiturates and other pharmaceuticals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHLOROACETIC ACID, SOLID

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.15 mg/m^3; also reported as .045 ppm (unspecified) and 23.7 mg/m^3 (irritation)

Unusual Hazards: Corrosive and toxic combustible solid. Products of combustion are of special concern.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat or fire; contact with incompatible materials; entry to sewers or confined spaces; inhalation, ingestion or direct physical contact. May ignite combustibles such as wood, paper, oil, etc.

HEALTH HAZARDS

Potential Health Hazards: The major hazard of chloroacetic acid is from direct physical contact or ingestion of the solid. Note, however, that any dust in air will pose an inhalation hazard and that highly irritating and/or toxic gases may be generated in fires.

Hazards of Skin or Eye Contact: Chloroacetic acid may cause severe irritation and burns of the skin which may only become apparent several hours after contact. The product is readily absorbed through the skin and is highly toxic by this route of exposure. Burns result in marked fluid and electrolyte loss and death may follow if too much of the skin is exposed. Contact with the eyes may result in severe irritation and burns.

Hazards of Inhalation: Inhalation of chloroacetic acid may cause irritation and tissue damage to mucous membranes, the upper respiratory tract and the lungs. Excessive exposures may result in pulmonary edema (which may be delayed in onset) and potentially severe consequences. Various symptoms of exposure may include a burning sensation, coughing, wheezing, shortness of breath, headache, nausea and vomiting.

Hazards of Ingestion: Ingestion of chloroacetic acid may cause interference with essential enzyme systems, burns of the mouth or stomach and potentially severe internal damage, perforation, peritonitis and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 8%

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible solid. Will burn but difficult to ignite.

Hazardous Combustion Products: May include highly toxic and/or irritating hydrogen chloride, phosgene and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Stable, generally not explosive according to available data.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

FIRST AID

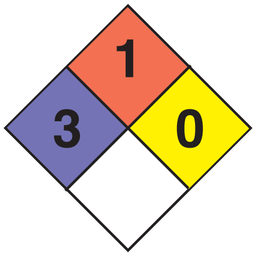
Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not

1751

CHLOROACETIC ACID, SOLID

Division 6.1 (Poisonous Material)



breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if burning or irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, lifting the upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of milk or water immediately. Do not attempt to make the victim vomit without seeking medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Water spray (fog), dry chemical, carbon dioxide, or foam.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water to protect exposures or prevent containers from failing. Do not flood spill material with water since it does not significantly reduce the pH. Fight fire from maximum distance. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Dike fire control water for proper disposal since it may contain toxic gases.

SPILL RESPONSES

General Information: Chloroacetic acid is a highly toxic solid that may cause environmental contamination. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Prevent substance from entering sewers, waterways and confined spaces. Underflow dams are not an effective means to dike material since it mixes with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

CHLOROACETIC ACID, SOLID

Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Chloroacetic acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of chloroacetic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind to unprotected personnel. Continually monitor for any conditions that would alter the situation.

TECHNIQUE

PROTECTION FROM THE WIND . . . If necessary, cover solid chloroacetic acid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chloroacetic acid, dust or mist, in air may reduce airborne concentrations.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

COVER MATERIAL . . . If necessary, cover solid chloroacetic acid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

TECHNIQUE

MECHANICAL REMOVAL . . . Material and any soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

CHLOROACETIC ACID, SOLID

Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where material is likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may become mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Protect solid from becoming wet. Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques.

CHLOROACETIC ACID, SOLID
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

AERATION . . . Water containing dissolved materials may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging, a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

CHLOROACETIC ACID, SOLUTION

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Chloroacetic acid is a colorless to light-yellow or amber liquid with a strong odor resembling vinegar. It is used as a herbicide, preservative, disinfectant and in the manufacturing of various dyes and other chemicals. Its minor uses are as an intermediate to produce glycolic acids and their esters, caffeine and barbiturates and other pharmaceuticals. It will dissolve rapidly in water generating some amount of heat. It is corrosive to cast iron, steel, some stainless steel, copper, brass, aluminum, silver and lead. It is stable although it will react with alkalis, strong oxidizing agents, strong reducing agents and active metals. It is heavier than water. Its vapors are heavier than air, but have a low vapor pressure. A flash point of 126°C (259°F) or greater indicates that the material is difficult to ignite unless substantially preheated.

Toxicity of the product is mostly related to its highly corrosive action on bodily tissues and it is important to note that the substance has a low vapor pressure. It is due to this characteristic that the hazards to health are mainly limited to direct skin or eye contact and ingestion, and not inhalation. However, inhalation is still a hazard if occurs. It is important to also note that severe burns may occur with contact to chloroacetic acid in the molten state. Products of decomposition or combustion are of special concern and include highly toxic and/or irritating hydrogen chloride, phosgene, carbon dioxide and carbon monoxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, carbon disulfide, carbon tetrachloride, chloroform, diethyl ether, ethanol, ether and methanol.
Specific Gravity: 1.41, 1.58 (both reported)
Vapor Density: 3.26
Boiling Point: 188-190°C (370.4-374°F) varies on concentration.
Melting Point: 61-63°C (141.8-145.4°F) varies on concentration.
Freezing Point: See melting point
Molecular Weight: 94.50
Heat of Combustion: Unavailable
Evaporation Rate (Butyl Acetate=1): 1
Vapor Pressure: low
Flash Point: 126-150°C (259-302°F) varies on concentration.
Autoignition Temperature: 470°C (878°F), also reported to be greater than 500°C (932°F)
Burning Rate: Unavailable
Flammable Limits: 8%(LEL) - Unavailable (UEL)
Stability: Stable
Polymerization Potential: Will not occur
pH: 1.93 (.1M Solution)
Corrosiveness: Corrosive to cast iron, steel, some stainless steel, copper, brass, aluminum, silver and lead.
Reactivity and Incompatibility: Reacts with alkalis, strong oxidizing agents, strong reducing agents and active metals.
Reactivity with Water: No reaction.
Other Characteristics: Pure chloroacetic acid exists in 4 crystalline forms (alpha, beta, gamma and delta). The alpha form is most stable and is most widely used in industry.

IDENTIFICATION

Shipping Name(s): Chloroacetic acid, solution (USDOT & IMO); Chloroacetic acid, molten (USDOT & IMO)
Synonyms and Tradenames: Acetic acid, chloro-; Chloracetic acid; MCAA; Chloroethanoic acid; MCA; Monochloracetic acid; Monochloroethanoic acid; Monochloroacetic acid.
CAS Registry No: 79-11-8
Chemical Formula: $ClCH_2COOH$
Constituent Components (% each): Varies below 97.5% pure.
UN/NA Designation: UN1750 (Solution); UN3250 (Molten)
IMO Designation: 6.1
RTECS Number: AF8575000
NFPA 704 Hazard Rating: 3 (Health): 1 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid or molten
Physical Form as Released: Liquid or molten
Color of the Shipped Material: Colorless to light-yellow or amber liquid
Odor Characteristics: Vinegar odor
Reportable Quantity: See appendix I
Common Uses: Herbicide, preservative, disinfectant, mfg. of various dyes and other chemicals. Minor use as an intermediate to produce glycolic acids and their esters, caffeine and barbiturates and other pharmaceuticals.

CHLOROACETIC ACID, SOLUTION

Division 6.1 (Poisonous Material)

*Also 3250

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.15 mg/m^3; also reported as .045 ppm and 23.7 mg/m^3 (irritation)

Unusual Hazards: Corrosive and toxic combustible liquid. Products of combustion are of special concern.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat or fire; contact with incompatible materials; inhalation, ingestion or direct physical contact. May ignite combustibles such as wood, paper, oil, etc. Contact with molten material.

HEALTH HAZARDS

Potential Health Hazards: Due to the low vapor pressure of chloroacetic acid, the major hazard is from direct contact and ingestion. Highly irritating and/or toxic gases may be generated in fires. Thermal burns may result from contact with the molten material.

Hazards of Skin or Eye Contact: Chloroacetic acid may cause severe irritation and burns of the skin which may only become apparent several hours after contact. The product is readily absorbed through the skin and is highly toxic by this route of exposure. Burns result in marked fluid and electrolyte loss and death may follow if too much of the skin is exposed. Contact with the eyes may result in severe irritation and burns.

Hazards of Inhalation: Inhalation of chloroacetic acid may cause irritation and tissue damage to mucous membranes, the upper respiratory tract and the lungs. Excessive exposures may result in pulmonary edema (which may be delayed in onset) and potentially severe consequences. Various symptoms of exposure may include a burning sensation, coughing, wheezing, shortness of breath, headache, nausea and vomiting.

Hazards of Ingestion: Ingestion of chloroacetic acid may cause interference with essential enzyme systems, burns of the mouth or stomach and potentially severe internal damage, perforation, peritonitis and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 8%

Upper Flammable Limit: Unavailable

Behavior in Fire: Although chloroacetic acid will not readily ignite, it will burn if exposed to sources of heat and flame.

Hazardous Combustion Products: May include highly toxic and/or irritating hydrogen chloride, phosgene and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Moderate, however containers exposed to prolonged heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

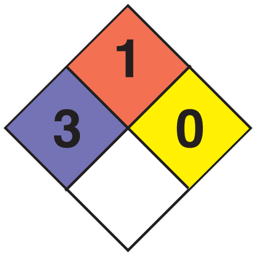
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

1750 *

CHLOROACETIC ACID, SOLUTION

Division 6.1 (Poisonous Material)



*Also 3250

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if burning or irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, lifting the upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of milk or water immediately. Do not attempt to make the victim vomit without seeking medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Water spray (fog), dry chemical, carbon dioxide, or foam.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. Use water to protect exposures or prevent containers from failing. Do not flood spill material with water since it does not significantly reduce the pH. Fight fire from maximum distance. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain toxic gases.

SPILL RESPONSES

General Information: Chloroacetic acid is a toxic liquid that may cause environmental contamination. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Underflow dams are not an effective means to dike material since it mixes with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

CHLOROACETIC ACID, SOLUTION
Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Chloroacetic acid is not expected to evolve large amounts of hazardous airborne contaminants. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

BURIAL . . . Under appropriate conditions, hot molten chloroacetic acid may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of vapors or fumes. Once solidified it can be removed by mechanical means.

CONSEQUENCE

An additional quantity of sand, earth or similar material will become contaminated.

MITIGATION

Consult qualified experts. Consider adding water as necessary to surface of covered material to cool spilled product.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

CHLOROACETIC ACID, SOLUTION
Division 6.1 (Poisonous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water via a processing system constructed on land.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CHLOROACETIC ACID, SOLUTION

Division 6.1 (Poisonous Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralization agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

January 1988

CHLOROBENZENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Chlorobenzene is a colorless liquid with a sweet, almond like, and aromatic odor. It is used to make pesticides, dyes, and other chemicals and has applications as a solvent and in heat transfer, dry cleaning, and color printing processes. Barely soluble in water and somewhat heavier, it can be expected to sink to the bottom of a water body and dissolve very slowly. Its flash point of 84°F indicates that it can be easily ignited in warm ambient temperature conditions. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 9.2 pounds per gallon.

Chlorobenzene is considered stable in normal transportation. It does not react with water or other common materials but is reactive with a wide variety of chemicals. Mixtures with silver perchlorate, alkali and alkaline earth metals, peroxides or strong reducing agents may be explosive. The product can be considered moderately toxic by all routes of exposure. Products of combustion may include toxic gases, such as hydrogen chloride, phosgene, and carbon monoxide.

Downwind evacuation should be considered on a case by case basis if chlorobenzene is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.049 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in alcohol, benzene, ether, and most organic solvents.
Specific Gravity (Liquid): 1.106 at 68°F (20°C)
Boiling Point: 270°F (132°C) at 1 atm.
Melting Point: –49.4°F (–45.2°C)
Freezing Point: –50.1°F (–45.6°C)
Molecular Weight: 112.56
Heat of Combustion: –6700 cal/g (est.)
Vapor Pressure: 10 mm Hg (0.193 psia) at 72°F (22.2°C)
Flash Point: 84°F (29°C), closed cup; 97°F (36.1°C), open cup.
Autoignition Temperature: 1099–1184°F (593–640°C)
Burning Rate: 4.6 mm/minute (est.)
Stability: Stable
Corrosiveness: Will attack some forms of plastics, rubbers, and coatings.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with silver perchlorate, dimethyl sulfoxide, strong oxidizers, cyanides, mercaptans, other organic sulfides, mineral acids, azo and diazo compounds, hydrazines, caustics, nitrides, alkali and alkaline earth and certain elemental metals, peroxides, and strong reducing agents.

IDENTIFICATION

Shipping Names: Chlorobenzene (USDOT and IMO)
Synonyms and Tradenames: Phenylchloride; monochlorobenzene; benzene chloride; chlorobenzol; chlorbenzene; chlorbenzol; MCB.
Chemical Formula: C_6H_5C1
Constituent Components(% each): Technical grade is 99.5% pure.
49 STCC: 49 091 53
UN/NA Designation: UN1134
IMO Designation: 3.3, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Mild amine odor; sweet, almond like; mildly aromatic.
Common Uses: Mfg. of pesticides, dyes, phenol, aniline, chloronitrobenzene; solvent; used in heat-transfer, dry cleaning, and color printing processes.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CHLOROBENZENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

***Threshold Odor* Concentration:** 0.21 ppm

Unusual Hazards: Flammable liquid with toxic combustion products.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): *75* ppm over each 8 hours of a *40* hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; runoff to sewers or water; incompatible materials; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of vapors in air. Physical contact and ingestion should also be avoided. Prolonged or repeated exposure may result in liver, kidney, or lung damage.

Hazards of Skin or Eye Contact: Repeated or prolonged contact of liquid chlorobenzene with the skin may cause irritation or burns. Contact with the eyes may cause temporary irritation.

Hazards of Inhalation: Vapors of chlorobenzene irritate the eyes, nose, and throat at *200* ppm in air. Inhalation of higher concentrations may cause narcosis and depression of the central nervous system with symptoms including coughing, dizziness, drowsiness, incoordination, and unconsciousness. Other possible symptoms may include twitching, red urine, cyanosis, deep rapid breathing, and weak irregular pulse. Extreme exposures may cause liver damage and possibly death.

Hazards of Ingestion: Ingestion may result in pallor, cyanosis, coma, vascular paralysis, and heart failure. Symptoms may be delayed several hours.

FIRE HAZARDS

Lower Flammable Limit: 1.3%

Upper Flammable Limit: 7.1%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel some distance to a source of ignition and flash back. There is some potential that containers may rupture violently in fire.

Hazardous Combustion Products: May include toxic hydrogen chloride, phosgene, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: 1.8%

Upper Explosive Limit: 9.6%

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire. Contact with silver perchlorate, alkali, alkaline earth metals, peroxides, or strong reducing agents may result in formation of explosive mixtures.

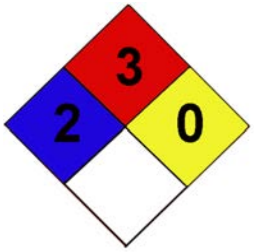
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Some compatible materials may include polyethylene, polyurethane, nitrile-butadiene rubber and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2400 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (2400 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use of limitations of these devices.

1134

CHLOROBENZENE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific symptoms: Irritation of the eyes and upper respiratory tract or signs of narcosis due to vapor exposure. Irritation of the skin or eyes due to direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if irritation persists after washing of skin.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, carbon dioxide, dry chemical, foam. Water may be ineffective except as a blanket.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Do not extinguish burning cargo unless flow can be stopped safely. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of chlorobenzene may result in rupture or explosion of boilers or industrial process equipment. Eliminate ignition sources. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that chlorobenzene is a flammable and relatively toxic substance.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Chlorobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of chlorobenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Chlorobenzene spills may expose downwind areas to toxic or flammable concentrations, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CHLOROBENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY ... . Water fog or spray applied to chlorobenzene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of chlorobenzene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of chlorobenzene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER APPLICATION . . . Application of water to the surface of contained liquid pools may reduce emissions of vapors. Water should float on top of chlorobenzene.

CONSEQUENCE

Addition of water will increase the volume of contaminated liquid requiring containment.

MITIGATION

Contain water and spilled product and remove as soon as possible. Be alert to conditions that

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Chlorobenzene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained chlorobenzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use compatible equipment. Monitor or control temperature of product.

CHLOROBENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment. ,

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to .remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

CHLOROBENZENE
Class 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 1992

CHLOROBUTANES
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Chlorobutane, which may also be shipped under the name "n-butyl chloride", is a fairly volatile, colorless, flammable liquid with an odor variously described as sharp, objectionable, pungent, and resembling either ether or chlorine. It is practically insoluble in water and lighter, so may be expected to form a floating surface slick on water that evaporates at an appreciable rate and dissolves very slowly. The product is used as a solvent, as a veterinary medicine, and for making a variety of other organic chemicals. Its lowest reported flash point of 13°F indicates that it can be easily ignited under a wide range of ambient temperature conditions. Vapors are somewhat heavier than air, may possibly accumulate and persist in low lying areas, and may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.35 pounds per gallon.

Chlorobutane is stable in normal transportation. It slowly hydrolyzes in the presence of moisture or water to form corrosive hydrochloric acid, may react in a hazardous fashion with aluminum and possibly other chemically active metals, is expected to react with a variety of other chemicals, and may attack some forms of plastics, rubber, and coatings. Any hydrochloric acid formed may corrode various metals while evolving flammable and potentially explosive hydrogen gas. Toxicity of chlorobutane is generally low to moderate by all routes of exposure but its products of combustion or thermal decomposition may include, but not be limited to, highly toxic and corrosive substances such as carbon monoxide, carbon dioxide, hydrogen chloride, hydrochloric acid, and phosgene. These substances may be more dangerous than the vapors of chlorobutane itself.

Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, and weather conditions if chlorobutane is leaking from its container but not on fire. Products of combustion or thermal decomposition include several that are highly toxic and may also provide cause for consideration of a such actions if evolved into the atmosphere in significant quantities. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

Due to various factors, the data and information found for this substance were limited in detail and contained various shortcomings.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 660 ppm at 53.6 or 54.5°F (12 or 12.5°C). Some sources report 0.11% by weight at an unspecified temperature.
Solubility in Other Chemicals: Soluble in alcohol and ether.
Specific Gravity (Liquid): 0.8862 - 0.8875 at 68°F (20°C)
Boiling Point: 173.1 - 173.5°F (78.4 - 78.6°C) at 1 atm is most commonly reported.
Melting Point: - 189.6 to - 189.0°F (- 123.1 to - 122.8°C)
Freezing Point: See melting point
Molecular Weight: 92.57
Heat of Combustion: Not available
Vapor Pressure: 80.1 or 81 mm Hg (1.5483 or 1.5656 psia) at 68°F (20°C); 200 mm Hg (3.8658 psia) at 104°F (40°C).
Flash Point: 13 to 20°F (- 10.6 to -6.7°C), closed-cup; 15 to 23°F (- 9.4 to - 5.0°C), open-cup.
Autoignition Temperature: 464 or 860°F (240 or 460°C); reported values vary.
Burning Rate: Not available
Stability: Stable in normal transportation
Corrosiveness: May react hazardously with aluminum and possibly magnesium according to various authorities, which also suggests the possibility of reactions with other active metals. Forms hydrochloric acid in the presence of water or moisture. May attack some forms of plastics, rubber, and coatings.
Reactivity with Water: Slowly Hydrolyzes to form hydrochloric acid. The reaction is not reported to be rapid, vigorous or violent.
Reactivity with Other Chemicals: Besides reactivity with metals discussed in the "Corrosiveness" section, the material is simply reported to be incompatible with oxidizing materials which may possibly cause a fire or explosion.

IDENTIFICATION

Shipping Names: n-Butyl chloride; chlorobutanes
Synonyms and Tradenames: Butane, 1-chloro; normal-butyl chloride; 1-chlorobutane; and n-propylcarbinyl chloride. Be advised that the shipping name "chlorobutanes" may also be used for a variety of isomers, including isomers of n-butyl chloride.
Chemical Formula: $CH_3CH_2CH_2CH_2C1$
Constituent Components (% each): Limited available data suggest the commercial product is usually 99% or more pure.
49 STCC: 49 081 15
UN/NA Designation: UN1127
IMO Designation: 3, flammable liquid
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sharp, objectionable; pungent, unpleasant; like ether or chlorine according to various authorities, though a resemblance to ether seems more likely if the product has not been exposed to water or moisture.
Common Uses: Used as a solvent and to make a variety of organic chemicals; used as a medicine to expel or destroy intestinal worms in veterinary medicine.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CHLOROBUTANES
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: One authority reports an absolute perception limit of 8.82 ppm; a 50% recognition level of 13.3 ppm; and a 100% recognition level of 16.7 ppm in air.

Unusual Hazards: Volatile flammable liquid with vapors that may be heavier than air and persist in low areas. Products of combustion or thermal decomposition appear more hazardous than the vapors of chlorobutane itself to downwind populations. The product hydrolyzes in the presence of water or moisture to form hydrochloric acid which is corrosive and may produce flammable and potentially explosive hydrogen gas in contact with many common metals. Chlorobutane is reported to be dangerously reactive with aluminum according to at least one authority and may also possibly be reactive with other chemically active metals.

Short Term Exposure Limit (STEL): Not established for chlorobutane or similar substances.

Time Weighted Average (TWA) Limit: Not established for chlorobutane. The TWA limit for ethyl chloride is 1000 ppm over each 8 hours of a 40 hour work week (ACGIH, 1991-92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; contact with hot surfaces that may result in thermal decomposition of the product.

HEALTH HAZARDS

Public Health Hazards: Major hazard, in the absence of fire or high temperatures, is from the high concentrations of chlorobutane vapors that may be present in air in the spill area and over some distances downwind. Direct contact and ingestion should also be avoided.

Hazards of Skin or Eye Contact: High concentrations of chlorobutane vapors in air may cause slight irritation of the eyes. Contact of the eyes with liquid chlorobutane may cause irritation with symptoms including discomfort, lacrimation, increased blinking, excess redness, and possible swelling. Contact of the skin with the liquid may cause mild irritation evidenced as mild local redness. Prolonged contact, as due from clothing wet with the liquid, may cause more severe irritation with symptoms including marked redness and possible local swelling. One authority adds that the liquid may cause a rash due to removal of skin oils, which indicates that prolonged or repeated contact may also possibly result in drying and cracking of the skin. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury. (Note: It appears logical to be more careful with chlorobutane that has been in prolonged contact with moisture or water. The hydrochloric acid that forms may possibly cause more severe irritation or burns to bodily tissues than described above.)

Hazards of Inhalation: Limited available data indicate that the vapors of chlorobutane may cause irritation of the nose and throat. High concentrations in air may cause dizziness, nausea, vomiting, lightheadedness, and unconsciousness. Very high levels may result in death. Be advised that substances similar to chlorobutane are known to be narcotics and central nervous system depressants which variably cause drowsiness, staggering gait, irregular heartbeat, tremors, confusion, difficulty in speaking, talkativeness, personality changes, loss of memory, blurred or double vision, painful abdominal cramps, diarrhea, incoordination, pulmonary congestion and edema, and/or effects on the liver and kidneys.

Hazards of Ingestion: Liquid chlorobutane is of low to moderate toxicity by ingestion. Symptoms of ingestion are reported to include nausea, vomiting, abdominal discomfort and cramping, diarrhea, central nervous system depression with many of the effects associated with inhalation, and possibly death in extreme cases.

FIRE HAZARDS

Lower Flammable Limit: 1.8%

Upper Flammable Limit: *10.1%*

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors may be heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in a fire and possibly rocket.

Hazardous Combustion Products: Thermal decomposition of chlorobutane at high temperatures or its combustion are reported to produce highly toxic and/or corrosive substances including but not limited to carbon monoxide, hydrogen chloride, hydrochloric acid, and phosgene. These substances may be more hazardous than the vapors of chlorobutane itself.

1127

CHLOROBUTANES
Class 3 (Flammable Liquid)

EXPLOSION HAZARDS

Lower Explosive Limit: Not available
Upper Explosive Limit: Not available
Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in a fire and possibly rocket. Contact with strong oxidizing agents, certain other chemicals, or certain metals may result in an explosion under appropriate conditions.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus may be necessary to prevent contact with high concentrations of gases or fumes generated by thermally decomposing or burning n-butyl chloride. Compatible materials for n-butyl chloride itself, according to highly respected authorities, may include polyvinyl alcohol (best) and Viton (fair to good). A major manufacturer of the product indicates that polyvinyl chloride (PVC) may also be suitable for use.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent) for fire fighting or in spill emergency situations.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; dizziness, drowsiness, confusion, nausea, vomiting, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Have victim lean forward with head below hips to reduce risk of aspiration into lungs and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, foam. Note that water may be ineffective and that n-butyl chloride will slowly hydrolyze in its presence to form corrosive hydrochloric acid. Be advised that authorities disagree as to whether regular or alcohol foam should be used; it is likely that both are effective to some degree.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with dense fumes or smoke resulting from burning or decomposing chlorobutane may be anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture, possibly rocket, and suddenly release massive amounts of product when exposed to high heat such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

CHLOROBUTANES
Class 3 (Flammable Liquid)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take the volatile and flammable nature of the substance and its heavier than air vapors into account while planning the response. Ensure that chlorobutane is not handled in or exposed to metals (particularly aluminum) with which it may be reactive. Note that the product slowly forms corrosive hydrochloric acid in the presence of moisture or water. Hydrochloric acid will evolve flammable and potentially explosive hydrogen gas while corroding various metals.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Chlorobutane discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chlorobutane vapors in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain small amounts (if any) of chlorobutane and possibly hydrochloric acid.

MITIGATION

Contain contaminated water where deemed necessary and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of chlorobutane vapors into the atmosphere. (Note: Authorities disagree as to whether regular or alcohol type foams are best suited for use with this product; both may be effective to some degree.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

CHLOROBUTANES
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid chlorobutane or contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods**.**

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. A hazardous reaction may take place if chlorobutane is handled in equipment constructed of aluminum or possibly other chemically active metals.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded, or may initiate a hazardous reaction. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

CHLOROBUTANES
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid chlorobutane is only very slightly soluble in water and lighter, so may be expected to form a floating and potentially flammable surface slick that dissolves far less slowly than it evaporates from the water surface.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS... Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh may absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose a risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING. . . Oil spill skimming devices may be deployed to recover floating liquid chlorobutane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose a risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

CHLOROBUTANES
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with chlorobutane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

CONTAINMENT DIKES . . . Where deemed necessary, water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Where deemed necessary, addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. [Note: Although no specific reference was found to indicate that chlorobutane is efficiently removed from water by the cited sorbents, it is expected that this response may be effective based on data for similar materials (ethyl chloride, e.g.)]

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved chlorobutane may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

NEUTRALIZAT10N . . . Where deemed necessary, application of a suitable neutralization agent to the contaminated water may reduce environmental hazards, particularly and especially if significant quantities of hydrochloric acid have formed due to prolonged contact of chlorobutane with water.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating contaminated water via a processing system constructed on land.

September 2000

CHLORODIFLUOROMETHANE

Division 2.2 (Non-Flammable Gas)

GENERAL INFORMATION

Chlorodifluoromethane is essentially a nonflammable colorless gas that is shipped under pressure as a liquid and has a very faint ethereal odor resembling carbon tetrachloride. It is used as a refrigerant, low-temperature solvent, and intermediate in making Teflon. Although it is slightly soluble in water and heavier, its boiling point of -40.9°F indicates that little will dissolve if the product is spilled into water. All spills on land or water may generate relatively large amounts of heavier than air vapors that may appear white at first and persist in pits, hollows, and depressions. Containers of chlorodifluoromethane may rupture due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 11.8 pounds per gallon near its boiling point temperature.

Chlorodifluoromethane does not react with water or many other common materials and is stable in normal transportation. It is reactive with certain metals, however, and will slowly decompose in the presence of rust and moisture. Toxicity of the product is relatively low, but it may be present in air in very high concentrations, and contact with cold liquid or gas may result in frostbite. Products of decomposition at high temperatures are toxic and irritating and may include fluorine and phosgene.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.3 g/100 g water at 77°F (25°C)

Solubility in Other Chemicals: Soluble in acetone, chloroform, and diethyl ether.

Specific Gravity (Liquid): 1.194

Vapor Density: 3.0

Boiling Point: -42°F (-41°C) at 1 atm.

Melting Point: -230.8°F (-146°C)

Freezing Point: -230.8°F (-146°C)

Molecular Weight: 86.48

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): >1

Vapor Pressure: 10 atm (146.9 psia) at 75.2°F (24°C)

Flash Point:Not flammable.

Autoignition Temperature: One source reports 1170°F (631°C)

Burning Rate: Not flammable

Flammable Limits: Not flammable

Stability: Stable

Polymerization Potential: Will not occur.

pH: Neutral

Corrosiveness: Not corrosive, but may react with some metals (see below).

Reactivity with Water: No reaction

Reactivity and Incompatibility: Slowly decomposes in the presence of rust and moisture. Reacts with alkali and alkaline earth metals and powdered aluminum, zinc, magnesium, beryllium, sodium, potassium, etc.

IDENTIFICATION

Shipping Name(s): Chlorodifluoromethane or Refrigerant gas R22 (USDOT & IMO)

Synonyms and Tradenames: Monochlorodifluoromethane; Difluorochloromethane; Difluoromonochloromethane; Algeon 22; Algofrene type 6; Aroton 4; Eskimon 22; Electro CF 22; F-22; Freon® 22; Frigen 22; FC-22; Genetron® 22; Isotron 22; R-22; Ucon 22.

CAS Registry No.: 75-45-6

Chemical Formula: $ChClF_2$

Constituent Components (% each): 99 - 100% pure

UN/NA Designation: UN1018

IMO Designation: 2.2, Non-flammable gases

RTECS Number: PA6390000

NFPA 704 Hazard Rating: 2(Health): 0(Flammability): 1(Reactivity)

Physical Form as Shipped: Compressed iquefied gas

Physical Form as Released: Gas or boiling liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Faint, ethereal, sweet, pungent, like carbon tetrachloride.

Reportable Quantity: See appendix I.

Common Uses: Refrigerant; low-temperature solvent; mfg. Teflon; former aerosol propellant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHLORODIFLUOROMETHANE

Division 2.2 (Non-Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Spills may result in large quantities of heavier than air vapors. Product boils at -42°F (-41°C) and may cause frostbite upon contact.

Short Term Exposure Limit (STEL): 1250 ppm (4375 mg/m^3)

Time Weighted Average (TLV-TWA): 1000 ppm (3500 mg/m^3)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to water bodies; inhalation or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations in air that may be present in the spill area and downwind. Contact with cold product or its containers may cause frostbite.

Hazards of Skin or Eye Contact: Contact with liquid chlorodifluoromethane or gas directly discharged from a container may result in mild to severe frostbite. Severe frostbite may affect deep tissue and may result in gangrene.

Hazards of Inhalation: Very high concentrations of chlorodifluoromethane in air may cause narcosis and other effects including lightheadedness, giddiness, shortness of breath, drowsiness, nausea, heart irregularities, unconsciousness, and possibly death. Death results from 30-40% concentrations in air in animal experiments; 20% causes narcosis; 10% causes stimulation and then depression. Various organs of the body may be affected at even lower concentrations.

Hazards of Ingestion: Ingestion is unlikely but would minimally result in frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization.

Hazardous Decomposition Products: Decomposition products may include carbon monoxide, carbon dioxide, hydrogen fluoride, hydrogen chloride gas, phosgene gas and traces of carbonyl halides.

EXPLOSION HAZARDS

Explosive Limit: Not flammable

Explosive Potential: Containers may rupture violently in fire due to overpressurization. Reacts violently with powdered metals such as aluminum and zinc, causing fire and explosion hazard. Attacks magnesium and its alloys.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

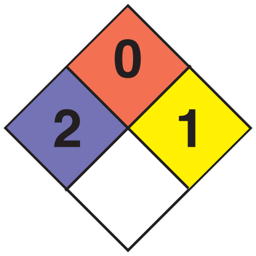
Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact with the spilled product and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Viton® is reported to provide more than 8 hours of protection.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge may suffice.

1018

CHLORODIFLUOROMETHANE

Division 2.2 (Non-Flammable Gas)



FIRST AID

Nonspecific Symptoms: Frostbite or symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Reports vary regarding removal of clothing, due to possibility of frostbite. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: Get medical attention immediately. Have victim drink lukewarm water, if victim is conscious.

FIRE RESPONSE

Extinguishing Agents: Use extinguishing media appropriate for surrounding fire.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the low boiling point of the product into account while planning the response. Beware of possible heavy gas concentrations in pits, hollows, and depressions.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chlorodifluoromethane vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact pools of liquid chlorodifluoromethane as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of chlorodifluoromethane from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

CHLORODIFLUOROMETHANE

Division 2.2 (Non-Flammable Gas)

TECHNIQUE

FOAM . . . Application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of chlorodifluoromethane vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching in moist soil, possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may confine spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Confined chlorodifluoromethane may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders. (Note: Most residue will rapidly evaporate.)

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

CHLORODIFLUOROMETHANE

Division 2.2 (Non-Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination. (Note: Little of the spilled product will dissolve while it is simultaneously sinking and boiling in water. Water spill responses may only be required in special cases. Consult qualified experts for advice.)

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

This page may be used for notes.

August 1997

CHLOROFORM

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Chloroform is a volatile colorless liquid with a pleasant, sweet, pungent odor resembling ether. It is used mainly as a starting material in the production of chlorodifluoromethane, which is used as a refrigerant, and aerosol propellant, but has many other uses also. It is slightly soluble in water and heavier, so may be expected to sink and dissolve at a slow rate. The product is not flammable, but due to its volatility, there is some potential that containers may rupture due to overpressurization if exposed to fire or excessive heat for a sufficient time duration. The product weighs approximately 12.4 pounds per gallon. Its vapors are heavier than air and may persist in low areas.

Chloroform does not react with water and is mostly stable in normal transportation. It reacts with a variety of chemicals and some metals however, and may become violently explosive if mixed with both water and strong alkalis. Toxicity of the product is low to moderate in acute exposures, but chloroform may be present in air in high concentrations. NIOSH considers chloroform a potential occupational carcinogen. Products of decomposition at high temperatures include phosgene, chlorine, carbon monoxide, carbon dioxide and hydrogen chloride gases. Phosgene and hydrogen chloride may also be formed (very slowly) if chloroform is exposed to air or light.

If the material is leaking and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.8 g/100g water at 20°C (68°F)
Solubility in Other Chemicals: Soluble in acetone and ligroin. Miscible with benzene, diethyl ether, ethanol, naphtha, fixed oils and volatile oils.
Specific Gravity (Liquid): 1.49 at 20°C (68°F)
Vapor Density (Air=1): 4.36
Boiling Point: 61.2°C (142°F)
Melting Point: See freezing point
Freezing Point: -63.5°C (-82.3°F)
Molecular Weight: 119.38
Evaporation Rate (Butyl Acetate=1): 11.6
Vapor Pressure: 150-160 mm Hg (2.90-3.09 psia) at 20°C (68°F)
Flash Point: Not flammable
Autoignition Temperature: Above 1000°C (1832°F)
Stability: Stable, but may decompose very slowly in presence of air or light to form toxic phosgene and hydrogen chloride.
Polymerization Potential: Will not occur
Corrosiveness: Will corrode iron and certain other metals in the presence of water or at high temperatures. Reactive with some other metals (see below). May attack some plastics, rubber and coatings.
Reactivity and Incompatibility: Reacts with strong alkalis or caustics, oxidizing materials, aluminum, pot metals and its alloys, magnesium, sodium, potassium, acetone, disaline, lithium, nitrogen tetroxide, potassium tert-butoxide, nitromethane, sodium methylate, primary amines, halogens or halogenating agents, perchloric acid and phosphorous pentoxide mixture, mix of methyl alcohols and sodium or potassium hydroxide, and phenols in basic solution.

IDENTIFICATION

Shipping Name(s): Chloroform (USDOT & IMO)
Synonyms and Tradenames: Trichloromethane; Methenyl trichloride; Formyl trichloride; Trichloroform; Methenyl chloride; Methane trichloride; Freon 20; R 20 (refrigerant); CAS Registry No: 67-66-3
Chemical Formula: $CHCl_3$
Constituent Components (% each): Technical grade is 99.5% pure; may contain small amount of ethanol as stabilizer.
UN/NA Designation: UN1888
IMO Designation: 6.1
RTECS Number: FS9100000
NFPA 704 Hazard Rating: 2 (Health): 0 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pleasant, sweet, pungent, like ether.
Reportable Quantity: See appendix I
Common Uses: Mainly used as a starting material in the production of chlorodifluoromethane which is used as a refrigerant and aerosol propellant. Veterinary medicine and anesthetic, grain fumigant, mfg. pharmaceuticals, artificial silk, plastics, floor polishes, cosmetics, fluorocarbons, pesticides and dyes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHLOROFORM
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 200-300 ppm reported often, but one source reports 50 ppm and one 8 ppm.
Unusual Hazards: None.
Short Term Exposure Limit (STEL): 2 ppm
Time Weighted Average (TLV-TWA): None.
Ceiling (C) Limit: 50 ppm
IDLH: 500 ppm
Conditions to Avoid: Inhalation, ingestion and direct physical contact; heat, fire and exposure to air and light; contact with incompatible materials; entry to sewers and water bodies.

HEALTH HAZARDS

Potential Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and some distance downwind. Direct contact and ingestion are also to be avoided. Note that alcoholics may be affected sooner and more severely from chloroform exposure. NIOSH considers chloroform a potential occupational carcinogen.

Hazards of Skin or Eye Contact: Contact with liquid chloroform may cause drying, cracking and inflammation of the skin due to the defatting action of the product. Contact with the eyes may cause immediate burning pain, irritation and transient corneal injury.

Hazards of Inhalation: Chloroform is a relatively potent general anesthetic at higher concentrations in air but is no longer used as such for humans because of the frequency of cardiac arrest during surgery and of delayed death due to liver injury. High concentrations in air may be narcotic and may cause central nervous depression with the symptoms including headache, dizziness, nausea, drowsiness, vomiting, irregular heartbeat, dilation of the pupils, fatigue, mental dullness, unconsciousness and possibly death. Liver and kidney injury may occur. Opinions vary, but it appears that as little as 500 ppm in air (or less) can produce some toxic effects in short-term acute exposures.

Hazards of Ingestion: Ingestion may cause severe burning of the mouth and throat, pain in the chest and abdomen, and vomiting. Depending on the amount swallowed, liver damage, unconsciousness and possibly death may follow. Aspiration of the lungs during vomiting may result in chemical pneumonia according to one manufacturer.

FIRE HAZARDS

Lower Flammable Limit: Not flammable
Upper Flammable Limit: Not flammable
Behavior in Fire: Generally does not burn except in direct contact with flame or high temperature. Containers may rupture in fire due to overpressurization. May evolve toxic vapors and gases upon release.
Hazardous Combustion Products: Decomposes to highly toxic phosgene, hydrogen chloride, chlorine, carbon dioxide and carbon monoxide gases.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture in fire due to overpressurization. Contact with a mixture of water and strong alkalis may result in explosion.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

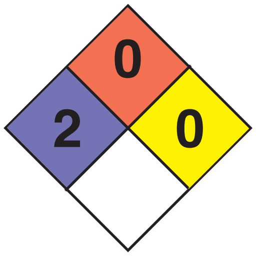
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Compatible materials may include: polyurethane, polyvinyl alcohol, Viton®, and nitrile-butadiene rubber; Tychem®9400 and Barricade® (longer than 8 hours); and, Tychem® 10,000 (323 minutes). Structural firefighting protective clothing does not provide an adequate level of personal protection for this product.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

1888

CHLOROFORM

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Eye or skin irritation; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if burning or irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.) Do not make an unconscious person vomit. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Since chloroform is not flammable, select appropriate agent for protecting fire exposures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear positive-pressure, self-contained breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Chloroform is a volatile and toxic liquid. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Wear appropriate level of personal protective clothing and equipment. Stop flow if it can be accomplished safely. Water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain toxic gases. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be toxic. Underflow dams are not an effective means to dike material since it is heavier than water. As a result, recovery efforts from water borne releases are difficult. Note that it may become explosive if mixed with water and strong alkalis. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

CHLOROFORM

Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

MONITOR THE SITUATION . . . Chloroform may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

TECHNIQUE

COVERAGE WITH WATER . . . The addition of a thin layer of water to the surface of contained liquid pools may slow the release of vapors into the atmosphere. Water will float on top of chloroform if the surface is calm.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Water will be contaminated and will increase the corrosivity and reactivity hazards of chloroform, especially if alkaline materials may be present.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste.

CHLOROFORM
Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

CHLOROFORM
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may spread contaminate.

MITIGATION

Excavate as last resort, unless adverse environmental impacts can be minimized.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottoms sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

CHLOROPICRIN
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Chloropicrin is a colorless to light yellow or green slightly oily nonflammable liquid with intensely irritating vapors having an effect like tear gas at very low concentrations in air. It is actually used as a tear gas, has been used as a poison gas by the military, and has uses in organic synthesis and the making of dyestuffs, fumigants, fungicides, insecticides, and rat poisons. The substance is only slightly soluble in water and heavier, so may be expected to sink to the bottom of a water body and dissolve at a very slow rate. It weighs approximately 13.8 - 14.1 pounds per gallon.

Chloropicrin does not react with water, but is said to be a strong oxidizing agent that reacts violently or can cause fires or explosions in contact with other oxidizers, combustible materials, or reducing agents as well as several other types of chemicals. Chloropicrin is considered stable in normal transportation but has several unusual characteristics relating to stability. Above a critical volume (one source says greater than 30 gallons), chloropicrin can be shock-detonated, particularly when heated. The material decomposes violently at about 234°F when heated or exposed to direct flame, especially in contact with metals, to produce highly toxic gases including phosgene, nitrogen oxides, nitrosyl choride, chlorine, and carbon monoxide. Toxicity of the undecomposed material is very high by all routes of exposure, and chloropicrin vapors in air may be harmful over very considerable downwind distances. The product is incompatible with aluminum and magnesium and their alloys, rubber, PVC, PVDC, and possibly other plastics and coatings.

Downwind evacuation should be considered whenever chloropicrin is leaking from a container. (Note: this guide primarily discusses the properties and hazards of pure chloropicrin except where noted otherwise.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very slightly soluble; about 0.18g/100g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, benzene, and carbon disulfide.

Specific Gravity (Liquid): 1.65-1.66 at 68°F (20°C)

Boiling Point: 233.2-234.1°F (111.8-112.3°C) at 1 atm; may explode if shocked or decompose violently.

Melting Point: – 84.1 to – 83.2°F (– 64.5 to – 64°C)

Freezing Point: See melting point

Molecular Weight: 164.4

Heat of Combustion: Not flammable

Vapor Pressure: 16.9-20 mm Hg (0.327-0.387 psia) at 68°F (20°C); reported values vary.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable during normal transport.

Corrosiveness: Chloropicrin may attack some forms of plastics, rubber, and coatings. It is incompatible with containers or equipment made of aluminum, magnesium or their alloys, rubber, PVC, or PVDC. Mild steel (if dry) and teflon lined equipment is suitable.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Incompatible materials include aniline, sodium hydroxide, sodium methylate, organic amines, strong oxidizers, reducing agents, sulfuric acid, propargyl bromide, and other compounds. See General Information section and Corrosiveness section for additional details.

IDENTIFICATION

Shipping Names: Chloropicrin (USDOT and IMO), chloropicrin mixture (USDOT and IMO)

Synonyms and Tradenames: Trichloronitromethane; nitrochloroform; nitrotrichloromethane; Tri-Clor; Profume A; Picride; Pic-Clor, PS; Chlor-O-Pic; Picfume; Acquinite; Microlysin; Larvacide; Dolochlor; etc.

Chemical Formula: $CC1_3NO_2$ or $C1_3CNO_2$

Constituent Components (% each): Liquid chloropicrin is usually 96% or more pure with remainder mostly water, other halonitroalkanes, and trace of hydrochloric acid. When "absorbed", the liquid is shipped absorbed on dry noncombustible carrier. Mixtures may include methyl bromide, methyl chloride, carbon tetrachloride, trichloroethylene, or other substances.

UN/NA Designation: UN1580 and UN1583

IMO Designation: 6.1, poison, for UN1580 and UN1583; 2.3, poison gas, for others.

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless to light yellow or green, slightly oily liquid. Colorless when pure.

Odor Characteristics: Intensely irritating tear gas odor and effect; penetrating.

Common Uses: Organic synthesis; dyestuffs; fumigants; fungicides; insecticides; rat exterminator; tear gas; military poison gas.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

CHLOROPICRIN

Division 6.1 (Poisonous Material)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1.1 ppm

Unusual Hazards: Highly reactive. Heated material may detonate if shocked while in confinement when present in excess of a critical volume. Vapors are highly toxic, as are decomposition products. Contact with other chemicals or combustible materials may result in fire or explosion.

Short Term Exposure Limits (STEL): 0.3 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 0.1 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major public hazard is from inhalation of the highly toxic vapor concentrations in air that may occur in the spill area and over significant downwind distances. Contact with the skin or eyes by either the liquid or high vapor concentrations in air and ingestion must also be strictly avoided.

Hazards of Skin or Eye Contact: Chloropicrin is a severe irritant having a corrosive action on bodily tissues. Contact of the skin with the liquid may result in redness and chemical burns; skin wounds exposed to the chemical may become septic. Although not specifically addressed in the literature, it is expected that similar or more severe eye effects may be expected.

Hazards of Inhalation: Chloropicrin vapors are highly irritating and toxic. Exposures may result in sore throat, coughing, labored breathing, dizziness, nausea, vomiting, faintness, and severe eye lacrimation. Higher levels may interfere with oxygen transport by blood, and cause bronchitis, irregular heatbeat, asthmatic attack, delayed pulmonary edema, and death. Survivors may suffer permanent damage of the kidney and heart, uremia, asthma, and some degree of sensitization. Concentrations of 0.3-0.37 ppm cause painful eye irritation in 3-30 seconds; 4 ppm is temporarily disabling in a few seconds; 15 ppm is not tolerable for more than a minute; 20 ppm for 1-2 minutes causes bronchial or pulmonary lesions; 298 ppm is lethal in 10 minutes; 119 ppm is lethal in 30 minutes.

Hazards of Ingestion: Chloropicrin is corrosive to the mouth, throat, and digestive tract, and may cause many of the same symptoms of inhalation.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Heated material decomposes violently at 234°F (112°C), especially in contact with metals. Containers may detonate if shocked. Large amounts of highly toxic vapors may be released if container ruptures in fire. Decomposition products are also highly toxic.

Hazardous Combustion Products: Decomposition upon heating or contact with flame produces highly toxic gases including phosgene, nitrogen oxides, nitrosyl chloride, chlorine, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable, but see below

Upper Explosive Limit: Not flammable, but see below

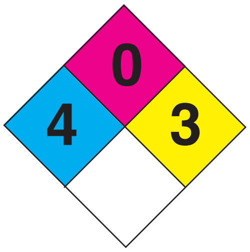
Explosiveness: Above a critical volume, chloropicrin can be shock detonated, particularly when heated. Contact with certain other substances such as combustible materials or propargyl bromide may result in the formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus may be necessary at concentrations above 4 ppm in air to prevent harmful contact. A manufacturer of chloropicrin indicates that suitable materials include neoprene and polyethylene. Another recommends that rubber, PVC, and PVDC materials be avoided.

1580

CHLOROPICRIN
Division 6.1 (Poisonous Material)



See UN/NA Designation for
other ID numbers.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 4 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (4 ppm or less) or an organic vapor cartridge respirator with a full facepiece (4 ppm or less) within the use limitations of these devices. (Note: The above statement is from NIOSH respirator selection tables. However, two sources warn that the usual chemical used in gas masks is ineffective for chloropicrin. Use such devices with great caution if at all.)

FIRST AID

Nonspecific Symptoms: Severe eye lacrimation and irritation or burns of the skin or respiratory tract.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire. Chloropicrin is not combustible.

Extinguishing Techniques: Unusual vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Fight fire from explosion-resistant location. Be alert to the possibility that the container may detonate under fire conditions. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw from area and let fire burn if this is not possible.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or rupture of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the volatility, reactivity, and highly toxic nature of chloropicrin into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent public exposure and to allow vapors or fumes to dissipate. Chloropicrin spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CHLOROPICRIN
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chloropicrin vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of chloropicrin from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of chloropicrin vapors into the atmosphere. (Note: The fact that foam is recommended for use in fighting surrounding fires suggests it may also have value in suppressing vapor evolution from pools of liquid chloropicrin.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER SPRAY APPLICATION . . . Application of water spray to the surface of contained liquid pools may reduce vapor emissions since chloropicrin is heavier than water and of limited solubility.

CONSEQUENCE

Addition of water will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Chloropicrin may be contained by building dikes using soil, sand or other materials .

CONSEQUENCE

Contained chloropicrin may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

CHLOROPICRIN
Division 6.1 (Poisonous Material)

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, vermiculite, or other inert noncombustible materials.

CONSEQUENCE

Once used sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CHLOROPICRIN
Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT . . . Chloropicrin will sink in water and dissolve very slowly (unless accompanied by a wetting agent that speeds dissolution). Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means .

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

CHLOROPRENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Chloroprene is a volatile colorless flammable liquid with a pungent odor resembling ether. It is primarily used to make synthetic rubbers such as neoprene and duprene. It is slightly soluble in water and somewhat lighter, so may be expected to form a floating surface slick that slowly dissolves. Its flash point of –4°F indicates that the product may be easily ignited under a wide range of ambient temperature conditions. Vapors are heavier than air, may accummulate and persist in low areas, and may travel a significant distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 8 pounds per gallon.

Chloroprene does not react with water or many other common materials. It is readily subject to self-polymerization, however, if exposed to heat, light, peroxides, or other oxidizing materials, and this reaction may result in violent rupture of containers. It is a relatively noncorrosive substance but may attack some forms of plastic, rubber, or coatings. Toxicity of the product is moderate to high by the various potential routes of exposure and some authorities consider chloroprene to be a potential human carcinogen in long term occupational exposures. Products of combustion are considered hazardous and may include carbon monoxide and hydrogen chloride gases.

Downwind evacuation should be considered if chloroprene is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble
Solubility in Other Chemicals: Soluble in acetone, benzene, diethyl ether, and other organic solvents.
Specific Gravity (Liquid): 0.9583 at 68°F (20°C)
Boiling Point: 138.9°F (59.4°C) at 1 atm.
Melting Point: –202°F (–130°C)
Freezing Point: – 202°F (–130°C)
Molecular Weight: 88.54
Heat of Combustion: Unavailable
Vapor Pressure: 179 mm Hg (3.46 psia) at 68°F (20°C)
Flash Point: – 4°F (– 20°C), closed cup
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Shipped with inhibitor but may polymerize under conditions described above, even at room temperatures. Maintain below 75°F (23.9°C).
Corrosiveness: May attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Polymerizes in the presence of peroxides or oxidizing materials. Peroxides form in the presence of air. May react with acids.

IDENTIFICATION

Shipping Names: Chloroprene, inhibited (USDOT and IMO)
Synonyms and Tradenames: 2-chloro-1,3-butadiene; chlorobutadiene; 2-chlorobutadiene; beta-chloroprene.
Chemical Formula: $H_2C = CClCH = CH_2$
Constituent Components(% each): Unavailable
49 STCC: 49 072 23
UN/NA Designation: UN1991
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, pungent, like ether
Common Uses: Mfg. synthetic rubber

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CHLOROPRENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

***Threshold Odor* Concentration:** Recognition at 0.11 ppm

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition. Very reactive, may self-polymerize under conditions described in the General Information section.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): (Skin) 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in the spill area and downwind over significant distances. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with liquid chloroprene may result in skin irritation and inflammation as well as temporary hair loss. Some amount may be absorbed through the skin to cause toxic effects. Contact with the eyes may cause irritation, edema of the eyelids, and possible corneal damage.

Hazards of Inhalation: Vapors of chloroprene may cause irritation of the eyes, nose, throat, and respiratory tract. High concentrations in air may result in central nervous system depression, anesthesia, respiratory paralysis, and possibly death in acute exposures. Chronic exposures to high concentrations may result in lung, liver and kidney damage, nervousness and irritability, anemia, low blood pressure, and reproductive system effects.

Hazards of Ingestion: Data unavailable. See hazards of inhalation for some potential effects.

FIRE HAZARDS

Lower Flammable Limit: 4%

Upper Flammable Limit: 20%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapor upon release. Vapors are heavier than air, may accumulate and persist in low areas, and may travel to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in violent polymerization.

Hazardous Combustion Products: May include toxic carbon monoxide and hydrogen chloride gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in the presence of peroxides or other oxidizers.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1991

CHLOROPRENE
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific symptoms: Irritation of the eyes, nose, throat, skin, or respiratory system; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of chloroprene may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the significant volatility, flammability, and toxicity of chloroprene into account when planning the response. Note that polymerization may occur if the product is exposed to heat, light, peroxides, or other oxidizers. Note also that heavier than air vapors may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Chloroprene spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chloroprene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of chloroprene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

CHLOROPRENE
Class 3 (Flammable Liquid)

TECHNIQUE

FOAM . . . There is an unconfirmed possibility that firefighting foam applied to the surface of liquid pools may slow the release of chloroprene vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Chloroprene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained chloroprene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, commercial sorbents, or other compatible substances. ,

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

CHLOROPRENE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available. ,

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating chloroprene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

CHLOROPRENE
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Peat or commercial sorbent materials compatible with chloroprene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2006

CHLOROSULFONIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Chlorosulfonic acid is a colorless to pale yellow fuming liquid with a sharp, acrid, penetrating, and pungent odor. It is used for making surfactants, dyes, pigments, pharmaceuticals, chemical blowing agents, pesticides, plasticizers, tanning agents, and a variety of other products and chemicals. Although the substance is not itself flammable, it is a strong oxidizer that may ignite combustible organic materials upon contact. In addition, contact with most metals generates flammable and potentially explosive hydrogen gas. The product weighs approximately 14.6 pounds per gallon.

Chlorosulfonic acid reacts violently with water or moisture in air to form a mixture of sulfuric and hydrochloric acids (see separate Guides) while evolving heat and large quantities of dense white acidic fumes. The acid and its fumes are highly corrosive to all bodily tissues and will also attack cast iron, brass, bronze, most non-ferrous metals, and a variety of rubbers and plastics. Reactions with numerous other chemicals may be hazardous. Reactions involving yellow or red phosphorus may be explosive.

If chlorosulfonic acid is involved in an incident, as an immediate precautionary measure, isolate spill or leak area in all directions for at least 150 feet (50 meters) for liquids and at least 75 feet (25 meters) for solids. In the event chlorosulfonic acid is released to the environment, the following evacuation distances should be considered. Note there are different distances for land and water spills due to the reactivity of chlorosulfonic acid with water. For **small** spills on ***land***, isolate area for a radius of 100 feet (30 meters) in all directions with a downwind evacuation of 0.1 miles (0.1 kilometers) for daytime and nighttime. For **small** spills in ***water***, isolate area for a radius of 100 feet (30 meters) in all directions with a downwind evacuation of 0.1 miles (0.1 kilometers) for daytime and 0.4 miles (0.6 kilometers) for nighttime. For **large** spills on ***land***, isolate area for a radius of 100 feet (30 meters) in all directions with a downwind evacuation of 0.2 miles (0.3 kilometers) for daytime and 0.3 miles (0.4 kilometers) for nighttime. For **large** spills in ***water***, isolate area for a radius of 300 feet (90 meters) in all directions with a downwind evacuation of 0.5 miles (0.7 kilometers) for daytime and 1.7 miles (2.8 kilometers) for nighttime. These distances should be adjusted when taking into consideration the amount of material spilled, location, local weather conditions and other factors. If bulk container of chlorosulfonic acid is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. Acid fumes may be heavier than air and collect in low lying areas.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts

Solubility in Other Chemicals: Soluble in liquid sulfur dioxide, nitrobenzene, and halogenated organic solvents containing hydrogen. Slightly soluble in carbon disulfide and other halogenated organic solvents.

Specific Gravity (Liquid): 1.752 at 68°F (20°C)

Vapor Density: 4.0

Boiling Point: 306 to 316.4°F (152 to 158°C) at 1 atm.

Melting Point: –112°F (–80°C)

Freezing Point: –112°F (–80°C)

Molecular Weight: 116.52

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): <1

Vapor Pressure: 1.0 mm Hg (0.019 psia) at 89.6°F (32°C); fuming acid

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Flammable (Explosive) Limits: Not flammable

Polymerization Potential: Will not occur

pH: <1

Corrosiveness: Attacks cast iron, brass, bronze, most other non-ferrous metals, and certain plastics and rubbers. Black iron, glass, 316 SS and Teflon® are resistant.

Reactivity with Water: Reacts violently with formation of sulfuric and hydrochloric acids, and evolution of heat and large quantities of dense white acid fumes.

Reactivity with Other Chemicals: Reacts with organic materials, nitrates, chlorates, metallic powders, carbides, picrates, sulfides, cyanides, fulminates, yellow phosphorus, red phosphorus, sodium hydroxide, ammonium hydroxide, creosote oil, sulfolane, and a wide variety of hydrocarbon derivatives.

IDENTIFICATION

Shipping Names: Chlorosulfonic acid (USDOT); Chlorosulphonic acid (IMO)

Synonyms and Tradenames: Chlorosulfuric acid; Sulfuric chlorohydrin; CSA; Sulfonic acid, Monochloride; Chlorsulfonic acid; Chlorosulphuric acid.

Chemical Formula: $HOSO_2CI$ or HSO_3CI

CAS Registry No.: 7790-94-5

Constituent Components(% each): 98.5–100% pure, remainder is sulfuric acid and free SO_3

UN/NA Designation: UN1754

IMO Designation: 8, corrosive substances

RTECS Number: FX5730000

NFPA 704 Hazard Rating: 4 (Health): 0 (Flammability): 2 (Instability): Water reactive; Oxidizer

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless to pale yellow

Odor Characteristics: Sharp, acrid, penetrating, pungent

Reportable Quantity: See Appendix I

Common Uses: Mfg. of surfactants, dyes, pigments, pharmaceuticals, chemical blowing agents, pesticides, resins, plasticizers, catalysts, tanning agents, saccharin, ion-exchange resins and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHLOROSULFONIC ACID

Class 8 (Corrosive Material)

and

and

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** Unavailable

Unusual Hazards: Highly corrosive fuming acid that attacks or reacts with a wide variety of materials. May ignite organic or combustible substances upon contact. Evolves hydrogen in contact with certain metals.

Short Term Exposure Limits (STEL): Unavailable, in contact with water produces hydrochloric and sulfuric acids (see separate Guides)

Time Weighted Average (TLV-TWA): Unavailable, in contact with water produces hydrochloric and sulfuric acids (see separate Guides)

Ceiling (C) Limit: Unavailable, in contact with water produces hydrochloric and sulfuric acids (see separate Guides)

IDLH: Unavailable, in contact with water produces hydrochloric and sulfuric acids (see separate Guides)

Conditions to Avoid: Contact with incompatible materials; runoff to water sources; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Any and all exposures to liquid chlorosulfonic acid or its concentrated vapors or fumes in air may be hazardous to health.

Hazards of Skin or Eye Contact: Contact with liquid chlorosulfonic acid or dense fumes in air may cause severe acid burns or ulcers and ulceration or corrosion to the eyes possibly leading to blindness.

Hazards of Inhalation: Vapors and fumes of chlorosulfonic acid are extremely irritating and corrosive to respiratory passages and may cause inflammation of the upper and lower respiratory tract. High concentrations in air may result in unconsciousness and serious delayed lung damage. Symptoms may include irritation of the nose and throat with sneezing, sore throat, runny nose, difficulty breathing, shortness of breath or pulmonary edema with cough, wheezing, abnormal lung sounds, possibly progressing to bluish discoloration of the skin. Symptoms may be delayed.

Hazards of Ingestion: Ingestion of chlorosulfonic acid may cause burns of the mouth, throat, esophagus and stomach, with severe pain, bleeding, vomiting, diarrhea and collapse of blood pressure. Damage may appear days after exposure. Exposure may be fatal.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Not flammable

Upper Flammable (Explosive) Limit: Not flammable

Behavior in Fire: While chlorosulfonic acid is non-flammable, it is a strong oxidizer and contact with combustible materials may cause fire. Reacts violently with water, spattering acid. Leaks or spills cause dense fumes. May generate large quantities of corrosive fumes and vapors upon release.

Hazardous Decomposition Products: Releases hazardous chlorine, hydrogen chloride, and sulfur dioxide gases when heated.

EXPLOSION HAZARDS

Explosive Potential: Contact with yellow or red phosphorus or certain other chemicals may result in formation of explosive mixtures. When diluted with water, chlorosulfonic acid reacts with most metals to release flammable, potentially explosive hydrogen gas.

1754

CHLOROSULFONIC ACID

Class 8 (Corrosive Material)

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable to prevent contact with high vapor or fume concentrations in air. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 2; Tychem® SL; Tychem® CPF 4; Tychem® Responder®; Tychem® Responder® CSM; Tychem® Responder® CSM; Tychem® Responder®; Tychem® TK; Tychem® ThermoPro.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid canister or an acid cartridge respirator with a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Chlorosulfonic acid may cause irritation or acid burns via all routes of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact do not delay, remove contaminated clothing immediately and wash skin with plenty of cold water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Sources disagree as to whether to give anything to drink, however, there are compelling arguments supporting those that do not recommend administrating water. Get medical attention immediately.

Note to Physician: Ingestion should not be treated solely by dilution with water, since this will generate corrosive substances and large amounts of heat. Gastric lavage may be considered if the patient's condition permits, but corrosive injury may preclude this procedure. Since heat and corrosive reaction products may be generated by the lavage procedure itself, attempt only with great care.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide or flooding quantities of water. Product is not flammable but may ignite combustible materials upon contact. It reacts violently with water.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if not a risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the corrosiveness and reactivity of product with many common metals when deciding on the appropriate response and equipment. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust. Consult a qualified specialist on neutralization techniques, however, some sources suggest neutralizing run-off with lime or soda ash to prevent corrosion of metals and to prevent the formation of hydrogen gas. Chlorosulfonic acid is highly reactive with water. Take into account while planning the response that it is highly corrosive and toxic with heavier than air vapors that may persist for a time in low areas. Be aware that chlorosulfonic acid may ignite organic matter upon contact and that hydrogen gas may be liberated upon contact with certain metals. Use explosion-proof and spark-proof equipment where necessary.

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

OIL/PERLITE APPLICATION . . . Application of white mineral oil (best) to the surface of liquid pools or the addition of perlite (good) or clay (not as good) may reduce emissions of vapors or fumes.

CONSEQUENCE

Addition of these materials will increase the volume of spilled product.

MITIGATION

Contain spilled product and contaminated materials and remove or neutralize as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to chlorosulfonic acid vapors or fumes at a point downwind of the spill may absorb vapors, knockdown fumes or aerosols, and/or accelerate their dispersal in the atmosphere. Do not spray water on pools of liquid chlorosulfonic acid in such cases, as this will increase fume evolution.

CONSEQUENCE

Water runoff may contain chlorosulfonic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid chlorosulfonic acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

CHLOROSULFONIC ACID

Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Chlorosulfonic acid may be contained by building dikes using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained chlorosulfonic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Flammable and potentially explosive hydrogen gas may be evolved in reactions with certain metals.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with absorbent clay, fly ash, cement powder, or other compatible, non-combustible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

CHLOROSULFONIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Flammable and potentially explosive hydrogen gas may be evolved in reactions with certain metals.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

August 1997

CHROMIC ACID SOLUTION

Class 8 (Corrosive Material)

GENERAL INFORMATION

Chromic acid is a dark red or orange, odorless liquid used for chrome plating, the manufacture of inks, paints and other chemicals, process engraving, anodizing and a variety of other purposes. Its percentages for commercial products range from 29% to 60% chromium trioxide. Due to the wide range of percentages, the specific gravity of the solution will change but will always be heavier than water with a low vapor pressure. Also due to the percentage difference, the boiling, melting and freezing points will vary. The boiling point will be higher than water and will increase with higher percentage of chromium trioxide and the melting point will be lower than water and decreased as percentage of chromium trioxide is increased. It is soluble in all proportions with water and may evolve heat. Chromic acid solution has a reported value for pH between 0.2 and 2.0. It is highly corrosive to many metals.

NIOSH lists chromic acid as a potential occupational carcinogen. It is considered hazardous through all routes of entry. Although it is not flammable it contributes to the combustibility of other materials and it can ignite combustible materials due to its powerful oxidizing capability. It is stable although there are numerous incompatible materials. Explosions can occur in contact with reducing agents, acetic acid or anhydrides, acetone, methyl alcohol, phosphorous, potassium, ferricyanide, pyridine and sulfur. Toxic chromium fumes may be emitted if exposed to fire and the decomposing material may form a hot viscous foam. Caution should be used to prevent a steam explosion where water is used to fight fires.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Chromium trioxide anhydrous is soluble in ethanol, ethyl ether, sulfuric and nitric acids.

Specific Gravity: 1.26 for 30% solution; 1.663 for 60% solution.

Vapor Density: Unavailable

Boiling Point: 250°C (482°F)

Melting Point: <-9.4°C (15°F)

Molecular Weight: 118.0

Vapor Pressure: Very low

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Flammable Limits: Not flammable

Stability: Stable

Polymerization Potential: Will not occur

pH: 1.1 in a 1% solution at 25°C (77°F); one source reports 0.2-2.0 for 1% solution

Corrosiveness: Corrosive to steel, iron, copper, bronze, brass, nickel, aluminum, and silver.

Reactivity and Incompatibility: Reacts with heat, acids, phosphorus, arsenic, ammonia, hydrogen sulfide, potassium, sodium selenium, dimethylformamide, alkalis, metals. Avoid contact with oils and greases or any organic or easily oxidizable material. Dangerous ignition hazards occur when contacted with methanol, ethanol, butanol, isobutanol, acetaldehyde, propionaldehyde, butyraldehyde, benzaldehyde, acetic acid, pelargonic acid, ethyl acetate, isopropyl acetate, pentyl acetate, diethyl ether, methyldioxane, dimethyldioxane, acetone and benzylethylaniline. May attack some forms of plastics, rubbers and coatings.

Reactivity with Water: May produce heat.

Other Characteristics: Strong oxidizing agent. Will promote combustion.

IDENTIFICATION

Shipping Name(s): Chromic acid solution (USDOT & IMO)

Synonyms and Tradenames: Chromic (VI) acid; Chromium oxide; Chromium (VI) oxide; Chromium trioxide; Chromium (6+) trioxide; Monochromium oxide; Monochromium trioxide.

CAS Registry No: 1308-14-1

Chemical Formula: H_2CrO_4

Constituent Components (% each): Reports vary from 29% to 60% in water for commercial shipments.

UN/NA Designation: UN1755

IMO Designation: 8

RTECS Number: GB6650000

NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 1 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Dark red or orange solution; one source reports it to be a clear liquid.

Odor Characteristics: Odorless

Reportable Quantity: See appendix I

Common Uses: Wood treating, copper stripping, aluminum anodizing, as a catalyst, refractories, in organic synthesis, photography, metal finishing, plating, leather industries, pigments, and used in many reactions for production or purification of chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHROMIC ACID SOLUTION

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: NIOSH lists chromic acid as a potential occupational carcinogen. It is corrosive to the eyes, skin and respiratory tract. May cause liver damage or be fatal if swallowed, inhaled or absorbed through the skin. Noncombustible, but will accelerate the burning of combustible materials. Powerful oxidizer.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): .001 mgCr(IV)/m^3

Ceiling (C) Limit: .1 mg/m^3

IDLH: 15 mg/m^3 as Cr(IV)

Conditions to Avoid: Contact with incompatible materials, organic materials, heat acids, alkalis, metals, oils, greases or any other easily oxidizable materials. Inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Potential Health Hazards: Routes of exposure are through ingestion, inhalation and eye and skin contact. NIOSH lists chromic acid as a potential occupational carcinogen. It causes severe burns upon contact, kidney failure and, in large enough doses, can cause death.

Hazards of Skin or Eye Contact: Overexposure to the eyes can cause severe burns, conjunctivitis and potential permanent damage. Contact with skin can cause severe burns. If contact is with broken skin there may be formation of firmly marginated “chrome sores”. May, in rare situations, cause allergic contact dermatitis. Dermal absorption of large amounts may lead to kidney failure and death.

Hazards of Inhalation: Inhalation of vapor, mist or liquid may cause burns of the respiratory tract and perforation of the nasal septum. Long term exposure can lead to respiratory cancer.

Hazards of Ingestion: Ingestion can cause severe tissue destruction. May cause liver damage, kidney failure and result in death.

FIRE HAZA5RDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Under fire conditions, decomposing material may form a hot viscous foam.

Hazardous Decomposition Products: At 250°C (482°F) gives off oxygen, and chromic oxide.

EXPLOSION HAZARDS

Explosive Potential: Chromic acid is noncombustible but will accelerate the burning of combustible materials. Under extreme heat it will decompose to chromic oxide and oxygen. Oxygen can then create a high combustion hazard or accelerate combustion.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

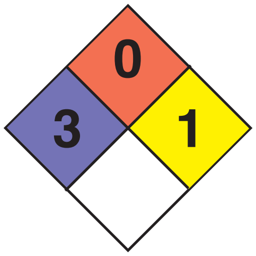
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn. Compatible materials include polyvinyl chloride, nitrile rubber, polyethylene, chlorinated polyethylene and Viton®. Suitable materials for construction are Tyvek® QC and Tychem® SL (longer than 8 hours).

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operation and where airborne concentrations are within the acceptable levels for their use. Protection by air purifying respirators is limited.

1755

CHROMIC ACID SOLUTION

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Contact with eyes can cause severe burns and permanent eye damage. Skin contact can cause severe burns and in cases of large dermal absorption may lead to kidney failure and even death. Inhalation can cause burns to the respiratory tract, perforation of the nasal septum, and may lead to respiratory cancer. Ingestion can cause severe tissue damage, kidney failure, liver damage or death.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. If the patient is conscious, irrigate the nasal passages and mouth with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, flush with large amounts of water. Remove contaminated clothing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large amounts of water or milk if patient is conscious. Do not induce vomiting without seeking medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physicians: Ascorbic acid administered intravenously and locally is reported to be an effective antidote (converting C6 to C3) in preventing renal tubular failure.

FIRE RESPONSE

Extinguishing Agents: Since material will not burn, select appropriate agent for surrounding fire. Chromic acid solution can generate oxygen to accelerate combustion. Water or foam is not recommended since water can cause a steam explosion, especially in a confined area and adding water will not significantly change the pH.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Stop flow if it can be accomplished safely. Use water to protect exposures or prevent containers from failing. Do not flood spill material with water since it does not significantly reduce the pH. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain toxic gases.

SPILL RESPONSES

General Information: Chromic acid is a highly toxic and corrosive liquid that may cause environmental contamination. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Underflow dams are not an effective means to dike material since it mixes with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic and/or corrosive. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Personal protective equipment contaminated with strong chronic acid can self-ignite after it dries, especially if previously contaminated with oil or grease. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the immediate area in all directions if a bulk container of the liquid is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available safe locations to house evacuees.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind if there is a large spill or the material is involved in a fire.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if concentrations exist and when conditions are safe to reenter the area. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted.

TECHNIQUE

MONITOR THE SITUATION . . . Chromic acid solution is not expected to evolve large amounts of hazardous airborne contaminants. Depending on the magnitude of the release, toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low laying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

CHROMIC ACID SOLUTION

Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

CHROMIC ACID SOLUTION
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralization agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

August 1997

CHROMIUM TRIOXIDE, ANHYDROUS

Division 5.1 (Oxidizing Material)

GENERAL INFORMATION

Chromium trioxide is an odorless, dark purplish red crystalline material or powder used for chrome plating, the manufacture of inks, paints and other chemicals, process engraving, anodizing and a variety of other purposes. It is produced by treatment of dichromate (e.g. $Na_2Cr_2O_7$) with sulfuric acid. It is soluble in water and becomes corrosive, acidic and evolves heat. It is also soluble in alcohol, ethanol, ether, ethyl ether and sulfuric and nitric acids. The solid weighs approximately 168.5 lbs/ft^3 and will readily absorb moisture from the air.

NIOSH considers chromium trioxide a potential occupational carcinogen. It is considered hazardous through all routes of entry. Although it is not flammable it contributes to the combustibility of other materials and it can ignite combustible materials due to its powerful oxidizing potential. It can cause severe burns upon contact, kidney failure and, in large enough doses, cause death. It is stable, although it is incompatible with numerous materials. Explosions can occur in contact with reducing agents, acetic acid or anhydrides, acetone, methyl alcohol, phosphorous, potassium, ferricyanide, pyridine and sulfur. Toxic chromium fumes may be emitted if exposed to fire and the decomposing material may form a hot viscous foam. Caution should be used to prevent a steam explosion where water is used to fight fires.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very soluble, 62-63%.

Solubility in Other Chemicals: Soluble in alcohol, ether, ethanol, ethyl ether, sulfuric and nitric acids.

Specific Gravity: 2.70 at 20°C (68°F)

Boiling Point: 250°C (482°F), decomposes.

Melting Point: 197°C (387°F)

Freezing Point: Unavailable

Molecular Weight: 100.00

Vapor Pressure: Negligible

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Flammable Limits: Not flammable

Stability: Stable.

Polymerization Potential: Will not occur.

pH: 1.1 in a 1% solution at 25°C (72°F)

Corrosiveness: Corrosive to steel, iron, copper, bronze, brass, nickel, aluminum, and silver. Also attacks cloth, leather and some plastics, possibly causing spontaneous ignition.

Reactivity and Incompatibility: Reacts with heat, acids, phosphorus, arsenic, ammonia, hydrogen sulfide, potassium, sodium selenium, dimethylformamide, alkalis, metals. Avoid contact with oils and greases or any organic or easily oxidizable material. Dangerous ignition hazards occur when contacted with methanol, ethanol, butanol, isobutanol, acetaldehyde, propionaldehyde, butyraldehyde, benzaldehyde, acetic acid, pelargonic acid, ethyl acetate, isopropyl acetate, pentyl acetate, diethyl ether, methyldioxane, dimethyldioxane, acetone, benzylethylaniline and other substances. May attack some forms of plastics, rubbers and coatings.

Reactivity with Water: Produces heat during formation of H_2CrO_4.

Other Characteristics: Strong oxidizing agent. This product will absorb moisture from the air and form a wet solid or solution.

IDENTIFICATION

Shipping Name(s): Chromium trioxide, anhydrous (USDOT & IMO); Chromic acid, solid (USDOT)

Synonyms and Tradenames: Chromic acid; Chromic (VI) acid; Chromic anhydride; Chromium oxide; Chromium (VI) oxide; Chromium trioxide; Chromium (6+) trioxide; Chromium trioxide, anhydrous; Monochromium oxide; Monochromium trioxide.

CAS Registry No: 1333-82-0

Chemical Formula: CrO_3

Constituent Components (% each): 99 - 100% Chromium trioxide

UN/NA Designation: UN1463 (USDOT & IMO) Chromium trioxide, anhydrous; NA1463 (USDOT) Chromic acid, solid

IMO Designation: 5.1

RTECS Number: GB6650000

NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 1 (Reactivity)

Physical Form as Shipped: Solid

Physical Form as Released: Solid

Color of the Shipped Material: Dark red, bipyramidal prismatic crystals, flakes or granular powder.

Odor Characteristics: Odorless

Reportable Quantity: See appendix I

Common Uses: Wood treating, copper stripping, aluminum anodizing, as a catalyst, refractories, in organic synthesis, photography, metal finishing, plating, leather industries, pigments, and used in many reactions for production or purification of chemicals

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CHROMIUM TRIOXIDE, ANHYDROUS

Division 5.1 (Oxidizing Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: NIOSH lists chromic acid as a potential occupational carcinogen. It is corrosive to the eyes, skin and respiratory tract. May cause liver damage or be fatal if swallowed, inhaled or absorbed through the skin. Noncombustible solid but will accelerate the burning of combustible materials. Powerful oxidizer. Under fire conditions, decomposing material may form a hot viscous foam.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): .001 mgCr(IV)/m^3

Ceiling (C) Limit: .1 mg/m^3

IDLH: 15 mg/m^3 as Cr(IV)

Conditions to Avoid: Contact with incompatible materials, organic materials, heat acids, alkalis, metals, oils, greases or any other easily combustible materials. Inhalation of dust or ingestion.

HEALTH HAZARDS

Potential Health Hazards: Routes of exposure are through ingestion, inhalation and eye and skin contact NIOSH lists chromic acid as a potential occupational carcinogen. It causes severe burns upon contact, kidney failure and, in large enough doses, can cause death.

Hazards of Skin or Eye Contact: Overexposure to the eyes can cause severe burns, conjunctivitis and potential permanent damage. Contact with skin can cause severe burns. If contact is with broken skin there may be formation of firmly marginated “chrome sores”. May, in rare situations, cause allergic contact dermatitis. Dermal absorption of large amounts may lead to kidney failure and death.

Hazards of Inhalation: Inhalation of vapor, mist or dust may cause burns of the respiratory tract and perforation of the nasal septum. Long term exposure can lead to respiratory cancer.

Hazards of Ingestion: Ingestion can cause severe tissue destruction. May cause liver damage, kidney failure and result in death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Decomposing material forms hot viscous foam that may cause steam explosion upon contact with water.

Hazardous Decomposition Products: At 250°C (482°F) gives off oxygen, and chromic oxide.

Hazardous Combustion Products: Decomposes with toxic fumes.

EXPLOSION HAZARDS

Explosive Potential: Chromic acid is noncombustible but will accelerate the burning of combustible materials. Under extreme heat it will decompose to chromic oxide and oxygen. Oxygen can then be a combustion hazard. Contact of water with molten solid may result in steam explosion.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

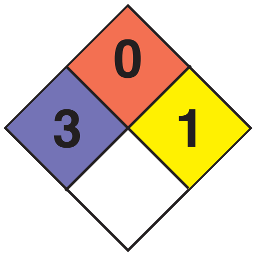
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn. Compatible materials include polyvinyl chloride, nitrile rubber, polyethylene, chlorinated polyethylene and Viton®. Suitable materials for construction are Tyvek® QC and Tychem® SL (longer than 8 hours).

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) with full facepiece is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operation and where airborne concentrations are within the acceptable levels for their use. Protection by air purifying resperator is limited.

1463

CHROMIUM TRIOXIDE, ANHYDROUS

Division 5.1 (Oxidizing Material)



FIRST AID

Nonspecific Symptoms: Contact with eyes can cause severe burns and permanent eye damage. Skin contact can cause severe burns and in cases of large dermal absorption may lead to kidney failure and even death. Inhalation can cause burns to the respiratory tract, perforation of the nasal septum, and may lead to respiratory cancer. Ingestion can cause severe tissue damage, kidney failure, liver damage or death.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. If the patient is conscious, irrigate the nasal passages and mouth with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, flush with large amounts of water. Remove contaminated clothing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large amounts of water or milk if patient is conscious. Do not induce vomiting without seeking medical advice. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physicians: Ascorbic acid administered intravenously and locally is reported to be an effective antidote (converting C6 to C3) in preventing renal tubular failure.

FIRE RESPONSE

Extinguishing Agents: Since material will not burn, select appropriate agent for surrounding fire. Chromic trioxide can generate oxygen to accelerate combustion.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water to protect exposures or prevent containers from failing. Do not flood spill material with water since it does not significantly reduce the pH. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Dike fire control water for proper disposal since it may contain toxic material. Note that under fire conditions, decomposing material may form a viscous foam.

SPILL RESPONSES

General Information: Chromic acid is a highly toxic and corrosive liquid that may cause environmental contamination. Confine and contain runoff. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Underflow dams are not an effective means to dike material since it mixes with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic and/or corrosive. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Personal protective equipment contaminated with strong chronic acid can self-ignite after it dries, especially if previously contaminated with oil or grease. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Usually chromium trioxide will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spill is removed.

CONSEQUENCE

Hazardous levels of chromium trioxide in air may be found in the local spill area and immediately downwind under appropriate conditions.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind to unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover all solid chromium trioxide with a plastic sheet or other compatible materials to prevent airborne dust or contact with water.

CONSEQUENCE

Cover material will be contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to chromium trioxide, dust or mist, in air may reduce airborne concentrations.

CONSEQUENCE

Runoff may contain toxic and corrosive concentrations of material.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where material is likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Protect solid from becoming wet. Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. Runoff may be toxic and corrosive. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

CHROMIUM TRIOXIDE, ANHYDROUS

Division 5.1 (Oxidizing Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

CHROMIUM TRIOXIDE, ANHYDROUS

Division 5.1 (Oxidizing Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralization agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

July, 1994

COAL TAR DISTILLATES*
Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Coal tar distillates refers to a range of hydrocarbon mixtures, derived from the distillation of coal tars, which have a flash point from below 23°C (73°F) and a boiling point above 35°C (95°F). The composition of these mixtures is variable but they will contain a range of aromatic hydrocarbons which include benzene, toluene, xylene, anthracene, acridine, acenapthene, chrysene, naphthalene, biphenyl, and others. Benzene, toluene and xylene (BTX) are obtained at the lower end of the distillation range and anthracene, acridine, and naphthalenes are obtained at the higher end of the range. Generally, products obtained at the lower end (light ends) of the range have a lower flash points, are less dense than water, and lighter in color. In contrast, products obtained at the higher end of the range (heavier ends) are darker brown, have higher flash points, and are heavier than water. Light end distillates have higher vapor pressures and lower boiling points than heavier ends and tend to be dominated by BTX mixtures. Shipments of coal tar distillates will be classified as either flammable or combustible and may be assigned to packing groups II or III. If shipped as combustible, the flash point will be between 38°C (100°F) and 93.3°C (200°F). Flammable liquid shipments assigned to packing group lI will have a flash point less than 23°C (73°F) and a boiling point of greater than 35°C (95°F). Flammable liquid shipments assigned packing group III will have flash points of from 23°C (73°F) to 60.5°c (141°F), and boiling points of greater than 35°C (95°F).

As a complex and variable mixture, the properties of coal tar distillates are variable and can only be expressed in general terms. The solubility of individual constituents is variable but, generally, coal tar distillates are only slightly soluble in water. The specific gravity ranges from slightly greater than that of water to slightly less than water and, as a result, spills in water carry contaminants which may float or sink, with trace contaminants mixing in the water column. Light ends will tend to float and heavier ends will tend to sink but will leave a sheen on the water's surface.

Coal tar distillates are considered toxic by all exposure routes. Skin contact may produce burns. Inhalation of vapors is likely in the immediate vicinity of the spill. Coal tar distillates will likely contain components which are suspected human carcinogens, such as benzene. Coal tar distillates are used for a variety of purposes including solvents, fuels, and feedstocks.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, varying with individual components.
Solubility in Other Chemicals: Soluble in benzene.
Specific Gravity (Liquid): 0.8 - 1.05
Vapor Density (Air=1): Unavailable.
Boiling Point: Variable, above 35°C (95°F).
Melting Point: Unavailable.
Freezing Point: .Unavailable.
Molecular Weight: Mixture.
Heat of Combustion: Greater than - 8880 cal/gm.
Vapor Pressure: Unavailable.
Flash Point: Depends on the mixture 23°C (73°F) or lower to 93.3°C (200°F).
Autoignition Temperature: Unavailable.
Burning Rate: Unavailable.
Stability: Stable, not subject to violent polymerization.
Corrosiveness: Irritant to tissues.
Reactivity with Water: Not reactive with water.
Reactivity with Other Chemicals: Will react with oxidizers, as do most organic materials. May be destructive to some plastics.

IDENTIFICATION

Shipping Names: Coal Tar Distillates.
Synonyms and Tradenames: Coke oven light oil, CAS 65996-78-3, (BTX, coal tar light oil, light oil); solvent naphtha, CAS 65996-79-4 (coal tar naphtha solvent, unwashed solvent naphtha); coal tar oil, CAS 65996-82-9 (intermediate light oil, naphthalene oil).
Chemical Formula: Mixture.
Constituent Components (% each): Variable, benzene, toluene, xylene, and higher molecular weight compounds.
UN/NA Designation: UN1136
IMO Designation: 3.2 or 3.3, flammable liquid.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Light, straw colored to dark brown.
Odor Characteristics: Aromatic, irritating, sulfurous.
Common Uses: Solvent for roofing compounds, additive for tar preparations, solvent for creosote. Solvents in printing operations and chemical feedstocks.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

COAL TAR DISTILLATES

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Xylene, 0.2 - 4 ppm (0.87 - 17.4 mg/m^3)

Unusual Hazards: Coal tar distillates are flammable. Light ends will be more easily ignited than heavier ends depending on the mixture. Vapor densities are heavier than air and, depending on the volatility of the material involved, may flashback from an ignition source.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): Unavailable.

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Hazards primarily from direct contact. Mixtures may contain suspected carcinogens such as benzene. Toxic by all exposure routes including skin absorption. Direct exposures may produce burns to exposed tissues. May de-fat exposed skin. Inhalation exposures may produce central nervous system effects.

Hazards of Skin and Eye Contact: Direct contact with eye tissue will produce varying degrees of irritation including burns. Vapors may produce eye irritation. Skin contact with liquids may produce varying degrees of irritation, including severe burns, depending on the amount and duration of exposure. Components may be absorbed through the skin (eg. benzene, toluene, xylene), de-fatting exposed areas and producing symptoms of dizziness and loss of coordination. In severe exposures, may produce cardiovascular collapse or death.

Hazards of Inhalation: Respiratory irritant. May produce systemic symptoms targeting the central nervous system. Symptoms may include dizziness, loss of coordination, excitation and, in severe exposures, cardiovascular collapse and death.

Hazards of Ingestion: Will likely produce irritation to exposed tissues. Irritation may be severe and bleeding may occur. May produce systemic effects acting on the central nervous system including dizziness, loss of coordination and circulatory collapse. Severe exposures may result in fatality.

FIRE HAZARDS

Lower Flammable Limit: Unavailable. Highly variable.

Upper Flammable Limit: Unavailable. Highly variable.

Behavior in Fire: Light ends are more volatile and may produce vapors which could concentrate in low lying areas or confined spaces. This may represent a potential for explosive ignition. Vapor generation from heavier ends will be lower and vapor concentrations are likely to be of greatest concern in the immediate spill vicinity. Shipments assigned to packing group II will likely present a greater risk of fire since they will have the lower flash points of the coal tar distillates. Packing group III shipments will have higher flash points and will likely present less of an ignition hazard than packing group II material. Coal tar distillates classified as combustible will present the lowest level of fire risk with flash points between 38°C (100°F) and 93.3°C (200°F)

Hazardous Combustion Products: May include a variety of unburned aromatic hydrocarbons, carbon monoxide, carbon dioxide and others. Smoke is irritating and may include toxic constituents.

EXPLOSION HAZARDS

Explosiveness: Light ends may produce vapors which could ignite explosively in confined settings. Containers of light end products may rupture violently if exposed to intense heat in fire situations. Heavier end products are less likely to exhibit this behavior.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully covering or encapsulating suits, made of compatible material are appropriate for most large spill situations. Viton and neoprene have been suggested as suitable materials of construction. Neoprene is attacked but breakthrough times are reported as greater than one hour.

1136

COAL TAR DISTILLATES

Class 3 (Flammable Liquid) or Combustible Liquid

PROTECTIVE CLOTHING AND EQUIPMENT (CONTINUED)

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

FIRST AID

Nonspecific Symptoms: Direct exposures may produce localized irritation to tissue or burns if exposures are severe. Inhalation and ingestion may produce irritation and burns to mucous membranes. Central nervous system effects may develop with severe exposures by inhalation or ingestion.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to progressive signs of respiratory distress. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance.

First Aid for Ingestion: Do not induce vomiting. Provide supportive care and seek medical assistance immediately. The risk of systemic toxicity is high when contaminant is aspirated into lungs. The decision to empty the stomach contents should be made by a physician considering the relative risks from toxicity and the danger from aspiration.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, compatible multi-purpose foam, carbon dioxide, water fog, or dry chemical extinguishing agents. Water as a direct stream may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with coal tar distillates. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water as a direct stream may be ineffective. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam is appropriate for fires involving coal tar distillates.

SPILL RESPONSES

General Information: Coal tar distillates are flammable. The severity of fire threat will depend on the nature of the product involved. Light ends are more volatile and have a lower flash point than the heavier ends. When mixed with water, the lighter ends (BTX) will float on the water surface. Heavier ends will also contain BTX as well as other light ends in the mixture, however, the specific gravity is generally greater than 1 and mixtures will tend to sink in the water column. A sheen will develop on the water's surface when heavier ends are spilled. Trace contaminants may be distributed in the water column. Light ends are likely to distribute more quickly in a spill situation as they are of lower viscosity. Response strategies should account for the fact that flammable vapors, particularly with light ends, are heavier than air and may travel some distance to a source of ignition. Intact containers containing coal tar distillates may rupture violently if exposed to extreme heat or fire. All spill responses should consider that until the product is removed to safe containers, ignition is possible. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of coal tar distillates may result in explosion.

COAL TAR DISTILLATES
Class 3 (Flammable Liquid) or Combustible Liquid

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Lighter ends of coal tar distillates may produce sufficient vapors to expose locally downwind areas to toxic or flammable concentrations over some distances. Increases in spill surface area and temperature will increase vapor release.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Coal tar distillates, particularly heavier ends, may not evolve large amounts of hazardous airborne contaminants. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of coal tar distillate vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

MITIGATION

Remove spilled material as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for flammable vapor concentrations.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog applied to coal tar distillate vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks and may not be necessary where heavier distillate ends are involved.

CONSEQUENCE

Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of coal tar distillate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with coal tar distillates.

COAL TAR DISTILLATES
Class 3 (Flammable Liquid) or Combustible Liquid

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of coal tar distillates on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Material may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to intercept leaking coal tar distillates.

CONSEQUENCE

Distillate mixtures may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Coal tar distillates are flammable and explosion proof (intrinsically safe) equipment must be used.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

MECHANICAL REMOVAL . . . Soils contaminated with coal tar distillates may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines. Explosion proof (intrinsically safe) equipment must be used due to the flammability of the material.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Removed materials may pose a continued risk of fire or contamination.

MITIGATION

Decontaminate all equipment after use, with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

COAL TAR DISTILLATES
Class 3 (Flammable Liquid) or Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . . Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

CONTAINMENT . . . Heavier coal tar fractions are denser than water and will tend to sink to the bottom, depending on the velocity of the water body. Use natural deep water pockets, excavated lagoons, or barriers to trap material on the bottom and limit spread of contamination.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Excavations are difficult and are not 100% effective.

MITIGATION

Monitor downstream users and test for signs of contamination. Excavate as a last resort. Take steps to remove trapped pockets of product as soon as possible.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible materials may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of the lighter coal tar distillate fractions.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating product components.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose a hazard to future users. Fire hazards pose risk to personnel and equipment.

MITIGATION

Decontaminate equipment after use. Store recovered material in a safe and secure location. Use compatible equipment. Eliminate ignition sources.

CRESOL

Divison 6.1 (Poisonous Material)

GENERAL INFORMATION

Cresol, also known as cresylic acid, is typically a mixture of three isomers (o-, m-, and p-cresol) that may be colorless, yellowish, brownish-yellow, or pinkish. The mixture has a sweet tarry odor and is used as a disinfectant, as an ore flotation agent, and for making chemicals, dyes, plastics,antioxidants, explosives, and photographic developing agents. It is somewhatsoluble in water and very slightly heavier, so may be expected to sink(eventually) and dissolve at a slow to moderate rate. Flash points are typically in the range of 175-202°F and indicate that the product must be heated before ignition may occur easily. The product weighs approximately 8.6-8.7 pounds per gallon. The properties and hazards of the individual isomers are very similar, so this guide pertains to these isomers singly as well as in combination.

Cresol does not react with water or many other common materials and is stable in normal transportation. It is a highly toxic substance and is very corrosive to bodily tissues. Products of combustion are also considered highly toxic.

If the material is on fire or involved in fire, toxic combution products may be formed; downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. If the material is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equiped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Somewhat soluble, 1.9-2.5 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, carbon tetrachloride, ether, glycol, and dilute alkalis.

Specific Gravity (Liquid): 1.03-1.07 at 68°F (20°C)

Boiling Point: 375.7-396°F (191-202.2°C) at 1 atm.

Melting Point: 52.7-94.6°F (11.5-34.8°C)

Freezing Point: 52.7-94.6°F (11.5-34.8°C)

Molecular Weight: 108.15

Heat of Combustion: –8180 to –8190 cal/g

Vapor Pressure: 0.1080-0.2453 mm Hg (0.002-0.005 psia) at 77°F (25°C)

Flash Point: 175-202°F (79.4-94.4°C)

Autoignition Temperature: 1038-1110°F (559-599°C)

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Not considered corrosive to usual materials of construction.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with strong oxidizers.

IDENTIFICATION

Shipping Names: Cresol (USDOT), cresols (IMO), cresylic acid (IMO).

Synonyms and Tradenames: Methyl phenol; cresylic acid; oxytoluene; hydroxytoluene; m-cresol; o-cresol; p-cresol; 1-hydroxy-3-methylbenzene;1-hydroxy-2-methylbenzene; 1-hydroxy-6-methylbenzene; cresole; kresol; tekresol; tricresol.

Chemical Formula: $CH_3CH_6H_4OH$

Constituent Components (% each): Various grades of mixtures and pure isomers. Impurities may include phenol and/or xylenols and may alter some properties.

UN/NA Designation: UN2076 (cresols); UN2022 (cresylic acid)

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid (may solidify)

Color of the Shipped Material: Colorless, yellowish, brownish yellow, or pinkish.

Odor Characteristics: Sweet, tarry

Common Uses: Disinfectant; ore flotation agent; mfg. chemicals, dyes, plastics, antioxidants, explosives, and photographic developing agents.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CRESOL
Divison 6.1 (Poisonous Material)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.68 ppb-68 ppm; reported values vary

Unusual Hazards: Highly toxic; corrosive to bodily tissues; rapidly absorbed through the skin.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): (Skin) 5 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to high vapor concentrations in air that may occur in the local spill area and immediately downwind. Ingestion and direct contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with liquid cresols may cause wrinkling, white discoloration, softening, and possibly gangrene of the skin; a burning and prickling sensation starts after a few minutes of contact and is followed by numbness. Absorption through the skin may occur and death may result from extensive exposures. Skin rashes may result from lesser exposures.Contact with the eyes may cause extensive damage and possible loss of vision.

Hazards of Inhalation: Vapors of cresol are irritating to the eyes, nose, and throat. High concentrations in air may cause headache, dizziness, dimness of vision, ringing of the ears, rapid breathing, weak pulse, profound weakness, mental confusion, and sometimes death. Effects may develop within 20-30 minutes in acute exposures. Chronic exposures may result in damage to the liver and kidneys, vomiting, diarrhea, loss of appetite, difficulty in swallowing, headache, salivation, fainting, dizziness, mental disturbance, pulmonary edema, and possibly death.

Hazards of Ingestion: Systemic effects of ingestion are similar to the effects of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 1.06-1.35% at approx. 300°F (150°C)

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite. There is some very limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: Considered highly toxic.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of hot liquid are ignited in a confined area. There is some very limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots,gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high smoke or fume concentrations in air. Compatible materials may include natural rubber, neoprene, chlorinated polyethylene, and Saranex.

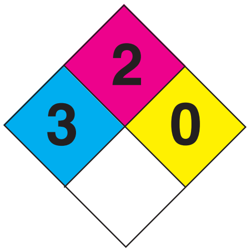
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 ppm), a self-contained breathing apparatus (SCBA) with full face piece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (250 ppm or less) or an organic vapor cartridge respirator with a full face piece (250 ppm or less) within the use limitations of these devices. These latter devices should also be fitted with a dust and mist filter.

2076

CRESOL

Divison 6.1 (Poisonous Material)

See UN/NA Designation for
other ID numbers.



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources where necessary. Protect sewers and waterways from contaminated runoff. Notify proper authorities, down stream sewer and water treatment operations, and other down stream users of potentially contaminated water. Note that intake of cresol may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that cresol is highly toxic by all routes of exposure including absorption through the skin. It is not very volatile, however, and may fully or partially solidify when spilled.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Cresol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of cresol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to cresol vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water run off may contain a small amount (if any) of cresol from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose run off or rain water that may add to spill volume and overfill impoundments.

CRESOL
Divison 6.1 (Poisonous Material)

TECHNIQUE

FOAM ... There is a possibility that firefighting foam applied to the surface of pools may slow the release of cresol vapors into the atmosphere.(Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Cresol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained cresol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread ofcontamination. Be alert to conditions such as fire hose runoff or rain water that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for ground water contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where ground water contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Cool temperatures may cause cresol to solidify and plug equipment.

MITIGATION

Use compatible equipment. Monitor or control temperature of product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

CRESOL
Divison 6.1 (Poisonous Material)

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT ... Spilled product will eventually sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING ... Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

CRESOL
Divison 6.1 (Poisonous Material)

TECHNIQUE

ADSORPTION ... Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 2000

CROTONALDEHYDE, STABILIZED

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Crotonaldehyde is a flammable, highly toxic, colorless to pale yellow or straw colored liquid with a pungent, suffocating, tar-like odor that quickly brings tears to the eyes. It is used for a variety of purposes, is quite soluble in water, and will dissolve rapidly. The lowest reported flash point for the pure material of 45ºF indicates the product is easily ignited under a wide range of ambient temperature conditions. Vapors which evolve from warm crotonaldehyde may be heavier than air and may travel some distance to a source of ignition and flash back at any temperature above the flash point. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is a possibility that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 7.1 pounds per gallon.

Crotonaldehyde handled in commerce typically contains some amount of water that stabilizes and inhibits the product from violent self-polymerization upon exposure to excessive heat or fire conditions, which may result in violent rupture of closed containers. Authorities appear to disagree, however, on the degree of protection afforded by mixture with water. Many claim that self-polymerization remains a possibility upon excessive heating while others specify that polymerization will not occur. Due to the uncertainty involved, this guide generally assumes that violent polymerization is indeed possible upon sufficient exposure to heat and may result in violent rupture of closed containers.

Crotonaldehyde does not react with water or many other common materials. It is generally stable in normal transportation but readily resinifies to a dimer when pure and slowly oxidizes to crotonic acid. May also react with oxygen in air to form potentially explosive peroxides after a time. Besides excessive heat, violent polymerization may also be initiated by contact with various alkaline materials or acids and the product is also incompatible with strong oxidizing and reducing agents. Toxicity hazards of the product are considerable by all routes of exposure and primarily derive from the highly irritating nature of the substance. Products of combustion may include toxic and irritating constituents.

If crotonaldehyde is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: 5.5 or 18.1g/100g water at 68ºF (20ºC); reported values vary.

Solubility in Other Chemicals: Soluble with alcohol, ether, benzene, acetone, toluene, kerosene, gasoline, or solvent naphtha.

Specific Gravity (Liquid): 0.85 at 68ºF (20ºC)

Vapor Density: 2.41

Boiling Point: 210 - 221ºF (99 - 105ºC) at 1 atm.

Melting Point: -105.7 to -101.2ºF (-76.5 to -74ºC)

Freezing Point: See melting point

Molecular Weight: 70.09

Heat of Combustion: -7760 cal/g

Evaporation Rate (butyl acetate=1): 2.7

Vapor Pressure: 30 - 32 mmHg (0.58-0.62 psia) at 68ºF (20ºC)

Flash Point: Approximately 55ºF (12.8ºC) closed cup and 127.4ºF (53ºC) open cup for 93% solution; about 45ºF (7.2ºC) closed cup and 55ºF (12.8ºC) open cup for anhydrous product; reported values not well defined.

Autoignition Temperature: 320ºF (161ºC), 405ºF (207ºC), or 450ºF (405ºC); reported values vary.

Burning Rate: 3.3 mm/minute

Flammable Limits: 2.1% (LEL) - 15.5% (UEL)

Stability: Generally stable in normal transportation but readily resinifies to a dimer when pure and slowly oxidizes to crotonic acid.

Polymerization Potential: Violent polymerization occurs in contact with alkaline materials like caustics, ammonia, or amines or with acids. May polymerize at elevated temperatures as in fire conditions.

Corrosiveness: Relatively noncorrosive. Compatible with aluminum or stainless steel. May attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Readily converted by oxygen (even in air) to hazardous and potentially explosive peroxides and to acids. Also incompatible with strong oxidizing and reducing agents and butadiene.

IDENTIFICATION

Shipping Name(s): Crotonaldehyde, stabilized (USDOT & IMO)

Synonyms and Tradenames: 2-Butenal; Crotonic aldehyde; Crotonal; beta-Methyl acrolein; Propylene aldehyde; 1,2-Ethanediol, dipropanoate; Ethylene glycol, dipropionate; Ethylene dipropionate; Ethylene propionate.

CAS Registry No.: 4170-30-3

Chemical Formula: $CH_3CHCHCHO$

Constituent Components (% each): Commercial crotonaldehyde is the trans isomer of this substance; usually 93% pure with remainder as water acting as stabilizer, but other concentrations may also be shipped.

UN/NA Designation: UN1143

IMO Designation: 6.1, Toxic substances

RTECS Number: GP9499000

NFPA 704 Hazard Rating: 4(Health): 3(Flammability): 2(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless; turns to pale yellow in light and air.

Odor Characteristics: Pungent; suffocating; penetrating; like tar.

Reportable Quantity: See appendix I.

Common Uses: Solvent; insecticides; tear gas; leather tanning; denaturant; purification of lube oils; mfg. rubber accelerators and other chemicals; warning agent in fuel gases.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CROTONALDEHYDE, STABILIZED

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.035-0.2 ppm; reported values vary.

Unusual Hazards: Relatively volatile flammable liquid with vapors that are highly toxic at low concentrations in air. There is potential for the product to violently self-polymerize when heated or in the presence of alkaline materials or acids.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 2 ppm (6 mg/m^3)

Ceiling (C) Limit: 0.3 ppm (ACGIH)

IDLH: 50 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact. Avoid allowing the product to evaporate to near dryness.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid crotonaldehyde may cause severe irritation or burns and possibly result in absorption of toxic amounts of this product through the skin if the exposure is excessive. Even high concentrations of vapors in air can cause a burning skin irritation. Contact of the liquid with eyes has the potential to cause severe injury and burns. Eye discomfort and irritation with tearing becomes considerable at vapor concentrations of 45 ppm in air in a few seconds.

Hazards of Inhalation: Vapors of crotonaldehyde are irritating to the nose and throat and may cause coughing, difficult breathing, chest pain, nausea, vomiting, pulmonary edema (which may be delayed in onset), and possibly death. Exposure to only 4 ppm in air can cause upper respiratory irritation and tearing of the eyes in 10 minutes. Rats did not survive exposure to 1650 ppm in air for 10 minutes in laboratory experiments and exhibited respiratory distress, an excitatory stage, and terminal convulsions.

Hazards of Ingestion: Ingestion of crotonaldehyde may cause gastrointestinal distress and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 2.1-2.15% or 2.9-2.95%; reported values vary.

Upper Flammable Limit: 15.5% or 19.5%; reported values vary.

Behavior in Fire: Exposure of containers to fire or heat may result in violent polymerization and possible container rupture. Will generate large quantities of flammable gas or vapor upon release. Vapors may be heavier than air at warmer temperatures and may travel some distance to a source of ignition and flash back.

Hazardous Combustion Products: Not well defined but considered highly irritating and toxic and may contain carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Excessive heat may cause spontaneous polymerization resulting in violent container rupture. Violent polymerization may also occur in presence of certain alkaline materials and acids.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

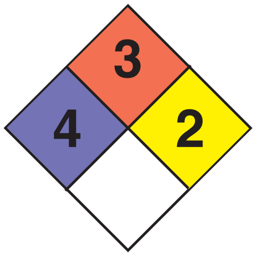
Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas tight safety goggles, and other impervious and resistant clothing. Butyl rubber is reported to provide more than 8 hours of protection, while Teflon® is reported to provide more than 4 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases according to some authorities to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece (100 ppm or less) within the use limitations of these devices.

1143

CROTONALDEHYDE, STABILIZED

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues, excessive tears in the eyes, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Authorities disagree on whether or not vomiting should be induced, probably due to the possibility that aspiration into the lungs during vomiting may lead to pulmonary edema or other injury. Seek immediate medical advice on this issue where possible.)

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, alcohol resistant foam (or possibly regular foam). Water may be ineffective for extinguishment but may be effective for cooling.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Take the relative volatility, flammability, and toxicity of crotonaldehyde into account when planning the response. (Note: In some rare spills, there may be time to apply oil spill containment and cleanup techniques to crotonaldehye floating on water before the chemical dissolves. This guide presumes that dissolution in water will be rapid.) Note that there is potential for the product to polymerize under a variety of conditions. The product should not be allowed to evaporate to near dryness.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

CROTONALDEHYDE, STABILIZED
Division 6.1 (Poisonous Materials)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to crotonaldehyde vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of crotonaldehyde from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL RESISTANT FOAM . . . There is a possibility that alcohol resistant foam applied to the surface of liquid pools may slow the release of crotonaldehyde vapors into the atmosphere. The fact that alcohol resistant foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid crotonaldehyde may slow the release of vapors into the atmosphere. (Note: All of the crotonaldehyde must be dissolved in water.)

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Crotonaldehyde may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined crotonaldehyde may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

CROTONALDEHYDE, STABILIZED

Division 6.1 (Poisonous Materials)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

CROTONALDEHYDE, STABILIZED

Division 6.1 (Poisonous Materials)

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

CYANOGEN
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Cyanogen is shipped as a colorless flammable liquefied compressed gas having an almond-like odor that is acrid and pungent at dangerous levels in air. Once used as a military poison gas, it is now used as a fumigant, in rocket propellants, for welding and cutting metals, and for making other chemicals. Being slightly soluble in water and lighter, and having a low boiling point, it will boil rapidly from the surface of a water body with limited dissolution. Cyanogen gas or vapor is heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.2 pounds per gallon as a liquid when at ambient temperature in a container and close to 8 pounds per gallon at its boiling point.

Cyanogen is stable in normal transportation, does not react with many common materials, and gradually decomposes when dissolved in water. It is reactive with fluorine and oxidizing agents that may cause its ignition, however, may form explosive mixtures with liquid oxygen, and may produce highly toxic fumes in contact with acids. Toxicity of the product must be considered very high by all routes of exposure since it readily causes cyanide poisoning. Products of combustion are also highly toxic and may include nitrogen oxides and cyanides.

If cyanogen is leaking (not on fire), downwind evacuation of the immediate spill area and downwind should be considered. If a fire becomes uncontrollable or a bulk container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently. Note that cylinders may also rupture violently and rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Somewhat soluble; 450 cc gas/100 ml water at 64.4 – 68°F (18 – 20°C).

Solubility in Other Chemicals: Somewhat soluble in alcohol and ether.

Specfic Gravity (Liquid): 0.954 at boiling point; 0.866 at 62.6°F (17°C)

BoilingPoint: – 6.2 to – 4.9°F (– 21.2 to – 20.5°C) at 1 atm.

Melting Point: –18.2°F (– 27.9°C) or – 29.9°F (– 34.4°C); reported values vary.

Freeing Point: See melting point

Molecular Weight: 52.0

Heat of Combustion: – 5033 cal/g

Vapor Pressure: 5.09 atm (74.8 psia) at 70°F (21.1°C)

Flash Point: Flammable gas

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable in normal transportation. High temperatures cause polymerization to insoluble paracyanogens (CN)/*x in apparently nonviolent reaction.

Corrosiveness: Data unavailable, but considered noncorrosive when dry by at least one authority.

Reactivity with Water: Some authorities state the solution gradually decomposes into ammonium oxalate and formate, hydrogen cyanide and urea, while also forming brown amorphous azulmic acid precipitate. Others say cyanogen is slowly hydrolyzed to oxalic acid and ammonia.

Reactivity with Other Chemicals: Reacts with fluorine gas to form white flame. Liquid cyanogen produces explosive mixture with liquid oxygen. Contact with acids or acid fumes may produce highly toxic fumes of nitrogen oxides and cyanides. Incompatible with oxidizing agents.

IDENTIFICATION

Shipping Names: Cyanogen (USDOT and IMO)

Synonyms and Tradenames: Ethanedinitrile; dicyan; oxalonitrile; oxalic acid dinitrile; carbon nitride; dicyanogen; nitriloacetonitrile; oxalyl cyanide; pursside.

Chemical Formula: NCCN

Constituent Components (% each): 98.5% or more pure

UN/NA Designation: UN1026

IMO Designation: 2.3, poison gas

Physical State As Shipped:Liquefied compressed gas

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Like almonds; acrid and pungent at lethal levels in air.

Common Uses: Organic synthesis; former military poison gas; welding and cutting metals; fumigant; rocket propellant.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

CYANOGEN

Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable; odor is not detectable at 250 ppm in air but 16 ppm causes eye and nose irritation in 6 – 8 minutes.

Unusual Hazards: Highly toxic and flammable liquefied compressed gas. Vapors are heavier-than-air and may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact with very cold liquid, gas, or containers.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in the spill area and over considerable distances downwind. All exposures should be strictly avoided.

Hazards of Skin or Eye Contact: Specific data are unavailable but liquid cyanogen is likely to cause frostbite and possibly burns in contact with the skin or eyes. Concentrations of 16 ppm in air are irritating to the eyes and nose in 6 – 8 minutes.

Hazards of Inhalation: Cyanogen interferes with the ability of the blood to carry oxygen via cyanide poisoning. Moderate exposures may result in irritation of the upper respiratory system, headache, dizziness, drowsiness, incoordination, giddiness, confusion, constriction in the chest, rapid breathing, weak rapid pulse, and tremors. High concentrations may rapidly cause convulsions, unconsciousness, and death. A concentration of 350 ppm was lethal to 50% of rats within one hour in laboratory experiments; 2600 ppm was fatal to mice in 12 minutes while 2000 ppm killed cats in 13 minutes.

Hazards of Ingestion: Ingestion of cyanogen is unlikely but the product must be considered highly toxic by this route of exposure. Symptoms are likely to resemble those of poisoning by inhalation.

FIRE HAZARDS

Lower Flammable Limit (LFL): 6.0% or 6.6%; reported values vary.

Upper Flammable Limit (UFL): Most authorities give 32%; a few give 42.6%.

Behavior in Fire: Flammable liquefied compressed gas. Will generate large quantities of flammable and toxic gas upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Burns with pink flame having a bluish or purple tinged border.

Hazardous Combustion Products: Highly toxic, may include nitrogen oxides, cyanides, and unburned cyanogen.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact of liquid cyanogen with liquid oxygen may result in the formation of an explosive mixture.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with liquid cyanogen, cold gas streams, or cold containers of the product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1026

CYANOGEN
Division 2.3 (Poison Gas)

FIRST AID

Nonspecifc Symptoms: Headache, dizziness, drowsiness, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.) If available and necessary, administer amyl nitrile pearl in cloth one inch from mouth and nostrils for 15 seconds. Repeat 5 times at 15-second intervals. Use fresh pearl as necessary every 5 minutes when there is no response until 3 – 4 have been used. Person giving first aid should avoid inhalation of amyl nitrite vapors to avoid possible dizziness.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Stop flow if possible or else allow fire to burn out while cooling surroundings with water spray. Carbon dioxide, dry chemical, or water spray may be used for extinguishment when reignition is no longer possible.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all lines and equipment. Take the highly toxic, flammable, and volatile nature of cyanogen into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Cyanogen spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CYANOGEN
Division 2.3 (Poison Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to cyanogen vapors may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid cyanogen as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of cyanogen from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of cyanogen vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if initial increased vapor evolution may affect downwind populations. Consult qualified experts where necessary.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid cyanogen or contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

CYANOGEN
Division 2.3 (Poison Gas)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines. Note that cyanogen can persist in soil as cyanide.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Although most liquid cyanogen will boil from the surface of the water body (unless the release is below the surface), there is a potential for hazardous amounts to dissolve in water bodies with critical uses.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe. Consult qualified experts for advice.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

CYANOGEN
Division 2.3 (Poison Gas)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

CYANOGEN CHLORIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Cyanogen chloride is a nonflammable liquefied compressed gas that is heavier than air and has a sharp, acrid, choking, pungent odor resembling bitter almonds. It is used for treating metals and their ores, for making synthetic rubber and other chemicals, as a military poison gas, and as a warning agent in fumigant gases. Being slightly soluble and heavier than water, and having a boiling point of 54.5 – 56.8°F, it may be expected to boil or vaporize rapidly from a water body with limited dissolution. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 9.9 pounds per gallon at room temperatures.

Cyanogen chloride is considered stable in normal transportation but at least one authority suggests the possibility of a hazardous polymerization reaction taking place under conditions that are not clearly specified. Other potential reactions are discussed below, but be aware that available data on this topic are extremely limited. Cyanogen chloride is not corrosive to ordinary metals when dry, but becomes corrosive in the presence of moisture. Toxicity of the product is extremely high by all routes of exposure. Involvement in fire may evolve unburned product, toxic oxides of nitrogen, and various toxic chlorides and cyanides.

Downwind evacuation should be considered if cyanogen chloride is leaking until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 2500 cc gas in 100 g water at 68°F (20°C); approximately 30,000 ppm.

Solubility in Other Chemicals: Soluble in alcohol, ether, and other organic solvents to various degrees.

Specific Gravity (Liquid): 1.186 at 68°F (20°C)

Boiling Point: 54.5 – 56.8°F (12.5 –13.8°C) at 1 atm.

Melting Point: 19.6 to 21.2°F (– 6.9 to – 6°C)

Freezing Point: See melting point

Molecular Weight: 61.47

Heat of Combustion: Not flammable

Vapor Pressure: 2.34 atm (34.4 psia) at 70°F (21.1°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable in normal transportation. One authority states that hazardous polymerization may occur if the product is not stabilized or is thermally decomposed. This is not supported by any of the many other references reviewed except (somewhat) by one that states that polymers tend to form upon storage.

Corrosiveness: Not corrosive to ordinary metals when dry. Corrosive in presence of moisture, in which case monel, tantalum, or glass or glass- lined equipment may be used.

Reactivity with Water: Very slow reaction which produces hydrogen cyanide.

Reactivity with Other Chemicals: Tanks containing cyanogen chloride and chlorine and moisture have exploded due to formation of NCl_3. Additional data unavailable. Contact with acids may evolve toxic fumes (possibly containing oxides of nitrogen and cyanides).

IDENTIFICATION

Shipping Names: Cyanogen chloride, stabilized (USDOT and IMO)

Synonyms and Tradenames: Chlorine cyanide; chlorocyanogen; chlorcyan; chlorocyan; chlorocyanide.

Chemical Formula: CNCl

Constituent Components (% each): 97 mole % or more pure; may contain 5% tetrasodium pyrophosphate as stabilizer; may contain small amounts of hydrogen cyanide and hydrogen chloride.

UN/NA Designation: UN1589

IMO Designation: 2.3, poison gas

Physical State As Shipped: Liquefied compressed gas

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Pungent; like bitter almonds; sharp; acrid; choking

Common Uses: Chemical synthesis; military poison gas; warning agent in fumigant gases; metal cleaner; in ore cleaning; making synthetic rubber.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

CYANOGEN CHLORIDE

Division 2.3 (Poison Gas)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at 1 ppm

Unusual Hazards: Highly toxic liquefied compressed gas. Vapors are heavier than air and may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.3 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and over considerable downwind distances. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with liquid cyanogen chloride may result in severe irritation or severe burns of the skin and eyes.

Hazards of Inhalation: Vapors of cyanogen chloride are highly irritating to the eyes, throat, and respiratory tract. Cyanogen chloride exposures interfere with the ability of the blood to carry oxygen via cyanide poisoning. Moderate exposures may result in headache, dizziness, drowsiness, weakness, hoarseness, vomiting, nausea, disorientation, rapid pulse and breathing, hemorrhagic exudate of the bronchi and trachea, and pulmonary edema (which may be delayed in onset). Severe exposures may cause rapid collapse, unconsciousness, convulsions, and death. Exposure to 159 ppm in air for 10 minutes or 48 ppm for 30 minutes may be fatal to humans.

Hazards of Ingestion: Cyanogen chloride is extremely toxic by ingestion. Symptoms and effects of poisoning are similar to those for inhalation. Burns of the mouth, throat, and stomach are also a possibility.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Nonflammable liquefied compressed gas. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of highly toxic gas or vapor upon release.

Hazardous Combustion Products: Involvement in fire may evolve unburned cyanogen chloride, toxic oxides of nitrogen, and various toxic chlorides and cyanides.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Containers may rupture violently in fire due to over-pressurization. Contact with chlorine and moisture in tanks may result in explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with cyanogen chloride. This may include rubber boots, gloves, face shields, splash-proof and gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self- contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include chlorinated polyethylene.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1589

CYANOGEN CHLORIDE
Division 2.3 (Poison Gas)

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; headache, dizziness, drowsiness, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.) If available and necessary, administer amyl nitrite pearl in cloth one inch from mouth and nostrils for 15 seconds. Repeat 5 times at 15-second intervals. Use fresh pearl as necessary every 5 minutes when there is no response until 3 – 4 have been used. Person giving first aid should avoid inhalation of amyl nitrite vapors to avoid possible dizziness.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire. Cyanogen chloride is not itself flammable.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of warm water to standing pools of liquid cyanogen chloride may increase vapor evolution. The boiling point of the product is in the 50 degree Fahrenheit range.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment according to one authority. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile and toxic nature of cyanogen chloride into account when planning the response. Note that vapors and gases are heavier than air and may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Cyanogen chloride spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CYANOGEN CHLORIDE
Division 2.3 (Poison Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to cyanogen chloride vapors or fumes may accelerate their dispersal in the atmosphere. If water is warm, apply it at a point downwind and do not allow it to contact pools of liquid cyanogen chloride as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of cyanogen chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that application of an appropriate firefighting foam to the surface of liquid pools may slow the release of cyanogen chloride vapors into the atmosphere. Use the coldest water available to generate the foam.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Cyanogen chloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained cyanogen chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

CYANOGEN CHLORIDE
Division 2.3 (Poison Gas)

TECHNIQUE

ABSORPTION . . . Some authorities suggest that spreading of liquid cyanogen chloride may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances. Note that the high volatility of cyanogen chloride indicates this response is of limited value in warm and even cool weather.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert. Use alternative technique if volatility of the product precludes effective use of sorbents.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines. (Note: Most residues will evaporate rapidly in many spill situations.)

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Although most liquid cyanogen chloride will rapidly boil or evaporate from the surface of the water body, even low concentrations dissolved in water may be hazardous.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

CYANOGEN CHLORIDE
Division 2.3 (Poison Gas)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniaues where air emissions may pose a downwind hazard.

September 2006

CYCLOHEXANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Cyclohexane is a fairly volatile clear, colorless liquid hydrocarbon with a mild, sweet, solvent odor resembling benzene or chloroform. It is used as a solvent, in paint removers, and for making nylon and other chemicals. Essentially insoluble in water and lighter, the product will form a floating surface slick. Its flash point of 0°F indicates that it can be easily ignited under virtually all ambient temperature conditions. Vapors are somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.5 pounds per gallon.

Cyclohexane does not react with water or many other common materials and is stable in normal transportation. It is incompatible with oxidizing materials, however, and may attack some plastics, rubber and coatings. Toxicity by all routes of exposure is generally low to moderate. Products of combustion may include toxic constituents.

If cyclohexane is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble, less than 0.01 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, methanol, alcohol, benzene, carbon tetrachloride, ether and ligroin.
Specific Gravity (Liquid): 0.779 at 68°F (20°C)
Vapor Density: 2.9
Boiling Point: 177.3°F (80.7°C) at 1 atm.
Melting Point: 43.8°F (6.6°C)
Freezing Point: 43.8°F (6.6°C)
Molecular Weight: 84.16
Heat of Combustion: –10380 cal/g
Evaporation Rate (butyl acetate=1): ~ 6
Vapor Pressure: 78 – 95 mmHg at 68°F (20°C)
Flash Point: 0°F (–18°C), closed cup
Autoignition Temperature: 473 – 518°F (245 – 270°C)
Burning Rate: 6.9 mm/minute
Flammable (Explosive) Limits: 1.3% (LEL) – 8% (UEL)
Stability: Stable
Polymerization Potential: Will not occur
pH: Not applicable
Corrosiveness: Noncorrosive to usual metals but may attack some plastics, rubber and coatings.
Reactivity with Water: No reaction
Reactivity and Incompatibility: May react with strong oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates. If cyclohexane is heated and mixed with liquid nitrogen dioxide, an explosion occurs.

IDENTIFICATION

Shipping Names: Cyclohexane (USDOT & IMO)
Synonyms and Tradenames: Hexahydrobenzene; Hexamethylene; Hexanaphthene; Benzene hexahydride.
CAS Registry No.: 110-82-7
Chemical Formula: $CH_2(CH_2)_4CH_2$
Constituent Components(% each): 85–99.9% pure, may contain 0.1% or so benzene
UN/NA Designation: UN1145
IMO Designation: 3, flammable liquids
RTECS Number: GU6300000
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Instability)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Mild, sweet, pungent, solvent odor; like benzene or chloroform
Reportable Quantity: See Appendix I
Common Uses: Solvent for cellulose ethers, fats, oils, rubber, lacquer, paint thinners and other substances; mfg. of perfumes, nylon, and organic chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

CYCLOHEXANE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** 25 – 300 ppm

Unusual Hazards: Moderately volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back. Vapors may persist for a time in pits, hollows and depressions. Flowing product may be ignited by self-generated static electricity.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 300 ppm (1050 mg/m^3) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 1300 ppm (10% LEL)

Conditions to Avoid: Heat, fire, and sparks; contact with oxidizing materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air as may be found in the spill area and in downwind locations. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid cyclohexane may cause drying and cracking of the skin due to the defatting action of the product. Splashes of liquid into the eyes may result in irritation.

Hazards of Inhalation: May cause mild irritation of the eyes and upper respiratory tract. High concentrations in air may cause narcosis and central nervous system depression with symptoms including excitement, loss of equilibrium, stupor, dizziness, nausea, vomiting, coma and occasionally death as a result of respiratory failure.

Hazards of Ingestion: May cause mouth and throat irritation, nausea, vomiting, headache, intoxication. Similar to symptoms of central nervous system depression. Aspiration into the lungs during vomiting may result in chemical pneumonitis with possibly severe consequences.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 1.3%

Upper Flammable (Explosive) Limit: 8%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Carbon dioxide, carbon monoxide, irritating aldehydes and ketones and possibly others.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

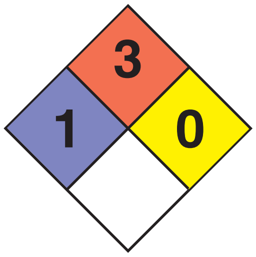
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: nitrile rubber (gloves, suits, boots); Viton®; Tychem® (BR; LV; Responder®; Responder® CSM; TK; F; Reflector®; ThermoPro); Nitri Solve 727® gloves; Viton 890® gloves, Viton 892® gloves, 4H® and Silver Shield® brand gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Teflon®; Polyvinyl alcohol (gloves). The following materials are ***not*** recommended for use: butyl rubbber, natural rubber, neoprene, polyethylene and polyvinyl chloride.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1300 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 1300 ppm): any supplied-air respirator operated in a continuous-flow mode (eye protection needed); any powered air-purifying respirator with organic vapor cartridge(s) (eye protection needed); any air-purifying full-facepiece respirator equipped with organic vapor cartridge(s); any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece.

1145

CYCLOHEXANE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, respiratory tract, or skin; symptoms of central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 15 minutes. Get medical attention immediately if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, foam or water fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Cyclohexane may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable vapors. Note that cyclohexane has a flash point of 0°F.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of cyclohexane may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that cyclohexane is a relatively volatile and flammable liquid that floats on water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

CYCLOHEXANE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Cyclohexane may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly if small amounts have spilled or in cold weather.

CONSEQUENCE

Hazardous levels of cyclohexane in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to cyclohexane vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain cyclohexane from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of cyclohexane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

CYCLOHEXANE

Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . . Cyclohexane may be contained by building dikes or barriers using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained cyclohexane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

CYCLOHEXANE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating cyclohexane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with cyclohexane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

August 1996

CYCLOHEXANONE*

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Cyclohexanone is an irritating, white to pale yellow oily liquid with a peppermint or acetone-like odor. It is used as a solvent for cellulose acetate, nitrocellulose, waxes, fat, vinyl resins, crude rubber, natural resins, shellac, and DDT. Cyclohexanone is also used as a metal degreasing solvent for lacquers, resins, and insecticides, and PVC polymers and copolymers. Over 96% of the cyclohexanone produced is oxidized to adipic acid. Commercial uses include spot remover and degreaser for leather. Cyclohexanone is produced from the catalytic oxidation of cyclohexane. Cyclohexanone is irritating to the eyes, skin and upper respiratory tract. Evidence suggests that skin permeation can occur in amounts capable of producing systemic toxicity. The most common routes of exposure are through inhalation and skin contact. It may be poisonous if inhaled or absorbed through the skin for prolonged periods.

Although the fire potential for cyclohexanone is moderate, heating can release ignitable vapors, which can form explosive mixtures with air. The material is generally stable, however it may form explosive peroxides on exposure to air. When heated to decomposition, the burning material may generate carbon monoxide. Vapors are heavier than air and may settle in low lying areas. Vapors may travel considerable distances to an ignition source and flash back. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for working in atmospheres where Cyclohexanone is present. Runoff from fire control may be flammable and/or toxic. Cyclohexanone is slightly water soluble. This material is incompatible with strong oxidizers and acids such as nitric acid. Empty containers containing product residue may be hazardous and proper safety precautions should be followed.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble (4.8 wt. % @ 30°C [86°F])
Solubility in Other Chemicals: Acetone, ethyl ether, alcohol, ethanol and other common organic solvents.
Specific Gravity (Liquid): 0.95 @ 4°C (39°F)
Vapor Density (Air=1): 3.4
Boiling Point: 156°C (313°F)
Melting Point: -16°C (2°F)
Freezing Point: -31°C (-23°F)
Molecular Weight: 98.14
Heat of Combustion: -15,430 BTU/LB. (-8,570 CAL/G.)
Evaporation Rate: 0.29 (Butyl Acetate = 1)
Vapor Pressure: 2 mm Hg at 20°C (68°F)
Flash Point: 44°C (111°F)
Autoignition Temperature: 420°C (788°F)
Flammable Limits: 1.1% (LEL) - 9.4% (UEL)
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with strong oxidizing agents such as nitric acid, and strong bases.
Other Characteristics: Decomposes with heat and produces carbon monoxide.

IDENTIFICATION

Shipping Name(s): Cyclohexanone (USDOT & IMO)
Synonyms and Tradenames: Anone, Cyclohexyl Ketone, Pimelic Ketone, Ketohexamethylene, Hytrol O, Hexanon, Pimelin Ketone, Sextone, Anon, and Nadone. CAS Registry No: 108-94-1
Chemical Formula: $C_6H_{10}O$
Molecular Formula: $C_6H_{10}O$
UN/NA Designation: UN1915
IMO Designation: 3.3
RTECS Number: NIOSH/GW1050000
OHMTADS Number: Unavailable.
NFPA 704 Hazard Rating: 1 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Water-white to pale yellow
Odor Characteristics: Peppermint or acetone-like odor
Common Uses: Product is used as a solvent for waxes, vinyl resins, crude rubber, natural resins, and shellac. It is also used as a metal degreasing solvent for lacquers, resins, and insecticides, and PVC polymers and copolymers. Commercial uses include spot remover and degreaser for leather.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

*Reportable Quantity (RQ) established. Refer to appendix I.

CYCLOHEXANONE

Class 3 (Flammable Liquid) or
Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.12-0.24 ppm

Unusual Hazards: Material will defat skin and cause transient corneal injury, central nervous system (CNS) depression. In high concentrations, it may cause death.

Time Weighted Average (TLV-TWA): 25 ppm

Short Term Exposure Limit (STEL): Unavailable.

IDLH: 5000 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong oxidizers, acids and bases.

HEALTH HAZARDS

Potential Health Effects: Cyclohexanone is irritating to the eyes, skin, nose and throat. It may be poisonous if inhaled or absorbed through the skin. Vapors may cause dizziness or suffocation. Skin contact with the liquid may cause defatting of the skin. Evidence suggests that skin permeation can occur in amounts capable of producing systemic toxicity. Excessive exposures may cause temporary central nervous system depression with anesthetic effects such as dizziness, drowsiness, fatigue, nausea, headache, respiratory failure, confusion, loss of coordination and loss of consciousness. Individuals with pre-existing conditions of the central nervous system or lungs may have increased susceptibility to the toxicity of excessive exposures.

Hazards of Skin Contact: Skin contact may cause skin irritation with rash, redness, burns, dermatitis, and swelling. Prolonged exposures may lead to skin burns, blistering and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, swelling, tearing, chemical conjunctivitis, or blurred vision. Prolonged eye contact may result in reversible corneal injury. Blindness can occur in some cases.

Inhalation Hazards: Inhalation may cause respiratory tract irritation, coughing, discomfort, dyspnea, and pulmonary edema. Prolonged exposures can produce central nervous system (CNS) effects such as narcosis, nausea, headache, dizziness, tremors, confusion, and fatigue.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, vomiting and abdominal pain.

FIRE HAZARDS

Lower Flammable Limit: 1.1%

Upper Flammable Limit: 9.4%

Behavior in Fire: Although cyclohexanone will not readily ignite, it will burn if exposed to sources of heat and flame. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff from fire control or dilution water may be flammable and/or toxic and cause environmental contamination.

Hazardous Decomposition Products: When heated to decomposition, material releases carbon monoxide and other irritating gases.

EXPLOSION HAZARDS

Explosive Potential: Slight to moderate in vapor form. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

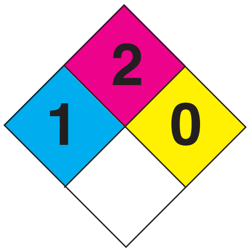
Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are butyl rubber and polyvinyl chloride (PVC). Structural firefighting protective clothing will provide a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits. Protection provided by air purifying respirators is limited.

1915

CYCLOHEXANONE

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Skin contact with the liquid may cause redness, swelling, burning, dermatitis, and defatting of the skin. Excessive exposures may cause temporary central nervous system depression with anesthetic effects such as narcosis, dizziness, drowsiness, fatigue, nausea, tremors, headache, respiratory failure, confusion, loss of coordination and loss of consciousness. Prolonged eye contact may result in chemical conjunctivitis and reversible corneal injury. Inhalation may cause irritation to the upper respiratory passages, with coughing and discomfort, and pulmonary edema.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and DO NOT INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog), or alcohol-resistant foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be flammable and/or toxic.

SPILL RESPONSES

General Information: Cyclohexanone may cause environmental contamination. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Non-sparking tools and explosion-proof equipment are recommended to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, storm drains and waterways. Underflow dams are not an effective means to dike material since it mixes with water. As a result, recovery efforts from water borne releases are difficult. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing.
Maintain respiratory protection throughout the decontamination process.

CYCLOHEXANONE

Class 3 (Flammable Liquid) or Combustible Liquid

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, storm drains and waterways.

TECHNIQUE

MONITOR THE SITUATION...Due to its moderate vapor pressure, and tendency for vapors to hug the ground and accumulate in low lying and enclosed areas, the highest concentrations of material will usually be located at ground level. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and down wind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, storm drains, and waterways.

TECHNIQUE

FOAM...Firefighting foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, storm drains and waterways. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

CYCLOHEXANONE

Class 3 (Flammable Liquid) or Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, Cyclohexanone would be slowly lost by volatilization. Cyclohexanone is readily biodegradable, and therefore, would be expected to biodegrade in natural waters. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material readily mixes with water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms are not an effective means to recover spilled material since the material is water soluble. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material is water soluble and the material does not float on the surface of the water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

CYCLOHEXANONE

Class 3 (Flammable Liquid) or Combustible Liquid

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...Cyclohexanone is estimated to be mobile in soil. In view of its moderate vapor pressure and low adsorption to soil, it would be expected to volatize from surface soil. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering sewers, waterways, or storm drains. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded to prevent the discharge of static electricity.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations.

January 1990

CYCLOPENTANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Cyclopentane is a clear, colorless, volatile, and flammable liquid hydrocarbon with a mild and sweet odor resembling gasoline. It is used as a solvent, motor fuel component, azeotropic distillation agent, and raw material and intermediate for making a variety of organic chemicals. Practically insoluble in water and lighter, cyclopentane will form a floating surface slick that will evaporate at an appreciable rate. Its flash point of – 35°F indicates that cyclopentane is easily ignited under all ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in ,pits, hollows, and depressions, particularly in warm weather. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.2 pounds per gallon.

Cyclopentane does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong oxidizing agents, however, and may attack some forms of plastics, rubber, and coatings. Toxicity by all routes of exposure is generally low, but the volatility of the product indicates that high concentrations of cyclopentane vapors may be found in air. Products of combustion may include toxic constituents.

If cyclopentane is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; specific data are unavailable but it is likely that only very small amounts will dissolve in water.

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and other hydrocarbon solvents.

Specific Gravity (Liquid): 0.745–0.746 at 68°F (20°C)

Boiling Point: 120.6 –120.7°F (49.2 – 49.3°C) at 1 atm.

Melting Point: –137.9 to –135.9°F (– 94.4 to – 93.3°C)

Freezing Point: See melting point

Molecular Weight: 70.14

Heat of Combustion: –11,110 cal/g

Vapor Pressure: Approx. 274 mm Hg (5.3 psia) at 68°F (20°C); 400 mm Hg (7.73 psia) at 87.8°F (31°C)

Flash Point: –35°F (–37.2°C), closed cup

Autoignition Temperature: 682–716°F (361–380°C)

Burning Rate: 7.9 mm/minute

Stability: Stable

Corrosiveness: Noncorrosive to usual metals but may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react or ignite in contact with strong oxidizing agents or materials.

IDENTIFICATION

Shipping Names: Cyclopentane (USDOT and IMO)

Synonyms and Tradenames: Pentamethylene

Chemical Formula: $(CH_2)_5$ (ring structure)

Constituent Components (% each): Various grades are 60% or more cyclopentane with remainder consisting of n-hexane, n-pentane, methylcyclopentane, 2,2dimethylbutane, and other hydrocarbons with similar boiling points. Highly impure products may have somewhat different physical properties than those given here for the relatively pure substance.

49 STCC: 49 081 35

UN/NA Designation: UN1146

IMO Designation: 3.1, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Mild; sweet; like gasoline

Common Uses: Solvent; motor fuel component; azeotropic distillation agent; raw material and intermediate for making a variety of organic chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

CYCLOPETANE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly volatile and flammable liquid with heavier than air vapors that may persist in pits, hollows, and depressions at times.

Short Term Exposure Limits (STEL). **Unavailable**

Time Weighted Average (TLV-TWA): 600 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided. There is a possibility that cyclopentane is a weak sensitizer of the heart to epinephrine.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid cyclopentane may result in drying and cracking of the skin as well as moderate irritation due to the defatting action of the product and possibly redness and blistering. Contact of liquid cyclopentane with the eyes may cause slight irritation with some pain, inflammation of the iris and mucous membranes, redness, and tearing. Do not wear contact lenses when working with cyclopentane.

Hazards of Inhalation: Exposure to high levels of cyclopentane vapors in air may cause eye, nose, and respiratory tract irritation. Inhalation of very high concentrations in air may cause narcosis and central nervous system depression with symptoms including dizziness, drowsiness, disorientation, headache, excitation, incoordination, stupor, nausea, vomiting, difficult breathing, respiratory and cardiac effects, loss of equilibrium, unconsciousness, coma, and possibly death in severe cases. The margin between onset of narcosis and death is very narrow and may be nonexistent based on animal experiments. A concentration of about 38,300 ppm of cyclopentane in air has been reported to be lethal to mice without the duration of exposure being recorded. For purposes on comparison, note that exposure to 18,000 ppm of cyclopropane in air for 39 minutes is lethal to mice; 26,600 ppm of cyclohexane is lethal to rabbits after 60 minute exposures in laboratory experiments.

Hazards of Ingestion: Ingestion of cyclopentane may cause gastrointestinal irritation. Severe diarrhea and vascular collapse resulting in heart, lung, liver, and brain degeneration have been reported upon oral administration of alicyclic hydrocarbons such as cyclopentane to animals. Effects may also include depression of the central nervous system with symptoms resembling those of inhalation. Aspiration of cyclopentane into the lungs during vomiting may cause pulmonary edema and chemical pneumonitis with potentially severe consequences. Based on the effects of similar substances, it is possible that pulmonary edema may be delayed in onset.

FIRE HAZARDS

Lower Flammable Limit: 1.1% or 1.5%; reported values vary

Upper Flammable Limit: 8.7%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined; reported to produce acrid smoke and fumes, carbon monoxide, carbon dioxide, and various hydrocarbons which may be toxic.

EXPLOSION HAZARDS

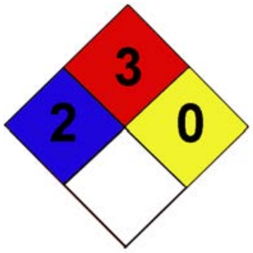
Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. There is some known potential for unconfined vapor clouds of very similar substances (primarily cyclohexane) to explode if ignited.

1146

CYCLOPETANE
Class 3 (Flammable Liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Clothing materials that may be compatible for cyclohexane include nitrile rubber, neoprene, Viton, chlorinated polyethylene, and Teflon. Some of these may also be suitable for use with the very similar cyclopentane.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 600 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; symptoms of narcosis and central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for **Ingestion:** Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, Halon, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of cyclopentane may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that cyclopentane is a highly volatile and flammable liquid that may evaporate rapidly and has heavier than air vapors.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Cyclopentane spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

CYCLOPETANE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to cyclopentane vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of cyclopentane from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of cyclopentane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Cyclopentane may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained cyclopentane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, vermiculite, perlite, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

CYCLOPETANE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL.

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Although cyclopentane will evaporate fairly rapidly from water surfaces, time or cold weather conditions may permit application of the oil spill containment and cleanup measures described below in some but not all cases. Only small amounts of cyclopentane, if any, can be expected to dissolve in water.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 – 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

CYCLOPETANE
Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating cyclopentane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with cyclopentane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: This and the following potential spill responses should be considered only where critical water resources have been impacted and it is desired to remove all traces of the spilled product. Consult qualified experts for advice where necessary.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

DENATURED ALCOHOL

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Denatured alcohol is a flammable, colorless liquid with a slightly pungent odor like alcohol. It is primarily ethyl alcohol (reportedly 80-95%) containing additives of 1 to 2 percent each to prevent its use as a beverage. These additives can cause it to have a subsidiary hazard of poison and thus the reason for the two identification numbers, NA1987 having the greater toxicity hazard. It has several uses but is used extensively as a solvent in the manufacture of varnishes and perfumes. It is soluble in water. Its flash point of 55ºF indicates that the product is easily ignited under a wide range of ambient temperature conditions. Accumulations of vapor from warmed liquid in confined spaces such as buildings or sewers may result in explosions if ignited. Denatured alcohol vapors are heavier than air and may travel considerable distances to a source of ignition and flash back. The product weighs approximately 6.8 pounds per gallon.

Denatured alcohol does not react with water or many other common materials and is stable in normal transportation. It is incompatible with strong acid and oxidizing materials. The primary routes of exposure are through inhalation and ingestion. The products of combustion may include carbon monoxide and carbon dioxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Complete

Solubility in Other Chemicals: Soluble in other alcohols.

Specific Gravity (Liquid): 0.8175

Vapor Density: 1.6

Boiling Point: 173ºF (78ºC)

Melting Point: -173ºF (-114ºC)

Freezing Point: Unavailable

Molecular Weight: 46.07

Heat of Combustion: Unavailable

Evaporation Rate (butyl acetate=1): 1.6, 2.7 and 3.3 are all reported values.

Vapor Pressure: 43 mmHg

Flash Point: 55°F (13ºC)

Autoignition Temperature: 793ºF (422°C)

Burning Rate: Unavailable

Flammable Limits: 3.3% (LEL) - 19% (UEL)

Stability: Stable

Polymerization Potential: Will not occur.

pH: Unavailable

Corrosiveness: Unavailable, most likely non-corrosive.

Reactivity with Water: No reaction.

Reactivity and Incompatibility: Avoid contact with strong acids and strong oxidizers such as nitric acid, hydrogen peroxide, acetyl chloride, potassium dioxide, bromine pentafluoride, acetyl bromide, acetyl chloride, platinum and sodium. Product can decompose at elevated temperatures. Reacts slowly with calcium hypochlorite, silver oxide and ammonia, causing fire and explosion hazard.

IDENTIFICATION

Shipping Name(s): Denatured alcohol (USDOT); Ethanol or Ethanol solutions (IMO)

Synonyms and Tradenames: Ethyl alcohol; Alcohol; Cologne spirit; Ethanol; EtOH; Grain alcohol.

CAS Registry No.: 64-17-5

Chemical Formula: C_2H_5OH or CH_3CH_2OH

Constituent Components (% each): Varies, generally close to 80-95% pure.

UN/NA Designation: NA1986 or NA1987 (USDOT); UN1170 (IMO)

IMO Designation: 3.2 or 3.3, Flammable liquids

RTECS Number: KQ6300000

NFPA 704 Hazard Rating: 0(Health): 3(Flammability): 0(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless, clear

Odor Characteristics: Slightly pungent odor like alcohol.

Reportable Quantity: See appendix I.

Common Uses: Ethanol is used extensively as a solvent in the manufacture of varnishes and perfumes; as a preservative for biological specimens; in the preparation of essences and flavorings; in many medicines and drugs; as a disinfectant and in tinctures (e.g., tincture of iodine); laboratory reagant and as a fuel and gasoline additive.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

DENATURED ALCOHOL

Class 3 (Flammable Liquid) or
Combustible Liquid

or

* 1986 or 1987

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 100-180 ppm (recognition), reports vary widely.

Unusual Hazards: None

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1000 ppm (1900 mg/m^3) (for ethyl alcohol)

Ceiling (C) Limit: Unavailable

IDLH: 3300 ppm or 10% LEL (for ethyl alcohol)

Conditions to Avoid: Heat, fire, and sparks, contact with incompatible materials, runoff to sewers or water bodies, inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Health hazards are generally low unless combined with other harmful products.

Hazards of Skin or Eye Contact: Essentially non-irritating to skin, however, prolonged or repeated skin contact may cause drying, cracking and irritation of the skin. Contact with the eyes may cause irritation.

Hazards of Inhalation: Prolonged exposure to high vapor concentrations in air may cause drowsiness and irritation of the eyes, respiratory tract and lungs.

Hazards of Ingestion: Ingestion toxicity considered to be low, may include dizziness, headache and drowsiness.

FIRE HAZARDS

Lower Flammable Limit: 3.4%

Upper Flammable Limit: 19%

Behavior in Fire: Flammable liquid. Material is flammable and will very likely ignite if exposed to sources of heat. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Vapors may cause a flash fire or ignite explosively. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers exposed to prolonged heat and flame may violently rupture.

Hazardous Combustion Products: Products of decomposition products may include carbon monoxide and carbon dioxide.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Explosions may result if vapors of warm liquid are ignited in a confined area. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas where vapors can accumulate and present an explosive hazard. Containers exposed to prolonged heat and flame may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

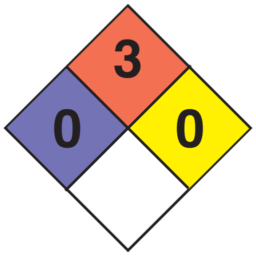
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge may suffice.

1986

1987

DENATURED ALCOHOL

Class 3 (Flammable Liquid) or Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention if symptoms persist. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Get medical attention if symptoms persist. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek medical assistance if symptoms persist. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Reports vary on whether or not to induce vomiting. Seek medical advice by a physician on whether or not to inducing vomiting. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Use dry chemical, alcohol type concentrate foam, carbon dioxide, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of denatured alcohol may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

DENATURED ALCOHOL

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to denatured alcohol vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

ALCOHOL TYPE CONCENTRATE FOAM . . . Alcohol type concentrate foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material has a high potential for mobility in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

DENATURED ALCOHOL
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

This page may be used for notes.

March 1995

DIBORANE
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Diborane is a colorless and highly flammable compressed or liquefied gas with a foul, musty, sickly sweet odor that is repulsive and nauseating. It is primarily used in making plastics, rubber, rocket propellants, electronic semiconductors, and other chemicals. The product has a flash point of – 90°F or below, may ignite spontaneously in moist air at temperatures of 100 – 125°F when pure, and may ignite at even lower temperatures when contaminated with other substances. Due to its instability, pure diborane is often handled in cylinders shipped in dry ice and or diluted with other gases. Diborane gas is heavier than air when cold and in any case may travel a considerable distance to a source of ignition and flash back if it does not self-ignite first. Accumulations of gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 3.5 pounds per gallon at its boiling point and only 1.5 pounds per gallon at 63°F or so.

Diborane slowly decomposes at room temperature producing higher boranes, other boron hydrides, and flammable and potentially explosive hydrogen gas. Very high temperatures produce hydrogen and boron. Reactions with water quickly produce hydrogen and boric acid while producing heat, and reactions with a variety of other chemicals may result in explosions or otherwise violent reactions. Toxicity of the product is extremely high by inhalation. Products of combustion are also considered toxic.

Downwind evacuation should be considered if diborane is leaking (not on fire) until properly-equipped responders have evaluated the hazard. If a fire becomes uncontrollable or a bulk container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the containers should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.

Solubility in Other Chemicals: Soluble in carbon disulfide, ammonium hydroxide, and concentrated sulfuric acid.

Specific Gravity (Liquid): 0.18 at 62.6°F (17°C); 0.42 at boiling point.

Boiling Point: –135 to –134.5°F (– 92.8 to – 92.5°C) at 1 atm.

Melting Point: – 265.9 to – 264.8°F (–165.5 to –164.9°C)

Freezing Point: See melting point

Molecular Weight: 27.7

Heat of Combustion: Unavailable

Vapor Pressure: 39.52 atm (580.55 psia) at 62.1°F (16.7°C), this being the critical point.

Flash Point: – 90°F (– 67.8°C) or below; reported values vary.

Autoignition Temperature: Ignites spontaneously in moist air at 100 –125°F (38 – 52°C); at lower temperatures if contaminated.

Burning Rate: Unavailable

Stability: Decomposes slowly under normal transportation conditions. May ignite spontaneously in moist air at room temperature. Decomposes at red heat to boron and hydrogen; to hydrogen, higher boranes, and other boron hydrides at lower temperatures. Some decompositions may be violent.

Corrosiveness: Compatible with most metals. May attack some forms of plastics, rubber, coatings, greases, and lubricants.

Reactivity with Water: Decomposes rapidly in water to form hydrogen and boric acid while generating heat.

Reactivity with Other Chemicals: Reacts slowly with bromine and explosively with chlorine to form boron halides. Reacts violently with halogenated hydrocarbons (including extinguishing agents) and oxidizing materials. Reacts to form spontaneously ignitable mixtures with aluminum, lithium, fuming nitric acid, or phosphorus trifluoride. May explode on contact with carbon tetrachloride while burning, in contact with nitrogen trifluoride at low temperatures, or in contact with oxygen. Reacts with many oxidized surfaces.

IDENTIFICATION

Shipping Names: Diborane, compressed (USDOT & IMO); diborane mixtures (USDOT)

Synonyms and Tradenames: Boroethane; diboron hexahydride; diborane (6); boron hydride.

Chemical Formula: B_2H_6

Constituent Components (% each): 95% or more pure; may also be shipped with diluent gas like hydrogen, argon, nitrogen, or helium to retard decomposition and otherwise reduce hazards.

UN/NA Designation: UN1911

IMO Designation: 2.3, poison gas

Physical State As Shipped: Liquefied compressed gas or compressed gas

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless gas

Odor Characteristics: Repulsive; sickly sweet; nauseating; pungent; musty; foul

Common Uses: Polymerization catalyst; rubber vulcanizer; reducing agent; in rocket propellants; doping agent for electronic semiconductors; in making other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

DIBORANE

Poison Gas
(Division 2.3)

Square background
applicable to rail cars.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Recognized at 3.3 ppm in air but quickly deadens sense of smell.

Unusual Hazards: Extremely toxic, reactive, flammable, potentially explosive, and volatile substance with many unusual characteristics. Gases may be heavier than air when cold. May ignite spontaneously in air.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.1 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard by far is from inhalation of the dangerous levels of diborane that may be present in air in the spill and over considerable distances downwind. Direct contact with liquid diborane is also to be strictly avoided.

Hazards of Skin or Eye Contact: Diborane gas has no significant effect on the skin or mucous membranes but high concentrations in air may irritate the eyes. One authority reports that contact with the liquid may cause local inflammation, blisters, redness, and swelling. Due to the low temperatures involved, frostbite must also be deemed possible. Do not wear contact lenses when working with this material.

Hazards of Inhalation: Low concentrations in air may cause tightness in the chest, cough, difficult breathing, chest pain, headache, dizziness, chills, possible fever, weakness, fatigue, and possible tremors. Higher levels may cause lung hemorrhage, possible damage to the liver and kidneys, and pulmonary edema which may be delayed in onset and have severe consequences. Concentrations of 29 and 50 ppm in air were respectively fatal to 50% of mice and rats in 4 hours in laboratory experiments. One manufacturer reports that 159 molar ppm is fatal to 50% of humans in 15 minutes.

Hazards of Ingestion: Due to its low boiling point and high reactivity, diborane itself is unlikely to be ingested.

FIRE HAZARDS

Lower Flammable Limit (LFL): 0.8% or 0.9%; reported values vary.

Upper Flammable Limit (UFL): 88% or 98%; reported values vary.

Behavior in Fire: Flammable compressed gas or liquefied compressed gas will generate large quantities of flammable and toxic gas upon release. Gas is heavier than air when cold and in any case may travel a considerable distance to a source of ignition and flash back or explode. Containers may rupture violently in fire.

Hazardous Combustion Products: Toxic; may include boric acid, boron oxides, other boron hydrides, and higher boranes.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. May also explode when mixed rapidly with air; mixtures of 2 – 25% detonate when sparked; 10% mixture gives most violent detonation. Some products of decomposition, such as tetraborane, may be shock sensitive, as may diborane itself to some extent. Contact or mixture of diborane with certain other chemicals may result in an explosion. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection as necessary from direct contact with liquid diborane, cold gas streams, or cold containers of the product. This may include rubber boots, gloves, face shields, splash- proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high gas or fume concentrations in air during fires according to one authority.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 0.1 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1911

DIBORANE
Poison Gas
(Division 2.3)

FIRST AID

Nonspecifc Symptoms: Headache, weakness, difficult breathing, dizziness, fatigue, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention as necessary. Do not use hot water or rub affected bodily tissues if frostbite has occurred.

FIRE RESPONSE

Extinguishing Materials: Stop flow of diborane or else let fire burn while cooling container and surroundings with water spray or fog. Do not use halogenated agents (halons) under any circumstances.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit where necessary if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that diborane reacts with water to form hydrogen gas and boric acid.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water containing boric acid. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground and electrically bond piping and equipment. Note that design of piping and equipment for undiluted diborane is highly specialized and requires experienced professionals. Take the extremely toxic, flammable, reactive, and potentially explosive nature of diborane into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Diborane discharges may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large amounts are involved.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

DIBORANE
Poison Gas
(Division 2.3)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to diborane gas or decomposition products in air may accelerate their dispersal in the atmosphere. Apply water with caution, keeping in mind that diborane reacts with water to form flammable hydrogen gas and boric acid, but that this reaction may actually have benefits at times in reducing overall hazards and is not described as being violent by any authority.

CONSEQUENCE

Water runoff may contain boric acid and other chemicals from contact with airborne gases and fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquids containing diborane reaction or decomposition products may be contained by building dikes using soil, sand or other materials where necessary. Note that the boric acid that remains after reaction of diborane with water may be toxic to some plant life but is not otherwise a significant hazardous material. Decisions on containment and treatment or recovery must be made on a case by case basis. Seek advice from qualified experts. Note that any liquid diborane spilled will rapidly vaporize but may also be temporarily contained where necessry to prevent spread of contamination.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain contaminated liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment compatible with the spilled product and of proper pressure capacity.

DIBORANE
Poison Gas
(Division 2.3)

TECHNIQUE

ABSORPTION . . . Spreading of contaminated liquids may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify contaminated liquids to less hazardous substances.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residues may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable gases or vapors in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination where necessary due to the presence of boric acid or other contaminants in the water. Seek advice from qualified experts.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

DIBORANE
Poison Gas
(Division 2.3)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Cation exchangers may also be effective.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

DI-n-BUTYLAMINE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Di-n-butylamine is colorless, corrosive, combustible liquid with a fishy odor resembling ammonia. It is used for making a variety of products such as corrosion inhibitors, pharmaceuticals, inks, paper, leather, photographic chemicals, plasticizers, fuel and lubricant additives, dyes, and insecticides, among others. Only slightly soluble in water and lighter, it can be expected to form a surface slick that dissolves at a relatively slow rate. Its lowest reported flash point considered to be accurate is 117°F and indicates that high ambient temperature conditions or some degree of heating is necessary before the product can be ignited easily. Accumulations of vapor from warmed liquid in confined spaces such as buildings or sewers may explode if ignited. There is some limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.3 – 6.4 pounds per gallon.

Di-n-butylamine does not react with water and is stable in normal transportation. It is known to be incompatible with acids and oxidizing agents, and as an aliphatic amine, is likely to be reactive with a variety of other chemical substances. Corrosive to some metals, the product may also attack some types of plastics, rubber and coatings, and is also highly corrosive to all bodily tissues. Products of combustion include toxic constituents.

If di-n-butylamine is leaking (not on fire), downwind evacuation should be considered on a case-by-case basis until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.47 g/100 g water or 3100 mg/l at 68°F (20°C); reported values vary somewhat.
Solubility in Other Chemicals: Soluble in most common organic solvents including alcohol, acetone, ether, benzene, and other hydrocarbons.
Specific Gravity (Liquid): 0.759 – 0.768 at 68°F (20°C)
Boiling Point: 318.2 –320°F (159 –160°C) at 1 atm.
Melting Point: –79.6 to – 74.2°F (– 62 to – 59°C)
Freezing Point: See melting point
Molecular Weight: 129.25
Heat of Combustion: – 10,440 cal/g
Vapor Pressure: 2 mm Hg (0.0387 psia) at 68°F (20°C)
Flash Point: 117–125°F (47.2 – 51.7°C), closed cup; 125 – 135°F (51.7 – 57.2°C), open cup
Autoignition Temperature: Unavailable
Burning Rate: 5.84 mm/minute
Stability: Stable
Corrosiveness: May corrode some metals and attack some forms of plastics, rubber, and coatings. Store in carbon or stainless steel, cast iron, aluminum, phenolic-lined steel, nickel, or tinned iron. Zinc, galvanized steel, copper, or copper alloys are not generally satisfactory for amines.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Specifically reported to be incompatible with acids and oxidizing agents. Amines in general are also often reactive with aldehydes, halogenated organics, isocyanates, elemental alkali metals, peroxides, epoxides, strong reducing agents, and possibly dithiocarbamates. Similar compounds are incompatible with mercury, nitrous oxide, and nitrites.

IDENTIFICATION

Shipping Names: Di-(n-butyl)amine (USDOT and IMO)
Synonyms and Tradenames: Dibutylamine; n-dibutylamine; n-butyl – 1-butanamine
Chemical Formula: $(CH_3CH_2CH_2CH_2)_2NH$
Constituent Components (% each): Relatively pure with possibly small amounts of n-butylamine, n-butylidenebutylamine, n-butanol, and/or tri-n-butylamine
UN/NA Designation: UN2248
IMO: Designation: 8, Corrosive
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Like ammonia or amine; fishy
Common Uses: Mfg. of corrosion inhibitors, emulsifiers, rubber accelerators, pharmaceuticals, inks, paper, leather, photographic chemicals, plasticizers, fuel and lubricant additives, dyes, insecticides, flotation agents, curing agents, and other products. Inhibitor for butadiene.

DI-n-BUTYLAMINE

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.48 ppm for 100% odor recognition; may be perceived as low as 0.08 ppm

Unusual Hazards: Corrosive and combustible liquid of comparatively low volatility.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and over some distance downwind. Direct physical contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Skin contact with liquid di-n-butylamine may cause severe irritation and/or blisters and chemical burns. There is an unconfirmed possibility of allergic skin sensitization. Contact of liquid di-n-butylamine with the eyes may result in severe damage resulting in blindness.

Hazards of Inhalation: Vapors of di-n-butylamine are irritating to the eyes, nose, throat, and lungs. High levels in air may cause headache, dizziness, faintness, anxiety, coughing, difficult breathing, and the possibility of delayed pulmonary edema or chemical pneumonitis with possibly severe consequences. Exposure to 500 ppm in air for four hours was lethal to 100% of rats in laboratory experiments, while 250 ppm proved non-lethal. (Note: The saturated vapor concentration of di-n-butylamine in air at 68°F is approximately 2630 ppm.)

Hazards of Ingestion: Ingestion may cause irritation and burning of the mouth and stomach, nausea, and vomiting. There may be potential for aspiration into the lungs during vomiting to result in delayed pulmonary edema and chemical pneumonitis with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 1.1%.

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but may be somewhat difficult to ignite unless warmed. There is some limited possibility that containers may rupture violently in fire.

Hazardous Combustion Products: Carbon dioxide, carbon monoxide, various hydrocarbons, and highly toxic oxides of nitrogen.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from warm liquid are ignited in a confined area. There is some limited possibility that containers may rupture violently in fire.

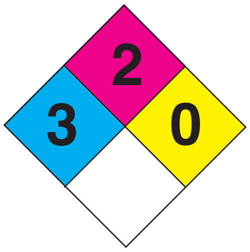
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases to prevent contact with high vapor or fume concentrations that may occur in air under fire conditions. Compatible materials may include polyvinyl alcohol and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For relatively low concentrations, a gas mask with chin-style or front or back mounted canister providing protection against di-n-butylamine or a chemical cartridge respirator with a full facepiece providing protection against di-n-butylamine within the use limitations of these devices.

2248

DI-n-BUTYLAMINE
Class 8 (Corrosive Material)



FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues; headache, dizziness, coughing, nausea, difficult breathing, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective. (Note: Authorities are divided as to whether alcohol or standard foam should be used. It is likely that both types are suitable to some degree.)

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit where necessary if contact with material or dense fumes/smoke is anticipated under fire conditions. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other down stream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that di-n-butylamine is highly corrosive to bodily tissues. Although considered a combustible liquid, its flash point is not much above high ambient temperatures that may be encountered in some spill situations.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Di-n-butylamine spills may expose downwind areas to toxic or irritating concentrations over considerable distances in some cases, particularly if large quantities have spilled under high ambient temperature conditions.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Di-n-butylamine may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills under low to moderate ambient temperature conditions.

CONSEQUENCE

Hazardous levels of di-n-butylamine in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

DI-n-BUTYLAMINE
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to di-n-butylamine vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of di-n-butylamine from contact with its air borne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and over fill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of di-n-butylamine vapors into the atmosphere. (Note: Authorities are divided as to whether alcohol or standard foam should be used. It is likely that both types are suitable to some degree.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Di-n-butylamine may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained di-n-butylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, perlite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

DI-n-BUTYLAMINE
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area under high temperature conditions may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Di-n-butylamine will float on water while dissolving at a relatively slow rate to form an alkaline solution.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 – 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

DI-n-BUTYLAMINE
Corrosive

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams or small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating di-n-butylamine.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location.

TECHNIQUE

ABSORPTION . . . Commercial sorbent materials compatible with di-n-butylamine may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause over flow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

October 1993

o-DICHLOROBENZENE
Division 6.1(Poisonous Material)

GENERAL INFORMATION

o-Dichlorobenzene is a colorless to pale yellow liquid with an odor that is variably described as mild, pleasant, disagreeable, pungent, aromatic, and possibly resembling mothballs. It is practically insoluble in water and heavier, so may be expected to sink to the bottom of a body of water and dissolve at a very slow rate. The substance must be preheated before it can be easily ignited. Vapors evolved from liquid o-dichlorobenzene heated above its flash point may travel to a source of ignition and flash back. Similarly, accumulations of such vapors may explode if ignited in confined spaces such as buildings or sewers. The product weighs approximately 10.9 pounds per gallon.

o-Dichlorobenzene does not react with water and is stable in normal transportation. The material is generally considered to be non-corrosive to metals, but it can react with aluminum (see below), and possibly other active metals such as zinc or magnesium, and may attack various forms of plastics, rubber, and coatings. There is an increased risk of vigorous reaction, fire and/or explosion in the presence of strong oxidizing agents and o-dichlorobenzene is otherwise reactive with strong acids and a variety of other chemical substances. Toxicity of the substance is generally low to moderate by direct contact and ingestion but quite high via inhalation. Products of combustion or thermal decomposition may include irritating, corrosive, and/or toxic substances such as hydrogen chloride, hydrochloric acid, chlorine, chlorocarbons, carbon monoxide, carbon dioxide, extremely toxic phosgene, and possibly other harmful substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if o-dichlorobenzene is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble.
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, carbon tetrachloride, ether, ligroine, and other organic solvents.
Specific Gravity (Liquid): 1.298 - 1.307 at 68°F (20°C).
Boiling Point: 341.6°F (172°C) - 361.4°F (183°C) at 1 atm.
Melting Point: 0.3 - 1.4°F (-17.6 to - 17°C).
Freezing Point: See melting point.
Molecular Weight: 147.0.
Heat of Combustion: -4,427 cal/g.
Vapor Pressure: 1.0 - 1.2 mm Hg at 68°F (20°C); 5.0 mm Hg at 114.8°F (46°C).
Flash Point: 151 - 160°F (66.1 - 71.1°C), closed-cup; 155 - 165.9°F (73.9 - 74.4°C), open-cup.
Autoignition Temperature: 1,198°F (647.8°C).
Burning Rate: 1.3 mm/minute.
Stability: Stable.
Corrosiveness: Generally considered non-corrosive to many common metals but is not compatible with many rubbers and plastics. Can react with aluminum (see below). Recommended materials include steel, stainless steel, Viton, polyethylene, and Teflon for equipment, hoses, etc.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Slow reaction with aluminum has potential to cause rupture or explosion of sealed aluminum containers, particularly if some amounts of aluminum chloride are present. May react vigorously with strong oxidizing agents. Incompatible with strong acids. Reactions of halogenated organic materials such as o-dichlorobenzene with cyanides, mercaptans or other organic sulfides typically generate heat, while those with mineral acids, amines, azo compounds, hydrazines, caustics or nitrides commonly evolve heat and toxic or flammable gases. Reactions with oxidizing mineral acids may generate heat, toxic gases and fires. Those with alkali or alkaline earth metals, certain other chemically active elemental metals like aluminum, zinc or magnesium, organic peroxides or hydroperoxides, or strong reducing agents typically result in heat generation and explosions and/or fires.

IDENTIFICATION

Shipping Names: o-Dichlorobenzene.
Synonyms and Tradenames: Benzene, 1,2-dichloro-; 1,2-dichlorobenzene; dichlorobenzene, ortho-; ortho-dichlorobenzene; ortho-dichlorobenzol; o-dichlorobenzol; DCB; o-DCB; ODB; ODCB; and numerous tradenames.
Chemical Formula: o-$C_6H_4Cl_2$ or 1,2-$C_6H_4Cl_2$.
Constituent Components (% each): The purest grades contain close to 100% ortho-dichlorobenzene. Some products apparently contain about 80 to 85% of the ortho isomer with the remainder consisting mostly of the para and meta isomers of dichlorobenzene. The crudest commercial grade product identified contains 48.8% of the ortho isomer, and 28% of the para isomer.
UN/NA Designation: UN1591.
IMO Designation: 6.1, poisonous material.
Physical State As Shipped: Liquid.
Physical State As Released: Usually liquid but may solidify at low temperatures.
Color As Shipped: Colorless to pale yellow.
Odor Characteristics: Reported as mild, pleasant, disagreeable, pungent, aromatic, and possibly resembling mothballs.
Common Uses: Solvent for waxes, gums, resins, tars, and rubbers; insecticide for termites and other pests; used to make other chemicals such as dyes, to degrease hides and wool, in industrial odor control, and metal polishes.

the word poison

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Some sources indicate most people can detect odor at 2 - 4 ppm in air. Others list an odor threshold of 50 ppm. Vapors are reported as strong and irritating at 100 ppm.

Unusual Hazards: Reacts in an unusual manner with aluminum and possibly other active metals. Vapors are highly toxic if inhaled.

Short Term Exposure Limit (STEL): (Skin) 50 ppm for 15 minutes (ACGIH, 1992 - 93).

Time Weighted Average (TWA) Limit: (Skin) 25 ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93).

Ceiling (C) Limit: 50 ppm absolute ceiling limit (OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to o-dichlorobenzene vapors that may be present in air in the immediate spill area and over some distance downwind. Ingestion and direct contact should also be avoided. Generally, long-term exposures to dichlorobenzenes are suspected of playing a role in causing leukemia in humans. Based on animal data, significant exposures may cause injury to the testes of males and fetal abnormalities. There is a possibility, based on experience with similar chemicals, that people who ingest or have ingested alcohol may be at much greater risk of kidney and/or liver injury when exposed to this material.

Hazards of Skin or Eye Contact: Vapors cause noticeable eye irritation at concentrations of 25 to 30 ppm in air; exposure to 60 to 100 ppm may cause pain if longer than a few minutes in duration. Contact of the eyes with liquid o-dichlorobenzene may cause pain, distress, irritation, and possible tissue damage that is likely to heal fairly quickly, especially if the substance is promptly removed. Application of the liquid for 15 minutes to the skin of humans caused a burning sensation which intensified with exposure up to one hour and abated when the liquid was removed. The skin became red and blistered; a brown stain developed and persisted for 3 months. The skin of some people may become sensitized upon repeated or prolonged exposure such that they become allergic. Excessive or repeated or prolonged skin contact has been shown to cause liver and kidney damage and death via absorption through the skin in animal studies. Effects of significant absorption through the skin are reported similar to those of excessive inhalation. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: The vapors of o-dichlorobenzene are irritating to the nose, throat, and upper respiratory tract. Exposure to high concentrations in air may cause narcosis and central nervous depression with symptoms variably including coughing, difficult breathing, chest pains, faintness, dizziness, headache, fatigue, drowsiness, nausea, vomiting, trembling, low blood pressure, unconsciousness, and possibly death. Non-lethal exposures may result in damage to the lungs, liver, and kidneys; the effects on the latter two organs may not be immediately evident. Accidental exposure of workers for 4 days resulted in significant alterations to leukocytes (white blood cells) which returned to normal in about 6 months. Severe toxic effects are reported to be seen in humans at a level of 300 ppm in one hour or less. Dichlorobenzenes in general may cause other effects such as swelling of the eyes, hands and feet. The NIOSH IDLH (1990) for o-dichlorobenzene is 1000 ppm. The saturated vapor concentration directly over a pool of liquid o-dichlorobenzene is about 1,320 to 1,580 ppm at 68°F (20°C), 2,500 ppm at 86°F (30°C), and 6,580 ppm at 114.8°F (46°C).

Hazards of Ingestion: Many effects of ingesting o-dichlorobenzene are similar to those associated with inhalation. Other reported symptoms include increased salivation and lacrimation, initial excitation followed by sleepiness, abdominal pain, nausea, vomiting, gastrointestinal irritation, shock, partial or full paralysis of the lower extremities, and possibly death due to paralysis of the respiratory center in extreme cases. Autopsies have shown liver and kidney injury, vascular disorders, hemorrhages into the submucosa of the stomach, and slight edema of the brain.

FIRE HAZARDS

Lower Flammable Limit: Most sources say 2%.

Upper Flammable Limit: Most sources say 9.2% to 12%.

Behavior in Fire: Combustible liquid. May require some degree of preheating to be easily ignited. May generate flammable vapors upon release if heated above its flash point. Such vapors have some potential to travel to a source of ignition and flash back. One authority reports that fires may be smoky due to incomplete combustion. There is some potential for containers to rupture in a fire (see Explosiveness below).

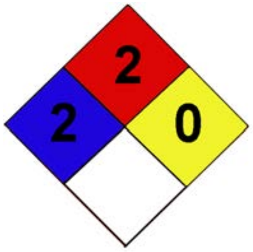
Hazardous Combustion Products: Not well-defined. Predicted by various sources to include irritating, corrosive, and/or toxic gases and fumes of hydrogen chloride, chlorine, chlorocarbons, carbon monoxide, carbon dioxide, extremely toxic phosgene, and possibly other harmful substances.

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors from hot liquid are ignited in a confined area. Despite the high boiling point and low vapor pressure of o-dichlorobenzene, some authorities warn that containers exposed to fire or excessive heat may rupture violently. (See Chemical Reactivity Data.)

1591

o-DICHLOROBENZENE
Division 6.1 (Poisonous Material)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment for normal operations should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the chemical. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. For fire or spill conditions, a fully encapsulating suit with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor, fume, or combustion product concentrations in air. Compatible materials for o-dichlorobenzene itself may include Viton and Viton/neoprene according to expert sources. Others report that Buna-N, neoprene, polyethylene/ ethylene vinyl alcohol/polyethylene, polyethylene, and Teflon may provide varying degrees of acceptable performance. Many factors affect the suitability of a material for a given application.

Respiratory Protection: For unknown concentrations, fire fighting, general use, or high concentrations (above 1,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a chemical cartridge respirator with a full facepiece (1,000 ppm or less) and organic vapor cartridge(s), or any powered air-purifying respirator (1,000 ppm or less) equipped with organic vapor cartridge(s) and eye protection within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, nose, throat, or respiratory system; narcosis and central nervous system depression; low blood pressure, salivation, lacrimation, nausea, vomiting, abdominal pain, shock, paralysis of extremities, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. At least one authority recommends that stimulants such as epinephrine (i.e., adrenalin) not be administered since they may increase myocardial irritability. Do not permit consumption of alcohol after any exposure to this substance.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if eye contact has occurred or promptly if skin irritation persists after washing. See comment above about alcohol consumption if skin contact was prolonged before treatment.

First Aid for Ingestion: Get immediate medical attention. Seek professional medical advice before inducing vomiting. If medical attention is not immediately available and if victim is conscious, administer large quantities of water (or dose of syrup of ipecac) and induce vomiting. Do not make an unconscious person vomit. If vomiting occurs naturally or is induced, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. See comment above about alcohol consumption and the use of stimulants.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, and regular foam are recommended by most authorities.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective clothing if contact with material or dense fumes/smoke is expected. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer

SPILL RESPONSES *(CONTINUED)*

lines as deemed necessary prior to use. Be advised there is a possibility that discharge of a carbon dioxide fire extinguisher at the point of leakage of liquid o-dichlorobenzene has the potential to solidify the product and stop the leak in some cases, at least temporarily. Other means of attempting to solidify the leaking liquid via cooling may also work. Whether or not the "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the container and its temperature. Use professional judgment in attempting this type of response action. Take the combustibility, toxicity, and reactivity of o-dichlorobenzene into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. o-Dichlorobenzene discharges may expose downwind areas to toxic and possibly flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm or hot weather or the liquid is somehow heated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION. . . Liquid o-dichlorobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled or in cold weather.

CONSEQUENCE

Hazardous levels of o-dichlorobenzene may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to o-dichlorobenzene vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of o-dichlorobenzene from contact with its airborne vapors.

MITIGATION

Where deemed necessary, contain contaminated water and remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of o-dichlorobenzene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . o-Dichlorobenzene is heavier than water and practically insoluble. Gentle application of a light spray of water onto the surface of confined pools of the liquid may form a floating layer of water that reduces vapor emissions.

CONSEQUENCE

Addition of water will increase the volume of contained liquids.

MITIGATION

Contain spilled product and remove it as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

o-DICHLOROBENZENE
Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid o-dichlorobenzene may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Liquid o-dichlorobenzene may solidify under cold ambient temperature conditions and plug or clog transfer or storage equipment (unless they are specially designed for this possibility).

MITIGATION

Use equipment compatible with the spilled product. Do not apply this technique at temperatures below the melting point of the product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of afire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE.. . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. o-Dichlorobenzene, which is quite toxic to various varieties of fish and other aquatic life, is heavier than water and practically insoluble. It may be expected to sink to the bottom of a body of water and dissolve at a very slow rate.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

o-DICHLOROBENZENE
Division 6.1 (Poisonous Material)

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

CHEMICAL TREATMENT . . . Application of appropriate chemical agent(s) to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

January 1989

DICHLOROD IFLUOROMETHANE
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Dichlorodifluoromethane is a colorless usually odorless gas shipped as a liquid under pressure and used as an aerosol propellant, refrigerant, and solvent with additional uses in making foaming agents and plastics, detecting leaks, and freezing various materials. It is very slightly soluble in water and somewhat heavier. Its boiling point of about –21°F indicates that it will boil under virtually all ambient temperature conditions, thus evolving a large amount of vapor or gas that is heavier than air and may persist in pits, hollows, and depressions. The product is not flammable but containers may rupture violently in a fire due to increasing pressure. Liquid dichlorodifluoromethane weighs approximately 11.1 pounds per gallon.

Dichlorodifluoromethane is stable in normal transportation and does not react with water or other common materials. Mixtures with alkali or alkaline earth elemental metals, peroxides, or strong reducing agents may be explosive, however, and dichlorodifluoromethane reacts with a wide variety of other chemicals. The product is not corrosive to many common metals but these may act as catalysts for decomposition at high temperatures. Vapors in air are of low toxicity except at relatively high concentrations and the major hazard of direct contact with the liquid or concentrated vapors is frostbite. Decomposition in a fire situation may evolve highly toxic phosgene, fluorides, halogen acids, hyrogen chloride, and carbonyl halides.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 280 mg/1 (0.028%W) at 77°F (25°C)
Solubility in Other Chemicals: Soluble in most organic solvents, alcohol, and ether.
Specific Gravity (Liquid): 1.329 at 68°F (20°C)
Boiling Point: –20.6 to –21.6°F (–29.2 to –29.8°C) at 1 atm.
Melting Point: –247 to –252.4°F (–155 to –158°C)
Freezing Point: –251.9°F (–157.7°C)
Molecular Weight: 120.91
Heat of Combustion: Not pertinent
Vapor Pressure: 5 atm (73.5 psia) at 61°F (16.1°C)
Flash Point: Not flammable
Autoignition Temperature: Not pertinent
Burning Rate: Not pertinent
Stability: Stable
Corrosiveness: Will attack some plastics, rubber, and coatings. Usually stored in steel or aluminum but also noncorrosive to cast iron, lead, brass, copper, and tin.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with hot aluminum, mineral acids, amines, strong oxidizing or reducing agents, alkali and alkaline earth elemental metals and certain other chemically active metals, peroxides, caustics, nitrides, cyanides, mercaptans, organic sulfides, azo or diazo compounds, and hydrazines

IDENTIFICATION

Shipping Names: Dichlorodifluoromethane (USDOT and IMO)
Synonyms and Tradenames: Difluorodichloromethane; Arcton 6; Eskinion 12; F-12; Freon 12; Genetron 12; Isotron 12; fluorocarbon-12; refrigerant-12; halon 122 or 1220; propellant-12; halocarbon-12; Algofrene Type 2; FC-12; Electro-CF12; Freon F-12; Frigen 12; Isceon 12; Ledon 12; Ucon 12.
Chemical Formula: $CC1_2F_2$
Constituent Components(% each): 99.5% or more pure
49 STCC: 49 045 16
UN/NA Designation: UN1028
IMO Designation: 2.2, nonflammable gas
Physical State as Shipped: Liquefied compressed gas
Physical State as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless below 20% by volume.
Common Uses: Aerosol propellant; refrigerant; low-temperature solvent; leak-detecting agent; foaming agent; mfg. plastics; freezing or chilling of foods, cocktail glasses, and frozen tissue sections.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DICHLORODIFLUOROMETHANE
Division 2.2 (Nonflammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** Odorless below 20% by volume

Unusual Hazards: May evolve large amounts of vapors upon release to the environment. Vapors are heavier than air and may be harmful or cause asphyxiation if breathed in high concentrations. Such concentrations may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): 1250 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 1000 ppm over each 8 hours of a 40 hour work **week. (ACGIH)**

Conditions to Avoid: Open flames and high temperatures; incompatible materials; inhalation or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air. Direct contact may result in frostbite.

Hazards of Skin or Eye Contact: Contact with liquid dichlorodifluoromethane may cause frostbite indicated by pallor, redness, loss of sensation and swelling of affected tissue.

Hazards of Inhalation: Vapors are relatively non-toxic but may act as a narcotic and central nervous system depressant at high concentrations. Symptoms may include dizziness, difficulty in breathing, giddiness, disorientation, incoordination, nausea, vomiting, and possible cardiac arrhythmias or cardiac arrest. Asphyxiation may also occur. Epinephrine may sensitize the myocardium to this substance. A 5% concentration in air causes dizziness.

Hazards of Ingestion: Ingestion of significant amounts is unlikely in short-term exposures.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. Will generate large quantities of gas or vapor upon release which may help extinguish the fire.

Hazardous Combustion Products: May decompose to toxic phosgene, fluorides, halogen acids, hydrogen chloride, and carbonyl halides.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may rupture violently in fire due to overpressure. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with liquid dichlorodifluoromethane or cold vessels containing the product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious resistant clothing. Compatible materials may include neoprene and Viton among others.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 1000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1028

DICHLORODIFLUOROMETHANE
Division 2.2 (Nonflammable Gas)

FIRST AID

Nonspecific symptoms: Symptoms of narcosis or irregular heartbeat from inhalation of high vapor concentrations. Frostbite from direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with large amounts of water, occasionally lifting the eyelids. Remove all contaminated clothing. Flush affected body areas with water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing. Warning: Do not use hot water.

First Aid for Ingestion: Significant ingestion is unlikely in short-term exposures.

FIRE RESPONSE

Extinguishing Materials: Use suitable agent for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the cylinder may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire-exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Avoid contact with spilled product. Keep unprotected personnel upwind of spill area. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that dichlorodifluoromethane is highly volatile. Accumulations of heavy gas may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Dichlorodifluoromethane may not generate hazardous concentrations in air in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product has evaporated, particularly if the spill is small.

CONSEQUENCE

Hazardous levels of dichlorodifluoromethane in air may be found in the local spill area and immediately downwind under appropriate conditions.

MITIGATION

Restrict access of unprotected personnel from the local spill area and areas immediately downwind of spill area.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Dichlorodifluoromethane spills may expose downwind areas to toxic concentrations, particularly if large amounts are released.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

DICHLORODIFLUOROMETHANE
Division 2.2 (Nonflammable Gas)

TECHNIQUE

WATER FOG OR SPRAY ... . Water fog or spray applied to dichlorodifluoromethane vapors or fumes from a point downwind of the spill may accelerate their dispersal in the atmosphere. Try not to get water on liquid pools as this may accelerate vapor evolution.

CONSEQUENCE

Water runoff may contain a very small amount of dichlorodifluoromethane from contact with airborne vapors or fumes.

MITIGATION

Where important water sources are threatened, contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is some uncertain possibility that firefighting foam applied to the surface of quiescent liquid pools may slow the release of dichlorodifluoromethane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. It is possible that vapor evolution will increase during initial stages of foam application. The response may be ineffective.

MITIGATION

Proceed with caution. Consult qualified experts. Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Dichlorodifluoromethane may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained dichlorodifluoromethane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in a few cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressure may be developed in equipment.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

DICHLORODIFLUOROMETHANE
Division 2.2 (Nonflammable Gas)

WATER SPILL

TECHNIQUE .

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. (Note: This and following responses may not be necessary except where critical water sources are impacted. Dichlorodifluoromethane is highly volatile and of low solubility in water.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 1992

DICHLOROMETHANE
Division 6.1 Poisonous Material)

GENERAL INFORMATION

Dichloromethane, also shipped with the name "methylene chloride", is a volatile, colorless liquid with a boiling point in the range of 103.6 to 105.8°F and an odor like ether or chloroform that can become unpleasant and irritating as concentrations increase in air. It is somewhat soluble in water and heavier, so can be expected to sink and dissolve at a slow yet appreciable rate. The product does not have a flash point when tested by standard methods but its vapors can nevertheless be flammable at elevated temperatures. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. Dichloromethane weighs approximately 11.1 pounds per gallon. Its vapors are heavier than air and may persist for a time in low areas.

Dichloromethane does not react with water or many other common materials and is stable in normal transportation. It is, however, violently or explosively reactive with strong oxidizing agents. Toxicity of the product is generally low to moderate in acute exposures but the material has several unusual toxicological characteristics that require special attention. Products of combustion or thermal decomposition may be more hazardous than dichloromethane itself via inhalation and may include carbon monoxide, hydrogen chloride, hydrochloric acid, some small amounts of highly toxic phosgene and possibly chlorine, and other toxic substances.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Somewhat soluble; 2.0, 1.38, or 1.32 g/100 g water at 68°F (20°C); reported values vary but first in list appears most likely to be accurate.

Solubility in Other Chemicals: Soluble in acetone, ethanol, ethyl ether, and many other organic solvents.

Specific Gravity (Liquid): 1.322 –1.336 at 68°F (20°C)

Boiling Point: 103.6 –105.8°F (39.8 –41°C) at 1 atm.

Melting Point: –142.6 to –139.0°F (– 97 to –95°C)

Freezing Point: See melting point

Molecular Weight: 84.933

Heat of Combustion: –1,445 cal/g as standard net heat of combustion

Vapor Pressure: Approx 200 mm Hg (3.866 psia) at 46.4°F (8°C); 350 mm Hg (6.765 psia) at 68°F (20°C); 500 mm Hg (9.664 psia) at 86°F (30°C).

Flash Point: None when measured by standard closedcup method. Has been found to be flammable when subjected to a sufficiently high level of ignition energy.

Autoignition Temperature: Reported values range from 1033 to 1224°F (556 to 662°C).

Burning Rate: Not available

Stability: Stable

Corrosiveness: Not corrosive to common metals such as iron, copper, etc., at normal temperatures. At high temperatures and in presence of water, the product can corrode iron, some stainless steels, copper, nickel, and certain other metals. One authority recommends stainless steel, Teflon, bronze, and steel for pump and hose construction materials and reports that Viton or cross-linked polyethylene may be used with caution. Some forms of plastics, rubber, and coatings may be attacked.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Generally reported to react violently or explosively with strong oxidizing agents, strong acids, or caustics. Reactivity with chemically active metals is ambiguous. Seek additional information from qualified experts on the interaction of dichloromethane with specific substances where necessary. Space does not permit a full discussion of all known incompatible materials.

IDENTIFICATION

Shipping Names: Dichloromethane; methylene chloride

Synonyms and Tradenames: DCM; freon 30; methane dichloride; methylene bichloride; and methylene dichloride.

Chemical Formula: CH_2Cl_2

Constituent Components (% each): One source reports the the product is available in grades of 99% to 99.99% purity.

49 STCC: 49 411 32; 49 217 35

UN/NA Designation: UN1593

IMO Designation: 6.1, poisonous material

Physical State As Shipped: Liquid

Physical State As Released: Liquid, boiling liquid, gas, or mixture of gas and aerosols (small liquid droplets) depending on nature and temperature of release.

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant, aromatic, sweet, penetrating; like ether or chloroform. Becomes unpleasant and irritating at higher concentrations.

Common Uses: Has numerous uses as a solvent, aerosol propellant, fumigant; used for making plastics and printed circuit boards; used for shrink-fitting synthetic rubber covers, dyeing of synthetic fibers, and in organic synthesis.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DICHLOROMETHANE
Division 6.1 Poisonous Material)

PG III can replace
the word poison

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: One authority reports odor detectable at 3 to 30 ppm; two others say 25 ppm or 50 ppm; another says 150 ppm; many give a value of 200 ppm or more. Odor reported as being sweetish above 300 ppm but becoming unpleasant for most people at about 1000 ppm. At 2300 ppm, the odor is strong and intensely irritating; dizziness may occur after a 5 minute exposure.

Unusual Hazards: Highly volatile liquid with heavier than air vapors that may persist in low areas. Inhalation of vapors may be more hazardous to certain population groups than others. Products of combustion or thermal decomposition may be more toxic via inhalation than dichloromethane itself.

Short Term Exposure Limit (STEL): 125 ppm for 15 minutes was proposed by OSHA and pending a final rulemaking as of June 1992.

Time Weighted Average (TWA) Limit: 50 ppm over each 8 hours of a 40 hour work week (ACGIH, 1991–92); 25 ppm TWA proposed by OSHA and pending final rule in June 1992. ACGIH denotes the substance as a suspected human carcinogen.

Conditions to Avoid: Contact of dichloromethane with high heat, fire, strong sparks, or hot surfaces; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentrations of dichloromethane vapor or gas that may be present in air at the spill site and over potentially considerable downwind distances. Direct contact and ingestion should also be avoided.

Hazards of Skin or Eye Contact: Vapors are irritating to the eyes at higher concentrations and may cause discomfort, lacrimation, and temporary blurring of vision. Contact of the eyes with liquid dichloromethane may result in pain, lacrimation, a burning sensation, moderate to severe irritation and inflammation of the eyelids and conjunctiva, and temporary corneal injury possibly requiring a week or two for recovery in severe cases. The severity of effects depends upon the amount of liquid which enters the eye; prompt flushing with water will reduce severity. Contact of liquid dichloromethane with the skin is reported to rapidly cause an intense burning sensation. Mild irritation and a dry, scaly, fissured dermatitis may result from repeated contact if the material is allowed to freely evaporate from the skin. Pain, inflammation and moderate to severe burns may be expected if the chemical is confined or sealed to the skin by gloves, shoes, or tight clothing. Some small amounts of liquid may be absorbed through the skin but the hazard via this route of exposure is reported as limited. Contact lenses should not be worn when working with this chemical.

Hazards of Inhalation: Vapors of dichloromethane are slightly irritating to the nose, throat, and upper respiratory tract. Inhalation may cause narcosis and central nervous system depression with symptoms variably including lightheadedness, headache, dizziness nausea, vomiting, tingling or numbness in hands and feet fatigue, inability to concentrate, sense of fullness in the head, sense of heat, giddiness, stupor, confusion, irritability, dullness, incoordination, chills, lethargy, and drunkenness. Exposure to very high concentrations in air may result in rapid loss of consciousness and death but prompt removal from exposure prior to death is reported to usually result in complete recovery.

Hazards of Ingestion: Dichloromethane is considered to be of low to moderate toxicity in single oral doses. Ingestion may cause irritation of the gastrointestinal tract, vomiting, and various symptoms of inhalation. The lowest dosage reported to cause a human death is 0.36 g/kg of body weight but the accuracy of this estimate is unknown.

FIRE HAZARDS

Lower Flammable Limit: Reported values in air are usually 12% and 13% with the lower figure quoted most often. Ignition in air is difficult except at elevated temperatures (at or above about 212°F) or when vapors in the flammable range are subjected to a sufficiently high level of ignition energy.

Upper Flammable Limit: Reported values range from 18% to 23% in air but the upper limit quoted most often is 19% in air.

Behavior in Fire: *Will* generate large quantities of vapors upon release:' Vapors are heavier than air. Containers may rupture violently in fires.

Hazardous Combustion Products: Contact of dichloromethane with hot surfaces or an open flame may result in evolution of irritating and highly toxic substances including but not limited to carbon monoxide, hydrogen chloride, hydrochloric acid, and some small amounts of phosgene and possibly chlorine.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors within the flammable range encounter a suitable high energy source of ignition or are at elevated temperatures. Containers may rupture violently in fire. Contact with a variety of other chemicals may result in an explosion or formation of explosive substances.

1593

DICHLOROMETHANE
Division 6.1 Poisonous Material)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with dense fumes or smoke generated from burning or thermally decomposing quantities of dichloromethane and possibly in other cases where very high concentrations may be encountered in air. Compatible materials may include Viton/neoprene and Silvershield according to one highly respected authority. Another suggests that polyvinyl alcohol or a combination of polyethylene and ethylene vinyl alcohol may be appropriate.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, or skin; lightheadedness, headache, dizziness, nausea, giddiness, confusion, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. It may not be prudent to administer adrenalin (i.e., epinephrine) to severely exposed individuals since this may possibly result in cardiac sensitization (based on the results of animal studies). See "Hazards of Inhalation".

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water if product has not already evaporated. Get medical attention immediately if irritation persists after washing. Do not reuse contaminated items of leather clothing unless they can be fully decontaminated.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs and then repeat administration of water. (Note: Although a few sources of data suggest that vomiting be induced, most do not. NIOSH recommends that medical attention be obtained immediately, that vomiting be induced only if immediate medical attention is not available, and that no attempt be made to make an unconscious person vomit.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire if methylene chloride is not ignited. Water spray, dry chemical, carbon dioxide, or foam otherwise. Authorities disagree as to whether regular or alcohol foam should be used; both may be effective to some degree.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with dense fumes or smoke resulting from burning or decomposing dichloromethane may be encountered. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Although dichloromethane is considered difficult to ignite, it is prudent to assume that ignition is a possibility. Take the highly volatile nature of the substance and its heavier than air vapors into account when planning the response.

DICHLOROMETHANE
Division 6.1 Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Note that inhalation of dichloromethane vapors may be more hazardous to certain population groups than others.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to airborne dichloromethane may absorb and/or accelerate dispersal of its vapors.

CONSEQUENCE

Water runoff may contain varying amounts of dichloromethane from contact with its vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume arid overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of dichloromethane vapors into the atmosphere. (Note: Authorities disagree as to whether regular or alcohol type foams are best suited for use with this product; both may be effective to some degree.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . Dichloromethane is heavier than water and only somewhat soluble. Gentle application of alight spray of water onto the surface of confined pools of the liquid may form a floating layer of water that reduces vapor emissions.

CONSEQUENCE

Addition of water will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid dichloromethane or contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination. Migration of this product from ground spills to groundwater has been observed at hazardous waste sites.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

DICHLOROMETHANE
Division 6.1 Poisonous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities. These substances (with the exception of cement powder) are also suitable for absorbing contaminated runoff.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders scrapers, loaders, bulldozers or draglines. Note that final residues of dichloromethane are likely to evaporate fairly rapidly from exposed surfaces.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may possibly be ignited by motorized removal equipment under appropriate circumstances.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Dichloromethane is designated as a priority toxic pollutant and potential carcinogen by the EPA. It is heavier than water and somewhat soluble, so may be expected to sink in water and then dissolve at a slow yet appreciable rate.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination where possible and deemed appropriate.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts. Containment of material on bottom may not serve a useful purpose if the amount of water and the currents present therein are such that most or all of the dichloromethane will dissolve before recovery operations can be initiated.

MITIGATION

Excavate as last resort. Consult qualified experts on the advisability of this and the following related response technique under the spill conditions being encountered.

DICHLOROMETHANE
Division 6.1 Poisonous Material)

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air. A delay in implementation of this technique may permit all or most of the dichloromethane to dissolve in the water.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed .by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

DICHLOROPROPENE*
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Dichloropropene is a clear, straw colored liquid with a sharp, sweet, chloroform-like odor. It is slightly heavier than water and its vapors are heavier than air. Dichloropropene is toxic by all exposure routes and is flammable under most conditions. The low vapor pressure and relatively high boiling point suggest vapor generation will be relatively low and of greatest concern in the vicinity of the spill. Factors such as increasing the spill surface area or liquid temperature will increase vapor generation. Vapors will concentrate in low lying areas and, if concentration is sufficient, may represent a potential for ignition and flashback to source, particularly in confined settings. Vapors may accumulate in confined areas such as buildings or sewers and may present an explosion hazard.

Dichloropropene is normally stable and not subject to violent polymerization. It will react violently, as do most organic materials, in the presence of strong oxidizers. It is corrosive to aluminum, magnesium, zinc, and cadmium. It is incompatible with strong bases.

Dichloropropene is most commonly used in soil fumigant mixtures for control of soil nematodes. Mixtures may range from 95% dichloropropene preparations to mixtures of dichloropropene and dichloropropane (DD soil fumigant) or preparations containing other materials, such as chloropicrin. Dichloropropene exposures may produce skin sensitization in exposed persons. Dichloropropene is considered to be a potential carcinogen.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very low solubility, approximately 0.1%.

Solubility in Other Chemicals: Soluble in acetone, toluene, and octane.

Specific Gravity (Liquid): 1.220 @ 25°C (77°F)

Vapor Density (Air=1): 3.38

Boiling Point: 104 - 112eC (219.2 to 233.6°F)

Melting Point: -84°C (-119.2°F)

Freezing Point: -84°C (-119.2eF)

Molecular Weight: 110.98

Heat of Combustion: -3900 cal/gm

Vapor Pressure: 28 mmHg @ 25°C (77°F)

Flash Point: 35.°C (95°F) OC; 26°C (79'F) CC

Autoignition Temperature: Unavailable.

Burning Rate: 3.4 mm/min

Stability: Normally stable, not subject to violent polymerization reactions.

Corrosiveness: Corrosive to aluminum, magnesium, zinc, cadmium.

Reactivity with Water: Not reactive with water.

Reactivity with Other Chemicals: Corrosive to aluminum, magnesium, zinc, and cadmium. Incompatible with strong bases and strong oxidizers.

IDENTIFICATION

Shipping Names: Dichloropropene.

Synonyms and Tradenames: 1,3-dichloropropene; 1propene; 1,3-dichloro-Bis (2-chlorethyl) ether; á,ã-dichloropropylene; ã-chlorallyl chloride; vidden d; telone; telone II; CAS 542-75-6.

Chemical Formula: $CHC1{:}CHCH_2Cl$

Constituent Components (% each): Mixture of two isomers, Cis - and Trans-.

UN/NA Designation: UN2047

IMO Designation: 3.3, flammable liquid.

Physical State as Shipped: Liquid.

Physical State as Released: Liquid.

Color of the Shipped Material: Colorless, to light straw color.

Odor Characteristics: Odor of chloroform, sweet, pungent, and irritating.

Common Uses: Soil fumigant, organic synthesis.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

DICHLOROPROPENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 1 - 3 ppm (5 - 15 mg/m^3).

Unusual Hazards: Moderate fire hazard. Toxic by inhalation, ingestion, and absorption. May produce skin sensitization in exposed persons.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): 1 ppm skin (5 mg/m^3) OSHA PEL - TWA

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Primary health hazards are associated with direct skin contact. Skin sensitization may occur in exposed individuals. Dichloropropene is toxic by all exposure routes and is considered to be a potential carcinogen.

Hazards of Skin and Eye Contact: Exposure to eyes may result in severe irritation and corneal injury. Vapors may be irritating to eyes and produce lachrymation (tearing). Dichloropropene is toxic by skin absorption on prolonged contact. It is irritating and a potential skin sensitizer.

Hazards of Inhalation: Strong irritant to respiratory mucous membranes. Prolonged exposure to excessive vapors may result in varying degrees of respiratory impairment including burning sensation, coughing, wheezing, shortness of breath, nausea and vomiting.

Hazards of Ingestion: Moderately toxic by ingestion. Likely to result in severe gastrointestinal distress. Animal data suggest target organs of toxicity include the liver and kidneys.

FIRE HAZARDS

Lower Flammable Limit: 5.3%.

Upper Flammable Limit: 14.5 %.

Behavior in Fire: Smoke may contain toxic and irritating vapors. Vapors are heavier than air and will tend to collect in confined spaces or low lying areas. Vapor concentrations may present a source for ignition and flashback to the source under circumstances favoring vapor buildup.

Hazardous Combustion Products: Toxic, irritating, likely to include unburned dichloropropene. Chemical formula suggests that products may include the formation of hydrogen chloride, and oxides of carbon.

EXPLOSION HAZARDS

Explosiveness: Ignition of vapors in confined settings may proceed at an explosive rate. Generally stable and not subject to violent polymerization.

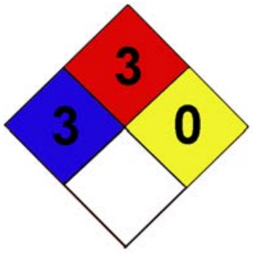
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with dichloropropene liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully encapsulating suits made of compatible material are appropriate for most large spill situations. Data is limited, however, butyl, neoprene, and nitrile rubber compositions have been suggested as suitable materials of construction..

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

2047

DICHLOROPROPENE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or bums to skin, eyes and respiratory tract. Severe gastrointestinal distress in cases involving accidental ingestion.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure resulting in increased respiratory distress with time. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Plush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists.

First Aid for Ingestion: Do not induce vomiting. Provide supportive care and seek medical assistance immediately. The risk of systemic toxicity is high when contaminant is aspirated into lungs. The decision to empty the stomach contents should be made by a physician considering the relative risks from toxicity and the danger from aspiration. There is no specific antidote for dichloropropene.

FIRE RESPONSE

Extinguishing Materials: Water fog, foam, alcohol foam, carbon dioxide, dry chemical.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with dichloropropene. Wear self contained breathing apparatus and appropriate personal protective clothing. Move intact container from fire area if without risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. Avoid taking positions along container ends. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam or the application of water fog is appropriate for fires involving dichloropropene.

SPILL RESPONSES

General Information: Dichloropropene is flammable and toxic. Response strategies should account for the fact that flammable vapors are heavier than air and may collect locally in enclosed spaces or low lying areas. When spilled in water, dichloropropene is only slightly soluble and will tend to settle to the bottom of the water column, depending on velocity of water flow. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of dichloropropene may result in explosion.

DICHLOROPROPENE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION... Dichloropropene may not evolve large amounts of hazardous airborne contaminants in many outdoor situations. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of dichloropropene vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

MITIGATION

Remove spilled dichloropropene as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for dichloropropene vapor concentration.

TECHNIQUE

WATER FOG OR SPRAY... Water fog applied to dichloropropene vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain a small amount (if any) of dichloropropene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM... Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of dichloropropene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with dichloropropene.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Spills of dichloropropene liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Dichloropropene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater, which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

DICHLOROPROPENE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking dichloropropene.

CONSEQUENCE

Dichloropropene may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater, which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION... Accumulated dichloropropene pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Avoid equipment containing components made of materials such as aluminum, magnesium, zinc, and cadmium. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION... Spilled dichloropropene can be absorbed and immobilized with inert materials such as sand, earth, saw dust, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with dichloropropene and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL... Soil contaminated with dichloropropene may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Avoid equipment containing components made of materials such as aluminum, magnesium, zinc, and cadmium. Store contaminated materials in a safe and secure location.

DICHLOROPROPENE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE... Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION... Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

CONTAINMENT... Spilled dichloropropene is slightly denser than water and will tend to sink to the bottom, depending on the velocity of the water body. Use natural deep water pockets, excavated lagoons, or barriers to trap material on the bottom and limit spread of contamination.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Excavations are difficult and are not 100% effective.

MITIGATION

Monitor downstream users and test for signs of contamination. Take steps to remove trapped pockets of dichloropropene as soon as possible.

TECHNIQUE

DREDGING/PUMPING... Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic or flammable vapors.

MITIGATION

Consult qualified experts. Decontaminate equipment after use. Arrange to store and dispose of recovered materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

GENERAL INFORMATION

Dichlorosilane is a highly flammable, corrosive, and toxic gas. It is usually shipped in the United States as a liquefied compressed gas in relatively low pressure cylinders having a water capacity of 250 pounds or less. Under USDOT exemption, it may also be transported at times in larger portable containers. Some of these containers may not be equipped with safety pressure reief devices. The odor of the product has been reported to be irritating, acidic, suffocating, and repulsive. The substance is used in industry for making electronic devices.

Dichlorosilane gas rapidly reacts with water or moisture to form hydrogen chloride, hydrochloric acid, and various silicon-containing substances. The dry gas is colorless but significant leaks may result in the formation of dense white fumes of corrosive hydrogen chloride and hydrochloric acid upon contact with moist air as the gas vents under pressure from its container. Liquid dichlorosilane is heavier than water, and based on the properties of similar substances, may possibly react violently in contact with water or moisture. The liquid has a boiling point of approximately 47°F and will therefore fume, rapidly vaporize, and/or boil under a wide range of environmental conditions, producing large amounts of vapors and fumes if released into the environment [Note: Hydrochloric acid and hydrogen chloride each have reportable quantities* of 5000 lb (2270 kg). Hydrogen chloride gas is designated as an Extremely Hazardous Substance (EHS) by the EPA.]

A flash point of –35°F indicates that dichlorosilane is easily ignited under all ambient environmental conditions. An autoignition temperature variably reported to be 136°F or 212°F indicates that comparatively low temperatures are sufficient to cause the product to self-ignite or reignite. Indeed, the heat evolved by reactions with water may be sufficient to ignite the product according to at least one source of information. Dichlorosilane has an unusually wide range of flammable limits, these being 4.1% to 98.8% by volume in air.

Dichlorosilane gas and vapor are heavier than air, may travel a considerable distance to a source of ignition and flashback, and/or may accumulate and persist in pits, hollows, and depressions. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupure violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. An unusual hazard is that temperatures in excess of 125°F may cause a cylinder filled to its "normal" capacity to become full of liquid, potentially resulting in excessive pressure buildup and rupture of the container. Other unusual characteristics and hazards of the dichlorosilane are reported below. The product weighs approximately 10.5 pounds per gallon at its boiling point temperature.

Dichlorosilane is stable in normal transportation when in sealed containers. In the absence of moisture or water, dichlorosilane can be safely handled in mild steel equipment. If even small traces of water are present, however, the product becomes extremely corrosive due to the formation of hydrochloric acid. Hydrochloric acid corrodes most metals, particularly iron and aluminum, while evolving potentially flammable hydrogen gas which may explode if ignited in confinement. Very little specific information exists concerning reactivity of dichlorosilane with other materials.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if dichlorosilane is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts rapidly and possibly violently
Solubility in Other Chemicals: Not available
Specific Gravity (Liquid): Approx 1.26 at boiling point *Boiling Point:* 46.8–47.1°F (8.2–8.4°C) at 1 atm.
Melting Point: –187.6°F (–122.0°C) *Freezing Point:* See melting point
Molecular Weight: 101.01
Heat of Combustion: Not available
Vapor Pressure: Approx 1255 mm Hg (24.2 psia; 1.65 atm) at 68°F (20°C)
Flash Point: –35°F (–37.2°C), closed or open cup
Autoignition Temperature: One major authority reports that the measured autoignition temperature of dichlorosilane is above 212°F (100°C) but any accumulated monochlorosilane above the bulk liquid may reduce the autoignition temperature to about 136.4°F (58°C). Data sources report either this latter temperature or 212°F (100°C).
Burning Rate: Not available
Stability: Stable in normal transportation when in sealed container
Corrosiveness: In the absence of moisture or water, dichlorosilane can be safely handled in mild steel equipment.
Reactivity with Water: Based on the properties of similar materials, there is a possibility that the reaction of liquid dichlorosilane with water may be vigorous or violent. Products of the reaction include hydrogen chloride. The reaction generates heat and this heat may be sufficient at times to ignite the product.
Reactivity with Other Chemicals: Very little specific information exists for dichlorosilane. One maker simply reports that the product is incompatible with oxidizing materials or agents. Another adds alkalies, alcohols, and acetone to the list. The very similar substance known as trichlorosilane is reported to react violently or explosively with ammonia, alcohols, ketones, amines and alkanes but not with chlorinated hydrocarbons.

IDENTIFICATION

Shipping Names: Dichlorosilane (IMO); usually shipped as "poisonous gas, flammable, n.o.s." under USDOT regulations. A description such as "flammable liquid, corrosive, n.o.s." may also be acceptable according to one authority. Note that the USDOT requires that the specific chemical name of the product appear in shipping papers when n.o.s. designations are used.
Synonyms and Tradenames: Dichlorosilicane
Chemical Formula: $Si\text{-}H_2\text{-}Cl_2$
Constituent Components (% each): Usually transported and used in ultra high-purity grades for use in the electronics industry; typically at least 99.9% or more pure.
49 STCC: 49 201 76
UN/NA Designation: UN2189 (dichlorosilane)
IMO Designation: 2.3, poison gas
Physical State As Shipped: Liquid or compressed liquefied gas
Physical State As Released: Fuming and/or boiling liquid, gas, or mixture of gas and aerosols (small liquid droplets); the boiling point of the product is about 47°F.
Color of the Shipped Material: Large leaks of dichlorosilane are reported to form dense white fumes of hydrogen chloride and hydrochloric acid upon contact with moist air.
Odor Characteristics: Irritating, acidic, suffocating, repulsive
Common Uses: Used in industry for making electronic devices

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available for dichlorosilane; 1 to 5 ppm for hydrogen chloride or hydrochloric acid.

Unusual Hazards: Temperatures in excess of 125°F may cause a cylinder to become full of liquid, potentially resulting in excessive pressure buildup and rupture of the container. The autoignition temperature of dichlorosilane is reported to be unusually low by several authorities, indicating that the product may be easily ignited or reignited by relatively low temperature heat sources. Indeed, the heat produced by contact of liquid dichlorosilane with water may be sufficient to ignite the product. Dichlorosilane is flammable in air over a very wide range of concentrations. There is at least one report of spontaneous ignition of the product under ambient conditions. Vapors and fumes are heavier than air and may persist in low areas. Acidic decomposition products formed by burning dichlorosilane may rapidly attack the metal at the leak area, especially if the metal is hot. Spraying water on the source of any leak may also potentially cause corrosion due to formation of hydrochloric acid and increase the leakage area. Contact of hydrochloric acid with metals may result in the generation of hydrogen gas.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Ceiling (C) Limit: Not established for dichlorosilane; 5 ppm absolute ceiling limit for hydrogen chloride (ACGIH, 1990–91; OSHA, 1989)

Conditions to Avoid: Heat fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Dichlorosilane is irritating and corrosive to all living tissue. Major hazard is from exposure to high vapor or fume concentrations that may exist in air in the spill area and over significant distances downwind. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid dichlorosilane or its concentrated vapors or fumes may rapidly result in severe inflammation (with redness and possible swelling) or highly painful acid burns and skin lesions resulting in early necrosis (death of tissue) and scarring. Prolonged or widespread skin contact with the liquid may result in the absorption of potentially harmful amounts. Contact of the eyes with vapors or fumes may cause severe irritation causing pain, excess lachrymation, closure of the eyelids, and marked excess redness and swelling of the conjunctiva. High concentrations of the gas or vapor in air or contact with the liquid may cause severe corneal burns and injury that may result in permanent damage with possible loss of sight. Do not wear contact lenses when working with this substance. (Note: According to one major authority, irritation of the eyes may not be felt or observed immediately after the exposure. In some cases, symptoms of eye exposure may be delayed several hours. Prompt treatment by a physician may be required even if no signs of irritation or injury are evident directly after the exposure.)

Hazards of Inhalation: Gases, vapors, or fumes resulting from discharges of dichlorosilane may cause irritation of the respiratory tract with burning, choking, coughing, excess sputum and saliva formation, and chest discomfort. Higher levels in air may result in burns and ulceration of the nose and throat, laryngeal edema or spasm, labored breathing, pulmonary edema, pneumonitis, and possibly death. The onset of pulmonary edema and pneumonitis may be delayed. Some individuals who survive the exposure may experience permanent injury. Although recent data indicate higher levels may be tolerable for a short time, authorities have traditionally warned that concentrations of 1000 to 2000 ppm of hydrogen chloride or hydrochloric acid in air may be dangerous to humans in even brief exposures.

Hazards of Ingestion: Ingestion of liquid dichlorosilane or concentrated acid may be expected to result in burns of the mouth, throat and stomach, pain, nausea, vomiting, and possibly death due to esophageal or gastric necrosis. Although not mentioned in the literature specifically with reference to ingestion, it should be noted that contact of liquid dichlorosilane with water may result in its ignition according to various authorities.

FIRE HAZARDS

Lower Flammable Limit: 4.1%

Upper Flammable Limit: 98.8%

Behavior in Fire: Containers may rupture violently in fire and possibly rocket. Some containers may not be equipped with safety pressure relief devices and will be particularly at risk. Temperatures in excess of 125°F may cause a cylinder to become full of liquid, potentially resulting in pressure buildup and container rupture. Due to its reported low autoignition temperature, dichlorosilane may be easily ignited, or reignited upon extinguishment (possibly explosively), by relatively low temperature heat sources. Contact with water used for firefighting may cause unignited dichlorosilane to ignite. Acidic decomposition products formed by burning dichlorosilane from leaks may rapidly attack the metal at the leak area, especially if the metal is hot. Spraying water on the source of any leak may potentially cause corrosion due to formation of hydrochloric acid and increase the leakage area. The product will generate potentially large quantities of flammable and corrosive vapors and fumes upon release.

Hazardous Combustion Products: Decomposition products are reported to include hydrogen chloride, hydrochloric acid, chlorine, and finely divided amorphous silica.

2198

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire and possibly rocket. Some containers may not be equipped with safety pressure relief devices and will be particularly at risk of rupture upon heating. Temperatures in excess of 125°F may cause a cylinder to become full of liquid, potentially resulting in pressure buildup and rupture of the container. If flames are extinguished, there is an unusual risk of reignition, which may be explosive in nature. Contact of hydrochloric acid with most metals produces hydrogen gas that may explode if ignited in a confined space.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with dichlorosilane or its acidic reaction products with water. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing for normal working conditions. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor, fume, or smoke concentrations in air. Various makers of dichlorosilane indicate that neoprene, natural rubber, polyvinyl chloride, or polyethylene may be compatible materials. The only material that appears to be simultaneously resistant to dichlorosilane, fairly concentrated hydrogen chloride or hydrochloric acid, and chlorine with some confidence is neoprene. Other materials that may provide adequate protection for a time appear to include Viton and Saranex. In the absence of fire, in which case chlorine will not be present in air as a product of combustion, possibilities appear to additionally include natural rubber and nitrile rubber. The issue is obviously complicated by the number of possible substances involved. It is very likely that several other materials would also be adequate for short-term emergency response purposes but insufficient data are available for a clear determination.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; choking, coughing or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Note that some symptoms may be delayed. Treatment by a physician may be necessary even if no symptoms of exposure are immediately evident. Keep victim under medical observation for at least 24 hours and possibly longer to detect early signs of pulmonary edema. Airway obstruction, as indicated by a harsh rasping breath sound from the larynx, may require the placement of an airway by qualified emergency medical technicians.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately, keeping in mind that the effects of eye exposure may be delayed. Proceed with caution where "dry" dichlorosilane has contaminated combustible clothing or the skin since contact with water may result in ignition of the dichlorosilane. Use drenching or flooding amounts of water where necessary.

First Aid for Ingestion: Specific first aid measures for ingestion of dichlorosilane were not found in the literature. For hydrochloric acid, it is suggested that large quantities of water be administered immediately if the victim is conscious, that no attempt be made to make the victim vomit, and that immediate medical attention be obtained. If vomiting occurs naturally, have the victim lean forward and keep head below hips to reduce the risk of aspiration of any liquids into the lungs.

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

FIRE RESPONSE

Extinguishing Materials: Shut off leak if no risk. Carbon dioxide or dry chemical are recommended for small fires. If reignition occurs or the fire cannot be extinguished, let it burn out while cooling containers unless the flow of dichlorosilane can be stopped safely. Use water spray or foam for larger fires. (Note: Authorities disagree and variously recommend regular foam, alcohol foam, or all-purpose foam for dichlorosilane fires. It is possible that all are effective to some degree.) Coarse water spray is recommended by one maker of the product because the reaction of dichlorosilane with water to form hydrochloric acid is said to be more rapid than the combustion reaction. Do not apply water to point of the leak in the container. Keep in mind that application of water to unignited liquid dichlorosilane may result in its ignition. Be prepared for this eventuality and take it into account while planning your fire response. Also remember that the autoignition temperature of the product is very low. Explosive reignition is possible.

Extinguishing Techniques: Unusual corrosive vapor/fume, reactivity, and flammability hazard. Stop leak if you can do it without risk. Stay upwind. Wear breathing apparatus and appropriate protective clothing, including fully-encapsulating vapor-protective suit where contact with material or dense fumes or smoke is anticipated. Move container from fire area if no risk. Let container burn unless leak can be stopped; with smaller tanks or cylinders, extinguish/isolate from other flammables. Be alert to the possibility that the container may rupture violently, possibly rocket, and suddenly release massive amounts of product when exposed to high heat. Stay away from ends of container involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out while recognizing hazards and warnings reported directly above. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of the tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill site and out of low areas. Avoid all contact with discharged product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Due to its reactivity with water, always handle dichlorosilane in dry equipment with a dry inert gas such as nitrogen. Pressurization with a dry inert gas is preferable to pumping for transfer purposes. Since reverse flow into a cylinder may cause rupture, use a check valve or other protective device in any line or piping from a cylinder to prevent reverse flow. Take the many unusual characteristics and hazards of dichlorosilane into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Dichlorosilane discharges may expose downwind areas to flammable and toxic concentrations over considerable distances in some cases. Dense white fumes of hydrogen chloride and hydrochloric acid are expected to form where there are large leaks of the product into moist air.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to dichlorosilane in air may react with, knockdown, and accelerate dispersal of vapors and fumes in the atmosphere. Apply water at a point downwind and do not let it contact pools of liquid dichlorosilane since this may cause ignition of the product, a violent reaction, and/or increased fume evolution rates. Do not apply water to the point of a leak in a container; any hydrochloric acid formed may cause corrosion and increase the area of the leak; the reaction with water may result in ignition of the dichlorosilane.

CONSEQUENCE

Water runoff may contain corrosive hydrochloric acid and other chemicals from contact with airborne vapors and fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid dichlorosilane may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller liquid spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Contact with inadequate amounts of water may lead to ignition and sustained combustion of the product. The sudden reaction with water may be violent.

MITIGATION

Some possibilities include downwind knockdown of vapors or fumes via water fog or spray and temporary evacuation of surrounding populations and other vulnerable resources. Proceed with caution and from a distance. Ensure that water can be applied in flooding quantities for a sustained period of time. Consult qualified experts for guidance where necessary.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid dichlorosilane or contaminated water runoff may be contained by building dikes using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of these liquids and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as appropriate and as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained liquids as appropriate and as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PRESSURIZED TRANSFER/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using vacuum trucks or another vacuum based system. Note that pressurization with a dry inert gas is preferable to use of pumps and hoses for transfer purposes between containers. Pumps and hoses should be used with great caution, if at all, and only if constructed of compatible materials and extremely dry and clean. Keep the potentially low autoignition temperature of the product in mind when using mechanical equipment with heat sources such as motors.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment. Heat and intake of even a small amount of air may lead to ignition or explosion of the product.

MITIGATION

Consult qualified experts for assistance. Use equipment of proper pressure capacity that is compatible with the spilled product and the hydrochloric acid that forms in contact with moisture or water. Avoid contact of the product with water or moist air. Avoid exposure of the product to heat. Consider using a dry cold gas such as nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of the product into equipment.

TECHNIQUE

ABSORPTION . . . Where temperatures permit, spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, fly ash, cement powder, compatible commercial sorbents and other compatible substances according to various authorities. Note that the boiling point of dichlorosilane is approximately 47°F and that the liquid product will boil or otherwise vaporize rapidly under most ambient temperature conditions. This technique is most appropriate in very cold weather and/or where sorbents can quickly and safely be placed in appropriately sealed, dry, and compatible containers.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under the guidance of a qualified expert. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

DICHLOROSILANE
Division 2.3 (Poisonous Gas)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product or acid runoff that has been contained to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical neutralization agents may entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and/or liquid residues may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Motorized equipment or other heat sources may easily ignite any flammable vapors in the spill area due to the low flash point and potentially low autoignition temperature of dichlorosilane.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product and any hydrochloric acid which forms in the presence of moisture or water. Store contaminated materials in a safe and secure location. Do not operate motorized equipment where their use may lead to ignition of the product. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Dichlorosilane is heavier than water and rapidly reacts with it to form hydrogen chloride, hydrochloric acid, and other substances variously reported to include silica, silicon oxyhydride, polymeric siloxanes, and/or insoluble silicon-containing solids or fluids. The reaction produces heat.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Contaminated water may be contained (or diverted to an impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards due to formation of acids.

CONSEQUENCE ,

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Where deemed necessary by environmental officials or other experts stream or lake beds may be dredged to remove heavier-than-water insoluble silicon-containing products of reaction with water and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for recovery.

CONSEQUENCE

Dredging may accelerate dispersal of contaminants through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Use equipment compatible with the materials expected to be recovered. Consult qualified experts for guidance.

July 1994

DICYCLOPENTADIENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Pure dicyclopentadiene is a colorless, crystalline solid, with a camphor like- odor. Solids will melt at around 32°C (89.6°F) to form a clear, colorless liquid. In commerce, however, it is typically found in the form of a mixture which is clear, colorless liquid consisting of from 60 -95% dicyclopentadiene and weighing approximately 8.2 pounds per gallon. This mixture is a flammable liquid and will have a camphor- like odor. The vapor pressure of pure dicyclopentadiene is low. This, coupled with a relatively high boiling point, indicates that vapor generation will be relatively low and of greatest concern in the immediate vicinity of the spill. Factors, such as increasing the spill surface area or liquid temperature, will increase vapor generation. Vapors are heavier than air and will tend to concentrate in low lying areas. If the vapor concentration is sufficient, ignition and flashback to source, particularly in confined settings, are possible. Vapor accumulations in confined areas, such as buildings or sewers, may present an explosion hazard. Dicyclopentadiene is somewhat lighter than water and is insoluble in water. Spills can be expected to float to the surface.

Dicyclopentadiene is widely used in the development of various polymer resins. It is a basic component in the manufacture of polyester resins used in a variety of commercial products. Non- reinforced polyester is used in insulators for electrical coils, fiber reinforced polyester is used in boating equipment, counter tops, molded shower stalls, and automotive parts. Dicyclopentadiene is also widely used in the manufacture of adhesives, sealants, and treatments for floor tiles and tires, flame retardants, and as a basic substrate for the manufacture of certain pesticide compositions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble.
Solubility in Other Chemicals: Soluble in alcohol, ether and acetic acid.
Specific Gravity (Liquid): 0.93 - 1.07
Vapor Density (Air= 1): 4.6
Boiling Point: 170°C (338°F), decomposes.
Melting Point: 32.5°C (90.5°F)
Freezing Point: 32.5°C (90.5°F)
Molecular Weight: 132.31
Heat of Combustion: - 10,400 cal/gm
Vapor Pressure: 36.5 mmHg @ 20°C (68°F)
Flash Point: 4.4 to 32.2°C (40 - 90°F)
Autoignition Temperature: 510°C (950°F)
Burning Rate: Unavailable.
Stability: Dicyclopentadiene is normally stable unless heated to near boiling point where it decomposes to cyclopentadiene. On heating or contact with acid polymerization catalysts (boron trichloride, aluminum trichloride), may polymerize violently.
Corrosiveness: Not corrosive, irritating to skin.
Reactivity with Water: Not reactive with water, insoluble, floats.
Reactivity with Other Chemicals: Reacts with oxidizers and may ignite, reacts with acids and polymerizes in the presence of catalysts such as boron trichloride or aluminum trichloride.

IDENTIFICATION

Shipping Names: Dicyclopentadiene
Synonyms and Tradenames: á-Dicyclopentadiene; CAS 77-73-6.
Chemical Formula: $C_{10}H_{12}$
Constituent Components (% each): 60 - 95 % dicyclopentadiene, codimers (15 - 23%), may contain small percentages of benzene, less than 1 %, and light ends (C_6 hydrocarbons or lower) less than 3%.
UN/NA Designation: UN2048
IMO Designation: 3.3, flammable liquid.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Colorless to light straw colored.
Odor Characteristics: Odor of camphor, unpleasant.
Common Uses: Manufacture of resins, synthetic alkaloids, and camphors; intermediate for insecticides. Used in manufacture of paints and varnishes, flame retardants for plastics.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424- 9300 OR (202) 483- 7616

DICYCLOPENTADIENE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 0.02 ppm (1.098 mg/m^3)
Unusual Hazards: Flammable, moderate fire risk. On heating to near boiling, may violently polymerize.
Short Term Exposure Limits (STEL): Unavailable.
Time Weighted Average (TLV-TWA): 5 ppm (27.45 mg/m^3) air, OSHA PEL - TWA
Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Primary health hazards are associated with ingestion and inhalation. While absorption through intact skin is possible, it is unlikely that a single prolonged exposure will result in absorption of harmful amounts.
Hazards of Skin and Eye Contact: Will produce localized, transient irritation to the eyes. Not likely to cause permanent eye damage unless exposure is severe. Lengthy exposures to skin may produce irritation. Skin burns are unlikely unless exposure is prolonged and severe.
Hazards of Inhalation: May cause irritation to respiratory mucous membranes. Prolonged exposure to excessive vapors may result in headache, dizziness, and other anesthetic effects. Respiratory symptoms may include coughing, wheezing, shortness of breath.
Hazards of Ingestion: Dicyclopentadiene is moderately toxic by ingestion. Symptoms may include nausea and abdominal pain. Excessive exposures can result in systemic toxicity targeting the central nervous system, liver and kidneys.

FIRE HAZARDS

Lower Flammable Limit: 1 %
Upper Flammable Limit: 7 - 10%
Behavior in Fire: A moderate ignition risk. Vapor generation is likely to be localized in the vicinity of the spill. Vapors are heavier than air and may ignite and flashback to the source. Vapors may collect in low lying areas and enclosed buildings. Temperature and spill surface area will affect the generation of flammable vapors.
Hazardous Combustion Products: May contain unburned product, oxides of carbon (carbon dioxide, carbon monoxide).

EXPLOSION HAZARDS

Explosiveness: Vapors collected and ignited in confined spaces may present an explosion hazard. Violent polymerization is possible in containers exposed to fire. Threat is greatest when temperatures reach near the boiling point (170°C, 338°F).

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with dicyclopentadiene liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully covering or encapsulating suits, made of compatible material are appropriate for most large spill situations.
Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

2048

DICYCLOPENTADIENE
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific Symptoms: Irritation to eyes, localized and transient irritation to skin on prolonged exposure, abdominal distress on ingestion. Anesthetic effects including headache, dizziness on prolonged respiratory exposure accompanied by coughing or wheezing depending on exposure duration.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible, without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists.

First Aid for Ingestion: Do not induce vomiting. Provide supportive care and seek medical assistance immediately. The risk of systemic toxicity is high when contaminant is aspirated into lungs. The decision to empty the stomach contents should be made by a physician considering the relative risks from toxicity and the danger from aspiration.

FIRE RESPONSE

Extinguishing Materials: Water fog, foam, alcohol foam, carbon dioxide, dry chemical.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with dicyclopentadiene. Wear self contained breathing apparatus and appropriate personal protective clothing. Move intact container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam or the application of water fog is appropriate for fires involving dicyclopentadiene.

SPILL RESPONSES

General Information: Dicyclopentadiene is flammable and toxic. Response strategies should account for the fact that flammable vapors are heavier than air and may collect locally in enclosed spaces or low lying areas. When spilled in water, dicyclopentadiene is insoluble and will tend to float on the waters surface depending on the water flow velocity. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of dicyclopentadiene may result in explosion.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION... Dicyclopentadiene may not evolve large amounts of hazardous airborne contaminants in many outdoor situations. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of dicyclopentadiene vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

DICYCLOPENTADIENE
Class 3 (Flammable Liquid)

AIR SPILL (CONTINUED)

MITIGATION

Remove spilled dicyclopentadiene as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for dicyclopentadiene vapor concentration.

TECHNIQUE

WATER FOG OR SPRAY... Water fog applied to dicyclopentadiene vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain a small amount (if any) of dicyclopentadiene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM... Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of dicyclopentadiene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with dicyclopentadiene.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Spills of dicyclopentadiene liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Dicyclopentadiene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking dicyclopentadiene.

CONSEQUENCE

Dicyclopentadiene may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

LAND SPILL (CONTINUED)

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION... Accumulated dicyclopentadiene pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION... Spilled dicyclopentadiene can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbents.

CONSEQUENCE

Sorbents will become contaminated with dicyclopentadiene and will pose the same hazards as the spilled product. Use of sorbents will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbents to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL... Spilled dicyclopentadiene and contaminated soil may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE... Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

DICYCLOPENTADIENE
Class 3 (Flammable Liquid)

WATER SPILL (CONTINUED)

TECHNIQUE

FLOATING BOOMS/BARRIERS... Oil spill containment booms of compatible materials may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 - 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of the spilled dicyclopentadiene.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT/DIVERSION... Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

SURFACE SKIMMING... Oil spill skimming devices may be deployed to recover floating dicyclopentadiene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose a hazard to future users. Fire hazards pose risk to personnel and equipment.

MITIGATION

Decontaminate equipment after use. Store recovered dicyclopentadiene in a safe and secure location. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

ABSORPTION... Straw, hay, peat, or commercial sorbent materials compatible with dicyclopentadiene may be used to absorb spilled product form the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of the contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in a proper and safe manner. Use compatible equipment. Eliminate ignition sources.

March 1995

DIETHANOLAMINE

Class 9 (Miscellaneous Hazardous Material)

GENERAL INFORMATION

Diethanolamine is a colorless or faintly colored combustible substance that has a melting point of 82.4°F and may be shipped as a molten liquid or crystalline solid. It is used to make detergents, lubricants, and dispersing agents found in a wide variety of commercial products and is also used for making rubber and other chemicals. It is highly soluble in water and will mix freely and rapidly. Its flash point in excess of 300°F indicates that substantial preheating is necessary before the product can be ignited easily. Accumulations of vapor from only very hot liquid may explode if ignited in confined spaces such as buildings or sewers. The product weighs approximately 9.1 pounds per gallon as a liquid. Diethanolamine does not react with water or many other common materials and is stable in normal transportation. It is generally noncorrosive to metals with certain exceptions and is described as being incompatible with strong acids, strong oxidizing agents that may cause its ignition, and carbon dioxide. The product has a low vapor pressure and is primarily an irritant to bodily tissues upon direct contact. Products of combustion are toxic and may include oxides of nitrogen, ammonia, and carbon monoxide.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Highly soluble; 95.4 – 96% wt at 68°F (20°C)

Solubility in Other Chemicals: Soluble in methyl alcohol and acetone

Specific Gravity (Liquid): 1.092 at 86°F (30°C)

Boiling Point: 514 – 516°F (268 – 269°C) at 1 atm; may decompose

Melting Point: 82.4°F (28°C)

Freezing Point: See melting point

Molecular Weight: 105.14

Heat of Combustion: –6000 cal/g

Vapor Pressure: Less than 0.01 mm Hg (0.0002 psia) at 68°F (20°C)

Flash Point: 305 – 336°F (151.7 –168.9°C), closed cup; 306 –342°F (152.2–172.2°C), open cup; reported values vary.

Autoignition Temperature: 1224°F (662°C)

Burning Rate: 0.74 mm/minute

Stability: Stable

Corrosiveness: Generally noncorrosive; may use iron or mild steel. Water levels above 15% or temperatures above 140°F (60°C) will corrode aluminum and evolve hydrogen gas. Avoid copper.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Incompatible with strong acids, strong oxidizing agents, and carbon dioxide.

IDENTIFICATION

Shipping Names: Enviromentally Hazardous Substance, Solid, N.O.S.

Synonyms and Tradenames: 2,2’-Iminodiethanol; 2,2’-iminobisethanol; bis(2-hydroxyethyl) amine; di(2-hydroxyethyl) amine; 2,2’-dihydroxydiethylamine; diethylolamine; diolamine; B,B’-dihydroxyethylamine; 2,2’-aminodiethanol; DEA

Chemical Formula: $(HOCH_2CH_2)_2NH$

Constituent Components (% each): 98.5% or more pure unless shipped as water solution; may contain small amounts of mono- and triethanolamine and a trace of ethylene oxide.

UN/NA Designation: UN3077

IMO Designation: 9, Miscellaneous Dangerous Substance

Physical State As Shipped: Usually as hot viscous liquid

Physical State As Released: Hot liquid or solid (solidifies below 82.4°F when pure)

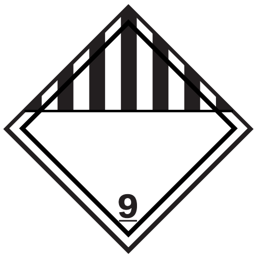
Color of the Shipped Material: Colorless or faintly colored crystals or liquid

Odor Characteristics: Mild ammonia or dead fish odor; pungent

Common Uses: Making liquid detergents and textile lubricants; intermediate for rubber chemicals; humectant and softening agent; dispersing agent; scrubbing agent for fuel gases; in organic synthesis.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

DIETHANOLAMINE
Class 9
(Miscellaneous Hazardous Material)



POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Ethanolamines can generally be detected at 2 – 3 ppm in air.

Unusual Hazards: None, but note that solid diethanolamine may absorb moisture from the air and liquefy.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 3 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: High heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Due to its very low vapor pressure, excessive outdoor inhalation exposures to this product are not likely unless individuals are very close to the spilled material, large quantities have spilled, and/or the product is very hot. Primary hazards are from direct physical contact and ingestion.

Hazards of Skin or Eye Contact: Brief contact of the skin with diethanolamine may cause smarting and local redness. Prolonged contact may result in severe irritation and possible burns. Prolonged contact with the eyes may cause moderate to severe irritation and corneal injury and burns. Brief contact followed by prompt washing with water is said to result in irritation and slight injury that heals rapidly.

Hazards of Inhalation: Vapors of diethanolamine may be irritating and may cause coughing and discomfort in the nose, throat, and chest. Excessive exposures may result in severe irritation of respiratory tract tissues, lung congestion, and possible injury to the lungs, liver, and kidneys.

Hazards of Ingestion: Diethanolamine is generally considered to be of low toxicity by ingestion. Nevertheless, one authority reports that intake of the concentrated product may cause burns of the mouth, throat, esophagus, and stomach with symptoms including pain or discomfort, nausea, vomiting, diarrhea, dizziness, drowsiness, faintness, weakness, collapse, and coma.

FIRE HAZARDS

Lower Flammable Limit (LFL): 1.6% (calculated)

Upper Flammable Limit (UFL): 9.8% (estimated)

Behavior in Fire: Combustible liquid or solid. Will burn but difficult to ignite.

Hazardous Combustion Products: May include toxic oxides of nitrogen, ammonia, and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors of very hot liquid (above 300°F) are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant cothing. A manufacturer of diethanolamine lists compatible materials as including neoprene, Buna-N, and polyvinyl chloride (PVC). Various protective clothing manufacturers list numerous other typical materials as compatible to some degree. The known exceptions are Viton and styrenebutadiene rubber.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, under ordinary circumstances, a chemical cartridge respirator with a full facepiece that provides protection against diethanolamine as needed within the use limitations of these devices.

3077

DIETHANOLAMINE
Class 9 (Miscellaneous Hazardous Material)

FIRST AID

Nonspecific Symptoms: Irritation of the skin, eyes, respiratory tract, or other bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing. Destroy any contaminated leather clothing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Although several authorities recommend inducement of vomiting, at least one recommends against the practice. Seek immediate medical advice on this issue if possible.)

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, carbon dioxide, alcohol foam. Water may be used to dilute spill to nonflammable mixture but do not use solid stream of water (or foam) on hot burning pools as this may cause frothing and increase fire intensity. Note that one authority states carbon dioxide is incompatible with this product but most recommend its use on fires. Use carbon dioxide with caution at first.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment under appropriate circumstances. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Diethanolamine will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of diethanolamine in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to diethanolamine vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of diethanolamine from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

DIETHANOLAMINE
Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of diethanolamine vapors into the atmosphere. The fact that alcohol foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to spilled diethanolamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid diethanolamine may be contained by building dikes using soil, sand or other materials. Note and take into account that the product will solidify at temperatures below 82.2°F (28°C) when pure.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Solidification of pure product may clog lines or pumps.

MITIGATION

Use equipment compatible with the spilled product. Heat transfer system where necessary or use alternative removal procedure.

DIETHANOLAMINE

Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

DIETHANOLAMINE
Class 9 (Miscellaneous Hazardous Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture some part of the spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Carbon treatment is of low to moderate effectiveness.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

October 1993

DIETHYLAMINE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Diethylamine is a colorless, flammable, and quite volatile liquid with a fishy, musty, sharp odor resembling ammonia. The substance is fully soluble in water and will mix freely. It may boil when released from containers exposed to very high ambient temperatures or when heated somewhat. It can easily be ignited under virtually all ambient temperature conditions. Vapors of the substance are heavier than air, may accumulate and persist in low areas, or may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. The liquid weighs approximately 5.9 pounds per gallon.

It does not react with water or many other common materials and is stable in normal transportation. It can be corrosive to a variety of metals, however, and may attack many forms of plastics, rubber, and coatings. Additionally, it is reactive with numerous other chemicals, including strong oxidizing agents and strong acids. The substance and its vapors are highly corrosive to bodily tissues and their toxic hazard must be considered high by all possible routes of exposure. Products of combustion are reported to include toxic and/or irritating gases such as ammonia, carbon monoxide, carbon dioxide, various hydrocarbons, various amines, and very highly toxic oxides of nitrogen.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if diethylamine is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble.

Solubility in Other Chemicals: Soluble in acetone, dimethyl sulfoxide, benzine, ether, ethyl alcohol, and various other organic solvents.

Specific Gravity (Liquid): 0.71 - 0.74 at 68°F (20°C).

Boiling Point: 131.0 - 134.6°F (55 - 57°C) at 1 atm.

Melting Point: - 58 to - 54.4°F (- 50 to -48°C).

Freezing Point: See melting point.

Molecular Weight: 73.14.

Heat of Combustion: - 9,994 cal/g.

Vapor Pressure: 189 - 200 mm Hg (3.653 - 3.866 psia) at 68°F (20°C); 400 mm Hg (7.732 psia) at 100°F (37.8°C).

Flash Point: -24°F to 0°F (- 31.1 to - 17.8°C), closed-cup; - 24°F (- 31.1°C) to 5°F (- 15°C), open-cup.

Autoignition Temperature: 594°F (312°C).

Burning Rate: 6.7 mm/minute.

Stability: Stable.

Corrosiveness: Limited data for diethylamine indicate that aluminum, copper, and zinc and their alloys (as well as zinc galvanized surfaces) should be avoided. The substance will attack many forms of plastics, rubber, and coatings. Steel and stainless steel are reported as compatible. Data for very similar ethylamine indicate that iron, steel, stainless steel, steel reinforced neoprene lines, and lead or asbestos composition gaskets are compatible. Aluminum, copper, lead, silver, tin, zinc, many of their alloys, and possibly nickel, are reported to be corroded by moist ethylamine.

Reactivity with Water: No reaction. Generates some heat while dissolving in water to form a strongly alkaline solution.

Reactivity with Other Chemicals: Diethylamine is said to react violently with considerable heat evolution in contact with sulfuric acid; contact with cellulose nitrate of high surface area may lead to spontaneous ignition; contact with strong oxidizers may cause fires and explosions; contact with strong acids may cause spattering; a mixture with 4-chloroacetophenone may explode when heated; the material is specifically reported as incompatible with chlorine, halogenated compounds, hypochlorites, nitrous acid, nitrites, reactive organic compounds, and some metals. The reaction of diethylamine with nitrites or other nitrosating agents can form potent carcinogens. Similar amines explode in contact with mercury. Aliphatic amines such as diethylamine generally evolve heat in reactions with aldehydes, non-oxidizing mineral acids, or organic acids; generate heat and toxic gases in reactions with oxidizing mineral acids, halogenated organics, or organic peroxides or hydroperoxides; evolve heat and flammable gases in reactions with alkali or alkaline earth elemental metals or strong reducing agents; generate heat, toxic gases, and fire in reactions with strong oxidizing agents; generate heat and cause violent polymerization of epoxides or isocyanates; and may possibly react in a hazardous fashion with dithiocarbamates.

IDENTIFICATION

Shipping Names: Diethylamine.

Synonyms and Tradenames: 2-Aminopentane; DEA; DEN; DETN; diethamine; n,n-diethylamine; and n-ethylethanamine.

Chemical Formula: $(CH_3CH_2)_2NH$.

Constituent Components (% each): 99% or more pure or as a solution in water.

UN/NA Designation: UN1154.

IMO Designation: 3, flammable. Physical State As Shipped: Liquid.

Physical State As Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Fishy, musty, sharp, like ammonia.

Common Uses: Making rubber and textile chemicals, corrosion inhibitors, dyes, flotation agents, resins, pesticides, pharmaceuticals, polymerization inhibitors, petroleum chemicals, polymers, surfactants, and electroplating solutions; used as selective solvent and as depilatory for animal skins.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

DIETHYLAMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at very low concentrations in air; reported odor thresholds are 0.14 and 0.3 ppm. Similar amines fatigue the sense of smell with time such that odor may not remain a reliable warning property.

Unusual Hazards: Contact with nitrites or other nitrosating agents can form potent carcinogens.

Short Term Exposure Limit (STEL): 25 ppm for 15 minutes (ACGIH, 1992 - 93; OSHA, 1989). The ACGIH has proposed a 15 ppm STEL that may be adopted sometime after 1993.

Time Weighted Average (TWA) Limit: 10 ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989). The ACGIH has proposed a 5 ppm TWA with a "skin" notation that may be adopted sometime after 1993.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentrations of diethylamine vapors that may be present in air at the spill site and over potentially considerable downwind distances. Direct contact and ingestion should also be avoided. Alkyl substituted n-nitrosamines, known to be potent carcinogens, may be formed when diethylamine comes in contact with nitrous acid, inorganic or organic nitrites or atmospheres with high nitrous oxide concentrations. Although no supporting data for humans is available, diethylamine is known to be mutagenic in short-term tests with bacterial cultures.

Hazards of Skin or Eye Contact: Prolonged or repeated exposure of eyes to vapor concentrations in air too low to cause other effects may cause blue hazy vision and the appearance of halos around lights due to eventual swelling of eye tissues. The eyes usually return to normal the next day but intense exposures may require several days for recovery and entail discomfort and sensitivity to light. Contact of the eyes with liquid diethylamine or its mists may rapidly result in redness, intense pain, and chemical burns involving corneal scarring and clouding, glaucoma, cataracts, and possibly permanent blindness. Note that aqueous solutions containing as little as 1% diethylamine by weight are known to have caused corneal opacities in animal experiments. Brief contact of the skin with liquid diethylamine or its concentrated vapors may cause various degrees of skin irritation and/or inflammation. Prolonged contact, especially if covered as with wet clothing, may result in blisters, extensive burns, tissue destruction, and/or deep scarring. Prolonged or repeated contact is reported capable of resulting in sensitization of the skin such that some people may become allergic. Prolonged or widespread contact may also result in the absorption of harmful amounts through even intact skin, possibly causing liver and kidney damage. Be advised that corrosive effects on the skin and eyes may be delayed at times and that damage may occur without the sensation or onset of pain. All exposures should be treated on an emergency basis without delay. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Mists or vapors of diethylamine are irritating and corrosive to the nose, throat, and lungs. Effects of excessive exposure are reported to include inflamed tissues of the nose and throat, laryngeal edema, coughing, chest pain, shortness of breath, difficult breathing, bronchitis, nausea, muscle contractions or spasticity, liver and/or kidney injury, cyanosis, and possibly death. Severe exposures that are initially survived may result in pulmonary edema and chemical pneumonitis that may be delayed in onset and which may have severe consequences. Exposure to 4,000 ppm in air for 4 hours was lethal to 50% of rats in laboratory experiments. The NIOSH IDLH (1990) for diethylamine vapors is 2,000 ppm. Concentrations of diet$ylamine vapors directly over a pool of the liquid are approximately 131,600 ppm at 42.8°F (6°C); 263,150 ppm at 68°F (20°C); and 526,300 ppm at 100°F (37.8°C). Although it has not been shown that diethylamine has this effect, similar amines are known to cause allergic respiratory system sensitization of some people in long-term chronic exposures.

Hazards of Ingestion: Excessive ingestion of liquid diethylamine is reported to result in burns of the mouth, throat and respiratory tract, irritation and/or burns of the digestive tract, possible hemorrhages in the stomach wall, severe abdominal pain, nausea, vomiting, collapse, liver and kidney damage, and possibly death. Single oral dosages of 500 to 649 milligrams of diethylamine per kilogram of body weight are reported as being fatal to 50% of mice and rats in laboratory experiments.

FIRE HAZARDS

Lower Flammable Limit: 1.8%.

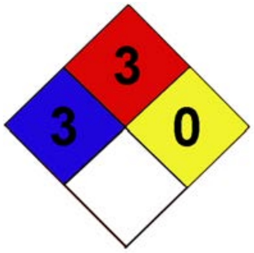
Upper Flammable Limit: 10.1%.

Behavior in Fire: Volatile flammable liquid. May generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently and possibly rocket in a fire.

Hazardous Combustion Products: Not well-defined; may include toxic and/or irritating gases and fumes including ammonia, carbon monoxide, carbon dioxide, various hydrocarbons, various amines, and very highly toxic oxides of nitrogen.

1154

DIETHYLAMINE
Class 3 (Flammable Liquid)



POTENTIAL HAZARDS *(CONTINUED)*
EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently and possibly rocket in a fire. Explosion may result if vapors are ignited in a confined area. Contact with certain other chemicals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product or its solutions. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials for diethylamine itself may include Silvershield, Teflon, and polyethylene/ethylene vinyl alcohol (PE/EVAL). Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: For unknown concentrations, fire fighting, general use, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister (500 ppm or less) or a chemical cartridge respirator with a full facepiece (500 ppm or less) may be adequate within the use limitations of these devices when equipped with appropriate canisters or cartridges providing appropriate protection against diethylamine.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, shortness of breath, nausea, vomiting, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes (a period of 30 - 60 minutes may be more appropriate), occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists or becomes apparent after washing. (Note: For ethylamine, a similar chemical, a major maker of the product says not to apply eye pads or pressure since this may cause "gluing" of the eyelids to the eyeball; 2 - 3 drops of a 0.5% pontocaine solution are permitted to relieve pain, after the relief of which eyes should be flushed with water or a 0.9% sodium chloride solution. The same source suggests rinsing the skin with vinegar or a 1 to 2% acetic acid solution after washing with water. The use of ointments or coverage of the injured area with clothing or a dry dressing is discouraged during the first 24 hour period. Instead, it is reported that the area may be covered with a dressing kept moist with a 0.9% sodium chloride solution.)

First Aid for Ingestion: Get medical attention immediately. If conscious, have victim wash out mouth with water (which should not be swallowed). If medical attention is not immediately available and victim is conscious, administer large quantities of water. Do not attempt to make the victim vomit. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs and repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol foam, water spray. Water may be ineffective but application of large quantities may dilute spills to nonflammable mixtures.

Extinguishing Techniques: Unusual corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent

SPILL RESPONSES *(CONTINUED)*

substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use. Take the corrosiveness, high flammability, high volatility, and toxic characteristics of diethylamine into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Diethylamine discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to diethylamine vapors may absorb vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of diethylamine from contact with its vapors.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of diethylamine vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION. . . The addition of large amounts of water to liquid diethylamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain liquids and neutralize and/or remove them as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES.. . Liquid diethylamine and its solutions may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Neutralize and/or remove liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

DIETHYLAMINE
Class 3 (Flammable Liquid)

LAND RESPONSES *(CONTINUED)*

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of afire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Do not operate motorized equipment in potentially flammable atmosphere. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Any spilled diethylamine will quickly dissolve in water. Be advised that potentially toxic and flammable vapors may evolve from the water surface for a time and travel in the downwind direction as the contaminated water moves downstream.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

DIETHYLAMINE
Class 3 (Flammable Liquid)

WATER SPILL *(CONTINUED)*

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Cation exchangers may be effective for use on neutral or acidic solutions.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

DIETHYL ETHER OR ETHYL ETHER

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Diethyl ether is a colorless, highly volatile, and flammable liquid with a sweet, pungent, and aromatic odor. It is the substance best known by the name "ether" and is used as an anesthetic, for priming gasoline engines, as an industrial solvent and extractant, in organic synthesis, and for several other purposes. It is fairly soluble in water and lighter, so can be expected to dissolve at an appreciable rate while also evaporating rapidly from the water surface. Its boiling point of approximately 94.1°F and flash point of -49°F indicate that diethyl ether is easily ignited under all ambient temperature conditions. Vapors of diethyl ether are heavier than air, may travel a considerable distance to a source of ignition and flash back and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6 pounds per gallon. Diethyl ether is lighter than water and therefore will float on water.

Diethyl ether does not react with water and is generally stable in normal transportation. It tends to form unstable and explosive peroxides when exposed for a time to heat, air and/or light, however, and may ignite, form a potentially explosive mixture, and/or spontaneously explode in contact with a wide variety of strong oxidizing agents. Additionally, it is reported to be incompatible with strong bases, is very sensitive to ignition by static electricity, and may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low but the volatility of diethyl ether indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

If diethyl ether is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; 7.5 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in lower aliphatic alcohols, acetone, benzene, chloroform, petroleum ether, solvent naphtha, other fat solvents, and many oils.

Specific Gravity (Liquid): 0.7134 - 0.7147 at 68°F (20°C)

Vapor Density: 2.56

Boiling Point: 94.1 - 94.3°F (34.5 - 34.6°C) at 1 atm.

Melting Point: -177.3°F (-116.3°C) for stable crystals; -189.9°F (-123.3°C) for metastable crystals.

Freezing Point: See melting point.

Molecular Weight: 74.12

Heat of Combustion: -8082 cal/g

Evaporation Rate (butyl acetate=1): 37.5

Vapor Pressure: 442 mmHg (8.54 psia) at 68°F (20°C)

Flash Point: -49°F (-45°C), closed cup; -40°F (-40°C),open cup

Autoignition Temperature: 320 - 374°F (160 - 190°C); reported values vary.

Burning Rate: 6.7 mm/minute

Flammable Limits: 1.9% (LEL) - 36.0% (UEL)

Stability: Stable in normal transportation but may decompose violently when heated. Product is especially sensitive to ignition by static electricity; when shaken under absolutely dry conditions, diethyl ether itself can generate sufficient static electricity to start a fire. Tends to form unstable explosive peroxides in prolonged presence of heat, air and/or light, especially if evaporated to dryness. These peroxides may explode spontaneously or when heated.

Polymerization Potential: Will not occur.

Corrosiveness: Generally noncorrosive to metals but may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: May react violently, ignite, form a potentially explosive mixture, and/or spontaneously explode in contact with a wide variety of strong oxidizing agents (including liquid air). Reacts with halogens, sulfur and sulfur compounds. Reported to be incompatible with strong bases.

IDENTIFICATION

Shipping Name(s): Diethyl ether (USDOT & IMO)or Ethyl ether (USDOT).

Synonyms and Tradenames: Diethyl oxide; Ethyl oxide; Sulfuric ether; Anesthetic or anesthesia ether; Solvent ether; Ether.

CAS Registry No.: 60-29-7

Chemical Formula: $CH_3CH_2OCH_2CH_3$

Constituent Components (% each): One maker reports its product to be 97% or more pure with remainder mostly ethyl alcohol.

UN/NA Designation: UN1155

IMO Designation: 3.1, Flammable liquids

RTECS Number: KI5775000

NFPA 704 Hazard Rating: 1(Health): 4(Flammability): 1(Reactivity) Note: Due to the reactivity of this material, some experts believe that the reported reactivity rating is conservative.

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid (boils at approx. 94.1°F)

Color of the Shipped Material: Colorless

Odor Characteristics: Sweet; pungent; aromatic; like ether.

Reportable Quantity: See appendix I.

Common Uses: Organic synthesis; industrial solvent and extractant; anesthetic; making of gun powder; alcohol denaturant; refrigerant; gasoline engine primer; in diesel fuels; in dry cleaning.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

DIETHYL ETHER OR ETHYL ETHER
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Most likely in range of 0.30 to 0.83 ppm; other reported values vary widely up to 1920 ppm.

Unusual Hazards: Highly volatile and flammable liquid with heavier than air vapors that may persist in pits, hollows, and depressions. The boiling point of diethyl ether is approximately 94.1°F. Tends to form explosive peroxides as reported above. Commonly explosive in contact with strong oxidizing agents. Very sensitive to ignition by static electricity.

Short Term Exposure Limit (STEL): 500 ppm (1520 mg/m^3) (ACGIH 1993-1994)

Time Weighted Average (TLV-TWA): 400 ppm (1200 mg/m^3)

Ceiling (C) Limit: Unavailable

IDLH: 1900 ppm or 10% LEL

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; exposure to air and light; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from prolonged inhalation of the very high vapor concentrations that may be present in air in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided. Note that overexposures may increase the severity of effects related to drinking alcoholic beverages.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid diethyl ether may result in drying and cracking of the skin due to the defatting action of the product. There is some unconfirmed potential for allergic sensitization of the skin. Brief contact usually causes mild irritation, if any. Although diethyl ether is said by one authority to be capable of being absorbed through the skin in amounts causing symptoms of inhalation, this is not generally considered to be a significant problem in humans. Contact of liquid diethyl ether with the eyes may cause a transitory smarting sensation and slight but reversible eye injury according to most authorities. One, however, reports there may be painful inflammation of a transitory nature. Do not wear contact lenses when working with diethyl ether.

Hazards of Inhalation: Exposure to high levels of diethyl ether vapors in air may cause irritation of the eyes, nose, and throat. Inhalation of very high concentrations in air may cause narcosis and central nervous system depression. Initial effects of acute overexposure may range from excitement to drowsiness, vomiting, paleness of the face, lowering of the pulse and body temperature, irregular respiration, muscular relaxation, and excessive salivation according to one expert source. Subsequent effects are said to be temporary and include vomiting, salivation, irritation of the respiratory passages, headache, and depression or excitation. Kidney injury is a possibility but has not been completely confirmed. Other possible symptoms listed by various authorities include dizziness, weakness, nausea, stupor, irregular heartbeat, jaundice, liver damage, unconsciousness, and possibly death from respiratory failure due to severe and continued exposures. Note that diethyl ether has been used as a surgical anesthetic for humans and is therefore not highly toxic by inhalation. A concentration of about 19,000 ppm in air is the lowest reported as necessary to induce anesthesia, while levels of 100,000 to 150,000 ppm are initially needed for this purpose in humans and 50,000 ppm is required to maintain the condition. In general, prolonged exposure to levels of 100,000 ppm or greater, this being 10% by volume in air, are required to cause fatalities. Continued inhalation of 2000 ppm simply causes dizziness. Exposure to 65,000 ppm for 100 minutes was necessary to kill 50% of mice in laboratory experiments

Hazards of Ingestion: Ingestion of diethyl ether is generally expected to cause many of the same effects as inhalation. More specific data are unavailable.

FIRE HAZARDS

Lower Flammable Limit: 1.9%

Upper Flammable Limit: 36.0%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Heat of nearby fire may possibly promote formation of unstable and explosive peroxides.

Hazardous Combustion Products: Not well-defined; said to produce acrid smoke, irritating fumes, carbon monoxide, carbon dioxide, explosive peroxides and possibly other toxic substances.

EXPLOSION HAZARDS

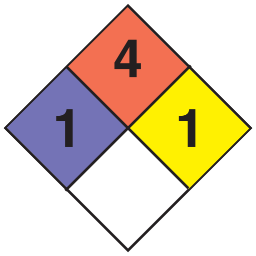
Explosive Limit: Unavailable

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with strong oxidizing agents may cause explosion. Exposure to heat, air, and/or light may produce unstable and explosive peroxides with time.

1155

DIETHYL ETHER OR ETHYL ETHER

Class 3 (Flammable Liquid)



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Polyvinyl (ALC) and Teflon® are reported to provide more than 8 hours of protection. Clothing materials listed as potentially compatible by various authorities include chlorinated polyethylene, Silvershield, neoprene/styrene-butadiene rubber, butyl rubber, nitrile rubber, polyethylene, and polyurethane.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 19,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge (19,000 ppm or less) with a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; symptoms of narcosis or central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Get medical attention if irritation persists after washing.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer a strong solution of salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: One major authority suggests the above, a second suggests that vomiting not be induced, while a third recommends that vomiting only be induced if immediate medical attention is not available. Seek immediate medical advice on this issue if possible, realizing that all courses of action entail various risks to the victim.)

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, Halon, alcohol type concentrate foam, water spray. Water may be ineffective, but very large quantities may be used to dilute spill to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture violently and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of diethyl ether may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment. Take into account while planning the response that diethyl ether is a highly volatile and flammable liquid that may evaporate rapidly. Beware of possible heavy vapor accumulations in pits, hollows, or depressions. Protect diethyl ether from static electricity and lightning. Avoid direct sunlight and exclude air from recovered product if at all possible.

Pay special attention to the fact that unstable and explosive peroxides may form with time. Where necessary, such peroxides may be removed by treating the ether and contaminated surfaces with a ferrous sulfate solution. One authority suggests a solution made up in a ratio of 100 grams of ferrous sulfate to 8 ml of concentrated hydrochloric acid in 85 ml of water. Be especially careful with aged containers of diethyl ether that may have formed peroxides upon long standing and which may be very unstable. Similarly, keep in mind that peroxides may form in containment and cleanup equipment that is contaminated with diethyl ether and not properly decontaminated. This warning applies to all response techniques listed below.

DIETHYL ETHER OR ETHYL ETHER

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to diethyl ether vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain varying amounts of diethyl ether from contact with its vapors.

MITIGATION

Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

ALCOHOL TYPE CONCENTRATE FOAM . . . There is a possibility that alcohol type concentrate foam applied to the surface of liquid pools may slow the release of diethyl ether vapors into the atmosphere. (Note: Be advised that authorities are divided on whether alcohol or standard foam is more appropriate. It is likely that both are suitable to some degree.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid diethyl ether may slow the release of vapors into the atmosphere. The amount of water must be sufficient to completely dissolve the ether or the response will not be effective. Thus, be prepared to add 15-20 times (or more) as much water by weight as the amount of ether that has spilled.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

DIETHYL ETHER OR ETHYL ETHER

Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

DIETHYL ETHER OR ETHYL ETHER
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination. (Note: Diethyl ether is not only highly volatile in all but very cold weather but its solubility in water is appreciable. Although some authorities suggest the possibility of using oil spill type confinement and cleanup techniques for diethyl ether spills on water, such techniques would only be suitable under relatively unusual conditions and are therefore not listed below)

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

1,1-Difluoroethane is a flammable, colorless, and odorless gas or liquid (liquefied compressed gas). It is sometimes reported to have a slight ethereal odor. It is used as a cooling agent, in aerosols and in the manufacture of other chemicals. It is stable, although any source of ignition should be avoided. Incompatible materials include, but may not be limited to, hot metals, moisture, strong oxidizing agents, brass, steel, magnesium, aluminum and their alloys. It is practically insolubility in water.

1,1-Difluoroethane is essentially non-toxic. The primary route of entry is inhalation of the vapors, although the liquid form may cause frostbite-like burns to the eyes and skin. Inhalation in moderate amounts may cause headaches, drowsiness, dizziness, excitation, excessive salvation, vomiting and unconsciousness. Larger amounts may cause unconsciousness and death due to asphyxia. 1,1-Difluoroethane can affect the heart causing irregular rhythm and skipped heartbeat.

The flammability potential for 1,1-difluoroethane is high. It will readily ignite from any source of ignition, including static electricity and friction from escaping gas. Flammable mixtures are formed with air. Vapors are heavier than air, may travel to distant sources of ignition and flash back. Initial downwind evacuation should be considered for at least one-half (1/2) mile if product is leaking but not on fire. If container of 1,1-difluoroethane is exposed to direct flame or a fire becomes uncontrollable, evacuate for one (1) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble (.28%)
Solubility in Other Chemicals: Unavailable
Specific Gravity: 1.004 at -13°F (-25°C)
Vapor Density (Air=1): 2.4
Boiling Point: -16.6°F (-27°C)
Melting Point: -179°F (-117°C)
Freezing Point: See melting point
Molecular Weight: 66.05
Heat of Combustion: Unavailable
Vapor Pressure: 4,550 mm Hg at 77°F (25°C)
Flash Point: < -58°F (-50°C), burns at all ambient temperatures.
Autoignition Temperature: 849°F (454°C)
Burning Rate: Unavailable
Flammable Limits: 3.7% (LEL) - 18% (UEL)
Stability: Stable. Avoid sparks or flame source that can cause ignition.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Incompatible with hot metals and moisture; strong oxidizing agents; magnesium, aluminum and their alloys; brass and steel.

IDENTIFICATION

Shipping Name(s): 1,1-Difluoroethane (USDOT & IMO); Refrigerant gas R152a (USDOT)
Synonyms and Tradenames: Difluoroethane; Difluoroethane, 1,1-; Ethylidene difluoride; Ethylidene fluoride; Fluorocarbon 152a; Freon 152a; Genetron 100; Genetron 152a; R-152a; Ethylene fluoride
CAS Registry No: 75-37-6
Chemical Formula: $C_2H_4F_2$
Constituent Components (% each): 100%
UN/NA Designation: UN1030
IMO Designation: 2.1, Flammable gases
RTECS Number: KI1410000
NFPA 704 Hazard Rating (Gas): 1 (Health): 4 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Compressed gas or liquid
Physical Form as Released: Gas or liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless to slight ethereal odor
Common Uses: It is used as a cooling agent, in aerosols and in the manufacture of other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Typically odorless

Unusual Hazards: Highly flammable. Liquid form of 1,1-difluoroethane can cause frost-like burns. Inhalation of large concentration of gas may cause dizziness, drowsiness and unconsciousness.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable (Simple asphyxiant)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity and incompatible materials.

HEALTH HAZARDS

Potential Health Hazards: 1,1-Difluoroethane has no toxicity reported except that it may asphyxiate and cause frost-like burns with skin or eye contact. 1,1-Difluoroethane can affect the heart causing irregular rhythm and skipped heartbeat.

Hazards of Skin or Eye Contact: Eye or skin contact with liquid can cause frostbite type injury due to rapid cooling from evaporation. Prolonged or repeated contact can cause drying and cracking of the skin.

Hazards of Inhalation: Breathing 1,1-difluoroethane can irritate the nose and throat causing coughing and wheezing. Moderate concentrations may cause headache, drowsiness, dizziness and unconsciousness. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema) with severe shortness of breath. In confined areas, vapors can accumulate and cause unconsciousness and death due to displacement of oxygen (simple asphyxia).

Hazards of Ingestion: Ingestion is unlikely due to physical properties of 1,1-difluoroethane. Contact with the extremely cold liquid would, at the very least, cause frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 3.7%

Upper Flammable Limit: 18%

Behavior in Fire: Flammable gas. It will readily ignite if exposed to sources of heat and flame. Vapors may be heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity and other potential ignition sources at locations distant from the point of release. Containers exposed to prolonged fire or heat may violently rupture.

Hazardous Decomposition Products: Products of combustion may include carbon monoxide, carbon dioxide, hydrogen fluoride, hydrofluoric acid, phosgene and/or carbonyl fluoride. Toxic products may become corrosive in the presence of moisture.

EXPLOSION HAZARDS

Explosive Potential: High. Severe explosion hazard when exposed to heat, flame or oxidizers. Explosive when mixed with air. Escaping gas may ignite spontaneously due to friction. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged fire or heat may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

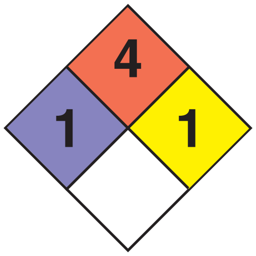
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Always wear thermal protective clothing when handling refrigerated/cryogenic liquids.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1030

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: 1,1-Difluoroethane is relatively inert. Contact of liquid with skin or eyes may cause frost-like burns. Inhalation is the major route of exposure and can cause headache, drowsiness, dizziness and unconsciousness.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact with cold liquid, remove contaminated clothing and wash affected body areas with large amounts of warm water. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming such as wrapping effected area gently in blankets if warm water is not available. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Ingestion is unlikely. If liquid is ingested, frostbite-like injury can occur. Drink warm water to relieve frostbite, but do not induce vomiting without medical supervision. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

FIRE RESPONSE

Extinguishing Agents: Stop the flow of gas. Use carbon dioxide, dry chemical or water spray (fog). A fine water spray or fog can be used on large discharges to control the fire by preventing its spread and absorbing some of its heat. Do not apply water streams directly on a 1,1-difluoroethane pool fire since this may greatly and/or suddenly increase the rate of burning and/or the size of the fire by increasing the vaporization rate of the liquid.

Extinguishing Techniques: Stay upwind. Secure ignition sources in the immediate spill area and downwind. Approach fire from upwind to avoid flammable vapors. Wear positive-pressure, self-contained breathing apparatus and appropriate protective clothing. Wear full chemical and/or thermal protective suit as necessary and appropriate. Move container from fire area if no risk. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to prolonged heat, such as from a direct flame. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable gases.

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)

SPILL RESPONSES

General Information: 1,1-Difluoroethane is highly flammable. Eliminate all sources of ignition. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with very cold gas or liquid unless properly equipped for such contact. If transfer operations are anticipated, only use equipment specifically designed for use with the material being transferred and its temperature and pressure at the time of transfer. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows and depressions. Use combustible gas detectors prior to entering any potentially affected confined space or any low area in which cold, heavier-than-air gases or vapors may have accumulated. Do not direct water at a venting safety device since this may cause icing to occur. Note that the rapid escape of gas under pressure may generate a static electricity charge that could cause gas ignition. Be advised that the very low temperatures associated with 1,1-difluoroethane can cause many materials to become brittle and subject to sudden failure or cracking. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ mile in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)

TECHNIQUE

FOAM . . . Foam can be applied in large volumes to the surface of confined pools to slow the rate of vapor evolution, particularly after boiling pools have quieted down. Be advised of the possibility of a short-term increase in vapor evolution when the foam (which will be warmer than the liquid) is first applied.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to the soil, initially liquid will rapidly boil, generate a large amount of flammable vapors and freeze the ground it is in contact with. Much later, the liquid will reach a less rapid boiling rate thereby evolving less vapors. Containment dikes or barriers using soil, sand or other related materials may be effective to confine the spill to a limited area thereby reducing the surface area and volume of gas generated until liquid evaporates. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material.

CONSEQUENCE

Contained material will take longer to evaporate.

MITIGATION

Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater, which may overfill diked areas.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches. Reducing the spill surface area may decrease vapor generation.

CONSEQUENCE

Contained material will take longer to evaporate. Mechanical equipment could ignite material.

MITIGATION

Continually monitor for flammable conditions. Dig a deep pit with small area to reduce vapor generation rate. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill pits.

TECHNIQUE

MECHANICAL REMOVAL . . . Most if not all the product will rapidly vaporize from soil surfaces once the bulk of the liquid has vaporized. Mechanical equipment can be used to grade frozen ground to eliminate any pockets of material.

CONSEQUENCE

Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Continually monitor for flammable conditions.

1,1-DIFLUOROETHANE

Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake and monitor situation.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

MONITOR THE SITUATION . . . 1,1-Difluoroethane may vigorously and rapidly boil off the surface of water bodies.

CONSEQUENCE

Flammable concentrations will exist in the area before time and distance from the area of the spill has diluted the gas.

MITIGATION

Evacuate area affected and continually monitor until conditions are safe.

March 1995

DIISOBUTYLENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Diisobutylene is a clear colorless liquid hydrocarbon with an odor comparable to gasoline or petroleum. It is used to make antioxidants, surfactants, plasticizers, lube additives, and other chemicals. Essentially insoluble in water, diisobutylene will float to form a surface slick. Its flash point is in the range of 10-23°F, thus indicating that it can be easily ignited under most ambient temperature conditions. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6 pounds per gallon.

Diisobutylene does not react with water or other common materials but is reactive with a variety of chemicals and certain active metals. The toxicity of the substance is generally considered low to moderate via various routes of exposure but is not very well defined. Toxic vapors may evolve if diisobutylene is heated to the point of decomposition. Downwind evacuation should be considered on a case by case basis if diisobutylene is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Essentially insoluble.
Solubility in Other Chemicals: Data unavailable.
Specific Gravity (Liquid): 0.715 at 68°F (20°C)
Boiling Point: 214-219°F (101-104°C) at 1 atm.
Melting Point: -150°F (-101°C)
Freezing Point: -136.3°F (-93.5°C)
Molecular Weight: 112.22
Heat of Combustion: -10500 cal/g
Vapor Pressure: 75 mm Hg (1.45 psia) at 100°F (37.8°C)
Flash Point: 10 to 23°F (-12.2 to -5°C), closed cup
Autoignition Temperature: 736-788°F(391-420°C)
Burning Rate: 7.9 mm/minute
Stability: Stable
Corrosiveness: Data unavailable.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with mineral acids, aldehydes, certain active metals, and strong oxidizers.

IDENTIFICATION

Shipping Name: Diisobutylene (USDOT and IMO)
Synonyms and Tradenames: Isomeric compounds; 2,4,4-trimethylpentene; diisobutene; 2,4,4-trimethyl-1-pentene; alpha-diisobutylene; beta-diisobutylene; 2,4,4-trimethylpentene-1, 2,4,4-trimethylpentene-2. (Note: product may be mixture of isomers.)
Chemical Formula: $(CH_3)_3CCH_2C(CH_3){=}CH_2$
Constituent Components(% each): 98.7-99.9% pure with isobutylene as probable major contaminant.
UN/NA Designation: UN2050
IMO Designation: 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Like gasoline or petroleum
Common Uses: Mfg. of antioxidants, surfactants, lube additives, plasticizers, rubber chemicals, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DIISOBUTYLENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Moderately volatile flammable liquid. Vapors may be heavier than air and may travel to a source of ignition and flashback. May evolve toxic vapors when heated to decomposition.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, open flames, and sparks; runoff to sewers or water; contact with incompatible materials; inhalation, ingestion, and direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air but diisobutylene may be considered a mild inhalative toxin in acute exposures.

Hazards of Skin or Eye Contact: Liquid diisobutylene is considered slightly to moderately irritating to the skin and eyes.

Hazards of Inhalation: Vapors of diisobutylene are irritating to the eyes, nose, and throat. High concentrations in air may cause narcosis involving dizziness, headache, difficult breathing or loss of consciousness. Very high levels may cause asphyxiation.

Hazards of Ingestion: Ingestion may cause nausea and vomiting.

FIRE HAZARDS

Lower Flammable Limit: 0.8%

Upper Flammable Limit: 4.8%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: There is some potential for containers to rupture violently in fires. Explosions may also result if vapors are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Vapor exposure may cause eye, nose, and throat irritation, dizziness, headache, difficult breathing, or loss of consciousness. Liquid is irritating to the skin and eyes. Ingestion may cause nausea and vomiting.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

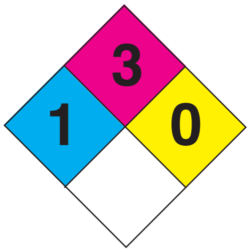
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

2050

DIISOBUTYLENE

Class 3 (Flammable Liquid)



FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Use explosion-proof equipment where necessary. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of diisobutylene may result in rupture or explosion of boilers or industrial process equipment. Take into account while planning the response that diisobutylene is a flammable liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Diisobutylene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of diisobutylene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Diisobutylene spills may expose downwind areas to toxic or flammable concentrations if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to diisobutylene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of diisobutylene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

DIISOBUTYLENE
Class 3 (Flammable Liquid)

TECHNIQUE

FOAM ... Firefighting foam applied to the surface of liquid pools may slow the release of diisobutylene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Diisobutylene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained diisobutylene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, straw, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the over all volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

DIISOBUTYLENE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS ... Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across streams and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled products.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS ... Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

DIISOBUTYLENE
Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION ... Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING ... Oil spill skimming devices may be deployed to recover floating diisobutylene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION ... Straw, hay, peat, or commercial sorbent materials compatible with diisobutylene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

July 1994

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Diisopropylamine is a clear, colorless liquid with a strong ammonia-like odor. It has a low flash point and its vapors may travel a considerable distance to a source of ignition. Vapors are easily ignited by flame, sparks, or static discharges. The vapors are denser than air and may concentrate in low lying areas or confined spaces. Diisopropylamine is completely soluble in water and, when mixed with water, will dilute and disperse throughout the water column. It is not particularly reactive unless mixed with strong acids or oxidizers. Diisopropylamine is not subject to violent polymerization. Its vapors can ignite explosively, particularly in confined settings. Liquid diisopropylamine weighs approximately 6 pounds per gallon.

Diisopropylamine is toxic by ingestion, inhalation, and absorption. On direct contact, it will produce strong irritation or burns to the skin, eyes or other mucous membranes. If vapors are inhaled, diisopropylamine will cause irritation to the respiratory tract. Severe inhalation exposures may result in the development of pulmonary edema. Ingestion will likely produce nausea, vomiting, abdominal distress, and diarrhea. Diisopropylamine is a skin and respiratory sensitizer and repeat exposures may result in the development of an allergic response. Persons previously sensitized to diisopropylamine may be at increased risk from exposures.

Diisopropylamine is used as a chemical intermediate in the manufacture of pharmaceuticals, pesticides, and as a laboratory reagent.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble.

Solubility in Other Chemicals: Soluble in most organic solvents.

Specific Gravity (Liquid): 1.54

Vapor Density (Air =1): 3.5

Boiling Point: 83.4 to 84.1°C (182.12 to 183.38°F)

Melting Point: - 61 to - 96.3°C (- 77.8 to - 141.34°F)

Freezing Point: - 61 to - 96.3°C (- 77.8 to - 141.34°F)

Molecular Weight: 101.19

Heat of Combustion: - 11,000 cal/gm

Vapor Pressure: 60 - 70 mmHg @ 20°C (68°F)

Flash Point: -13.3°C (8°F) CC; - 6.1°C (21°F) OC

Autoignition Temperature: 316 to 402.2°C (600.8 to 755.96°F)

Burning Rate: Unavailable.

Stability: Stable, not subject to polymerizarion.

Corrosiveness: Alkaline liquid, corrosive to skin, corrosive to copper and copper alloys, zinc and zinc alloys.

Reactivity with Water: Completely soluble, no reaction.

Reactivity with Other Chemicals: Reactive with oxidizers, acids, anhydrides, and acid chlorides.

IDENTIFICATION

Shipping Names: Diisopropylamine.

Synonyms and Tradenames: N-(1-Methylethyl)-2-propanamine; 2-propanamine, N-(1-methylethyl), DIPA; DIPN; CAS 108-18-9.

Chemical Formula: $[(CH_3)_2CH]_2NH$

Constituent Components (% each): 100% diisopropylamine.

UN/NA *Designation:* UN1158

IMO Designation: 3.2, flammable liquid.

Physical State as Shipped: Liquid.

Physical State as Released: Liquid.

Color of the Shipped Material: Clear, colorless, waterwhite.

Odor Characteristics: Amine odor, ammonia-like, irritating.

Common Uses: Chemical intermediate and catalyst. Used in the manufacture of pesticides and pharmaceuticals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424- 9300 OR (202) 483- 7616

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.85 ppm (3.4 mg/m^3)

Unusual Hazards: Diisopropylamine is flammable and will irritate or burn tissues. It is a skin and respiratory sensitizer and repeated exposures may result in the development of allergic reactions.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): 5 ppm (20 mg/m^3) skin, OSHA PEL - TWA

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Toxic by inhalation and skin absorption. Direct contact with diisopropylamine or direct contact with contaminated materials is the most likely route of exposure. It is an irritant and a sensitizing agent. It may act as a contact allergen in sensitive individuals. There is an increased risk to persons with pre-existing conditions such as known sensitivity to diisopropylamine, asthma or allergies.

Hazards of Skin and Eye Contact: Exposure to vapors may be irritating. Exposure to liquid or mists can cause corneal damage and transient corneal edema. Severe exposures may result in burns to eye tissues. May cause irritation to the skin and, in severe, prolonged exposures, may cause burns to the skin. Diisopropylamine can be absorbed through intact skin on repeated or prolonged exposures. It is a skin sensitizer and repeated exposures may result in the development of an allergic reaction. Sensitive individuals may develop itching or rash on exposure to small amounts of diisopropylamine.

Hazards of Inhalation: May cause irritation to respiratory mucous membranes, coughing, wheezing, or other signs of irritation. By analogy with other amines, toxic effects may include nausea, faintness, headache and anxiety. As a group, amines tend to affect the sympathetic nervous system. Exposures may aggravate pre-existing respiratory conditions such as asthma or allergies. In sensitized individuals, diisopropylamine may elicit an allergic response such as development of a skin rash or various degrees of respiratory response such as wheezing and asthma. Allergic responses will vary depending on the sensitivity of the individual exposed but could become life threatening. Exposure to extremely high concentrations may result in lung damage.

Hazards of Ingestion: May result in severe irritation or burns of the mouth, throat, stomach and associated tissue, depending on the concentration. Exposures may cause nausea, vomiting, and gastrointestinal distress. Ingestion of diisopropylamine may produce symptoms including dizziness, light headedness, and nervousness or anxiety.

FIRE HAZARDS

Lower Flammable Limit: 0.8%

Upper Flammable Limit: 7.1 %

Behavior in Fire: Smoke may contain toxic and irritating vapors. Vapors are heavier than air and will tend to collect in confined spaces or low lying areas. Vapor concentrations may present a source for ignition and flashback to the source under circumstances favoring vapor buildup. Sealed containers, exposed to heating, may rupture.

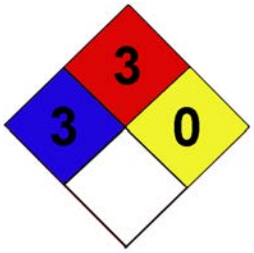
Hazardous Combustion Products: Ammonia, unburned product, oxides of carbon and other constituents.

EXPLOSION HAZARDS

Explosiveness: Vapor mixtures within the flammable limits may ignite explosively. Not subject to violent polymerization.

1158

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with diisopropylamine liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully encapsulating suits made of compatible material are appropriate for most large spill situations. Data are limited, however, nitril rubber, teflon, and viton have been suggested as suitable materials of construction.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

FIRST AID

Nonspecific Symptoms: Irritation or bums to skin, eyes and respiratory tract. Irritation or burns to mouth, throat and stomach, gastrointestinal distress, nausea, vomiting, dizziness and difficulty breathing in cases involving accidental ingestion.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure resulting in increased respiratory distress with time. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance immediately. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists or exposure is severe.

First Aid for Ingestion: Do not induce vomiting. If victim is conscious, administer large quantities of water or milk. Never give anything by mouth to an unconscious person. Seek medical assistance immediately. Be alert to signs of difficulty in breathing, nervousness or other indications of systemic toxicity.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, compatible mufti-purpose foam, carbon dioxide, or dry chemical extinguishing agents. Water may be ineffective as a firefighting agent but may be used to dilute mixtures to a non-flammable concentration. Diluting with water will add significantly to the spill volume.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with diisopropylamine. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water may be ineffective. Carbon dioxide, or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam is appropriate for fires involving diisopropylamine.

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)

SPILL RESPONSES

General Information: Diisopropylamine is highly flammable and easily ignited. Response strategies should account for the fact that flammable vapors are heavier than air and may travel some distance to a source of ignition. Intact containers containing diisopropylamine may rupture violently if exposed to extreme heat or fire. When spilled in water, diisopropylamine is completely soluble and will tend to disperse in the water column. All spill responses should consider that until the product is removed to safe containers, ignition is possible. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of diisopropylamine may result in explosion. Use only spark proof tools when working around diisopropylamine. Be sure lighting systems are of explosion proof design (intrinsically safe). Be alert to sources of ignition and static electrical discharge. Ground all transfer equipment to prevent static charge buildup.

AIR SPILL

TECHNIQUE

EVACUATION... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Diisopropylamine spills may expose downwind areas to toxic or flammable concentrations depending on the temperature and the size of the spill. Increased spill surface will result in increased vapor generation.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION... Diisopropylamine may not evolve large amounts of hazardous airborne contaminants depending on the air temperature and the size of the spill. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of diisopropylamine vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

MITIGATION

Remove spilled diisopropylamine as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for diisopropylamine vapor concentration.

TECHNIQUE

WATER FOG OR SPRAY... Water fog applied to diisopropylamine vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks:

CONSEQUENCE

Water runoff may contain diisopropylamine from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)

AIR SPILL *(CONTINUED)*

TECHNIQUE

FOAM... Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of diisopropylamine vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with diisopropylamine.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Spills of diisopropylamine liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Diisopropylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking diisopropylamine.

CONSEQUENCE

Diisopropylamine may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION... Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Diisopropylamine is highly flammable and explosion proof (intrinsically safe) equipment must be used.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

DIISOPROPYLAMINE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

TECHNIQUE

ABSORPTION... Spilled diisopropylamine can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbents.

CONSEQUENCE

Sorbents will become contaminated with diisopropylamine and will pose the same hazards as the spilled product. Use of sorbents will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbents to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL... Soil contaminated with diisopropylamine may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines. Explosion proof (intrinsically safe) equipment must be used due to the high flammability of diisopropylamine.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Removed materials may pose a continued risk of fire or contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE... Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION... Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

January 1990

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Diisopropyl ether is a colorless, highly volatile, and flammable liquid with a sweet, pungent, pleasant, and slightly sharp odor resembling the chemical commonly referred to as "ether". It is used as a solvent for oils, waxes and resins, as an extractant, and in paint and varnish removers and rubber cements. Only slightly soluble in water and lighter, it can be expected to form a surface slick that dissolves at a relatively slow rate while also evaporating from the water surface. Its flash point of –18°F indicates that diisopropyl ether is easily ignited under all ambient temperature conditions. Vapors of diisopropyl ether may be heavier than air, particularly in warm weather, and may in any case travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6–6.1 pounds per gallon.

Diisopropyl ether does not react with water and is generally stable in normal transportation. It tends to form unstable and explosive peroxides when exposed to air for a time under various conditions, however, and may react vigorously or ignite (explosion must be considered a possibility) in contact with a variety of strong oxidizing agents. Known to react violently with propionyl chloride, the product is not generally considered corrosive to metals but may attack some forms of plastics, rubber, and coatings. Toxicity by all potential routes of exposure is generally low, but the volatility of diisopropyl ether indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

If diisopropyl ether is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 1.2 g/100 g water, 0.02% wt, or 9000 mg/l at 68°F (20°C); 0.65% wt at 77°F (25°C); reported values vary.

Solubility in Other Chemicals: Soluble in alcohol, acetone, benzene, chloroform, ethyl ether, and most other organic solvents.

Specific Gravity (Liquid): 0.724–0.730 at 68°F (20°C)

Boiling Point: 153.5–156.2°F (67.5–69°C) at 1 atm.

Melting Point: –124.4°F to –122.6°F (–86.9 to –85.9°C) or –76°F (–60°C); reported values vary

Freezing Point: See melting point

Molecular Weight: 102.18

Heat of Combustion: –9390 cal/g

Vapor Pressure: 120 –130 mm Hg (2.32–2.51 psia) at 68°F (20°C)

Flash Point: –18°F (–27.8°C), closed cup; –15°F (–26.1°C), open cup

Autoignition Temperature: 830°F (443°C)

Burning Rate: 5.0 mm/minute

Stability: Stable in normal transportation but tends to form unstable explosive peroxides which precipitate as crystals in prolonged presence of air, especially if evaporated to dryness or heated. These peroxides may explode spontaneously or when heated or shaken. A partially filled old bottle on a shelf is known to have exploded when its stuck cap was freed.

Corrosiveness: Specific data unavailable; expected to be generally noncorrosive to metals but able to attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: May react vigorously or ignite (explosion must be considered a possibility) in contact with a variety of strong oxidizing agents. Reported to react violently with propionyl chloride.

IDENTIFICATION

Shipping Names: Diisopropyl ether (USDOT and IMO)

Synonyms and Tradenames: Isopropyl ether; diisopropyl oxide; 2,2'-oxybispropane; 2-isopropoxypropane

Chemical Formula: $(CH_3)_2CHOCH(CH_3)_2$

Constituent Components (% each): 94% or more pure with small amount of p-benzylaminophenol, hydroquinone, or other inhibitor added to prevent peroxide formation in normal transportation.

49 STCC: 49 081 95

UN/NA Designation: UN1159

IMO Designation: 3.1, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Like ether; sweet; pungent; slightly sharp; pleasant

Common Uses: Solvent for oils, waxes, and resins; extractant; in paint and varnish remover; in rubber cements.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.017–0.053 ppm

Unusual Hazards: Highly volatile and flammable liquid with heavier than air vapors. Tends to form explosive peroxides when exposed to air for a time or when evaporated to dryness or heated.

Short Term Exposure Limits (STEL): 310 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 250 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with air or incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and some distance downwind. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid diisopropyl ether may result in drying and cracking of the skin due to the defatting action of the product. Brief contact pauses mild irritation, if any. Contact of liquid diisopropyl ether with the eyes may cause irritation and possibly minor injury according to most authorities, but at least one maker of the product claims the irritation may be severe. Do not wear contact lenses when working with diisopropyl ether.

Hazards of Inhalation: Exposure to high levels of diisopropyl ether vapors in air may cause irritation of the eyes, nose, and throat. Inhalation of very high concentrations in air may cause narcosis and central nervous system depression. Reported effects for this product include dizziness, weakness, fatigue, nausea, headache, tremors, anesthesia, unconsciousness, and possibly death in severe cases. Exposure to 30,000 ppm for 60 minutes was survived by monkeys, rabbits, and guinea pigs with signs of anesthesia in laboratory experiments. Similar experiments resulted in death of the animals when the exposure involved 60,000 ppm for 60 minutes. A level of 16,000 ppm was lethal to rats in four hour exposures. Exposure of humans to 800 ppm for five minutes resulted in irritation of the eyes and nose and some respiratory discomfort in sensitive individuals.

Hazards of Ingestion: Diisopropyl ether is generally of low toxicity by ingestion. Intake of a significant amount, however, may result in intense and rapid intoxication involving gastrointestinal irritation, nausea, vomiting, diarrhea, various symptoms of inhalation, and possibly death due to respiratory failure.

FIRE HAZARDS

Lower Flammable Limit: 1.4%

Upper Flammable Limit: 7.9% or 21% (most sources give 7.9%)

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapors upon release. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined; said to produce acrid and irritating smoke and fumes, carbon monoxide, carbon dioxide, and possibly other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Exposure to air may produce unstable and explosive peroxide crystals with time.

1159

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Clothing materials listed as potentially compatible by various authorities include chlorinated polyethylene, polyvinyl alcohol, neoprene, nitrile rubber, and Viton.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (10,000 ppm or less) or a chemical cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, or skin; symptoms of narcosis or central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, Halon, alcohol foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of diisopropyl ether may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment. Take into account while planning the response that diisopropyl ether is a volatile flammable liquid. Exclude air from recovered product if at all possible. Pay special attention to the fact that unstable and explosive peroxides may form with time if diisopropyl ether is exposed to air, particularly if the product is evaporated to dryness or heated. Where necessary, peroxides may be removed by treatment with a sodium sulfite solution. Consult qualified expert for advice. Be especially careful with aged containers of diisopropyl ether that may have formed peroxides and which may be very unstable. Similarly, keep in mind that peroxides may form in containment and cleanup equipment that is contaminated with diisopropyl ether and not properly decontaminated. This warning applies to all response techniques listed below.

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Diisopropyl ether spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Diisopropyl ether spills may not evolve large amounts of toxic airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed or fully evaporates, particularly for smaller spills and where flammability hazards are limited.

CONSEQUENCE

Hazardous levels of diisopropyl ether in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to diisopropyl ether vapors in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain small amounts (if any) of diisopropyl ether from contact with its airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of diisopropyl ether vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE .

CONTAINMENT DIKES . . . Diisopropyl ether may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained diisopropyl ether may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, vermiculite, perlite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Diisopropyl ether is quite volatile and will evaporate from the water surface fairly rapidly in all but cold weather. Nevertheless, its solubility is water is limited. Time may permit the application of the oil spill type containment and cleanup techniques listed below for floating surface slicks in some cases when containment or recovery is considered desirable.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

DIISOPROPYL ETHER
Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water-hose streams, or small boat propeller wash.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating diisopropyl ether.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with diisopropyl ether may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Anhydrous dimethylamine is a colorless flammable gas that is shipped under pressure as a liquid and has a fishy odor resembling ammonia. It is used for making leather, rubber, detergents; pesticides, plastics, pharmaceuticals, photographic developers, and a variety of other chemicals and products. Its flash point of 20°F indicates that the product is easily ignited under a wide range of ambient temperature conditions. Its boiling point of 44.4°F and its considerable vapor pressure indicate that dimethylamine will boil or otherwise evaporate rapidly upon release. Nevertheless, since the product is fully soluble in water, spills onto water may result in some amount of dissolution. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.6 pounds per gallon at its boiling point.

Anhydrous dimethylamine does not react with water or many other common materials in a hazardous fashion and is stable in normal transportation. The product is reactive with a variety of chemicals, however, and may form an explosive mixture with mercury. In addition, it is corrosive to various metals, may attack some forms of plastics, rubber and coatings, and is irritating and corrosive to bodily tissues. Products of combustion may include toxic oxides of nitrogen and other toxic constituents.

Downwind evacuation should be considered if dimethylamine is leaking but not on fire. If fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in ethanol and ether
Specific Gravity (Liquid): 0.671 at 68°F (20°C)
Boiling Point: 44.4°F (6.9°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –134°F (–92.2°C)
Molecular Weight: 45.08
Heat of Combustion: –9340 cal/g
Vapor Pressure: 1.72 atm (25.27 psia) at 68°F (20°C)
Flash Point: 20°F (–6.7°C), closed cup
Autoignition Temperature: 756°F (402°C)
Burning Rate: 4.5 mm/minute
Stability: Stable
Corrosiveness: Corrosive to copper and its alloys, aluminum, zinc and galvanized surfaces. May attack some forms of plastics, rubber, and coatings.
Reactivity with Water: No reaction, but evolves some heat. Solution is alkaline and corrosive. Eventually degrades to ammonia in water.
Reactivity with Other Chemicals: Reacts with mercury, strong oxidizers, strong acids, halogens, some cleaning solutions, and nitrosating agents like sodium nitrite. Reaction with mercury may be explosive.

IDENTIFICATION

Shipping Names: Dimethylamine, anhydrous (USDOT); dimethylamine (IMO).
Synonyms and Tradenames: N-Methylmethanamine; DMA.
Chemical Formula: $(CH_3)2NH$
Constituent Components(% each): 99.5% pure
49 STCC: 49 055 10
UN/NA Designation: UN1032
IMO Designation: 2.1, flammable gas
Physical State as Shipped: Compressed liquefied gas
Physical State as Released: Gas or liquid (boils at 44.4° F)
Color of the Shipped Material: Colorless
Odor Characteristics: Fishy, pungent, strongly ammoniacal
Common Uses: Leather tanning; rubber vulcanization accelerator; mfg. detergents, pharamaceuticals, pesticides, photographic developer, plastics, and other chemicals and products; used as solvent and polymer stabilizer; component of rocket propellant and other fuels.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424`9300 OR (703) 527-3887 (COLLECT)

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.01–0.06 ppm

Unusual Hazards: Extremely volatile and flammable substance with heavier than air vapors that may travel a considerable distance to a source of ignition and flash back. Vapors may be toxic over considerable downwind distances. Product may explode in contact with mercury.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and over considerable downwind distances. Ingestion and direct contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of liquid anhydrous dimethylamine or its concentrated vapors with the skin may rapidly result in chemical burns and possibly frostbite. Contact with the eyes may cause irritation, impaired vision, and/or severe corneal injury.

Hazards of Inhalation: Vapors of dimethylamine are severely irritating to the lungs, nose, throat, and eyes, and may cause coughing, sneezing, and difficult breathing. High concentrations in air may result in pulmonary edema and liver injury with possibly severe consequences. Very high concentrations may cause asphyxiation due to displacement of air.

Hazards of Ingestion: Ingestion is unlikely but may result in burns of the mouth, throat, and stomach.

FIRE HAZARDS

Lower Flammable Limit: 2.8%

Upper Flammable Limit: 14.4%

Behavior in Fire: Flammable compressed or liquefied gas. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flashback. Containers may rupture violently in fire.

Hazardous Combustion Products: Include toxic oxides of nitrogen and other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Contact with mercury may result in formation of explosive mixtures. Containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with very high gas or vapor concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister for dimethylamine or a dimethylamine cartridge respirator with a full facepiece within the use limitations of these devices.

1032

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas. Carbon dioxide, dry chemical, alcohol foam, and water spray may be used on fires involving water solutions of dimethylamine.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of warm water to exposed pools of liquid anhydrous dimethylamine may increase vapor evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected. personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile, flammable, and corrosive nature of dimethylamine into account while planning the response. Do not use equipment containing mercury. Note that accumulations of heavy gas may persist in pits, hollows, and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Anhydrous dimethylamine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to anhydrous dimethylamine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not let it contact pools of liquid anhydrous dimethylamine as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain dimethylamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of cold water to liquid anhydrous dimethylamine may eventually slow the release of vapors or fumes into the atmosphere. The response has very special risks and is better suited to smaller spills.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Anhydrous dimethylamine may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained anhydrous dimethylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Wet or warm sorbents may increase vapor evolution from contained pools of liquid anhydrous dimethylamine.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert. Proceed with caution if sorbents are wet or warm.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involve additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

` Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

DIMETHYLAMINE, ANHYDROUS
Division 2.1 (Flammable Gas)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. Cation exchanges may be used on neutral or acidic solutions.

CONSEQUENCE

Recovery of adsorbents may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2003

2-DIMETHYLAMINOETHANOL

Class 8 (Corrosive Material)

GENERAL INFORMATION

2-Dimethylaminoethanol is a flammable, colorless to pale liquid that has a pungent, amine-like odor. The product is a hygroscopic liquid and is fully soluble in water. It is also soluble in ethyl alcohol, acetone, ether and benzene. It is used in medications and for making dyestuffs, textiles, pharmaceuticals and emulsifiers in paints and coatings. It is flammable and highly reactive with oxidizing agents, acids, acid anhydrides, acid chlorides, cellulose nitrate, isocyanates, nitrous acid, nitrites, copper, copper alloys, zinc and galvanized iron and steel. The product weighs approximately 7.4 pounds per gallon.

2-Dimethylaminoethanol is stable in normal transportation. It may be slowly oxidized by air, turning yellow and then brown. The product and its vapors are highly corrosive to all bodily tissue. Toxic vapors of nitrogen oxides, carbon monoxide and carbon dioxide are generated when product is heated to decomposition. Note that fumes and vapors may be heavier than air.

Initial downwind evacuation should be considered on a case by case basis if the product is leaking and large amounts of fumes are generated. If container of 2-dimethylaminoethanol is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble
Solubility in Other Chemicals: Soluble in all proportions in ethyl alcohol, acetone, ether and benzene.
Specific Gravity (Liquid): 0.887
Vapor Density: 3.1
Boiling Point: 282°F (139°C)
Melting Point: -94°F (-70°C)
Freezing Point: See melting point
Molecular Weight: 89.14
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): .48
Vapor Pressure: 6 mm Hg at 68°F (20°C); 100 mm Hg at 178.7°F (81.5°C)
Flash Point: 100°F (38°C) c.c.; 106°F (41°C) 41°C o.c.
Autoignition Temperature: 563°F (295°C)
Burning Rate: Unavailable
Flammable Limits: 1.9% (LFL) - 13.4% (UFL)
Stability: Stable. It may be slowly oxidized by air, turning yellow and then brown.
Polymerization Potential: Will not occur
pH: 11-12
Reactivity with Water: Although it is not reactive with water it is a hygroscopic liquid.
Reactivity and Incompatibility: Reacts with oxidizing agents, acids, acid anhydrides, acid chlorides, cellulose nitrate, isocyanates, nitrous acid, nitrites, copper, copper alloys, zinc, galvanized iron and galvanized steel. May react with carbon dioxide in the air to form salts.

IDENTIFICATION

Shipping Name(s): 2-Dimethylaminoethanol (USDOT & IMO)
Synonyms and Tradenames: Dimethylaminoethanol; DMAE; beta-Dimethylaminoethyl alcohol; Dimethylethanolamine; beta-hydroxyethyldimethylamine; Deanol; N,N-Dimethyl-2-Hydroxyethylamine; N,N-Dimethylaminoethanol; N,N-Dimethylethanolamine; N,N-dimethyl-N-(2-hydroxyethyl)amine; N,N-Dimethyl-N-ethanolamine
CAS Registry No.: 108-01-0
Chemical Formula: $HOCH_2CH_2N(CH_3)_2$
Constituent Components (% each): Typically 70 - 100%
UN/NA Designation: UN2051
IMO Designation: 8, Corrosive substances
RTECS Number: KK6125000
NFPA 704 Hazard Rating: 2 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless to pale yellow liquid
Odor Characteristics: Pungent, amine-like odor
Common Uses: It is used as a medication in the treatment of behavioral problems in children. It is also used in making dyestuffs, textiles, pharmaceuticals and emulsifiers in paints and coatings.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

2-DIMETHYLAMINOETHANOL

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.015 ppm - 0.25 ppm

Unusual Hazards: Highly corrosive. Product is a hygroscopic and flammable liquid.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, fire or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Vapors are extremely corrosive to the eyes, brief contact will be extremely irritating and can cause permanent damage including blindness.

Hazards of Inhalation: Breathing vapors can irritate the nose, throat and lungs causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema). Can cause headache, muscle tenderness, restlessness, increased irritability, lack of sleep, weight loss and possibly death.

Hazards of Ingestion: Ingestion may result in severe burns of the mouth, throat, pharynx and gastrointestinal tract. May cause nausea, vomiting drowsiness, dizziness, incoordination, unconsciousness and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 1.9%

Upper Flammable Limit: 13.4%

Behavior in Fire: Product is flammable. May generate large quantities of corrosive fumes or vapors upon release.

Hazardous Combustion Products: Products of combustion include carbon monoxide, carbon dioxide and nitrogen oxide.

EXPLOSION HAZARDS

Explosive Potential: Contact with oxidizers may result in fire or explosion. Product is sensitive to static discharge.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

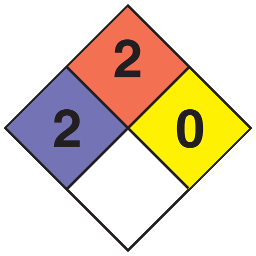
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Butyl rubber and nitrile rubber are reported to have a resistance to breakthrough longer than 8 hours. 4H^{TM} is reported to have a resistance to breakthrough longer than 4 hours. Natural rubber, neoprene, polyvinyl chloride and Viton$^{®}$ are NOT RECOMMENDED for use as they have a reported resistance to breakthrough of less than 1 hour.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted acid gas canister and high efficiency particulate filter or a high efficiency particulate filter respirator with a full facepiece.

2051

2-DIMETHYLAMINOETHANOL

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Eye Contact: Flush eyes immediately with water for at least 30 minutes, while lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide or alcohol-resistant foam.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire-exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Product is a highly corrosive, flammable liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that product is highly corrosive and reactive. Use explosion-proof and spark-proof equipment where necessary. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . 2-Dimethylaminoethanol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the product is not fuming or small quantities have spilled.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

2-DIMETHYLAMINOETHANOL
Class 8 (Corrosive Material)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to corrosive and/or toxic concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of chemical from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Alcohol-resistant foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . 2-Dimethylaminoethanol may be confined by building dikes using soil, dry sand or other materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible, impervious materials.

2-DIMETHYLAMINOETHANOL

Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, noncombustible compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

2-DIMETHYLAMINOETHANOL

Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

DIMETHYLDICHLOROSILANE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Dimethyldichlorosilane is a clear, colorless, flammable, fuming liquid with a pungent, sharp, irritating odor resembling hydrogen chloride or muriatic acid, commonly used as an intermediate for the manufacture of silicone products. Its flash point of approximately 3°F indicates that the product is easily ignited under most ambient temperature conditions. Vapors are somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time, duration. The liquid weighs approximately 8.9 pounds per gallon.

Dimethyldichlorosilane reacts vigorously or violently with water to form hydrochloric acid and a complex mixture of dimethylsiloxanes (which are presumed to be oily silicone fluids of low solubility) in a process that may evolve corrosive and toxic fumes. It is also incompatible with oxidizing agents, solvents containing hydroxyl, and possibly a wide variety of other substances, and is highly irritating and corrosive to bodily tissues by all routes of exposure. Products of combustion include hydrochloric acid, hydrogen chloride, possibly phosgene, and other possibly toxic constituents.

If dimethyldichlorosilane is leaking but not on fire and generating vapors or fumes, downwind evacuation should be considered. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts vigorously
Solubility in Other Chemicals: Soluble in benzene and ether
Specific Gravity (Liquid): 1.06 at 68°F (20°C)
Boiling Point: 158.0–158.9°F (70–70.5°C) at 1 atm
Melting Point: Either –122.8°F (–86°C) or –104.8°F (–76°C); reported values vary.
Freezing Point: See melting point
Molecular Weight: 129.06
Heat of Combustion: Est. –3300 cal/g
Vapor Pressure: *100* mm Hg (1.933 psia) at 63.5°F (17.5°C)
Flash Point: 3.2°F (–16°C),closed cup; 15–16°F (–9.4 to –8.9°C),open cup
Autoignition Temperature: Over 750°F (399°C)
Burning Rate: 3.3 mm/minute
Stability: Stable during normal transport
Corrosiveness: Steel is satisfactory for dry dimethyldichlorosilane, but any contact with water or moisture produces hydrochloric acid that is corrosive to most metals.
Reactivity with Water: Reacts vigorously with water to form hydrochloric acid and complex mixture of dimethylsiloxanes. Corrosive and toxic fumes may be evolved.
Reactivity with Other Chemicals: Reacts with oxidizing agents, solvents containing hydroxyl, and possibly a wide variety of other substances.

IDENTIFICATION

Shipping Names: Dimethyldichlorosilane (USDOT and IMO)
Synonyms and Tradenames: Dichlorodimethylsilane; dichlorodimethylsilicon; Inerton DW-DMC.
Chemical Formula: $(CH_3)ZSiCl_2$
Constituent Components (% each): 99% or more pure
49 STCC: 4907610
UN/NA Designation: UN1162
IMO Designation: 3.2, flammable liquid
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless, clear, fuming liquid
Odor Characteristics: Pungent, sharp, acidic, irritating, like hydrogen chloride or muriatic acid.
Common Uses: Intermediate for silicone products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DIMETHYLDICHLOROSILANE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

***Threshold Odor* Concentration:** Unavailable

Unusual Hazards: Highly flammable and moderately volatile fuming liquid that reacts vigorously or violently with water or moisture to form highly corrosive hydrochloric acid and dimethylsiloxanes.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure. May be present in air in high concentrations in spill area and over considerable downwind distances.

Hazards of Skin or Eye Contact: Liquid dimethyldichlorosilane may cause severe burns in contact with the skin or eyes, with eye effects including severe pain, swelling, corneal erosion, and possibly permanent injury and/or loss of sight. Concentrated vapors or fumes in air may also cause significant irritation.

Hazards of Inhalation: Vapors and fumes of dimethyldichlorosilane are highly irritating to the eyes and respiratory tract. Excessive exposures may result in difficulty in breathing, nausea, vomiting, rapid heartbeat, shock, pulmonary edema, suffocation, and possibly death. Some symptoms may be delayed in onset. Exposure to 930 ppm for 4 hours was sufficient to cause fatalities among rats in laboratory experiments.

Hazards of Ingestion: Ingestion of dimethyldichlorosilane may cause severe burns of the mouth and stomach and may prove fatal.

Edema of the throat may close the airway.

FIRE HAZARDS

Lower Flammable Limit: 3.4%

Upper Flammable Limit: 9.5% (possibly greater)

Behavior in Fire: Flammable liquid. Difficult to extinguish. May generate large quantities of flammable vapor upon release. Vapors may travel to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Hydrochloric acid, hydrogen chloride, possibly phosgene, and other possibly toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Reaction with water produces hydrochloric acid that may evolve flammable and potentially explosive hydrogen gas in contact with most metals.

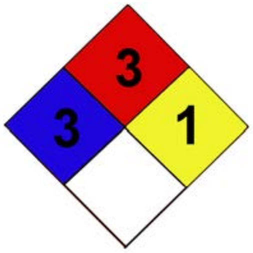
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid gas canister or an acid gas cartridge respirator with a full facepiece within the use limitations of these devices.

1162

DIMETHYLDICHLOROSILANE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol foam, water fog or spray. Note that the spilled product reacts with water such that water or foam must be applied with caution.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. *Staff upwind*. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Use explosion-proof and spark-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the reactive, flammable, and potentially corrosive nature of dichlorodimethylsilane into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent public exposure and to allow vapors or fumes to dissipate. Dimethyldichlorosilane spills may expose downwind areas to toxic and/or flammable concentrations over considerable distances.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

DIMETHYLDICHLOROSILANE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to dimethyldichlorosilane vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain dimethyldichlorosilane from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FLOODING WITH WATER . . . The rapid addition of flooding quantities of water to liquid dimethyldichlorosilane may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

NEUTRALIZATION . . . There is a possibility that the application of an appropriate neutralization agent to liquid dimethyldichlorosilane may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that application of alcohol foam to the surface of liquid pools may slow the release of dimethyldichlorosilane fumes or vapors into the atmosphere. (Note: Several sources suggest foam use for firefighting even though the water in the foam will clearly react with the spilled product. Thus, there is a chance the foam may control fume evolution if a blanket of foam can be maintained.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid dimethyldichlorosilane may be contained by building dikes using dry sand or other compatible dry materials.

CONSEQUENCE

Contained liquid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

DIMETHYLDICHLOROSILANE

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid, with dry sand, dry vermiculite, dry ground dolomite, or possibly other noncombustible mineral-based materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE .

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Motorized equipment may ignite flammable vapors in the spill area.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product. Store contaminated materials in a safe and secure location. Take suitable precautions for the possibility of flammable vapor concentrations in the spill area.

DIMETHYLDICHLOROSILANE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Dimethyldichlorosilane reacts vigorously with water to form hydrochloric acid and a complex mixture of dimethylsiloxanes. Water containing chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land. (Note: Other containment or treatment methods may be necessary for any dimethylsiloxanes in the water. Data on this topic were unavailable. Contact shippers or other sources of expert advice for assistance where necessary.)

September 2003

DIMETHYL ETHER

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Dimethyl ether, also commonly known as methyl ether, is a colorless gas or liquid (liquefied compressed gas) having a slight ethereal odor. It is used as a refrigerant, solvent, propellant for aerosol sprays and in making certain plastics. It is stable, although any source of ignition should be avoided. Containers that have been opened and then stored for six months or longer can form peroxides which can then be detonated by friction, impact or heating. It is soluble in water, alcohol, ether, chloroform, acetone and organic solvents. Incompatible materials include, but are not limited to, strong oxidizing agents, combustible materials and halogens (see below). The primary route of entry is inhalation of the vapors. Dimethyl ether has no toxicity reported except that it may asphyxiate and cause frost-like burns of the skin or eyes from contact with liquid. Inhalation in moderate amounts may cause headaches, drowsiness and dizziness. Larger amounts may cause unconsciousness and death due to asphyxia.

The flammability potential for dimethyl ether is high. It will readily ignite from any source of ignition, including static electricity and friction from escaping gas. Flammable mixtures are formed in air. Vapors are heavier than air, may travel to distant sources of ignition and flash back. Initial downwind evacuation should be considered for at least one-half (1/2) mile if product is leaking but not on fire. If container of dimethyl ether is exposed to direct flame or a fire becomes uncontrollable, evacuate for one (1) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble (7.6%)
Solubility in Other Chemicals: Soluble in alcohol, ether, chloroform, acetone and organic solvents.
Specific Gravity: 0.661
Vapor Density (Air=1): 1.62
Boiling Point: -11°F (-24°C)
Melting Point: -224°F (-142°C)
Freezing Point: See melting point
Molecular Weight: 46.07
Heat of Combustion: -1328.3 kJ/mol
Vapor Pressure: 3,982 mm Hg at 68°F (20°C)
Flash Point: -42°F (-41°C) c.c.
Autoignition Temperature: 662°F (350°C)
Burning Rate: Unavailable
Flammable Limits: 3.4% (LEL) - 27% (UEL)
Stability: Stable. Avoid sparks or flame source that can cause ignition.
Polymerization Potential: Will not occur
Corrosiveness: Non-corrosive and can be used with most common structural metals.
Reactivity and Incompatibility: May form explosive peroxides. Avoid prolonged storage, contact with air, light or use above room temperature. Incompatible with oxidizing materials, combustible materials and halogens. Contact with chromic anhydride, nitric acid, oxidizers, oxygen and ozone may cause explosion. Aluminum hydride and lithium tetrahydroaluminate may cause explosion due to carbon dioxide impurity.

IDENTIFICATION

Shipping Name(s): Dimethyl Ether (USDOT & IMO)
Synonyms and Tradenames: Dimethyl-13C2 ether (gas); Methoxymethane; Methyl ether; Methyl oxide; Oxybismethane; Wood ether
CAS Registry No: 115-10-6
Chemical Formula: C_2H_6O
Constituent Components (% each): 100%
UN/NA Designation: UN1033
IMO Designation: 2.1, Flammable gases
RTECS Number: PM4780000
NFPA 704 Hazard Rating (Gas): 1 (Health): 4 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Compressed gas or liquid
Physical Form as Released: Gas or liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Ethereal odor
Common Uses: It is used as a refrigerant, solvent, propellant for aerosol sprays and in making certain plastics.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

DIMETHYL ETHER
Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly flammable. Liquid form of dimethyl ether can cause frost-like burns. Inhalation of large concentration of gas may cause dizziness, drowsiness and unconsciousness. Peroxides may form in containers that have been opened and then stored for six months or longer. Peroxides can be detonated by friction, impact or heating.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity and incompatible materials.

HEALTH HAZARDS

Potential Health Hazards: Dimethyl ether has no toxicity reported except that it may asphyxiate and cause frost-like burns with skin or eye contact.

Hazards of Skin or Eye Contact: Eye or skin contact with liquid can cause frostbite type injury due to rapid cooling from evaporation.

Hazards of Inhalation: Narcotic or anesthetic effects depend on the duration of exposure and vary from incoordination, headache, dizziness, periods of excitation, inability to see well, to anesthesia and eventual unconsciousness.

Hazards of Ingestion: Ingestion is unlikely due to physical properties of dimethyl ether. Contact with the extremely cold liquid would, at the very least, cause frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 3.4%

Upper Flammable Limit: 27%

Behavior in Fire: Flammable gas. It will readily ignite if exposed to sources of heat and flame. Vapors may be heavier than air, travel along the ground and settle in low lying areas to form explosive mixtures with air. Vapors may travel to a distant source of ignition and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity and other potential ignition sources at locations distant from the point of release. Containers exposed to prolonged fire or heat may violently rupture.

Hazardous Decomposition Products: Products of combustion may include carbon monoxide, carbon dioxide and irritating and toxic fumes.

EXPLOSION HAZARDS

Explosive Potential: High. Severe explosion hazard when exposed to heat, flame or oxidizers. Explosive when mixed with air. Escaping gas may ignite spontaneously due to friction. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged fire or heat may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

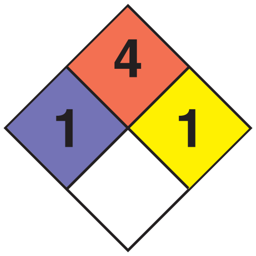
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Buna N (R) rubber is recommended by one source as exhibiting reasonable resistance. Always wear thermal protective clothing when handling refrigerated/cryogenic liquids.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1033

DIMETHYL ETHER

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Contact of liquid with skin or eyes may cause frost-like burns. Inhalation is the major route of exposure and can cause headache, drowsiness, dizziness and unconsciousness.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact with cold liquid, remove contaminated clothing and wash affected body areas with large amounts of warm water. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming such as wrapping effected area gently in blankets if warm water is not available. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Ingestion is unlikely. If liquid is ingested, frostbite-like injury can occur. Drink warm water to relieve frostbite, but do not induce vomiting without medical supervision. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

FIRE RESPONSE

Extinguishing Agents: Stop flow. Carbon dioxide, dry chemical or water spray (fog). A fine water spray or fog can be used on large discharges to control the fire by preventing its spread and absorbing some of its heat.

Extinguishing Techniques: Stay upwind. Secure ignition sources in the immediate spill area and downwind. Approach fire from upwind to avoid flammable vapors. Wear positive-pressure, self-contained breathing apparatus and appropriate protective clothing. Wear full chemical and/or thermal protective suit as necessary and appropriate. Move container from fire area if no risk. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to prolonged heat, such as from a direct flame. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable gases.

DIMETHYL ETHER
Division 2.1 (Flammable Gas)

SPILL RESPONSES

General Information: Dimethyl ether is highly flammable. Eliminate all sources of ignition. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with very cold gas or liquid unless properly equipped for such contact. If transfer operations are anticipated, only use equipment specifically designed for use with the material being transferred and its temperature and pressure at the time of transfer. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows and depressions. Use combustible gas detectors prior to entering any potentially affected confined space or any low area in which cold, heavier-than-air gases or vapors may have accumulated. Do not direct water at a venting safety device since this may cause icing to occur. Note that the rapid escape of gas under pressure may generate a static electricity charge that could cause gas ignition. Be advised that the very low temperatures associated with dimethyl ether can cause many materials to become brittle and subject to sudden failure or cracking. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ mile in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

DIMETHYL ETHER
Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to the soil, liquid will initially boil rapidly, generate a large amount of flammable vapors and freeze the ground it is in contact with. Much later, the liquid will reach a less rapid boiling rate thereby evolving less vapors. Containment dikes or barriers using soil, dry sand or other related, non-combustible materials may be effective to confine the spill to a limited area thereby reducing the surface area and volume of gas generated until liquid evaporates. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material.

CONSEQUENCE

Contained material will take longer to evaporate.

MITIGATION

Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater, which may overfill diked areas.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches. Reducing the spill surface area may decrease vapor generation.

CONSEQUENCE

Contained material will take longer to evaporate. Mechanical equipment could ignite material.

MITIGATION

Continually monitor for flammable conditions. Dig a deep pit with small area to reduce vapor generation rate. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill pits.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Due to its relatively low boiling point, high pressures may develop very rapidly in recovery equipment at moderate to high ambient temperatures.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as carbon dioxide or nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates when equipment temperatures exceed the boiling point of the liquid to be recovered. Consult qualified experts as necessary for assistance.

TECHNIQUE

MECHANICAL REMOVAL . . . Most if not all the product will rapidly vaporize from soil surfaces once the bulk of the liquid has vaporized. Mechanical equipment can be used to grade frozen ground to eliminate any pockets of material.

CONSEQUENCE

Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Continually monitor for flammable conditions.

DIMETHYL ETHER

Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake and monitor situation.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where emissions may pose a downwind hazard.

August 1996

N,N-DIMETHYLFORMAMIDE*

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

N,N-Dimethylformamide is a colorless to pale yellow liquid with a fish/ammonia-like odor used as a solvent for liquids, gases, orlon and similar polyacrylic fibers. It is also reacted with chlorosulfonic acid to produce cellulose sulfate, an anti-static agent, photographic film additive, and solution thickener. In addition, N,N-dimethylformamide is termed the universal organic solvent and is used as a selective medium for extraction of aromatics from crude oil, solvent for dyes, as a solvent for the formation of acrylic fibers and sheets, films, and coatings of other polymeric materials such as polyurethanes and specialty PVC. In the pharmaceutical industry, the product is used as a crystallization medium for the purification of vitamins and hormones. N,N-dimethylformamide has commercial use as a solvent for electrolytes, particularly in high voltage capacitors and in electroplating processes. N,N-dimethylformamide is produced from the reaction of methyl formate and dimethylamine, or from dimethylamine and formic acid. Other manufacturing processes include the reaction of carbon monoxide and dimethylamine, and the reaction of hydrogen cyanide and methanol. N,N-dimethylformamide is harmful if inhaled or on skin contact. It may be toxic if inhaled or absorbed through the skin for prolonged periods. The most common routes of exposure are through inhalation and skin contact. It is a strong skin irritant. **N,N-dimethylformamide is a potential human carcinogen** (Group 2B).

Although the fire potential for N,N-dimethylformamide is moderate, heating can release ignitable vapors, which can form explosive mixtures with air. The material is generally stable, however it may react vigorously with oxidizing agents and halogenated hydrocarbons. Vapors are heavier than air and may settle in low lying areas. Vapors may travel considerable distances to an ignition source and flash back. Normal structural fire fighting protective clothing will not provide an adequate level of personal protection for working in contaminated atmospheres. Runoff may be flammable and/or toxic. N,N-dimethylformamide is miscible with water and most organic solvents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble.
Solubility in Other Chemicals: Alcohol, ether acetone, benzene, and chloroform.
Specific Gravity (Liquid): 0.95 @ 25°C (77°F)
Vapor Density (Air=1): 2.5
Boiling Point: 153°C (307°F)
Melting Point: -47°C (-52°F)
Freezing Point: -61°C (-78°F).
Molecular Weight: 73.10
Heat of Combustion: Unavailable.
Evaporation Rate: Unavailable.
pH: 6.7
Vapor Pressure: 3.7 mm Hg at 20°C (68°F)
Flash Point: 58°C (136°F)
Autoignition Temperature: 445°C (833°F)
Flammable Limits: 2.2% (LEL) - 15.2% (UEL)
Stability: Stable
Polymerization Potential: Will not occur except in those situations where the material comes in contact with diisocyanatomethane which causes violent polymerization of the isocyanate.
Reactivity and Incompatibility: Can react vigorously with oxidizing agents, halogenated hydrocarbons and inorganic nitrates. Incompatible with carbon tetrachloride, aluminum alkyls, bromine, inorganic acids, magnesium, and isocyanates.
Other Characteristics: Can generate hazardous fumes when exposed to heat and flames. Material is a dipolar aprotic solvent.

IDENTIFICATION

Shipping Name(s): N,N-Dimethylformamide (USDOT & IMO)
Synonyms and Tradenames: Dimethyl Formamide, DMF, DMF (Amide), DMFA, Formamide, N,N-Dimethyl, Formic Acid, Amide, N,N-Dimethyl, N,N-Dimethylmethanamide, N-Formyldimethylamine, NSC 5256, U-4224, NCI-C60913. CAS Registry No: 68-12-2
Chemical Formula: C_3H_7NO
Molecular Formula: C_3H_7NO
UN/NA Designation: UN2265
IMO Designation: 3.3
RTECS Number: NIOSH/LQ2100000
OHMTADS Number: Unavailable.
NFPA 704 Hazard Rating: 1 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless to pale yellow
Odor Characteristics: Fish/Ammonia-like odor
Common Uses: N,N-Dimethylformamide is considered a universal organic solvent and is used as a selective medium for extraction of aromatics from crude oil, solvent for dyes, as a solvent for the formation of acrylic fibers and sheets, films, and coatings of other polymeric materials such as polyurethanes and specialty PVC.

---

*Reportable Quantity (RQ) established. Refer to appendix I.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

N,N-DIMETHYLFORMAMIDE

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 100 ppm

Unusual Hazards: Strong skin irritant and possibly carcinogenic to humans.

Time Weighted Average (TLV-TWA): 10 ppm.

Short Term Exposure Limit (STEL): Unavailable.

IDLH: 3500 ppm

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as oxidizing agents, halogenated hydrocarbons, inorganic nitrates, contact with carbon tetrachloride, triethylaluminum, sodium metal, and aluminum alkyls.

HEALTH HAZARDS

Potential Health Effects: N,N-dimethylformamide is a strong skin irritant. Contact with the eyes and skin may result in irritation. It may be poisonous if inhaled or absorbed through the skin. Vapors may cause dizziness or suffocation. Material is considered moderately hazardous by inhalation and may pass through intact skin or can be absorbed through the lungs. Inhalation may cause facial flushing, mucous membrane irritation, cyanosis, headache, dizziness, confusion, and coma. Excessive exposures may cause adverse reactions of the liver, kidneys, skin and cardiovascular system. N,N-dimethylformamide is a possible human carcinogen. Individuals with pre-existing conditions of the central nervous system or lungs may have increased susceptibility to the toxicity of excessive exposures.

Hazards of Skin Contact: Skin contact may cause skin irritation with rash, redness, and swelling. Prolonged exposures may lead to skin burns, blistering and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, swelling, tearing, chemical conjunctivitis, corneal burns, opacification, or blurred vision. Profuse lacrimation may also occur in some cases.

Inhalation Hazards: Inhalation may cause irritation to the upper respiratory passages, and mucous membranes, pulmonary edema, wheezing, and dyspnea. Prolonged exposures can produce central nervous system (CNS) effects such as cyanosis, nausea, headache, dizziness, confusion, and coma.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, vomiting and abdominal pain.

FIRE HAZARDS

Lower Flammable Limit: 2.2%

Upper Flammable Limit: 15.2%

Behavior in Fire: Although it will not readily ignite, N,N-dimethylformamide will burn if exposed to sources of heat and flame. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic.

Hazardous Decomposition Products: When heated to decomposition, material releases gases such as carbon monoxide and oxides of nitrogen.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. A mixture of trimethylaluminum and N,N-dimethylformamide explodes when heated.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

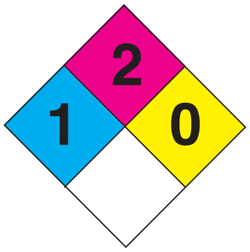
Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are butyl rubber and teflon. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits. Protection provided by air purifying respirators is limited.

2265

N,N-DIMETHYLFORMAMIDE

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Skin contact with the liquid may cause redness, swelling, burning, and dermatitis. Excessive exposures may cause temporary central nervous system depression with anesthetic effects such as , dizziness, drowsiness, nausea, headache, confusion, and loss of consciousness. Prolonged eye contact may result in reversible corneal injury. Inhalation may cause irritation to the upper respiratory passages and mucous membranes with coughing and discomfort.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog), or alcohol-based foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be flammable and/or toxic.

SPILL RESPONSES

General Information: N,N-dimethylformamide may cause environmental contamination. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways, and storm drains. Underflow dams are not an effective means to dike material since it readily mixes with water. As a result, recovery efforts from water borne releases are difficult. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

N,N-DIMETHYLFORMAMIDE

Class 3 (Flammable Liquid) or Combustible Liquid

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential ignition sources such as of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...Based on its vapor pressure, N,N-dimethylformamide is expected to exist almost entirely in the gaseous phase when released into the atmosphere. The highest concentrations of material will usually be located at ground level. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if hazardous concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

FOAM...Alcohol-resistant foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

N,N-DIMETHYLFORMAMIDE

Class 3 (Flammable Liquid) or Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...The biodegradation of N,N-dimethylformamide in water sources should be rapid. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material readily mixes with water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms are not an effective means to recover spilled material since the material is water soluble. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material is water soluble and the material does not float on the surface of the water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

N,N-DIMETHYLFORMAMIDE

Class 3 (Flammable Liquid) or Combustible Liquid

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...N,N-dimethylformamode is estimated to be highly mobile in soil. The material is readily biodegradable, and therefore, would be expected to biodegrade rapidly in soil. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed, or confine or divert the spill to a limited area until the material volatizes or biodegradation occurs.

CONSEQUENCE

Material is highly mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

October 1993

DIMETHYL SULFATE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Dimethyl sulfate is a colorless, oily, combustible, and highly poisonous liquid that may be odorless or have a faint odor like onion. It is heavier than water and somewhat soluble, so may be expected to sink to the bottom of a body of water and dissolve at a fairly appreciable rate. Its lowest reported flash point of 182°F (83.3°C) indicates that it must be preheated before it can be easily ignited. Accumulations of vapors may explode if ignited in confined spaces such as buildings or sewers. The product weighs approximately 11.1 pounds per gallon. Be advised that many but not all data sources indicate that the autoignition temperature of the substance is only 370°F (187.8°C).

Dimethyl sulfate is stable in normal transportation. It reacts with moisture or water to form methyl hydrogen sulfate which further decomposes to sulfuric acid and methyl alcohol in a non-hazardous fashion. It will attack some forms of plastics, rubber and coatings. Although the vapor pressure of dimethyl sulfate is quite low at normal ambient temperatures, the toxic hazard posed by the liquid and its vapors is extremely high. Not only are effects severe and delayed in onset, but a lack of warning properties means that the victim is usually not aware a serious and potentially lethal exposure is taking place. Products of combustion are not well-defined but may include irritating, corrosive, and/or toxic substances such as sulfuric acid, methyl alcohol, carbon monoxide, carbon dioxide, sulfur dioxide, sulfur trioxide, and possibly other harmful substances.

Downwind evacuation or an alternative protective action must be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if dimethyl sulfate is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Fairly soluble.

Solubility in Other Chemicals: Soluble in alcohol, aliphatic hydrocarbons, carbon disulfide, and ether.

Specific Gravity (Liquid): 1.33 at 68°F (20°C)

Boiling Point: 370.4°F (188°C) with decomposition at 1 atm.

Melting Point: -16.2°F (-26.8°C) to -25.2°F (-31.8°C); reported values vary.

Freezing Point: See melting point.

Molecular Weight: 126.13.

Heat of Combustion: Not available.

Vapor Pressure: 0.1 mm Hg (0.00193 psia) at 70°F (21.1°C); and 1.1 mm Hg (0.02126 psia) at 100°F (37.8°C).

Flash Point: 182°F (83.3°C), closed-cup; 182°F (83.3°C) or 240°F (115.6°C), open-cup.

Autoignition Temperature: Most sources 370°F (187.8°C) a major producer 923°F (495°C).

Burning Rate: Not available.

Stability: Stable.

Corrosiveness: Corrodes various metals in the presence of water or moisture due to the formation of sulfuric acid; will attack some forms of plastics, rubber, and coatings.

Reactivity with Water: Reacts in a non-hazardous fashion with water or moisture to form methyl hydrogen sulfate which further decomposes to corrosive sulfuric acid and potentially flammable and toxic methyl alcohol while evolving heat (and pressure in closed containers). Any heat evolved in reactions with water or chemicals may increase the vaporization rate of dimethyl sulfate.

Reactivity with Other Chemicals: Available data are limited. Mixture with sodium azide may explode if its pH is allowed to fall below 5; reacts extremely violently with anhydrous ammonia or concentrated aqueous ammonia; ignites in contact with barium chlorite; is incompatible with strong oxidizers, strong caustic solutions, and a broad range of other substances according to various authorities.

IDENTIFICATION

Shipping Names: Dimethyl sulfate.

Synonyms and Tradenames: Acid, sulfuric dimethyl ester; methyl sulfate; dimethyl monosulfate; DMS; and sulfuric acid, dimethyl ester.

Chemical Formula: $(CH_3)_2S0_4$

Constituent Components (% each): Limited data available. One major maker describes its product as 100% pure.

UN/NA Designation: UN1595.

IMO Designation: 6.1, poisonous material.

Physical State As Shipped: Liquid.

Physical State As Released: Liquid.

Color of the Shipped Material: Colorless oily liquid.

Odor Characteristics: Odorless or with a weak, faint odor like onion according to most sources.

Common Uses: Used to make many organic chemicals, polyurethane-based adhesives, dyes, pharmaceuticals, perfumes, pesticides, and solvent.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

DIMETHYL SULFATE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Only value found was 0.1 ppm.

Unusual Hazards: Extremely toxic substance with unusual characteristics. Many but not all authorities list an autoignition temperature of only 370°F (187.8°C).

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: (Skin) 0.1 ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989). ACGIH considers this substance to be a suspected human carcinogen.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Both liquid dimethyl sulfate and its vapors are extremely corrosive and toxic with severe effects that often do not become apparent for several hours after exposures have ended. This material is a suspected, mutagen, carcinogen and teratogen when subjects are exposed to long-term inhalation of vapors or repeated injection of liquid under the skin. Repeated exposures may result in loss of hair. All exposures should be strictly avoided.

Hazards of Skin or Eye Contact: Low levels of vapors in air may cause numbness such that the extremely corrosive action of the substance may not be detected while an exposure is occurring. Exposure of the eyes to vapors, after a period of up to 6 hours without symptoms, can result in severe irritation and inflammation, sensitivity to light, lacrimation, swollen eyelids, conjunctival hyperemia, superficial clouding and irregularity of surface tissues of the cornea, and possibly tissue death. The skin of the face and other exposed parts may become red and there may be a temporary loss of smell and taste. Contact of the liquid with the eyes may cause no immediate discomfort but be followed later by sudden pain, swelling of the lids and anterior chambers of the eyes, gray-white opacification of the cornea, tissue destruction, and corneal or conjunctival ulceration resulting in permanent loss of vision. Effects of skin contact with the liquid may also be delayed for several hours without signs of discomfort. Symptoms are said to start with a burning and itching sensation and redness, followed by severe blistering, tissue burns, ulceration, and eventual scarring of the affected area. Absorption of the liquid through skin is rapid and may result in poisoning at times even if the skin is promptly treated. Such poisoning may result in various symptoms associated with inhalation exposures, convulsions, delirium, coma, and even death in severe cases. Unprotected contact with the vapor or with the liquid requires immediate medical attention even if there is no evidence of injury. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Except for the possibility of slight eye and nose irritation, the vapors of dimethyl sulfate provide no warning that extremely hazardous exposures are taking place. Symptoms of exposure may be delayed in onset for up to 10 hours and may variably include temporary loss of smell and taste, generalized loss of sensitivity to pain, nausea, vomiting, diarrhea, giddiness, delirium, fever, headache, weakness, irregular pulse, fall in arterial pressure, pain and swelling of the larynx causing hoarseness, difficulty in swallowing, chest pain, severe inflammation and death of tissues of the mouth and respiratory tract, difficult breathing, painful coughing, foamy white sputum, painful urination, cyanosis, prostration, convulsions, paralysis, severe lung damage with effects including emphysema, bronchitis and pulmonary edema, coma, delayed damage to the kidneys, liver and heart, and death (either prompt or delayed). Prolonged exposures may cause liver and kidney injury leading to yellow jaundice and bloody urine. Repeated excessive exposures over a period of time may cause changes to the lymph nodes, inflammation and tumors of the nasal cavity, lung and brain tumors, pneumonia, and possibly death. The concentration of dimethyl sulfate vapors directly over a pool of the liquid is at least 130 ppm and possibly as high as 660 ppm at 68 - 70°F (20 - 21.1°C); about 920 ppm at 77°F (25°C); and about 1450 ppm at 100°F (37.8°C). The lowest concentration reported fatal to a human is 97 ppm in a 10 minute exposure. The NIOSH (1990) IDLH for dimethyl sulfate is 10 ppm.

Hazards of Ingestion: Ingestion of liquid dimethyl sulfate, in addition to effects associated with inhalation, may cause burns of the mouth, throat, and stomach. In one actual case, symptoms first appeared after half an hour and led to death due to cardiac failure within three hours. Dosages that result in the death of 50% of rats and mice are in the range of 140 to 440 mg/kg.

FIRE HAZARDS

Lower Flammable Limit: 3.6%.

Upper Flammable Limit: 23.3%.

Behavior in Fire: Combustible liquid. Requires preheating to be easily ignited. May generate flammable vapors upon release if heated above its flash point. Such vapors may travel to a source of ignition and flash back. Containers may possibly rupture or explode in a fire. If not ignited, liquid dimethyl sulfate may vaporize at a higher rate upon heating and pose greater downwind inhalation hazards.

Hazardous Combustion Products: Not well-defined; reported to include toxic and/or corrosive vapors and fumes containing sulfuric acid, methyl alcohol, carbon monoxide, carbon dioxide, oxides of sulfur, and possibly other harmful substances.

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors from hot liquid are ignited in a confined area. Containers may possibly rupture or explode in a fire. Contact or mixture with certain other chemicals may result in an explosion.

1595

DIMETHYL SULFATE
Division 6.1 (Poisonous Material)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing in well-controlled normal operations. Under fire or non-fire spill conditions, fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with vapors and/or combustion products. Compatible materials for dimethyl sulfate itself, according to a major maker of the product, may include butyl rubber and neoprene. Another source recommends polyethylene/ethylene vinyl alcohol/polyethylene (PE/EVAL/PE) material. NIOSH notes that use of fully encapsulating suits may be necessary to prevent skin contact at levels in air greater than 10 ppm. Another authority implies protection is needed even at 1 ppm. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: At concentrations above 0.1 ppm, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; nausea, vomiting, diarrhea, giddiness, fever, headache, weakness, respiratory system discomfort, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. (Note: A physician should be contacted immediately if anyone develops any possible symptoms of a chemical exposure and suspects they may have been caused by exposure to dimethyl sulfate.)

First Aid for Skin and Eye Contact: Unprotected contact with the vapor at levels over 1 ppm or with the liquid product requires immediate treatment even if there is no evidence of injury. Flush eyes immediately with water for at least 15 minutes occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get immediate medical attention.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective but very large quantities may dilute the spill to a nonflammable mixture.

Extinguishing Techniques: Unusual toxic/corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material, its vapors, or combustion products is anticipated. Move container from fire area if no risk. Do not get water inside container. Be alert to the possibility that a closed container may possibly rupture or explode and suddenly release massive amounts of product if exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with extreme caution. Restrict access to area. Keep all unprotected personnel upwind and away from spill area. Avoid any and all contact with spilled product and its vapors. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product or its products of reaction with moisture or water where these may be present. Ground all equipment and transfer lines as necessary prior to use. Remember that products of reaction of dimethyl sulfate with moisture or water include corrosive sulfuric acid and potentially flammable methyl alcohol. Take the toxic nature and unusual hazards of dimethyl sulfate into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Dimethyl sulfate discharges may expose downwind areas to highly toxic concentrations over very considerable distances in some cases.

DIMETHYL SULFATE
Division 6.1 (Poisonous Material)

AIR SPILL *(CONTINUED)*

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to dimethyl sulfate vapors in air may absorb them and/or accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not let spray contact pools of liquid dimethyl sulfate if one or more of the following response techniques is not also employed simultaneously (since the reaction of dimethyl sulfate with small amounts of water spray may possibly generate heat that may promote increased vaporization of the liquid).

CONSEQUENCE

Water runoff may contain varying amounts of dimethyl sulfate and its products of reaction with water.

MITIGATION

Contain contaminated water and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of dimethyl sulfate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Proceed with extreme caution. Consult qualified experts for advice where necessary. Maintain a foam blanket that is as thick as possible. Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . Dimethyl sulfate is heavier than water and of limited solubility. Gentle application of water spray onto the surface of confined liquid pools may possibly form a floating layer of water that reduces vapor emissions. Remember that dimethyl sulfate will react with water. Progressive addition of water to liquid dimethyl sulfate will eventually cause its conversion to sulfuric acid and methyl alcohol. Note also that this approach may possibly be combined with neutralization techniques discussed below.

CONSEQUENCE

Addition of water will increase the volume of contained liquids.

MITIGATION

Proceed with extreme caution. Consult qualified experts for advice where necessary. Contain liquids and neutralize and/or remove them as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid dimethyl sulfate may eventually slow the release of vapors into the atmosphere by modifying the spilled product to less hazardous substances. (Note: A manufacturer indicates that liquid dimethyl sulfate can be treated with dry soda ash followed by water flooding, a 2 - 5% solution of aqueous ammonia, or a dilute caustic soda solution. The resulting liquid mixture should be allowed to stand until it tests negative for the presence of dimethyl sulfate. Depending on environmental concerns, the resulting mixture should be removed or the spill area should be flushed with plenty of water.)

CONSEQUENCE

Application of chemical agents may entail additional risks.

MITIGATION

Proceed with extreme caution. Consult qualified experts for safe neutralizing techniques and more specific advice.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquids may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in spread of contamination.

DIMETHYL SULFATE
Division 6.1 (Poisonous Material)

AIR SPILL *(CONTINUED)*

MITIGATION

Neutralize and/or remove contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquids.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Neutralize and/or remove liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Any moisture or water present will react with dimethyl sulfate to form flammable methyl alcohol and corrosive sulfuric acid.

MITIGATION

Use dry equipment compatible with the spilled product (and its reaction products with moisture or water if and as necessary).

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to less hazardous substances. See the discussion on neutralization under the heading "Air Spill" above.

CONSEQUENCE

Application and removal of chemical agents may entail additional risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors present in the area may be ignited by motorized removal equipment under appropriate circumstances. (Note: Potentially flammable methyl alcohol and corrosive sulfuric acid may be produced in the presence of water or moisture. Many authorities list an autoignition temperature for dimethyl sulfate of only 370°F.)

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Do not operate motorized equipment in potentially flammable atmospheres or where any dimethyl sulfate may be easily ignited due to its possibly low autoignition temperature. Consult qualified experts for advice as necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Dimethyl sulfate is heavier than water and of limited but fair solubility therein. It may be expected to sink to the bottom of a body of water and dissolve at an appreciable rate. The product will eventually react with water to form sulfuric acid and methyl alcohol. The reaction rate appears to be a function of temperature.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. If time permits containment and recovery of underwater pools of dimethyl sulfate, use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . If time permits these actions before underwater pools dissolve in or react with water, stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air and/or may be corrosive.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat to the contaminated water, followed by effective mixing, may capture some of the contaminants dissolved in the water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of suitable neutralization agent(s) to the contaminated water may reduce certain environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing methyl alcohol may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

Air bubbles entering the atmosphere will be contaminated with some amount of methyl alcohol vapors and possibly some small amounts of dimethyl sulfate vapors if the technique is effective and promptly applied.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1997

DINITROTOLUENES

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Dinitrotoluene (DNT) is a yellow solid at ambient temperatures or a clear oil with a distinctive odor. The major use of DNT is the production of toluene diisocyanate and toluenediamine that are intermediates in the making of polyurethane foams and polymers. DNT is produced by the nitration of toluene. It has a high boiling point at 300°C (572°F) and a negligible vapor pressure of 1 mm. Hg. It is insoluble in water, but soluble in acetone, alcohol, ether, ethanol and diethyl ether. Material is unstable at temperatures above 250°C (482°F) and is incompatible with strong oxidizing or reducing agents, alkalis, caustics and metals.

NIOSH lists dinitrotoluene as a potential occupational carcinogen. It is readily absorbed through all routes of exposure. Inhalation, ingestion or any tissue absorption can cause CNS depression and methemoglobinemia leading to cyanosis. Certain pre-existing disorders of the liver, cardiovascular system, bone marrow or skin may be increased from exposure to this material.

The material is a combustible solid but difficult to ignite, however it is an explosion hazard if heated and confined. It forms highly explosive mixtures with nitric acid. DNT spontaneously decomposes at 250°C, however contamination with other alkalis or organics can lower the decomposition temperature and increase the risk of explosion. DNT does not require air or oxygen to decompose. Products of decomposition are carbon dioxide, carbon monoxide and nitrogen oxides.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, .03 g/100g at 20°C (68°F)

Solubility in Other Chemicals: Soluble in acetone, alcohol, ether, ethanol and diethyl ether

Specific Gravity: 1.32 at 57°C (135°F)

Vapor Density (Air=1): 6.27

Boiling Point: 300°C (572°F)

Melting Point: 69.5° (157°F)

Freezing Point: 56°C (133°F) dry basis

Molecular Weight: 182.15

Heat of Combustion: -357 ± 5.9 kj/mol

Vapor Pressure: 1 mm Hg at 106°C (223°F)

Flash Point: 207°C (405°F) closed cup

Autoignition Temperature: Not available

Burning Rate: Not available

Flammable Limits: Not available

Stability: May be unstable at temperatures above 250°C (482°F).

Polymerization Potential: Will not occur

Reactivity and Incompatibility: Strong oxidizing or reducing agents, alkalis, caustics and metals.

IDENTIFICATION

Shipping Name(s): Dinitrotoluenes (liquid or solid) (USDOT & IMO); Dinitroltoluenes, molten (USDOT & IMO)

Synonyms and Tradenames: Binitrotoluene; DNT; Dinitrophenylmethane; Dinitrotoluol; 2,4- and 2,6-Dinitrotoluene; 1-Methyl-2,4- and 1-Methyl-2,6-Dinitrobenzene; Methyldinitrobenzene.

CAS Registry No: 25321-14-6.

Chemical Formula: $(NO_2)_2C_6H_3CH_3$

Constituent Components (% each): 80% 2,4-Dinitroltoluene and 20% 2,6-Dinitrotoluene; also reported 76% 2,4-Dinitrotoluene, 19% 2,6-Dinitrotoluene, and 5% other Mono/Di/Tri-Nitrotoluene isomers.

UN/NA Designation: UN2038 (solid or liquid); UN1600 (molten)

IMO Designation: 6.1

RTECS Number: XT1300000

NFPA 704 Hazard Rating: 3 (Health): 1 (Flammability): 3 (Reactivity)

Physical Form as Shipped: Sometimes shipped molten in tank cars or as a solid or liquid. Usually found in molten state. Commercial grade consisting of a mixture of 2,4-, 3,4- and 3,5- is an oily liquid.

Physical Form as Released: Solid, liquid or molten.

Color of the Shipped Material: Yellow crystalline solid at ambient temperature; clear oil.

Odor Characteristics: Distinctive

Reportable Quantity: See appendix I

Common Uses: The major use of DNT is the production of toluene diisocyanate and toluenediamine, which are intermediates in the making of polyurethane foams and polymers. It is also used to produce ammunition, explosives and dyes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

DINITROTOLUENES

Division 6.1 (Poisonous Material)

*Also 1600

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: NIOSH lists dinitrotoluene as a potential occupational carcinogen. It is readily absorbed by all routes of exposure and can cause CNS depression and methemoglobinemia leading to cyanosis. Individuals with preexisting disorders of the liver, cardiovascular system, bone marrow or skin may have increased susceptibility to this material.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1.5 mg/m^3

Ceiling (C) Limit: Unavailable

IDLH: 50 mg/m^3

Conditions to Avoid: Avoid contact with strong oxidizers, strong reducing agents, alkalis, caustics, metals such as tin or zinc, heat, sparks, flame and high mechanical impact.

HEALTH HAZARDS

Potential Health Hazards: Material is readily absorbed through all routes of exposure and should be treated as a potential occupational carcinogen. It is harmful if swallowed, inhaled or absorbed through the skin. Inhalation, ingestion or tissue absorption may cause central nervous system depression and methemoglobinemia leading to cyanosis. Allergic skin sensitization is also possible. Individuals with preexisting disorders of the liver, cardiovascular system, bone marrow or skin may have increased susceptibility to this material.

Hazards of Skin or Eye Contact: Skin contact is not expected to cause skin irritation. However, central nervous system depression may occur. Symptoms may include nausea, vomiting, headaches, drowsiness, dizziness, weakness and loss of coordination, shortness of breath, rapid heart rate. Can also result in the production of methemoglobinema leading to cyanosis. Prolonged overexposure may cause mild skin rashes and other skin complications due to allergic skin sensitization. Contact with molten or hot fumes can cause sever burns and permanent eye damage may result.

Hazards of Inhalation: Inhalation of this material is not expected to cause irritation. However, central nervous system depression may occur. Symptoms may include nausea, vomiting, headaches, drowsiness, dizziness, weakness and loss of coordination. Can also result in the production of methemoglobinema leading to cyanosis. Chronic overexposure can lead to liver damage, jaundice, cyanosis and anemia.

Hazards of Ingestion: Ingestion can cause gastrointestinal irritation including nausea, diarrhea, lethargy and vomiting. This route of exposure may also lead to central nervous system depression. Symptoms may include nausea, vomiting, headaches, drowsiness, dizziness, weakness and loss of coordination. Can also result in the production of methemoglobinema leading to cyanosis. Chronic overexposure can lead to liver damage, jaundice, cyanosis and anemia.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: During fire, irritating and toxic forms of nitrogen oxides may be formed.

Hazardous Decomposition Products: Carbon dioxide, carbon monoxide, and nitrogen oxides. Spontaneously decomposes at temperatures above 250°C (482°F). Air or oxygen are not needed for decomposition.

EXPLOSION HAZARDS

Explosive Potential: Combustible solid but difficult to ignite. Explosion hazard if heated, stricken, dropped or confined. Forms highly explosive mixture with nitric acid. Ignites on contact with sodium oxide. Contamination with other alkalis or organics can lower the decomposition temperature and increase the risk of explosion.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

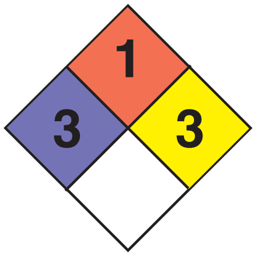
Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn. Suitable materials of construction are Saranex® (longer than 8 hours). Natural rubber and nitrile rubber are not recommended for use due to a less than 1 hour breakthrough time. Wear a face-shield in case of potential splashing.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an

2038 *

DINITROTOLUENES

Division 6.1 (Poisonous Material)



*Also 1600

organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

FIRST AID

Nonspecific Symptoms: Dinitrotoluene is not expected to be an eye, skin or respiratory irritant. It is expected to be a gastrointestinal irritant with symptoms including nausea, diarrhea, vomiting and lethargy. However all routes of exposure can lead to CNS depression and can cause nausea, vomiting, headaches, drowsiness, dizziness, weakness and loss of coordination. Can also result in the production of methemoglobinema leading to cyanosis. Chronic overexposure can lead to liver damage, jaundice, cyanosis and anemia.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination

First Aid for Skin Contact: In case of skin contact, wash with soap and water. Remove contaminated clothing. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, give large quantities of water and induce vomiting. Do not give anything by mouth if patient is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Special Note to Physicians: Absorption of this product into the body leads to the formation of methemoglobin which, in sufficient concentrations, leads to cyanosis. Since reversion of methemoglobin to hemoglobin occurs spontaneously after termination of exposure, moderate degrees of cyanosis may be treated with only supportive measures such as bed rest and oxygen inhalation. **Thorough cleansing of the entire body including scalp and nails is essential.** If cyanosis is severe, intravenous injection of methylene blue, 1 mm/kg body weight, may be of value. Cyanocobalamin (Vitamin B-12), 1 mg intramuscularly, will speed recovery. Intravenous fluids and blood transfusions may be indicated in severe exposures.

FIRE RESPONSE

Extinguishing Agents: Water, dry chemical, carbon dioxide or foam. If in liquid form, use ice, liquid carbon dioxide or water to render material in a solid form.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Dinitrotoluenes is a highly toxic liquid that may cause environmental contamination. Prevent substance from entering sewers, waterways and confined spaces. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Underflow dams are not an effective means to dike material since it can mix somewhat with water and is heavier than water. As a result, recovery efforts from water borne releases are difficult. Runoff may be toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. **Saturated structural firefighting clothing must be decontaminated immediately.** Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Usually, dinitrotoluenes will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the substance is a solid.

CONSEQUENCE

Hazardous levels of dinitrotoluenes in air may be found in the local spill area and immediately downwind under appropriate circumstances. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of toxic vapors.

MITIGATION

Remove spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel, particularly if dry solid has spilled. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover all solid dinitrotoluenes with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will be contaminated.

MITIGATION

Handle covered material with care during site cleanup. Decontaminate cover or treat as hazardous waste for proper disposal.

TECHNIQUE

WATER SPRAY OR FOG . . . Water spray or fog applied to dinitrotoluenes, dust or mist, in air may reduce airborne concentrations.

CONSEQUENCE

Runoff may contain toxic concentrations of material.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments

TECHNIQUE

BURIAL . . . Under appropriate conditions, hot molten dinitrotoluenes may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of vapors or fumes.

CONSEQUENCE

An additional quantity of sand, earth or similar material will become contaminated.

MITIGATION

Consult qualified experts. Consider adding water as necessary to surface of cover material to cool spilled product.

DINITROTOLUENES

Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may be mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Solidify molten liquid using water, ice or carbon dioxide. Shovels, as well as a variety of heavy equipment such as backhoes and loaders may remove soil contaminated with spilled material.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Organize work to minimize dust generation. Decontaminate equipment.

DINITROTOLUENES
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may spread contaminate.

MITIGATION

Excavate as last resort, unless adverse environmental impacts can be minimized.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottoms sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

DI-n-PROPYLAMINE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Di-n-propylamine is a colorless liquid that is used for making other chemicals and has an amine or ammonia-like odor. It is moderately soluble in water and lighter, so may be expected to form a floating surface slick that quickly dissolves. Its flash point of 53°F indicates that it can be easily ignited under many ambient temperature conditions. Vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as sewers or buildings may explode if ignited. There is some potential that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.1-6.2 pounds per gallon.

Di-n-propylamine does not react with water or many other common materials but does attack some forms of plastic and is reactive with a wide variety of chemicals. It is stable in normal transportation and corrosive to copper, aluminum, zinc, and galvanized surfaces. The liquid is a severe irritant to the eyes and skin while the vapor is irritating and rather toxic. If combustion is complete, products include carbon monoxide and nitrogen oxides. If oxygen is insufficient, products of combustion may additionally include highly toxic hydrogen cyanide, nitriles, cyanic acid, isocyanates, cyanogens, nitrosamines, amides, and carbamates.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Moderately soluble
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.
Specific Gravity (Liquid): 0.736-0.741 at 68°F (20°C)
Boiling Point: 221-234°F (105-112°C) at 1 atm.
Melting Point: -39.3°F (-39.6°C)
Freezing Point: Unavailable
Molecular Weight: 101.19
Heat of Combustion: -10420 cal/g
Vapor Pressure: 21-22 mm Hg (0.406-0.425 psia) at 68°F (20°C)
Flash Point: 53°F (11.7°C), closed cup; 68°F (17°C), open cup; may be lower.
Autoignition Temperature: 570°F (299°C)
Burning Rate: 6.1 mm/minute
Stability: Stable
Corrosiveness: Corrodes copper, aluminum, zinc, and galvanized surfaces; may attack some plastics. Iron or steel not attacked.
Reactivity with Water: No reaction.
Reactivity with Other Chemicals: Reacts with strong oxidizers, acids, halogens, peroxides, nitrous oxide, nitrites, aldehydes, halogenated organics, isocyanates, epoxides, alkali, alkaline earth elemental metals, strong reducing agents, and possibly dithiocarbamates.

IDENTIFICATION

Shipping Name: Dipropylamine (USDOT & IMO)
Synonyms and Tradenames: Dipropylamine; n-dipropy lamine; n-propyl-1-propanamine; DNPA
Chemical Formula: $(CH_3CH_2CH_2)_2NH$
Constituent Components(% each): 98% or more pure with some fraction water.
UN/NA Designation: UN2383
IMO Designation: 3.2, Flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Amine odor; ammonia-like; neutral to unpleasant.
Common Uses: Intermediate for making other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

DI-n-PROPYLAMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 0.1 ppm

Unusual Hazards: Flammable liquid. Poses moderate hazard via inhalation of vapors. Products of combustion may be highly toxic if combustion is incomplete.

Short Term Exposure Limits(STEL): Manufacturer implies 20 ppm for 15 minutes.

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, flames, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of vapors in air. Direct physical contact and ingestion may also have significant effects.

Hazards of Skin or Eye Contact: Skin contact with liquid di-n-propylamine may cause severe irritation or burns. Prolonged or repeated contact may result in sensitization. Contact with the eyes may result in eye damage leading to blindness.

Hazards of Inhalation: Vapors of di-n-propylamine irritate the eyes and mucous membranes of the respiratory tract. Higher levels in air may cause headache, dizziness, coughing, difficult breathing, and the possibility of delayed pulmonary edema or chemical pneumonitis with possibly severe consequences. Exposure to 1000 ppm for 4 hours is lethal to some rats.

Hazards of Ingestion: Ingestion may cause irritation and burning of the mouth and stomach, nausea, and vomiting. There may be potential for aspiration into the lungs during vomiting to result in delayed pulmonary edema and chemical pneumonitis with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: Somewhat less than 2.8% (estimated)

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Nitrogen oxides and carbon monoxide when combustion is complete. A variety of highly toxic substances when fire is oxygen starved. See general information section for details.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

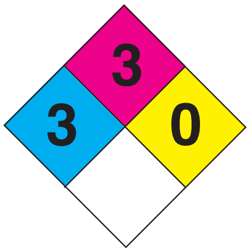
Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash- proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include polycarbonate. Butyl rubber may provide limited protection.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2383

DI-n-PROPYLAMINE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, mucous membranes of the respiratory tract, and other symptoms due to vapor exposure. Irritation or burns due to direct physical contact or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of milk or water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Water fog, dry chemical, carbon dioxide, and alcohol foam. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fires in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that di-n-propylamine is a moderately volatile and toxic flammable liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION ... Di-n-propylamine may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of di-n-propylamine in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Di-n-propylamine spills may expose downwind areas to toxic or flammable concentrations, particularly if large amounts have spilled and the weather is warm.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

DI-n-PROPYLAMINE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to di-n-propylamine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of di-n-propylamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of di-n-propylamine vapor into the atmosphere. (Note: the fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid di-n-propylamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent to liquid di-n-propylamine may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Di-n-propylamine may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained di-n-propylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

DI-n-PROPYLAMINE

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

DI-n-PROPYLAMINE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

Adsorption ... Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION ... Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

DODECYLBENZENESULFONIC ACID
Class 8 (Corrosive Material)

GENERAL INFORMATION

Dodecylbenzenesulfonic acid, is a viscous, highly acidic, water-soluble and non-volatile liquid that may vary from being colorless to light yellow or brown. Although some product formulations may be odorless, others may evolve some amounts of highly toxic sulfur dioxide gas that may accumulate in containers and which has a sharp and pungent odor resembling burning sulfur. The lowest reported flash point of the material is 230°F (110°C) and indicates that substantial preheating may be necessary before the substance can be ignited easily. These acidic formulations are reported to attack most metals while evolving flammable and potentially explosive hydrogen gas. The liquid weighs 8.8 - 9.0 pounds per gallon.

Dodecylbenzenesulfonic acid does not react with water and is stable in normal transportation. As noted above, it is corrosive to most metals. It is also likely to attack some forms of plastics, rubber and coatings and, as a strong sulfonated acid, is otherwise reactive with a wide variety of other substances. The product is a highly corrosive liquid which should not be contacted or ingested. Products of combustion are reported to include irritating, corrosive, and/or toxic substances such as sulfur dioxide, sulfur trioxide, sulfuric acid, hydrogen sulfide, and carbon monoxide. They are also likely to include carbon dioxide, various other sulfur and organic compounds, and other harmful substances.

Downwind evacuation over more than relatively minor distances is generally unnecessary unless it is burning in a fashion that exposes vulnerable populations to harmful levels of its products of combustion. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, use professional judgment to determine if the exposure might be sufficient to cause violent rupture or explosion of the container. If it might be, evacuate for a radius of one-half (1/2) mile for protection from flying debris.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Generally soluble in all proportions.

Solubility in Other Chemicals: Not available.

Specific Gravity (Liquid): Reported as 1.06 - 1.08 at 77°F (25°C).

Boiling Point: 572°F (300°C) at 1 atm.

Melting Point: Not available.

Freezing Point: Not available.

Molecular Weight: 316 - 318 for commercial product formulation; 326.5 for pure substance.

Heat of Combustion: Not available.

Vapor Pressure: Apparently very low at ambient temperatures.

Flash Point: 230°F (110°C), closed-cup; 300°F (148.9°C), open-cup.

Autoignition Temperature: Not available.

Burning Rate: Not available.

Stability: Stable.

Corrosiveness: Reported to attack most metals while evolving flammable and potentially explosive hydrogen gas. Specifically stated as incompatible with carbon steel and aluminum. One authority says that product formulations should be handled in type 316 stainless steel or fiberglass with Atlac 382 corrosion liner. Specially lined steel drums also appear suitable for use. The product is considered likely to attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Available data are limited. Generally reported as incompatible with amines, strong alkalis, cyanides, oxidizing agents, reducing agents, sulfides and combustible materials. One source says that contact with acids can result in emission of highly toxic sulfur oxides.

IDENTIFICATION

Shipping Names: Dodecylbenzenesulfonic acid (for U.S. shipments only); international shipments may possibly use "alkyl sulfonic acid, liquid" as the proper shipping name or a suitable alternative name.

Synonyms and Tradenames: Benzenesulfonic acid, dodecyl ester; DDBSA; n-dodecylbenzenesulfonic acid; laurylbenzenesulfonic acid; and many tradename products including but not limited to Bio-Soft S-100, Conoco SA 597, and Nacconol 988A.

Chemical Formula: $CH_3(CH_2)_{11}C_6H_4S0_3H$ or $C_{18}H_{30}S0_3$

Constituent Components (% each): Products made in the U.S. are apparently more than 95% pure with the remainder consisting of sulfuric acid and possibly some amount of "unsulfonated material".

UN/NA Designation: NA2584 for U.S. shipments.

IMO Designation: 8, corrosive material.

Physical State As Shipped: Viscous liquid.

Physical State As Released: Viscous liquid.

Color of the Shipped Material: May vary from colorless to light yellow to brown.

Odor Characteristics: May be odorless, or if sulfur dioxide is being evolved, may smell sharp and pungent like burning sulfur.

Common Uses: Used in a wide variety of detergents and cleaning agents; an intermediate for making emulsifiers and wetting and foaming agents.

DODECYLBENZENESULFONIC ACID
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available

Unusual Hazards: May potentially evolve toxic sulfur dioxide gas; contact with incompatible metals may result in evolution of flammable and potentially explosive hydrogen gas; both gases may accumulate in containers. Use of water or foam on fires must be undertaken carefully to avoid frothing, spattering, and potential tank boilover hazards. Otherwise, be advised that any spilled material is slippery.

Short Term Exposure Limit (STEL): Not formally established for product of concern; 5 ppm for sulfur dioxide for 15 minutes (ACGIH, 1992 - 93; OSHA, 1989); 3 mg/ml for sulfuric acid for 15 minutes (ACGIH, 1992 - 93).

Time Weighted Average (TWA) Limit: Not formally established for product of concern; 2 ppm for sulfur dioxide; 1 mg/m^3 for sulfuric acid; both over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989) when considered separately. Seek qualified advice where necessary.

Conditions to Avoid: Heat, hot surfaces, or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: In the absence of a significant vapor pressure at ambient temperatures, it appears that inhalation exposures will be of significant concern only when this product formulation evolves highly toxic sulfur dioxide gas. Otherwise, the product is a corrosive, non-volatile liquid.

Hazards of Skin or Eye Contact: Contact of the highly acidic liquid product or its mists or vapors with the eyes is variably reported to cause irritation, redness, pain, lacrimation, blurred vision, swelling, severe chemical burns, corneal injury, and/or possibly permanent impairment of vision or blindness. Contact of the skin with the liquid product, depending upon its free sulfuric acid content, may either rapidly or upon prolonged or repeated contact cause defatting, redness, swelling, pain, severe burns, and possibly permanent damage. Even 0.5 to 1.0% concentrations in water have been observed to cause significant irritation. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Vapors or mists of dodecylbenzenesulfonic acid are reported to be irritating and harmful to the nasal passages and respiratory tract. Any mists or fumes of sulfuric acid present at high concentrations in air may be expected to have the potential to cause effects such as sneezing, coughing, difficult breathing, laryngeal, tracheobronchial and/or pulmonary edema (which may be delayed in onset), and/or chemical pneumonia with possibly severe consequences. Any sulfur dioxide present may cause irritation of the nose, throat, and lungs at levels as low as 10 ppm in air. Higher levels may cause similar effects such as choking, coughing, difficult breathing, chest tightness, delayed chemical pneumonia, and possibly death due to respiratory paralysis.

Hazards of Ingestion: Effects of ingestion of the highly acidic liquid are variably reported to include irritation or burns of the mouth, throat, and stomach, with symptoms such as intestinal distention, gastrointestinal irritation, headache, nausea, vomiting, and diarrhea. Note that concentrated sulfuric acid has the potential to additionally cause perforation of the esophagus or stomach, staining and erosion of teeth, vomiting of blood and eroded tissue, and possibly death. Laboratory experiments have shown that single oral doses required to kill 50% of rats range from 0.65 to 2.3 grams of dodecylbenzenesulfonic acid per kilogram of an animal's body weight; the corresponding range for mice is 1.4 to 1.8 g/kg.

FIRE HAZARDS

Lower Flammable Limit: Not available.

Upper Flammable Limit: Not available.

Behavior in Fire: Exposure to high temperatures and a source of ignition may result in ignition of spilled liquid. The high boiling point and low vapor pressure of the product make a significant probability of rupturing or exploding unlikely. It may be prudent, nevertheless, to take appropriate precautions if a closed container is exposed to a large and hot fire for a relatively prolonged period of time.)

Hazardous Combustion Products: Not well-defined; reported to include highly irritating and toxic gases, fumes, and mists of sulfur dioxide (SOA sulfur trioxide (S03), sulfuric acid, hydrogen sulfide (H2S), and carbon monoxide. Likely to also include carbon dioxide, various other sulfur and organic compounds, and other harmful substances.

EXPLOSION HAZARDS

Explosiveness: See "Behavior in Fire" section above for discussion of container rupture potential. Note that these product formulations are reported to attack most metals while evolving flammable and potentially explosive hydrogen gas.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof

2584

DODECYLBENZENESULFONIC ACID
Class 8 (Corrosive Material)

PROTECTIVE CLOTHING AND EQUIPMENT *(CONTINUED)*

safety goggles, and other impervious and acid-resistant clothing for normal operations. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with products of combustion during firefighting operations. An acid-resistant slicker type suit and rubber gloves, boots, and a SCBA are suggested for non-fire spill situations. Compatible materials for the product itself may include chlorinated polyethylene, neoprene, nitrile rubber, and polyvinyl chloride. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: For unknown concentrations, fire fighting, general use, or high concentrations, use a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For normal or cleanup operations where low levels of vapors or mists may be encountered, an approved full facepiece air-purifying cartridge type respirator equipped for organic vapors/mists and acid gases may provide adequate performance within the use limitations of such devices. Seek expert advice for selection and use of a respirator type appropriate for the contaminant levels and exposures being encountered.

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; sneezing, coughing, difficult breathing, headache, nausea, vomiting, diarrhea, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. If skin is not damaged, perform final wash with soap and water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If conscious, have victim wash out mouth with water (which should not be swallowed) and then drink large quantities of water immediately. Do not attempt to make the victim vomit, since vomiting may result in further damage to the throat and esophagus. If available, follow water with administration of milk of magnesia or aluminum hydroxide gel in an equal amount of water. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Regular or alcohol foam both may be effective to some degree. Be advised that application of water or foam as a direct stream onto the burning liquid may result in potentially violent frothing or spattering; entry into burning tanks of the product may possibly result in violent frothing or boilover that may be hazardous to nearby personnel. Apply water or foam as a spray with caution and from a distance at first. Water may possibly be used on smaller spills to dilute discharged liquid to a nonflammable mixture.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with fumes from hot liquid or smoke from fire is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to extreme heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after the fire is out but do not direct water streams into burning containers. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines as necessary prior to use. One manufacturer says to avoid "free fall" of the liquid while another with a product reported to evolve sulfur

DODECYLBENZENESULFONIC ACID
Class 8 (Corrosive Material)

SPILL RESPONSES *(CONTINUED)*

dioxide gas says to vent containers frequently, and more often in warm weather, to relieve any pressure. Also said is not to use pressure to empty containers. Take the corrosivity, reactivity, and other unusual hazards and characteristics of the product into account while planning the response. Remember that sulfur dioxide and/or hydrogen gas may accumulate in some containers.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION. . . Dodecylbenzenesulfonic acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, but give special attention to the possibility that sulfur dioxide may evolve from some product formulations.

CONSEQUENCE

Hazardous levels of the product or other substances may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind as appropriate.

TECHNIQUE

WATER FOG OR SPRAY . . . Where deemed necessary, water fog or spray may be applied to any vapors or mists in air to absorb vapors, knockdown mists, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts (if any) of various chemicals from contact with vapors or mists.

MITIGATION

Where necessary, contain contaminated water and neutralize and/or remove it as soon as possible and as necessary to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam (either regular or alcohol type, see "Extinguishing Materials") may be applied to the surface of liquid pools to possibly slow the release of chemical vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. Application of foam to a very hot liquid product may cause violent frothing.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply foam to very hot liquid with extreme caution at first.

TECHNIQUE

DILUTION . . . Where deemed necessary, the addition of a relatively large amount of water to liquid dodecylbenzenesulfonic acid may slow the release of various gases, vapors, or fumes into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Contact of water with very hot liquid product may cause violent frothing. Water streams may result in considerable foaming of the product, which may or may not be desirable.

MITIGATION

Add water gently to the product in a manner that minimizes foaming if desired. Where necessary, contain liquid and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Apply water to very hot liquid with extreme caution at first.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid dodecylbenzenesulfonic acid or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in spread of contamination.

DODECYLBENZENESULFONIC ACID
Class 8 (Corrosive Material)

LAND SPILL *(CONTINUED)*

MITIGATION

Contain liquid and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION.. . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged, develop leaks, and/or be corroded in a manner that generates flammable and potentially explosive hydrogen gas.

MITIGATION

Use equipment compatible with the spilled product or neutralize contained liquids prior to recovery.

TECHNIQUE

ABSORPTION.. . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire. Corrosivity hazards to cleanup personnel may be mitigated by neutralizing the liquid prior to recovery.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques. If soda ash is used, provide adequate ventilation to dissipate the carbon dioxide gas that will be generated.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors or gases present in the area, such as hydrogen gas generated by the action of sulfuric acid in the product on various metals, may possibly be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Even small amounts of the product can cause foaming in water since the material is essentially a detergent.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Neutralization may also be necessary.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

CHEMICAL TREATMENT . . . Application of appropriate chemical agent(s) to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

FOAMING . . . Water containing dissolved detergent such as dodecylbenzenesulfonic acid may be decontaminated to some degree by aeration techniques. This requires the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

Large amounts of foam may be generated and may be difficult to capture and place in proper storage until it collapses if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment and in applying this technique. Consider treating contained water via a processing system constructed on land.

March 1995

EPICHLOROHYDRIN
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Epichlorohydrin is a colorless liquid with a sweet, pungent, irritating odor that may resemble garlic or chloroform. It is used as a solvent and in making resins, glycerol, rubber, stabilizers, and chemicals for paints, varnishes, and lacquers. It is 6.6% soluble in water by weight and somewhat heavier, so may be expected to sink and dissolve at a moderate rate. Its flash point of 87°F indicates that it may be easily ignited in warm ambient temperature conditions. In such situations, vapors may be somewhat heavier than air and may travel some distance to a source of ignition and flashback. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 9.8 pounds per gallon.

Epichlorohydrin reacts mildly with water. Although stable in normal transportation, acids, bases, certain salts, or excessive heat (temperatures above 617°F) may initiate self-polymerization in a reaction that may cause violent rupture of the container. The product may react violently with magnesium and aluminum and their alloys, and will pit steel when wet. It is reactive with a variety of other chemicals and substances and will attack some kinds of plastics, rubbers, and coatings. Vapors of epichlorohydrin are irritating and highly toxic. The liquid is injurious to the eyes and skin and highly toxic by ingestion. Products of combustion may include highly toxic phosgene, hydrogen chloride, and carbon monoxide gases.

Downwind evacuation should be considered if the product is leaking but not on fire. If a product container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 6.6% W at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, carbon tetrachloride, benzene, ether, and most organic solvents.

Specific Gravity (Liquid): 1.176 at 68°F (20°C)

Boiling Point: 239.4-244.2°F (115.2-117.9°C) at 1 atm.

Melting Point: -71°F (-57.2°C)

Freezing Point: -71°F (-57.2°C)

Molecular Weight: 92.53

Heat of Combustion: -4524 cal/g

Vapor Pressure: 12.5 mm Hg (0.242 psia) at 68°F (20°C)

Flash Point: 87°F (30.6°C), closed cup; 91-105°F (32.8-40.6°C), open cup.

Autoignition Temperature: 772-804°F (411-429°C)

Burning Rate: 2.6 mm/minute

Stability: Stable in normal transportation. May polymerize under conditions described above.

Corrosiveness: Reacts with magnesium and aluminum and their alloys; wet product will pit steel. Attacks some kinds of plastics, rubbers, and coatings. Penetrates leather easily.

Reactivity with Water: Mild reaction.

Reactivity with Other Chemicals: Reacts with acids; caustics; bases such as ammonia and amines; sodium, potassium, magnesium, aluminum and other chemically active metals and their alloys; metal halides such as iron chloride; 2-aminoethanol; ethyleneimine; ethylene diamine; potassium tert-butoxide; and strong oxidizers.

IDENTIFICATION

Shipping Names: Epichlorohydrin (USDOT and IMO)

Synonyms and Tradenames: 3-chloro-1,2-epoxypropane; 2- chloropropylene oxide; epichlorhydrin; gamma-chloropropylene oxide; 1-chlor-2,3-epoxypropane; chloromethyloxirane; (chloromethyl) ethylene oxide; 3-chloro-1,2-propylene oxide; epichlorophydrin; 1,2-epoxy-3-chloropropane; 2,3-epoxypropyl chloride; EPI; ECH; glycidyl chloride; glycerol epichlorohydrin; alpha-epichlorohydrin.

Chemical Formula: CH_2OCHCH_2Cl

Constituent Components(% each): 99% min purity with 0.10% water max

UN/NA Designation: UN2023

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sweet, pungent, irritating, like garlic, like chloroform.

Common Uses: Curing rubber; solvent; mfg. of resins, glycerol, stabilizer for chlorine-containing materials, paints, varnishes, lacquers, cement for celluloid, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

EPICHLOROHYDRIN

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10 ppm

Unusual Hazards: Flammable liquid that may self-polymerize at high temperatures. Product is highly toxic via all routes of exposure.

Short Term Exposure Limits(STEL): (Skin) 5 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 2 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is due to inhalation of vapors in air. The product is also highly toxic by ingestion or direct physical contact. Repeated or prolonged exposure may cause liver, lung, and kidney injury as well as sterility. Earliest symptoms may involve gastrointestinal distress or pain in the region of the liver. The product is a carcinogen to animals.

Hazards of Skin or Eye Contact: Contact of the skin with liquid epichlorohydrin may result in delayed blistering and deep-seated pain. The product may be absorbed through the skin in toxic amounts and may cause occasional sensitization and an allergenic skin condition. Contact with the eyes may cause severe irritation and possible tissue damage.

Hazards of Inhalation: Vapors of epichlorohydrin are irritating tothe eyes, nose, and respiratory tract at levels as low as 20-40 ppm in air. High levels may cause central nervous system depression with symptoms including headache, nausea, vomiting, coughing, difficult breathing, blue coloration of the skin (cyanosis) and possibly death. Breathing difficulties may be delayed by several hours and may involve chemical pneumonitis. Exposure to 250 ppm in air for 4 hours kills some rats while 7400 ppm kills some mice in 30 minutes.

Hazards of Ingestion: Ingestion of as little as 1 gram of epichlorohydrin could be fatal. Symptoms may include vomiting, convulsions, rapid pulse, and respiratory paralysis.

FIRE HAZARDS

Lower Flammable Limit: 3.8%

Upper flammable limit: 21%

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Exposure of containers to fire may result in violent polymerization and container rupture.

Hazardous Combustion Products: May include toxic phosgene, hydrogen chloride, and carbon monoxide gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Excessive heat may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in the presence of acids, bases, and certain salts.

PROTECTIVE CLOTHING AND EQUIPMENT

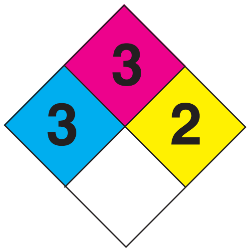
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2023

EPICHLOROHYDRIN

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, or respiratory tract due to vapor exposure, as well as other symptoms of inhalation or ingestion. Blisters, pain, or injury due to direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water, saltwater, or milk immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical (unless fire is in container with confined vent), water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that epichlorohydrin is a toxic and flammable substance. Violent polymerization may occur under conditions described in the General Information section. Violent reactions may occur in the presence of magnesium or aluminum or their alloys.

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Epichlorohydrin spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

EPICHLOROHYDRIN
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to epichlorohydrin vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of epichlorohydrin from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM ... Alcohol foam applied to the surface of liquid pools may slow the release of epichlorohydrin vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION ... The addition of a relatively large amount of water to liquid epichlorohydrin may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impound ments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Epichlorohydrin may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained epichlorohydrin may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

EPICHLOROHYDRIN

Division 6.1 (Poisonous Material)

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ... Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, saw dust, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCES

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

EPICHLOROHYDRIN
Division 6.1 (Poisonous Material)

TECHNIQUE

Adsorption ... Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

CONTAINMENT ... Spilled product may sink in slowly flowing water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination, particularly if water volume is limited.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts. Epichlorohydrin may rapidly dissolve or react with water, thus rendering this response ineffective.

MITIGATION

Excavate as last resort. Use other containment methods if conditions are appropriate for rapid dissolution in water.

TECHNIQUE

DREDGING/PUMPING ... Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air. Epichlorohydrin may dissolve or react with water before this response can be implemented.

MITIGATION

Consult qualified experts for guidance. Use hoses and pumps or vacuum trucks promptly after spillage.

September 2000

ETHANOLAMINE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Ethanolamine is a colorless liquid with a fishy, ammoniacal odor. It is used to make pharmaceuticals, ammonia, detergents, wool treating agents, paints, polishes, corrosion inhibitors, and other products and chemicals. It is fully soluble in water and will mix freely in all proportions. Its flash point of 185°F indicates the product must be heated before ignition may occur. There is some very limited potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weights approximately 8.5 pounds per gallon.

Ethanolamine does not react with water, but some heat will be evolved as it mixes. It is stable in normal transportation, and corrosive to copper, brass, other copper alloys and some types of plastic, rubber and coatings. There is a possibility that reactions with nitrides may be explosive. The product is of low volatility but vapors may be toxic at relatively low concentrations in air. Products of combustion may be toxic and may include nitrogen oxides and other substances.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.
Solubility in Other Chemicals: Soluble in acetone, chloroform, and methanol; slightly soluble in benzene.
Specific Gravity (Liquid): 1.02 at 68°F (20°C)
Vapor Density: 2.1
Boiling Point: 338 - 342°F (170 - 172.2°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: 50.5°F (10.3°C)
Molecular Weight: 61.1
Heat of Combustion: -5950 cal/g
Evaporation Rate (butyl acetate=1): 0.02
Vapor Pressure: 0.48 mmHg (0.009 psia) at 68°F (20°C)
Flash Point: 185°F (85°C), closed cup; 200°F (93.3°C), open cup.
Autoignition Temperature: 770°F (410°C)
Burning Rate: Unavailable
Flammable Limits: 5.5% (LEL) - 17% (UEL)
Stability: Stable; heat contributes to instability
Polymerization Potential: Will not occur.
pH: The substance is a medium strong base.
Corrosiveness: Attacks copper, brass, other copper alloys, and some forms of plastics, rubber, and coatings. Stainless steel and aluminum are recommended for use with the product.
Reactivity with Water: No reaction but some heat will be evolved.
Reactivity and Incompatibility: May react with mineral acids, strong oxidants, peroxides, organic acids and anhydrides, isocyanates, epoxides, azo or diazo compounds, hydrazines, alkali and alkaline earth elemental metals, strong reducing agents, nitrides, aldehydes, halogenated organics, dithiocarbamates, vinyl acetate, beta-propiolactone, mesityl oxide, epichlorohydrin, acrylonitrile, and acrolein.

IDENTIFICATION

Shipping Name(s): Ethanolamine or Ethanolamine, solutions (USDOT & IMO)
Synonyms and Tradenames: Ethanolamine; 2-Aminoethanol; beta-Aminoethyl Alcohol; 2-Hydroxyethylamine; Colamine; beta-Ethanolamine; Glycinol; beta-Hydroxyethylamine; MEA; Olamine; Thiofac m-50; Ethylolamine; USAF EK-1597; Amino-ethyl alcohol.
CAS Registry No.: 141-43-5
Chemical Formula: $HO(CH_2)_2NH_2$
Constituent Components (% each): 85% in water or 99% or more pure with trace water.
UN/NA Designation: UN2491
IMO Designation: 8, Corrosives
RTECS Number: KJ5775000
NFPA 704 Hazard Rating: 3(Health): 2(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid; solidifies at 50.5°F (10.3°C)
Color of the Shipped Material: Colorless
Odor Characteristics: Mildly ammoniacal, fishy.
Reportable Quantity: See appendix I.
Common Uses: Scrubbing of acid gases; softening of hides; mfg. of mordants, pharmaceuticals, ammonia, detergents, wood treating agent, emulsion paints, polishes, agricultural sprays, corrosion inhibitor, rubber accelerator, and other chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

ETHANOLAMINE

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 2-4 ppm
Unusual Hazards: Concentrated vapors are quite toxic.
Short Term Exposure Limit (STEL): 6 ppm (15 mg/m^3)
Time Weighted Average (TLV-TWA): 3 ppm (8 mg/m^3)
Ceiling (C) Limit: Unavailable
IDLH: 30 ppm
Conditions to Avoid: Heat and fire; incompatible materials; runoff to water bodies; inhalation, ingestion, and direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of high vapor concentrations in air. Ingestion and direct physical contact with liquid or solid ethanolamine are also to be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with liquid or solid ethanolamine may cause redness and irritation. Contact with the eyes may cause severe eye irritation and possibly severe injury. The liquid can be absorbed somewhat through the skin.

Hazards of Inhalation: Vapors of ethanolamine may irritate the eyes, nose, and respiratory tract. Severe exposure may result in narcosis or delayed pulmonary edema with possibly severe consequences, or injury to the liver and kidneys. A concentration of 223 ppm in air was lethal to 4 of 6 guinea pigs in one hour in laboratory experiments.

Hazards of Ingestion: Ingestion of ethanolamine may, at the very least, result in damage to the throat and esophagus.

FIRE HAZARDS

Lower Flammable Limit: 5.5%
Upper Flammable Limit: 17%
Behavior in Fire: Combustible liquid. Will burn but difficult to ignite. There is some limited potential that containers may rupture violently in fire.
Hazardous Decomposition Products: Nitrogen oxides and other toxic products of organic substances. Incomplete combustion gives carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: There is some very limited potential that containers may rupture violently in fires. Contact with other chemicals such as nitrides may result in formation of explosive mixtures. Explosion may result if vapors from heated liquid are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

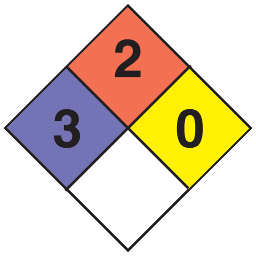
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Butyl rubber, neoprene, nitrile rubber and Vitol® are reported to provide more than 8 hours of protection. Other compatible materials may include natural rubber, nitrile rubber/polyvinyl chloride, polyethylene, chlorinated polyethylene, polyurethane, polyvinyl alcohol, polyvinyl chloride, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 150 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge for ethanolamine (150 ppm or less) or an air purifying respirator (APR) with organic vapor cartridge for ethanolamine (150 ppm or less) with a full facepiece within the use limitations of these devices.

2491

ETHANOLAMINE

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, respiratory tract, skin, throat, or esophagus; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious, administer artificial respiration. Administer oxygen if victim remains unconscious or breathing is difficult. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Alcohol resistant foam, dry chemical, carbon dioxide, water spray or fog. Water may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to ethanolamine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of ethanolamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

ETHANOLAMINE
Class 8 (Corrosive Material)

TECHNIQUE

DILUTION . . . The addition of a large amount of water to liquid ethanolamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL RESISTANT FOAM . . . There is a possibility that alcohol resistant foam applied to the surface of liquid pools may slow the release of ethanolamine vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol resistant foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Liquid ethanolamine may be confined by building dikes or barriers using soil, sand or other materials. Note: Ethanolamine may solidify at temperatures below 50.5°F (10.3°C).

CONSEQUENCE

Confined ethanolamine may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

ETHANOLAMINE
Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment after use. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE
