Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Equipment can become clogged if the product freezes.

MITIGATION

Use equipment compatible with spilled product. Act promptly and prevent freezing if possible.

TECHNIQUE

ABSORPTION . . . Spreading of liquid product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines. Excessive agitation may cause toxic dust to become airborne.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

ortho-NITROCHLOROBENZENE

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: This response included by analogy to para isomer.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

para-NITROCHLOROBENZENE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

The para isomer of nitrochlorobenzene is a light yellow solid that may be shipped as a molten liquid and that has a sweet and pleasant aromatic odor. It is used for making dyes, pharmaceuticals, gasoline gum inhibitors, corrosion inhibitors, and chemicals used in agriculture, photography, and rubber production. It is practically insoluble in water and heavier, so may be expected to sink and dissolve at an extremely slow rate. A flash point of 261°F indicates that it must be heated well above its melting point to be ignited easily. The product weighs approximately 10.8 pounds per gallon.

para-Nitrochlorobenzene does not react with water and is stable in normal transportation. Reactions with alkali or alkaline earth elemental metals, certain other metals, peroxides, strong reducing agents, caustics, strong oxidizers, or chlorine trifluoride may possibly be explosive and the product is otherwise reactive with a variety of chemicals. Some forms of plastics, rubber, and coatings may be attacked by para-nitrochlorobenzene but the product is not corrosive to iron or steel when dry. It is a highly toxic substance and considered a poison. Products of combustion may be toxic and may include oxides of nitrogen, hydrogen chloride, carbon monoxide, chlorides, and possibly chlorine.

If para-nitrochlorobenzene is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.003 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, and ether.

Specific Gravity (Liquid): about 1.3 at 196°F (91°C) or 90°F (15.5°C)

Boiling Point: 462.2-467.6°F (239-242°C) at 1 atm.

Melting Point: 181.4-183.2°F (83-84°C)

Freeing Point: Unavailable

Molecular Weight: 157.56

Heat of Combustion: Unavailable

Vapor Pressure: 0.09 mm Hg (0.002 psia) at 77°F (25°C)

Flash Point: 261°F (127°C), closed cup; 255°F (124°C), open cup.

Autoignition Temperature: Unavailable

Burning Rate: Unavailable

Stability: Stable below 572°F (300°C)

Corrosiveness: Dry product is not corrosive to iron and steel but traces of moisture may cause mild corrosion of steel. May attack some forms of plastics, rubber, and coatings.

Reactivity with Water: Data unavailable, but reaction is unlikely.

Reactivity with Other Chenicals: May react with mineral acids, amines, strong oxidizing agents, alkali or alkaline earth elemental metals, certain other metals, peroxides, strong reducing agents, caustics, nitrides, cyanides, mercaptans, other organic sulfides, azo and diazo compounds, hydrazines, aldehydes, and chlorine trifluoride.

IDENTIFICATION

Shipping Names: Chloronitrobenzenes (USDOT & IMO).

Synonyms and Tradenames: Benzene, 1-chloro-4-nitro; p-chloronitrobenzene; 4-chloro-1-nitrobenzene; p-nitrochlorobenzene; 4-chloronitrobenzene; PNCB or PCNB (do not confuse with pentachloronitrobenzene).

Chemical Formula: $C_6H_4CLNO_2$

Constituent Components(% each): 99.5 + % or more pure with a trace of water.

UN/NA Designation: UN1578

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Solid, or molten liquid that solidifies enroute.

Physical State as Released: Solid or molten liquid.

Color of the Shipped Material: Light yellow

Odor Characteristics: Sweet; pleasant aromatic.

Common Uses: Mfg. of chemicals, dyes, pharamaceuticals, gasoline gum inhibitor, corrosion inhibitor, agricultural chemicals, rubber chemicals, and photographic chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

para-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic substance that affects ability of blood to carry oxygen. Ingestion of alcohol aggravates the toxic effects of exposure to this product. Effects are more dangerous than readily apparent and may be delayed up to 4 hours.

Short Term Exposure Limits(STEL): (Skin) 2 mg/m^3 for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): (Skin) 1 mg/m^3 (3 mg/m^3 proposed) over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks when product is liquid or airborne dust; contact with incompatible materials; contamination of water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from ingestion or inhalation of vapors and dusts. Prolonged skin contact is also to be avoided.

Hazards of Skin or Eye Contact: Contact may cause allergic dermatitis but usual effect (apparently) is slight eye or skin irriation. May also be absorbed through the skin rapidly in toxic amounts to cause cyanosis. Molten liquid may cause thermal burns.

Hazards of Inhalation: Causes cyanosis and affects the ability of the blood to carry oxygen. Symptoms include bluish discoloration of skin starting in lips, nose and earlobes, headache, irritability, dizziness, weakness, nausea, vomiting, shortness of breath, drowsiness, unconsciousness, and possibly death if treatment is not prompt. Effects may be delayed up to 4 hours and are aggravated by ingestion of alcohol. Exposure to 3.3 ppm in air for 24 hours was lethal to cats in laboratory experiments.

Hazards of Ingetion: Causes cyanosis. See hazards of inhalation.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Will burn but usually difficult to ignite.

Hazardous Combusbtion Products: Oxides of nitrogen, hydrogen chloride, carbon monoxide, chlorides, and possibly chlorine.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Vapors may form explosive mixtures with air at high temperatures.

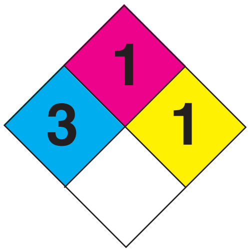
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Reguired: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency particulate filter respirator with a full facepiece (50 mg/m^3 or less); any fume respirator or dust and mist respirator except single use or quarter mask types (10 mg/m^3 or less); any dust and mist respirator of the multiple use type (5 mg/m^3 or less); within the limitations of these devices.

1578

para-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Eye or skin irritation; symptoms of cyanosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Give special attention, as necessary, to cleaning hair and scalp, finger and toenails, nostrils, and ear canals.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Foam, dry chemical, carbon dioxide, water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fume/smoke anticipated. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Eliminate ignition sources as and if necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the significant toxicity of the product into account while planning the response. Note that the molten product will solidify at ambient temperatures.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . para-Nitrochlorobenzene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of para-nitrochlorobenzene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid para-nitrochlorobenzene with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product a soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

para-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to para-nitrochlorobenzene vapors or dusts in air or the surface of the spilled product may reduce downwind concentrations.

CONSEQUENCE

Water runoff may contain a small amount of para-nitrochlorobenzene from contact with the product.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Para-nitrochlorobenzene may be contained by building dikes or barriers using soil, sand or other materials. Liquid spills should solidify fairly rapidly.

CONSEQUENCE

Contained para-nitrochlorobenzene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Equipment can become clogged if the product freezes.

MITIGATION

Use equipment compatible with spilled product. Act promptly and prevent freezing if posible.

TECHNIQUE

ABSORPTION . . . Spreading of liquid product may be controlled by absorbing liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means after product has frozen.

para-NITROCHLOROBENZENE
Division 6.1 (Poisonous Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause toxic dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Handle spilled product carefully.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. The spilled product, together with bottom material, may be deposited into a barge or pumped ashore as a slurry. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

para-NITROCHLOROBENZENE

Division 6.1 (Poisonous Material)

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

January 1990

NITROGEN
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Nitrogen is a colorless, odorless nonflammable and nontoxic element of nature that makes up about 78% of the atmosphere by volume and is handled as a compressed gas under high pressure or as a refrigerated cryogenic liquid at extremely low temperatures. Its uses include cryotherapy of skin lesions, making of various industrial chemicals and explosives, use as a coolant or propellant gas, and general use as an inert gas, among others. Due to its slight solubility in water and boiling point of approximately –320°F spills of liquid nitrogen on land or water or ruptures of compressed gas containers may quickly generate large amounts of gas that may appear white at first due to condensation of water vapor in the air. Initially, the cold gas may be heavier than air and may persist for a time in pits, hollows and depressions, but will approach the density of air as it warms. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The refrigerated liquid weighs 6.7 – 6.8 pounds per gallon at its boiling point temperature.

Due to the fact that the compressed gas is shipped at temperatures far in excess of its very low critical temperature, the pressure within containers of compressed gas is a function of the temperature of the container and the amount of nitrogen it contains (such that the term "vapor pressure" no longer has meaning). These pressures can vary, but commonly exceed 137 atmospheres (2000 psig) at room temperature within gas cylinders.

Nitrogen is fully stable in transportion and does not react with water or other common materials. It is, however, reactive with certain other rather unusual substances described below. Although nitrogen is completely nontoxic, the large volumes of gas that may be generated in a major accident may cause suffocation by displacing oxygen in the air. The extremely low temperatures that may occur under certain conditions of release (primarily but not exclusively from discharges of liquid) may cause tissue damage and burns due to frostbite.

Note: Nitrogen has two stable isotopes and four short-lived and artificial radioactive isotopes. This guide is solely intended for use with the two considerably more common non-radioactive isotopes.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 2.33–2.40 ml (gas)/100 ml water at 32°F (0°C); 1.52–1.60 ml (gas)/100 ml water at 68°F (20°C).

Solubility in Other Chemicals: Slightly soluble in alcohol; soluble in liquid ammonia and liquid oxygen.

Specific Gravity (Liquid): 0.81 at normal boiling point

Boiling Point: – 320.4 to – 319.9°F (–195.8 to – 195.5°C) at 1 atm.

Melting Point: – 346 to – 345.6°F (– 210 to – 209.8°C)

Freezing Point: See melting point

Molecular Weight: 28.01

Heat of Combustion: Not flammable

Vapor Pressure: See General Information section above.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Noncorrosive; requires no special materials of construction so long as temperatures and pressures are tolerated.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Forms cyanides when heated with carbon in the presence of alkalies or barium oxide; reacts vigorously with neodymium; may spontaneously ignite molten lithium; titanium will burn in free nitrogen at 1476°F (802°C). Overall, however, nitrogen is generally considered to be chemically unreactive.

IDENTIFICATION

Shipping Names: Nitrogen (USDOT and IMO); nitrogen, compressed (USDOT and IMO); nitrogen, refrigerated liquid (USDOT and IMO).

Synonyms and Tradenames: None, nitrogen is one of the natural elements.

Chemical Formula: N_2

Constituent Components (% each): 99.5% or more pure with possible traces of nitrogen oxides, methane, oxygen, and possibly other gases.

49 STCC: 49 045 65 (nitrogen or compressed nitrogen); 49 045 66 (refrigerated liquid).

UN/NA Designation: UN1066 (nitrogen or compressed nitrogen); UN1977 (refrigerated liquid).

IMO Designation: 2.2, nonflammable gas

Physical State As Shipped: Compressed gas or refrigerated liquid

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless to faint yellow liquid; colorless gas

Odor Characteristics: Odorless

Common Uses: Cryotherapy of skin lesions; making of various industrial chemicals and explosives; as a coolant or propellant gas; in food freezing operations; for filling certain thermometers and incandescent light bulbs; as a general inert gas; and for bright annealing of steel.

NITROGEN
Division 2.2 (Nonflammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Large volumes of nontoxic and nonflammable gas generated upon release may cause suffocation via displacement of oxygen in air at high concentrations. Extreme cold of liquid or vapors may cause tissue damage or burns due to frostbite. Temperatures may be low enough under some conditions to condense and liquefy some amount of oxygen from air on the surface of equipment containing liquid nitrogen. Very cold nitrogen gas is heavier than air and may persist for a time in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): Unavailable; see below

Time Weighted Average (TLV-TWA): Unavailable; listed as simple asphyxiant.

Conditions to Avoid: Entry into any area in which oxygen levels may be reduced unless a self-contained breathing apparatus is worn. Contact with cold liquid, gas, or containment equipment. Use of equipment not suitable for the temperatures and pressures that may be encountered.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the high gas concentrations that may be present in air in the immediate spill area. Contact should be avoided with cold liquid, gas, or containment equipment to prevent tissue damage and burns due to frostbite.

Hazards of Skin or Eye Contact: Contact with liquid nitrogen or cold nitrogen gas may cause extensive tissue damage or burns due to the extremely cold temperatures involved. Blistering and deep tissue freezing may occur from excessive contact.

Hazards of Inhalation: High concentrations of nitrogen gas in air may cause suffocation by diluting the concentration of oxygen in air below levels necessary to support life. Lack of oxygen may produce dizziness, nausea, errors in judgment, fatigue, accelerated pulse, gasping, confusion, vomiting, headache, loss of consciousness and death, possibly in seconds and without warning. Dangers increase as oxygen concentrations drop below 18 percent by volume in air.

Hazards of Ingestion: Ingestion of liquid nitrogen is highly unlikely.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable compressed gas or refrigerated liquid. Containers may rupture violently in fire due to overpressurization. Will generate large quantities of nontoxic and nonflammable gas upon release.

Hazardous Combustion Products: *Will* not burn or decompose but forms cyanides when heated with carbon in the presence of alkalies or barium oxide.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Not flammable but containers may rupture violently in fire due to overpressurization.

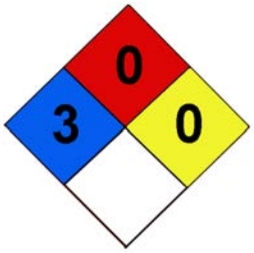
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with excessively cold liquid nitrogen, gas, or containment equipment. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Note that gas masks and cartridge type respirators will not function in oxygen depleted environments and may lead to suffocation.

1066

NITROGEN
Division 2.2 (Nonflammable Gas)



FIRST AID

Nonspecific Symptoms: Symptoms of oxygen deficiency or frostbite.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration and get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove frozen clothing after thawing. Wash affected body areas with large amounts of water. Get medical attention immediately. Do not use hot water on or rub frostbitten areas.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid bodily contact with cold liquid or gas. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential due to overpressurization. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent entrapment of liquid in closed systems. Use oxygen monitoring equipment to test for oxygen deficient atmospheres where necessary. Vent nitrogen to atmosphere slowly in well ventilated outdoor location if this method of disposal is selected. Note that cold liquid nitrogen in exposed piping may cause some amount of oxygen in air to condense and liquefy. Consequently, it is best that any insulating materials used be compatible with oxygen if possible. Only metals and materials compatible with extremely low temperatures and/or high pressures should be used, thus excluding use of metals or other materials that may become brittle at the low temperatures that may be encountered. Take the initially heavier than air nature of nitrogen gas into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Nitrogen discharges may not generate hazardous airborne contaminant concentrations over significant distances in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the product is removed or depleted, particularly if less than large amounts have been released in outdoor locations.

CONSEQUENCE

Hazardous levels of nitrogen in air may be found in the local spill area and immediately downwind.

MITIGATION

Restrict access to the local spill area and areas immediately downwind by unprotected personnel until flow is stopped or the container empties. Check for oxygen levels in air.

TECHNIQUE

EVACUATION . . . Where necessary due to the possibility of massive releases in populated areas, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

NITROGEN
Division 2.2 (Nonflammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid nitrogen, where necessary due to vulnerable surroundings, may be contained by building dikes or barriers using soil, sand or other materials. Note that any spilled liquid will boil vigorously at first and continue to vaporize rapidly.

TECHNIQUE

EXCAVATION . . . Where necessary, a trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Where necessary and possible, accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks due to the high pressures and low temperatures that may be encountered.

MITIGATION

Use suitable equipment. Consider allowing liquid nitrogen to boil or evaporate until naturally depleted or use a light water spray to accelerate boil-off.

WATER SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Any liquid nitrogen contacting a water body will rapidly boil off. Traces of nitrogen remaining in the water (if any) are completely harmless.

January 1995

NITROGEN TETROXIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Nitrogen tetroxide, also commonly referred to as nitrogen dioxide, is a yellowish to dark brown, nonflammable, highly volatile and extremly poisonous liquid with a boiling point in the range of 69.5 to 70.3°F and a freezing point variously reported to be either 11.8 or 15.3°F. The solid product is colorless. Vapors and fumes evolving from the liquid are reported to be yellowish-brown, reddish-brown, or dark brown when in sufficient concentrations to be visible in air. They have a sharp, pungent, acrid, unpleasant and irritating odor. The product is used for making nitric and sulfuric acids as well as nitrated organic chemicals and explosives. It is also used as a catalyst, an oxidizer for rocket fuels and other substances, a polymerization inhibitor for acrylates, and as an agent for increasing the wet strength of paper.

Nitrogen tetroxide (N_2O_4)and nitrogen dioxide (NO_2) are usually found together in equilibrium. Each molecule of nitrogen tetroxide actually consists of two molecules of nitrogen dioxide which have combined. These molecules may also break apart to reform nitrogen dioxide. Solid nitrogen tetroxide is essentially pure N_2O_4. At a temperature of 212°F the liquid contains less than 1%, nitrogen dioxide but the vapor contains about 90%, of the latter substance. Liquid nitrogen tetroxide and nitrogen dioxide are soluble in water and heavier and will react to form nitric and nitrous acids. It is not clear whether the reaction is violent, but a lack of readily available information on the subject implies it is not.

The vapors and fumes of the product are heavier than air and may persist in pits, hollows, and depressions. Some cylinders and other containers used in transportation are not equipped with safety pressure relief devices and are particularly at risk to rupture violently due to overpressurization and possibly rocket if exposed to fire or excessive heat, thus suddenly releasing large amounts of vapors and fumes into the atmosphere. This hazard is shared with all other containers used to transport or store the product, but to a somewhat lesser degree.

Although nitrogen tetroxide and nitrogen dioxide are not themselves combustible, they are extremely reactive oxidizers that may cause a fire or explosion upon contact with combustible or oxidizable materials and will support and accelerate their burning. The products are not corrosive to most structural materials when dry. In the presence of moisture, however, the formation of acids may develop corrosive conditions. Both nitrogen oxides of concern are extremely toxic and dangerous via all routes of exposure but especially if inhaled in even relatively low concentrations in air. Liquid nitrogen tetroxide and nitrogen dioxide weigh approximately 12.1 pounds per gallon at room temperature.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, and weather conditions if nitrogen tetroxide is leaking from its container. A large release may require an evacuation or protective action zone measured in miles. Evacuation may also become necessary if a container is exposed to direct flame or a fire becomes uncontrollable, not only for protection from flying debris if the container should rupture violently, but also because a large amount of non-flammable but extremely toxic vapors and fumes may be suddenly released to the atmosphere.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble; reacts to form nitric acid, nitrous acid, and nitric oxide.

Solubility in Other Chemicals: Reported to be soluble in alkalies, carbon disulfide, chloroform, and concentrated sulfuric and nitric acids.

Specific Gravity (Liquid): 1.45 at 68°F (20°C)

Boiling Point: 69.5-70.3°F (20.8-21.3 °C) at 1 atm.

Melting Point: 11.8 or 15.3°F (–11.2 or – 9.3°C); reported values vary

Freezing Point: See melting point

Molecular Weight: 92.02 for nitrogen tetroxide (N_2O_4); 46.01 for nitrogen dioxide (NO_2)

Heat of Combustion: Not flammable

Vapor Pressure: 400 mm Hg (7.732 psia) at 46.4°F (8°C); approx 720 mm Hg (13.917 psia) at 68°F (20^{o}C); 1782 mm Hg (34.44 psia) at 105°F (40.6°C)

Flash Point: Not flammable

Stability: Stable in normal transportation when sealed in gas-tight container.

Corrosiveness: Not corrosive to mild steel at ordinary temperatures and pressures when dry (0.1% moisture or less); numerous metals and alloys such as carbon steel, stainless steel, aluminum, nickel and Inconel are satisfactory for handling and storage.

Reactivity with Water: Forms nitric and nitrous acids. the latter decomposing, especially with increased temperature, to nitric acid and nitric oxide. Nitric oxide may react with oxygen to form more nitrogen dioxide.

Reactivity with Other Chemicals: N_2O_4 and NO_2 are strong oxidizing agents with the potential to react violently with, cause the ignition of, or explode in contact with combustible and/or oxidizable materials.

IDENTIFICATION

Shipping Names: Dinitrogen tetroxide (USDOT and IMO); nitrogen dioxide (IMO)

Synonyms and Tradenames: Nitrogen (IV) oxide; dinitrogen tetroxide; NTO; red oxide of nitrogen; nitrito

Chemical Formula: N_2O_4 for nitrogen tetroxide; NO_2 for nitrogen dioxide

Constituent Components (%, each): 99.5%, or more pure mixture; the product exists as an equilibrium mixture of NO_2 and N_2O_4. At 212°F (100°C), the liquid state contains less than 1 percent NO_2 and the vapor state contains about 90% NO_2. The solid form is entirely N_2O_4. Nitrogen tetroxide may also be shipped as a mixture with nitric oxide. Nitric oxide combines with oxygen in the air upon release to form nitrogen dioxide, with the rate of conversion depending on several factors. Nitric oxide and nitrogen dioxide are often found together in air in dynamic equilibrium.

UN/NA Designation: UN1067 (dinitrogen tetroxide); UN1975 (nitric oxide and nitrogen tetroxide mixtures.)

IMO Designation: 2.3, poison gas

Physical State As Shipped: Solid, liquid, or compressed liquefied gas

Physical State As Released: Gas, mixture of gas and aerosols (small liquid droplets, fuming and/or boiling liquid, or solid depending upon environmental and release conditions; the product boils at about 70°F and solidifies at about 15°F or below.

Color of the Shipped Material: Colorless solid; yellowish to dark brown liquid; vapors are variously reported to be yellowish-brown, reddishbrown, or dark brown when in sufficient concentration to be visible in air.

Odor Characteristics: Sharp, pungent, unpleasant, acrid, irritating.

Common Uses: Making nitric and sulfuric acids; nitration of organic compounds and explosives; catalyst; oxidizer for rocket fuels and other substances.

for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reported data vary; one source states that the odor of NO_2 is perceptible to some people at 0.11 ppm and for most at 0.22 ppm. Others list an odor threshold of 5 ppm.

Unusual Hazards: Highly volatile substance with extremely toxic vapors that may be dangerous over very considerable downwind distances depending on location, rate and duration of release, and weather conditions. Lethal doses may be inhaled before a victim experiences any significant discomfort. A highly reactive and strong oxidizing agent. Vapors are heavier than air and may persist in low areas.

Short Term Exposure Limits (STEL): 5 ppm as NO_2 for 15 minutes (ACGIH, 1990 – 91); 1 ppm for 15 minutes as NO_2 (OSHA, 1989)

Time Weighted Average (TWA) Limits: 3 ppm as NO_2 over each 8 hours of a 40 hour work week (ACGIH TLV, 1990 – 91): OSHA permitted a transitional ceiling limit for NO_2 of 5 ppm in 1989 which will be phased out over time in favor of the 1 ppm STEL reported above.

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: One of the most insidious and dangerous substances with respect to vapor inhalation hazards. Significant discharges may be highly hazardous at the spill site and over considerable distances downwind. Direct contact with both the liquid and its vapors and fumes should be strictly avoided. Note that the following discussions are somewhat generalized in order to address the mixture of nitrogen oxides that may be present in air following a discharge of nitrogen tetroxide.

Hazards of Skin or Eye Contact: The vapors and fumes of concern may be extremely irritating to the eyes, nose, throat, and skin. Excessive contact with the skin may result in burns. Contact with the eyes may cause severe irritation or possibly permanent injury involving marked redness, swelling, and opacification of the cornea; only 70 ppm of nitrogen tetroxide vapors in air for 8 hours were required to cause persistent corneal opacification in the eyes of rabbits that survived the experiment; higher concentrations may possibly cause this effect in far less time. Contact of liquid nitrogen tetroxide with the skin or eyes will cause severe burns upon even brief contact. Permanent eye injury may result. Prolonged or widespread contact with either vapor or liquid may result in the absorption of potentially harmful amounts of these substances through the skin. Contact with ordinary clothing may cause its ignition. Contact lenses should not be worn when working with this substance.

Hazards of Inhalation: Depending on the level and duration of exposure, these gases and vapors may cause different responses in victims. At high levels in air, symptoms potentially include irritation of the eyes, nose and throat, drowsiness, dizziness, headache, tightness and/or burning in the chest, coughing, choking, production of frothy or mucoid sputum, salivation, restlessness, anxiety, mental confusion, nausea, vomiting, tremors, incoordination, cyanosis, fatigue, increasing and/or irregular respiratory and heart rates, difficulty in breathing, and lung airway constriction resulting in asphyxiation, convulsions, coma and possibly rapid death. Substantially lower concentrations can result in delayed pulmonary edema and death, often with little or no initial symptoms or warning signs. For example, breathing as little as 25 ppm of nitrogen oxides for 8 hours, 100 to 150 ppm for 30 to 60 minutes or just a few breaths at 200 to 700 ppm, may cause severe effects after a latent period of as little as 2 hours, 5 to 8 hours (apparently most typical), or as long as 48 hours in which there are few significant symptoms (if any) and the victim may feel well. The respiratory system effects discussed above will suddenly appear after this period and may ultimately cause death. In yet other cases, there may be mild or moderate signs of injury immediately after the exposure. These will disappear over a period of 2 to 3 weeks, only to be followed by sudden onset of fever, chills, increasing difficultly in breathing, increasing cyanosis, pulmonary edema, and possibly death. Survivors usually recover in another 2 to 3 weeks; however, some do not return to normal but experience varying degrees of impaired lung function. Pneumonia is a general threat from all major exposures. Other significant observations are that: 1) NO_2 exposures may decrease resistance to pulmonary infection; 2) severity of the pulmonary reaction may be lessened if the victim avoids exertion after exposure; 3) just a few ppm in air (e.g., 4-5 ppm of NO_2 for 15 minutes) may rapidly cause increased resistance to the flow of air and other effects in the respiratory systems of healthy adults; 4) inhalation of nitrogen oxides at very low concentrations (e.g., 0.1 ppm of NO_2 for 2 hours) may aggravate the conditions of people with “reactive airway disease”, including those who suffer from asthma, chronic bronchitis, or inflammatory or fibrotic pulmonary disease; and 7) survivors of significant exposures may occasionally develop “bronchiolitis fibrosa obliterans” fibrotic lesions in the lungs) between 10 days to 6 weeks after resolution of acute symptoms.

Hazards of Ingestion: Ingestion is deemed by most authorities to be an unlikely source of exposure and rarely discussed in the literature. One manufacturer simply states that ingestion may result in burns of the mouth, esophagus, and stomach. It is not unreasonable to assume that far more serious effects may follow and that death may result if the exposure is severe.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable substance that is a strong oxidizer and may support and possibly greatly intensify surrounding fires upon release. There is a possibility that some substances that do not normally burn in air will ignite or explode upon contact with the liquid or in a highly oxidizer enriched atmosphere. Containers may rupture violently and possibly rocket in a fire, suddenly releasing large quantities of extremely toxic oxidizing gases into the atmosphere.

Hazardous Combustion Products: Not flammable

1067

See "UN/NA Designation"
for other ID numbers.

NITROGEN TETROXIDE

Division 2.3 (Poison Gas)

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may rupture violently in a fire and possibly rocket. Cylinders and “ton container” tank cars may not be equipped with safety pressure relief devices and are particularly at risk. The substance is a strong oxidizer that may cause a wide variety of materials to ignite or explode upon contact.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with nitrogen tetroxide or nitrogen dioxide. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing for normal working conditions. Several authorities strongly recommend the use of fully encapsulating suits with self-contained breathing apparatus (SCBA) to prevent contact with the liquid or its concentrated vapors in the event of a discharge. Compatible materials for nitrogen tetroxide and nitrogen dioxide may include chlorinated polyethylene, polyethylene, chlorobutyl rubber, and CR 39.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister (5 ppm or less) containing non-oxidizable sorbents and providing protection against nitrogen dioxide or a chemical cartridge respirator (5 ppm or less) with a full facepiece and cartridge(s) containing non-oxidizable sorbents and providing protection against nitrogen dioxide within the use limitations of these devices. N_20_4 and NO_2 are strong oxidizers and should not come in contact with oxidizable materials. Some cartridges and canisters may contain oxidizable materials, such as activated charcoal or carbon, and therefore should not be used to provide protection against these substances.

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, nose, throat, or skin; other symptoms of exposure to the nitrogen oxides of concern.

First Aid for Inhalation: Anyone exposed even momentarily to high concentrations of nitrogen oxides in air should receive immediate attention. Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim’s lungs or vomit.) Get medical attention immediately. Qualified personnel should administer oxygen as soon as possible to prevent or minimize the possibility of pulmonary edema. Keep the victim warm, quiet, and under medical observation until the danger of delayed pulmonary edema has passed (at least 72 hours). Physical exertion should be discouraged as it may increase the severity of resulting pulmonary edema or chemical pneumonitis. Note that there are specific medical treatments recommended for exposure to these substances.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelid. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention immediately. (Note: These recommendations apply to both the liquid contaminant and its vapor or fumes in air. Be advised that certain types of clothing may ignite at some point after contamination.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have the victim lean forward to reduce the risk of aspiration of liquid into the lungs.

FIRE RESPONSE

Extinguishing Materials: Authorities disagree. The USDOT (1990) recommends that only water spray or fog be used on small fires or where a fire must otherwise be fought. It specifically says not to apply dry chemical, carbon dioxide or Halon, but its rationale for avoiding all alternatives is unclear. Others recommend use of water, foam, carbon dioxide, or dry chemical on surrounding fires as necessary. It would appear best to follow USDOT recommendations or to use other extinguishing agents with due caution. In particular, note that certain Halons have the potential to react violently with the nitrogen oxides of concern.

Extinguishing Techniques: Unusual toxic gas, corrosive fume, and oxidizing agent hazard. Keep combustible and oxidizable materials away from spilled material. Stop leak if you can do it without risk. Stay upwind. Wear breathing apparatus and appropriate protective clothing, including fully-encapsulating vapor-protective suit where contact with material or its vapors or fumes is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may rupture violently, possibly rocket, and suddenly release massive amounts of product when exposed to high heat. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

NITROGEN TETROXIDE

Division 2.3 (Poison Gas)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area and out of low areas. Avoid all contact with discharged product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Since reverse flow into a cylinder may cause rupture, use a check valve or other protective device in any line or piping from a cylinder to prevent reverse flow. Take the extremely toxic and reactive nature of the nitrogen oxides of concern into account when planning the response. Note also that nitrogen tetroxide freezes at either 11.8 or 15.3F. Cooling of the liquid below its freezing point will solidify the product and may provide a useful means to stop or reduce the flow of liquids from holes or cracks in containers and/or to facilitate containment and cleanup.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Nitrogen tetroxide or nitrogen dioxide discharges may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to the nitrogen oxides of concern in air may absorb vapors and fumes and accelerate their dispersal in the atmosphere. (Note: The reaction between water and liquid nitrogen tetroxide or nitrogen dioxide is not reported as being violent. Nevertheless, if it appears that contact of water with these liquids is increasing evolution of vapors or fumes, apply water at a point downwind and away from liquid pools.)

CONSEQUENCE

Water runoff may contain corrosive nitric and nitrous acids from contact with airborne vapors and fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . There is an unconfirmed possibility that the addition of a relatively large amount of water to contained liquid nitrogen tetroxide or nitrogen dioxide may slow the release of vapors into the atmosphere. (Note: The reaction between water and liquid nitrogen tetroxide or nitrogen dioxide is not reported as being violent. Nevertheless, if it appears that contact of water with these liquids is increasing evolution of vapors or fumes or shows signs of violence, immediately terminate this response technique unless the spill quantity is relatively small and large amounts of water can be rapidly applied on a sustained basis. Proceed with extreme caution at first.)

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

NITROGEN TETROXIDE
Division 2.3 (Poison Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid nitrogen tetroxide, nitrogen dioxide, and contaminated water runoff may be contained by building dikes using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of these liquids and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain liquid leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Higher than ambient pressures may develop in equipment at higher than moderate temperatures.

MITIGATION

Use equipment of proper pressure capacity that is compatible with the spilled product and any acids that may be formed in contact with moisture or water. Consider using a cold gas such as nitrogen to precool transfer lines and receiving containers when necessary to avoid high initial vaporization rates of the product upon its entry into equipment warmer than its boiling point.

TECHNIQUE

ABSORPTION . . . Where temperatures permit, spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, compatible commercial sorbents and other compatible substances according to various authorities. Note that a 1981 publication of the EPA only lists calcium carbonate as a suitable sorbent material. Note also that the boiling point of nitrogen tetroxide and nitrogen dioxide is approximately 70°F and that the liquid product will boil or otherwise vaporize rapidly under most ambient temperature conditions. This technique is most appropriate in cold weather and/or where sorbents can quickly and safely be placed in appropriately sealed and compatible containers.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under the guidance of a qualified expert. Note that noncombustible sorbents should be used in order to reduce the risk of fire.

NITROGEN TETROXIDE

Division 2.3 (Poison Gas)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical neutralization agents may entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Solid nitrogen tetroxide, contaminated soil and/or liquid residues may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Certain oxidizable substances that have been exposed to the nitrogen oxides and acids of concern may possibly be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product and any nitric and nitrous acids which may form in the presence of moisture or water. Store contaminated materials in a safe and secure location. Do not operate motorized equipment where their use may lead to ignition of combustible materials. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Liquid or solid nitrogen tetroxide and nitrogen dioxide are heavier than water and will sink and react to form nitric acid, nitrous acid and nitric oxide, the latter of which will combine with oxygen to form more nitrogen dioxide. The rate at which these reactions will take place could not be readily determined but is assumed sufficient in most cases to preclude the use of pumps and hoses to remove pools of the liquid products of concern from the bottom of the water body. There may be cases, however, in which containment and pumping from the bottom may be viable options.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Contaminated water may be contained (or diverted to an impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: One authority reports that anion exchange resins may also be effective.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 1992

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Pure nitrogen trioxide has a normal boiling point of 38.3°F (3.5°C) and is usually shipped as a non-combustible, poisonous, compressed liquefied gas in steel cylinders, though the use of larger containers is not prohibited if appropriate transportation regulations are satisfied. When pure, the product is a blue liquid or light bluish gas with an unpleasant odor. Liquid nitrogen trioxide weighs approximately 12.1 pounds per gallon near its boiling point temperature. NOTE WELL: Due to the complex phenomena that take place wen nitrogen trioxide is exposed to air or moisture, it is advised that the Emergency Action Guides for Nitric Acid, Nitric Oxide, and Nitrogen Tetroxide be used in conjunction with this Guide at the scene of an emergency.

Liquid nitrogen trioxide (N_2O_3) may contain some amounts of nitric oxide (NO) and nitrogen dioxide (NO_2) due to its partial dissociation in the liquid state. When released into air, nitrogen trioxide vapors are mostly dissociated into nitric oxide and nitrogen dioxide, the latter of which will form and be in equilibrium with various amounts of nitrogen tetroxide (N_2O_4). The presence of moisture may resut in formation of some amounts of corrosive nitric and nitrous acids. See the "Stability" and "Reactivity with Water" discussions below for further details. As these processes occur, the mixture of gases, vapors, and fumes that form in air may appear yellowish-brown, reddish-brown, or dark brown if present in sufficient concentrations. The odor of mixture components has variably been described as sharp, sweet, acrid, unpleasant, pungent, and irritating. Although nitric oxide is practically insoluble in water, nitrogen trioxide and the oter nitrogen oxides and acids formed are considerably more soluble.

The gases, vapors, and fumes of concern are heavier than air and may persist in low areas. Cylinders and other containers used to transport nitrogen trioxide are not usually equipped with safety pressure relief devices and are particularly at risk to rupture violently if exposed to fire or excessive heat for sufficient time duration, thus suddenly releasing large amounts of gases, vapors and fumes into the atmosphere. Nitrogen trioxide and the other nitrogen oxides mentioned are extremely reactive oxidizers that support and accelerate combustion and which may cause a fire or explosion upon contact with numerous combustible or oxidizable materials. All of these nitrogen oxides are extremely toxic and dangerous via all routes of exposure but especially if inhaled.

Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, and weather conditions if nitrogen trioxide is leaking from its container. A large release may require a very large evacuation or protective action zone. Evacuation may also become necessary if a container is exposed to direct flame or a fire becomes uncontrollable, not only for protection from flying debris if the container should rupture violently, but also because a large amount of noncombustible but extremely toxic gases, vapors and fumes may suddenly be released into the atmosphere.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reported as soluble in cold water.
Solubility in Other Chemicals: Soluble in ether
Specific Gravity (Liquid): 1.447 at 35.6°F (2°C)
Boiling Point: 38.3°F (3.5°C) at 1 atm.
Melting Point: –151.6°F (–102°C)
Freezing Point: See melting point
Molecular Weight: 76.02
Heat of Combustion: Not combustible
Vapor Pressure: 21.4 atm (314.7 psia) at 70°F (21.1°C)
Flash Point: Not combustible
Autoignition Temperature: Not combustible
Burning Rate: Not combustible

Stability: Liquid nitrogen trioxide may contain some amounts of nitric oxide and nitrogen dioxide due to partial dissociation. In the gaseous state at room temperatures, nitrogen trioxide is largely dissociated into nitric oxide and nitrogen dioxide, the latter of which will form and be in equilibrium with various amounts of nitrogen tetroxide. Overall, at a temperature of 77°F (25°C), the combination of these gases in air will only contain about 10% nitrogen trioxide b volume. At temperatures below 70°F (21.1°C), some nitrogen oxide and/or nitrogen tetroxide gas in air may condense to form liquid nitrogen tetroxide.

Corrosiveness: Nitrogen trioxide is corrosive to steel in the presence of moisture or water. However, if its moisture content is 0.1% or less, steel is a satisfactory container material.

Corrosiveness (continued): Either wet or dry nitrogen trioxide may be handled in type 18 – 8 stainless steel. At least one producer of the product uses type 303 stainless steel in valves in contact with dry nitrogen trioxide liquid. It is expected that the product will attack some forms of plastics, rubber, and coatings. See the Guides for nitric oxide, nitrogen tetroxide, and nitric acid for additional corrosivity data.

Reactivity with Water: Through various means, it may be expected that corrosive nitric and nitrous acids will form when the various nitrogen oxides of interest encounter moisture or water. Nitric acid has the chemical formula HNO_3; the chemical formula for nitrous acid is HNO_2.

Reactivity with Other Chemicals: Little specific information is available for nitrogen trioxide itself beyond the report that phosphine gas ignites spontaneously if a trace of nitrogen trioxide is added. Nitric oxide, nitrogen dioxide, and nitrogen tetroxide are all very strong oxidizing agents with the potential to react violently with, cause the ignition of, or explode in contact with numerous other chemicals and combustible and/or oxidizable materials. Decomposition of the dioxide and tetroxide at elevated temperatures will release oxygen that supports and accelerates combustion. Seek additional information from quailfied experts on the interaction of the products in question with specific substances where necessary. Space does not permit a full discussion of all known incompatible materials.

IDENTIFICATION

Shipping Names: Nitrogen trioxide
Synonyms and Tradenames: Dinitrogen trioxide; nitrogen (III) oxide; nitrogen sesquioxide; and nitrous anhydride
Chemical Formulae: N_2O_3 for nitrogen trioxide; NO for nitric oxide; NO_2 for nitrogen dioxide; N_2O_4 for nitrogen tetroxide
Constituent Components (% each): May be 99% or more pure when first produced but the liquid may partially dissociate thereafter. See the Stability discussion above.
49 STCC: 49 203 74 for nitrogen trioxide
UN/NA Designation: UN2421
IMO Designation: 2.3, poison gas
Physical State As Shipped: Compressed liquefied gas (boils at 38.3°F)
Physical State As Released: Gas, mixture of gas and aerosols (small liquid droplets), or boiling liquid. Note that any nitrogen tetroxide formed in air may condense to form liquid
Physical State As Released (continued): droplets or fumes at temperatures of 70°F and below and that nitrogen tetroxide solidifies at temperatures of about 15°F and below.
Color of the Shipped Material: Nitrogen trioxide is a blue liquid or solid and a light bluish gas when pure. As it dissociates in air, the mixture of nitrogen oxides that forms may appear yellowish-brown, reddish-brown, or dark brown if present in sufficient concentrations.
Odor Characteristics: Nitrogen trioxide is simply reported to have an unpleasant chemical odor. The odor of nitric oxide gas has variably been described as sharp, sweet, acrid, unpleasant, pungent, and irritating. Nitrogen tetroxide's odor is said to be similar to that of nitric odor.
Common Uses: Used as an oxidizer in special fuel systems, to make pure alkali nitrites, and for identification of terpenes.

CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

Square background
applicable to rail cars.

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: No specific data are available for nitrogen trioxide. Reported data vary for nitrogen dioxide. One source reports that the odor of NO_2 is perceptible to some people at 0.11 ppm and for most at 0.22 ppm; others list its odor threshold as 5 ppm.

Unusual Hazards: *Will* evolve extremely toxic gases, vapors, and fumes that may be dangerous over very considerable downwind distances depending on location, rate and duration of release, as well as weather conditions. Lethal doses of these materials may be inhaled before a victim experiences any significant discomfort. The substances of concern are highly reactive and strong oxidizing agents. They are heavier than air and may persist in low areas. Containers do not usually have pressure relief devices and are prone to rupture violently in a fire or if exposed to excessive heat for sufficient time duration.

Short Term Exposure Limits (STEL): Not established for nitrogen trioxide; 5 ppm as NO_2 for 15 minutes (ACGIH, 1991–92); 1 ppm for 15 minutes as NO_2 (OSHA, 1989).

Time Weighted Average (TWA) Limits: Not established for nitrogen trioxide; 25 ppm as nitric oxide or 3 ppm as NO_2 over each 8 hours of a 40 hour work week (ACGIH TLV, 1991–92); 25 ppm as nitric oxide (OSHA PEL, 1989) under similar circumstances.
OSHA permitted a transitional ceiling limit for NO_2 of 5 ppm in 1989 which will be phased out over time in favor of the STEL reported above. Note that use of exposure limits is a complex undertaking where a mixture of highly toxic and related gases may be present in air.

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of even low concentrations of nitrogen trioxide and the substances it forms in air, these being among the most insidious and dangerous substances in commerce with respect to this hazard. Significant discharges may be highly dangerous at the spill site and over considerable downwind distances. Direct contact with gas, fumes or liquid with the skin and particularly the eyes should also be strictly avoided. Note that the following discussions are generalized in order to address the mixture of nitrogen oxides that may be present in air following a discharge of nitrogen trioxide.

Hazards of Skin or Eye Contact: The gases, vapors, and fumes of concern can be extremely irritating to the eyes, nose, throat, and skin. Excessive contact with the skin may result in burns. Contact with the eyes may cause severe irritation or possibly permanent injury involving marked redness, swelling, and opacification of the cornea. Only 8 hours exposure to 70 ppm of nitrogen tetroxide vapors in air were required to cause persistent corneal opacification in the eyes of rabbits that survived the experiment; higher concentrations may possibly cause this effect in far less time. Contact of liquid nitrogen trioxide with the skin, by analogy to the characteristics of nitrogen tetroxide, may be expected to cause severe burns upon even brief contact; contact with the eyes may result in permanent eye injury. Due to its boiling point temperature, frostbite due to contact with liquid nitrogen trioxide, very cold gas streams, or very cold containers is of additional concern. Prolonged or widespread contact with either gases vapors, fumes, or liquids may result in the absorption of potentially harmful amounts of these substances through the skin. Ordinary clothing may be ignited when contaminated by these substances. Do not wear contact lenses where these substances have been or may be discharged.

Hazards of Inhalation: Depending on the level and duration of exposure, these gases and vapors may cause different responses in victims. At high levels in air, symptoms potentially include irritation of the eyes, nose and throat, drowsiness, dizziness, headache, tightness and/or burning in the chest coughing, choking, production of frothy or mucoid sputum, salivation, restlessness, anxiety, mental confusion, nausea, vomiting, tremors, incoordination, cyanosis, fatigue, increasing and/or irregular respiratory and heart rates, difficulty in breathing, and lung airway constriction resulting in asphyxiation, convulsions, coma and possibly rapid death. For example, exposure of mice to 5000 ppm of nitric oxide for 6 to 8 minutes was fatal, as was exposure to 2500 ppm for 12 minutes. Cyanosis occurred after a few minutes; breathlessness, paralysis, convulsions and death followed. Substantially lower concentrations can result in delayed pulmonary edema and death, often with little or no initial symptoms or warning signs. For example breathing as little as 25 ppm of nitrogen oxides for 8 hours, 100 to 150 ppm for 30 to 60 minutes, or just a few breaths at 200 to 700 ppm, may cause severe effects after a latent period of as little as 2 hours, 5 to 8 hours (apparently most typical), or as long as 48 hours in which there are few significant symptoms (if any) and the victim may feel well. The respiratory system effects discussed above will suddenly appear after this period and may ultimately cause death. In yet other cases, there may be mild or moderate signs of injury immediately after the exposure. These will disappear over a period of 2 to 3 weeks, only to be followed by sudden onset of fever, chills, increasing difficultly in breathing, increasing cyanosis, pulmonary edema, and possibly death. Survivors usually recover in another 2 to 3 weeks however, some do not return to normal but experience varying degrees of impaired lung function. Pneumonia is a general threat from all major exposures. Other significant observations are that: 1) NO_2; exposures may decrease resistance to pulmonary infection; 2) severity of the pulmonary reaction may be lessened if the victim avoids exertion after exposure; 3) just a few ppm in air (e.g., 4–5 ppm of NO_2 for 15 minutes) may rapidly cause increased resistance to the flow of air and other effects in the respiratory systems of healthy adults; 4) inhalation of nitrogen oxides at very low concentrations (e.g., 0.1 ppm of $N0_2$ for 2 hours) may aggravate the conditions of people with "reactive airway disease", including those who suffer from asthma, chronic bronchitis, or inflammatory or fibrotic pulmonary disease; and 7) survivors of significant exposures may occasionally develop "bronchiolitis fibrosa obliterans" (fibrotic lesions in the lungs) between 10 days to 6 weeks after resolution of acute symptoms.

Hazards of Ingestion: Due to characteristics of the substance, ingestion of liquid nitrogen trioxide is considered unlikely. Its effects via single oral doses have apparently not been studied. Nevertheless, it may be presumed that frostbite and burns may take place upon contact with bodily tissues and that toxicological effects may be severe and possibly fatal if the exposure is significant.

2421

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

FIRE HAZARDS

Lower Flammable Limit: Not combustible
Upper Flammable Limit: Not combustible
Behavior in Fire: Noncombustible substance that is a strong oxidizer and may support and possibly greatly intensify surrounding fires upon release. There is a possibility that some substances that do not normally burn in air will ignite or explode upon contact with the liquid or in a highly oxidizer enriched atmosphere. Containers may rupture violently in a fire, suddenly releasing large quantities of extremely toxic oxidizing gases into the atmosphere.
Hazardous Combustion Products: Product may decompose and evolve oxygen and other gases in a fire, including less complex oxides of nitrogen.

EXPLOSION HAZARDS

Lower Explosive Limit: Not combustible
Upper Explosive Limit: Not combustible
Explosiveness: Containers of nitrogen trioxide do not normally have pressure relief valves or devices. They may rupture violently in a fire or if exposed to excessive heat for sufficient time duration. The substance is a strong oxidizer that may cause a wide variety of materials to ignite or explode upon contact.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with liquid or gaseous nitrogen trioxide and the various oxides of nitrogen it forms in contact with air. This may include rubber boots, gloves, face shields, gas-tight safety goggles, and other impervious and resistant clothing for normal working conditions. Several authorities strongly recommend the use of fully encapsulating suits with self-contained breathing apparatus (SCBA) to prevent contact in the event of a discharge. Materials reported as probably compatible with nitrogen tetroxide and nitrogen dioxide include chlorinated polyethylene, polyethylene, chlorobutyl rubber, and CR 39. Those reported as probably compatible with nitric oxide include butyl rubber, polyvinyl chloride (PVC), and chlorinated polyethylene.
Respiratory Protection: Given the complex mixture of hazardous gases, vapors, and fumes that may be present in air, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent) should be used under all emergency conditions. If a gas mask or chemical cartridge respirator providing protection against the nitrogen oxides of concern is used where contaminant concentrations in air are very low, the devices should not contain oxidizable sorbents such as activated charcoal or carbon and should only be used under the direction of a qualified expert.

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, nose, throat, or skin; other symptoms of exposure to the nitrogen oxides of concern.
First Aid for Inhalation: Anyone exposed even momentarily to excessive concentrations of nitrogen oxides in air should receive immediate attention. Carry victim to fresh air and keep warm and at absolute rest despite lack of any apparent ill effects. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Get medical attention immediately. Qualified personnel should administer oxygen as soon as possible to prevent or minimize the possibility of pulmonary edema. Keep the victim warm, quiet, and under medical observation until the danger of delayed pulmonary edema has passed (at least 72 hours). Physical exertion should be completely discouraged as it may increase the severity of resulting pulmonary edema or chemical pneumonitis. Note that there are specific medical treatment protocols recommended for exposure to these substances. If vomiting occurs naturally, have the victim lean forward with head below hips to reduce the risk of aspiration of fluids into the lungs.
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention immediately. (Note: These recommendations apply to both the liquid contaminant and its gases, vapors, or fumes in air. Be advised that there is some possibility that certain types of clothing may ignite at some point after contamination.) If signs of frostbite are apparent, do not use hot water and do not rub frozen areas.
First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have the victim lean forward with head below hips to reduce the risk of aspiration of fluids into the lungs. If signs of frostbite are apparent, do not use hot water and do not rub frozen areas.

FIRE RESPONSE

Extinguishing Materials: Authorities disagree. The USDOT (1990) recommends that only water spray or fog be used on small fires or where a fire must otherwise be fought. It specifically says not to apply dry chemical, carbon dioxide or Halon, but its rationale for avoiding all alternatives is unclear. Many others recommend use of water, foam, carbon dioxide, or dry chemical on surrounding fires as necessary. It would appear best to follow USDOT recommendations or to use other extinguishing agents with due caution. In particular, note that certain Halons have the potential to react violently with the nitrogen oxides of concern.

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

FIRE RESPONSE (continued)

Extinguishing Techniques: Unusual toxic gas, corrosive fume, and oxidizing agent hazard. Keep combustible and oxidizable materials away from spilled material. Stop leak if you can do it without risk. Stay upwind. Wear breathing apparatus and appropriate protective clothing, including fully-encapsulating vapor-protective suit where contact with material or its vapors or fumes is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may rupture violently and suddenly release its contents when exposed to high heat. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area and out of low areas. Avoid all contact with discharged product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Note that nitrogen trioxide should preferably be withdrawn from cylinders as a liquid when desired or necessary to prevent dissociation of the product to nitric oxide, nitrogen dioxide, and nitrogen tetroxide. Prior to such withdrawals, the cylinder should preferably be cooled (using an ice-water bath, for example). A manufacturer of the product suggests that one way to handle disposal of leaking cylinders is to "Put on . . . breathing equipment. Transfer cylinder to a (lab) hood and cool in ice-water. Attach appropriate needle valve with piece of suitable flexible tubing to the cylinder valve. Run the liquid nitrogen trioxide into excess 10% aqueous sodium hydroxide solution. Transfer to plant disposal unit for neutralization and disposal." Since there may be a possibility that reverse flow into a cylinder may cause rupture use a check valve or other protective device in any line or piping from a cylinder to prevent reverse flow. Take the extremely toxic and reactive nature of the nitrogen oxides of concern into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow airborne contaminants to dissipate. Nitrogen trioxide discharges may expose downwind areas to toxic concentrations of various nitrogen oxides over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE ,

WATER FOG OR SPRAY . . . Water fog or spray applied to the nitrogen oxides of concern in air may absorb or knockdown gases, vapors and fumes and/or accelerate their dispersal in the atmosphere. Apply water at a point downwind and away from any exposed liquid pools of nitrogen trioxide to avoid contact with water and possible acceleration of vapor evolution.

CONSEQUENCE

Water runoff may contain various oxides of nitrogen and corrosive nitric and nitrous acids from contact with airborne gases, vapors and fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff' or rainwater that may add to spill volume and overfill impoundments.

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid nitrogen trioxide or water runoff that is contaminated with oxides of nitrogen and/or nitric and nitrous acids may be contained by building dikes using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained liquids and spread of contamination.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Be alert to conditions such as excessive fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking liquid nitrogen trioxide or contaminated water runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove or neutralize contained liquids as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated pools of liquid nitrogen trioxide or contaminated water may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the accumulated liquids may become damaged or develop leaks. High pressures may develop in equipment if an attempt is made to recover pools of cold liquid nitrogen trioxide and the equipment is warmer than the liquid.

MITIGATION

Use equipment of proper pressure capacity that is compatible with the accumulated liquid and/or any acids that may have formed in contact with moisture or water. Where an attempt is to be made to recover cold liquid nitrogen trioxide, consider using a non-reactive cold gas such as nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates of the product upon its entry into equipment. Ensure that the equipment is completely clean and dry.

TECHNIQUE

ABSORPTION . . . Where deemed necessary, spreading of contaminated water runoff may be controlled by absorption of the liquid with sand, earth, clay, compatible commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the contaminated liquids. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under the guidance of a qualified expert. Note that noncombustible, non-oxidizable sorbents should be used in order to reduce the risk of fire.

TECHNIQUE

NEUTRALIZATION . . . Application of appropriate neutralization agents may modify nitrogen trioxide or contaminated water runoff to less hazardous substances.

CONSEQUENCE

Application and removal of chemical neutralization agents may entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

NITROGEN TRIOXIDE
Division 2.3 (Poison Gas)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and/or liquid residues may be removed by shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Certain oxidizable substances that have been exposed to the nitrogen oxides and acids of concern may possibly be ignited or caused to explode by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with the spilled product and any nitric and nitrous acids which may form in the presence of moisture or water. Store contaminated materials in a safe and secure location. Do not operate motorized equipment where their use may lead to ignition of combustible materials. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . If liquid nitrogen trioxide or significantly contaminated water runoff enters a body of water, notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Although much of any liquid nitrogen trioxide will boil and vaporize as it sinks in water, some portion may dissolve. The water may contain a variable mixture of nitrogen trioxide, nitrogen dioxide, nitrogen tetroxide, nitric acid, and/or nitrous acid as various reactions take place over time. This recommendation and those that follow may not be required in cases simply involving contaminated water runoff if the contaminants will be diluted below harmful levels. Seek guidance from a qualified expert where necessary.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Where necessary, contaminated water may be contained (or diverted to an impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Where necessary, application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1989

NITROUS OXIDE
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Nitrous oxide is a nonflammable compressed or refrigerated liquefied gas with an odor described as ranging from sweet to acrid. Also known as "laughing gas", the product is used as an anesthetic in dentistry and surgery, and also has uses as an aerosol propellant, for making other chemicals, in leak detection, and in rocket fuels. Slightly soluble and heavier than water, it is expected to sink while rapidly boiling and dissolving very slowly. Spills on either land or water may generate relatively large amounts of heavier than air vapors that may accumulate and persist in pits, hollows, and depressions. Containers may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. Discharges under fire conditions may accelerate and intensify the burning of other combustible materials since the product is normally a mild oxidizing agent. Exposure to high temperatures, however, may cause dissociation to elemental nitrogen and oxygen and enhance the oxidizing effect, and this dissociation has been described as being potentially explosive at times. The liquid product weighs approximately 10.2 pounds per gallon near its boiling point and 6.2 pounds per gallon at room temperature.

Nitrous oxide does not react with water, is noncorrosive to common metals, and is stable in normal transportation. As noted above, it is a mild oxidizing agent, and it is also reactive with a variety of other chemicals. Toxicity of the product is low in acute exposures, but it may be present in air in very high concentrations. Contact with the cold liquid or gas may result in frostbite.

Although the inhalation toxicity of nitrous oxide is quite low, downwind evacuation should be considered if the product is leaking until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.1211g/100g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, oils, ether, and concentrated sulfuric acid.

Specific Gravity (Liquid): 1.226 at boiling point; 0.745 at 70°F (21.1°C)

Boiling Point: –127.3°F (– 88.5°C) at 1 atm.

Melting Point: –131.4°F (–90.8°C)

Freezing Point: See melting point

Molecular Weight: 44.0

Heat of Combustion: Not flammable

Vapor Pressure: 51.7 atm (759.7 psia) at 70°F (21.1°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable in normal transportation

Corrosiveness: Noncorrosive; may be used with common structural metals, but may dissolve some plastics containing plasticizers.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Forms flammable mixtures, some of which may ignite spontaneously, with tungsten carbide (when heated), hydrazine, lithium hydride, powdered aluminum, amorphous boron (when heated), and gaseous sodium (when heated). Mixture with phosphine may explode if ignited. Mixture with phenyllithium forms unstable compound. Avoid contact with flammable or combustible materials, especially oil and grease.

IDENTIFICATION

Shipping Names: Nitrous oxide (USDOT and IMO); nitrous oxide, refrigerated liquid (USDOT and IMO); nitrous oxide, compressed (USDOT).

Synonyms and Tradenames: Dinitrogen oxide; dinitrogen monoxide; hyponitrous acid anhydride; factitious air; laughing gas.

Chemical Formula: N_2O

Constituent Components (96 each): 97% or more pure

49 STCC: 49 043 40 (compressed); 49 043 45 (refrigerated)

UN/NA Designation: UN1070 (compressed); UN2201 (refrigerated)

IMO Designation: 2.2, nonflammable gas

Physical State As Shipped: Compressed or refrigerated liquefied gas

Physical State As Released: Gas or boiling liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Sweet to acrid

Common Uses: Anesthetic in dentistry and surgery; aerosol propellant; in leak detection; in rocket fuels; making other chemicals.

NITROUS OXIDE

Division 2.2 (Nonflammable Gas)

See UN/NA Designation for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Extremely volatile liquefied gas that is heavier than air and may persist in pits, hollows, or depressions. Noncombustible but is a mild oxidizer that will accelerate and intensify the burning of combustible material in a fire. Dissociates to elemental nitrogen and oxygen at high temperatures and becomes stronger oxidizing agent. Some nonflammable materials will burn in nitrous oxide. May also decompose explosively at high temperatures, but note that little decomposition occurs below 1200°F (648°C).

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact with very cold liquids, gas, or containers.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the very high gas concentrations that may be present in air in the immediate spill area and some distance downwind. Physical contact may result in frostbite. Note that chronic inhalation of nitrous oxide is suspected but not confirmed to cause increased birth defects, miscarriages, and other problems among dental health professionals in occupational exposures.

Hazards of Skin or Eye Contact: Contact with liquid nitrous oxide or cold gas streams can freeze bodily tissues and result in frostbite type burns.

Hazards of Inhalation: Nitrous oxide gas is a nontoxic and nonirritating asphyxiant that may cause brain damage or death by displacement of oxygen at very high concentrations in air in acute exposures. Somewhat lower concentrations may cause air hunger, headache, dizziness, nausea, vomiting, bewilderment, and loss of consciousness. Inhalation of high concentrations for a few seconds affects the central nervous system and may produce a type of hysteria.

Hazards of Ingestion: Due to its very low boiling point and low solubility in water, ingestion of nitrous oxide is not considered likely.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Not flammable but may accelerate and intensify burning of other materials. Containers may rupture violently in fire due to over-pressurization.

Hazardous Combustion Products: Decomposes to elemental nitrogen and oxygen at high temperatures.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: Not flammable but containers may rupture violently in fire due to overpressurization. Nitrous oxide is said to have the potential to decompose explosively at high temperatures. Contact with other chemicals such as phosphine or phenyllithium may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from contact with liquid nitrous oxide, cold gas streams, or cold equipment to prevent frostbite. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full face-piece (or the equivalent).

1070

NITROUS OXIDE
Division 2.2 (Nonflammable Gas)

FIRST AID

Nonspecific Symptoms: Frostbite from physical contact; headache, dizziness, nausea, or other symptoms of excessive inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: Do not use hot water or rub frozen area. Treat for frostbite if necessary.)

FIRE RESPONSE

Extinguishing Materials: Nitrous oxide is not flammable. Use water spray or fog, dry chemical, carbon dioxide, or foam as necessary on surrounding fire.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to pools of liquid nitrous oxide may increase gas evolution.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the highly volatile and heavier than air nature of nitrous oxide into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . .Although the inhalation toxicity of the spilled product is relatively low, it may be prudent to consider downwind evacuation when exposed populations may be subjected to prolonged high concentrations in air. Otherwise, monitor the situation and restrict access to the immediate spill area and areas immediately downwind by unprotected personnel.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to nitrous oxide vapors or fumes may accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not permit it to contact pools of liquid nitrous oxide as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of nitrous oxide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

NITROUS OXIDE
Division 2.2 (Nonflammable Gas)

TECHNIQUE

FOAM . . .There is a possibility that application of an appropriate firefighting foam applied to the surface of quiescent liquid pools may slow the release of nitrous oxide vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid nitrous oxide may be contained by building dikes or barriers using soil, sand or other materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines. (Note: Most if not all residue will rapidly evaporate.)

CONSEQUENCE

Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Very little of the spilled product will dissolve as it sinks and boils in water. Water spill responses may only be required in special cases. Consult qualified experts for advice.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

NITROUS OXIDE
Division 2.2 (Nonflammable Gas)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

OCTANOL
Combustible Liquid

GENERAL INFORMATION

Octanol, also known as octyl alcohol (normal isomer), is a colorless relatively nonvolatile liquid with a sweet, penetrating, and aromatic odor. It is used to make perfumes and other chemicals, to mask industrial odors, and for formulating wetting and foam control agents. It is slightly soluble in water and lighter, so may be expected to form a floating surface slick that dissolves at a slow rate. Its flash point of 178°F indicates that the product must be heated before it can be easily ignited. There is some very limited potential that containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.9 pounds per gallon.

Octanol does not react with water or many other common materials and is stable in normal transportation. It is reactive with strong oxidizing agents, and such agents may cause its ignition. Toxicity of the product is considered low to moderate by the various routes of exposure. Products of combustion are considered acrid and may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.6 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in chloroform, ethyl alcohol, and diethyl ether.
Specific Gravity (Liquid): 0.829 at 68°F (20°C)
Boiling Point: 381-383°F (194 –195°C) at 1 atm.
Melting Point: 1.9 to 5°F (– 16.7 to – 15°C)
Freezing Point: 1.9 to 5°F (– 16.7 to – 15°C)
Molecular Weight: 130.23
Heat of Combustion: – 8963 cal/g
Vapor Pressure: 0.2 mm Hg (0.004 psia) at 68°F (20°C)
Flash Point: 178°F (81.1°C), closed cup.
Autoignition Temperature: Unavailable
Burning Rate: 3.7 mm/minute (approx.)
Stability: Stable
Corrosiveness: Noncorrosive
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizing agents.

IDENTIFICATION

Shipping Names: Alcohol, N.O.S. (USDOT)
Synonyms and Tradenames: Octyl alcohol; n-octanol; 1-octanol; n- or 1-octyl alcohol; n-octan-1-ol; alcohol C-8; capryl alcohol; caprylic alcohol; Dytol M-83; heptyl carbinol; Lorol 20; octilin; Sipol L8; 2-ethyl-hexyl alcohol; 2-ethyl hexanol; WLNL Q8.
Chemical Formula: $CH_3(CH_2)_6CH_2OH$
Constituent Components(% each): Varies up to 100% pure.
UN/NA Designation: UN1987
IMO Designation: Not regulated
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, penetrating, aromatic
Common Uses: Mfg. perfumes and esters; masking of industrial odors; wetting agents; foam control agent.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:

OCTANOL

Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 2 ppb - 0.53 ppm; reported values vary.

Unusual Hazards: None

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Hazards are relatively limited.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid octanol may cause some degree of drying, cracking, and inflammation of the skin due to the defatting action of the product. Some amounts may be absorbed through the skin. Contact with the eyes may result in irritation and temporary corneal injury.

Hazards of Inhalation: The low vapor pressure of octanol suggests limited potential for high vapor concentrations in air. Exposures to prolonged high concentrations may be expected to cause temporary disorders of the central nervous system with symptoms including headache, dizziness, and nausea.

Hazards of Ingestion: Octanol is of relatively low oral toxicity in single doses based upon animal experiments.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite. There is some remote chance that containers may rupture violently in fire.

Hazardous Combustion Products: Considered acrid, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of heated liquid are ignited in a confined area. There is some remote chance that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include natural rubber, neoprene, nitrile rubber, polyvinyl alcohol, and polyvinyl chloride.

Respiratory Protection: For fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the skin or eyes; central nervous system disorders.

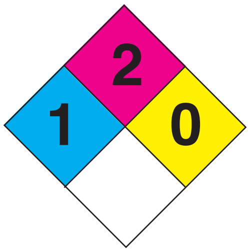
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim’s lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

1987

OCTANOL
Combustible Liquid



FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of octanol may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that octanol is a combustible liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Octanol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of octanol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to octanol vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of octanol from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of octanol vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

OCTANOL
Combustible Liquid

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Octanol may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained octanol may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

OCTANOL
Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating octanol.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

OCTANOL
Combustible Liquid

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with octanol may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified

September 2003

1-OCTENE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

1-Octene is a clear, flammable liquid with a hydrocarbon like odor. It is employed in the production of surfactants and used as an additive to many polymeric formulations. It is very flammable, having a low flash point of 70°F (open cup), and is reactive with strong acids and oxidizing agents. While being soluble in a variety of hydrocarbon solvents, its solubility in water is negligible. It is expected to float on water (as it is lighter than water and only negligibly soluble). The product weighs approximately 6 pounds per gallon.

1-Octene is stable and will not polymerize. Symptoms of exposure may include skin defatting and central nervous system effects, such as headache, dizziness, nausea, vomiting, weakness, loss of coordination, blurred vision, drowsiness, confusion or disorientation. At extreme exposures, central nervous system effects may include respiratory depression, tremors or convulsions, loss of consciousness, coma or death. 1-Octene has an evaporation rate of 1.3 and is therefore considered a relatively fast evaporator, thereby increasing health and fire hazards. Fumes and vapors are heavier than air, may form explosive mixtures with air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of 1-octene is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible
Solubility in Other Chemicals: Soluble in hydrocarbon solvents, alcohol, acetone, ether, petroleum, benzene, chloroform and coal tar solvents.
Specific Gravity (Liquid): 0.72
Vapor Density: 3.9
Boiling Point: 250-253°F (121-123°C)
Melting Point: -151.0°F (-101.7°C)
Freezing Point: See melting point
Molecular Weight: 112.2
Heat of Combustion: 1269.3 kcal/mole
Evaporation Rate (butyl acetate=1): 1.3
Vapor Pressure: 15 - 36 mm Hg at 68°F (20°C)
Flash Point: 50°F (10°C) closed cup; 70°F (21°C) open cup
Autoignition Temperature: 430°F (221°C)
Burning Rate: 6.5 mm/min
Flammable Limits: 0.8% (LFL) - 6.7% (UFL)
Stability: Stable
Polymerization Potential: Will not occur
pH: Unavailable
Reactivity with Water: None
Reactivity and Incompatibility: May react with strong acids or strong oxidizing agents, such as chlorates, nitrates and peroxides.

IDENTIFICATION

Shipping Name(s): Flammable liquid, n.o.s. (1-Octene) or Hydrocarbons, liquid, n.o.s. (1-Octene) (USDOT & IMO)
Synonyms and Tradenames: Oct-1-ene; Caprylene; Octene-1; 1-Octylene; alpha-Octylene
CAS Registry No.: 111-66-0
Chemical Formula: $CH_3(CH_2)_5CHCH_2$
Constituent Components (% each): 97% to 100% pure
UN/NA Designation: UN1993, UN3295
IMO Designation: 3, Flammable liquids
RTECS Number: Unavailable
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless liquid
Odor Characteristics: Hydrocarbon odor
Common Uses: Used as an additive to many polymeric formulations. A co-monomer for linear low density polyethylene. Employed in the production of surfactants (detergent alcohols and alkyl aromatics).

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

*Also 3295

1-OCTENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 2 ppm

Unusual Hazards: Fumes and vapors are heavier than air. Vapors may form explosive mixtures with air. Vapors may travel to source of ignition and flash back.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Avoid heat, flames, sparks and other sources of ignition. Containers may rupture or explode if exposed to heat. Keep out of water supplies and sewers. Avoid inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Skin defatting: may include drying and reddening of the skin. Central nervous system effects may include headache, dizziness, nausea, vomiting, weakness, loss of coordination, blurred vision, drowsiness, confusion or disorientation. At extreme exposures, central nervous system effects may include respiratory depression, tremors or convulsions, loss of consciousness, coma or death.

Hazards of Skin or Eye Contact: Causes skin and eye irritation. Contact with the skin is not expected to cause prolonged or significant irritation. Skin contact may cause drying or defatting of the skin. Not expected to be harmful to internal organs if absorbed through the skin.

Hazards of Inhalation: Expected to be irritating to respiratory tract. Symptoms of overexposure to vapors may include drowsiness, weakness, headache, dizziness and nausea.

Hazards of Ingestion: Causes gastrointestinal irritation with nausea, vomiting and diarrhea. Aspiration of material into the lungs may cause chemical pneumonitis, which may be fatal.

FIRE HAZARDS

Lower Flammable Limit: 0.8%

Upper Flammable Limit: 6.7%

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas, and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable and toxic vapors upon release.

Hazardous Combustion Products: Normal combustion forms carbon dioxide and water vapor; incomplete combustion can produce carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with flash protection and SCBA may be required.

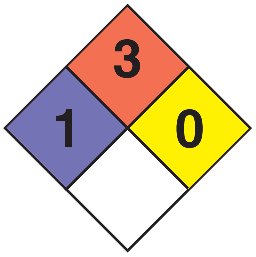
Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1993*

*Also 3295

1-OCTENE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of any bodily tissues or central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility if irritation develops or persists. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, regular foam, water spray or carbon dioxide.

Extinguishing Techniques: Toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Do not use a solid stream of water, since the stream may scatter and spread the fire. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: 1-Octene is a highly flammable liquid that may cause environmental contamination. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited to spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

1-OCTENE

Class 3 (Flammable Liquid)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . 1-Octene may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

1-OCTENE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

1-OCTENE

Class 3 (Flammable Liquid)

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Sorbent pads or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating product.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Sorbent pads, peat or commercial sorbent materials compatible with product may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

September 2003

OCTYL ALDEHYDES

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Octyl aldehyde is a clear, flammable liquid with a strong citrus-like odor. It is commonly called octanal or caprylaldehyde and is used as a fragrance, an additive to food or liquor or as a chemical intermediate in the production of linear alcohols. It has a flash point of 124°F and therefore flammable, but it can be identified as a flammable or combustible liquid when in transportation. It is reactive with strong oxidizing agents, strong bases and strong reducing agents. The product weighs approximately 6.8 pounds per gallon.

Octyl aldehyde is stable and will not polymerize. Having a specific gravity of 0.821 and being only slightly solubility in water, much of the product is expected to form a floating layer on water. For this reason, if product is on fire, a straight stream of water should not be used as it may possibly spread the fire. It has a low vapor pressure of 0.85 mm Hg at 77°F and is therefore not likely to have high quantities of the material in a vapor state. However, fumes and vapors are heavier than air, may form explosive mixtures with air and may travel to a distant source of ignition and flash back. Excessive heat may cause rupture of containers.

Symptoms of exposure may include irritation of all bodily tissue and central nervous system effects, such as headache, dizziness, nausea, vomiting, weakness, loss of coordination, blurred vision, drowsiness, confusion or disorientation. Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if product is leaking but not on fire. If container of octyl aldehyde is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): 0.821
Vapor Density: 4.42
Boiling Point: 340°F (171°C)
Melting Point: 54 - 59°F (12 - 15°C)
Freezing Point: See melting point
Molecular Weight: 128.2
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): Unavailable
Vapor Pressure: 0.85 mm Hg at 77°F (25°C)
Flash Point: 124°F (51°C)
Autoignition Temperature: 410°F (210°C)
Burning Rate: Unavailable
Flammable Limits: Unavailable
Stability: Stable under normal conditions
Polymerization Potential: Has not been reported
Reactivity and Incompatibility: May react with strong oxidizing agents, strong bases and strong reducing agents.

IDENTIFICATION

Shipping Name(s): Octyl Aldehydes (USDOT & IMO)
Synonyms and Tradenames: 1-Octaldehyde; 1-Octanal; 1-Caprylaldehyde; 1-Octylaldehyde; ALDEHIDO C-8; Aldehyde C8; C8 aldehyde; n-Octaldehyde; n-octanal; n-Octyl Aldehyde; octanal; Caprylaldehyde; Caprylic aldehyde; normal-Octaldehyde
CAS Registry No.: 124-13-0
Chemical Formula: $C_8H_{16}O$
Constituent Components (% each): 92% to 100% pure
UN/NA Designation: UN1191
IMO Designation: 3, Flammable liquids
RTECS Number: RG7780000
NFPA 704 Hazard Rating: 2 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless liquid
Odor Characteristics: Lemon-lime, citrus
Common Uses: Used as a fragrance agent, i.e., for soaps, detergents, perfumes and creams; flavoring agent, i.e., for baked goods, candy and gelatins; chemical intermediate in production of linear alcohols from olefins.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

OCTYL ALDEHYDES

Class 3 (Flammable Liquid) or Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Fumes and vapors are heavier than air. Vapors may form explosive mixtures with air. Vapors may travel to source of ignition and flash back.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Avoid heat, flames, sparks and other sources of ignition. Containers may rupture or explode if exposed to heat. Keep out of water supplies and sewers. Avoid inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Causes irritation to all bodily tissues and possibly central nervous system depression. Central nervous system effects may include headache, dizziness, nausea, vomiting, weakness, loss of coordination, blurred vision, drowsiness, confusion or disorientation.

Hazards of Skin or Eye Contact: Causes skin and eye irritation. May cause chemical conjunctivitis and corneal damage. May cause dermatitis or cyanosis of the extremities.

Hazards of Inhalation: Causes respiratory tract irritation. Vapors may cause dizziness, burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, vomiting and possibly suffocation. Can produce delayed pulmonary edema.

Hazards of Ingestion: May cause gastrointestinal irritation with nausea, vomiting and diarrhea. Ingestion of large amounts may cause central nervous system depression.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquid. Vapors are heavier than air, may collect in low areas, and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable and/or toxic vapors upon release.

Hazardous Combustion Products: Products of combustion may include carbon dioxide, carbon monoxide and irritating and toxic fumes and vapors.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

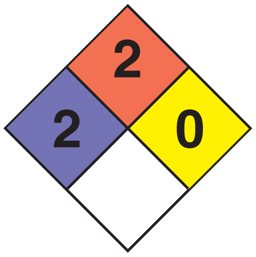
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1191

OCTYL ALDEHYDES

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of any bodily tissues or central nervous system depression.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, alcohol-resistant foam, water spray or carbon dioxide.

Extinguishing Techniques: Toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire-exposed containers cool. Do not use a solid stream of water, since the stream may scatter and spread the fire. Water spray may be used to dilute spills to nonflammable mixtures, protect personnel attempting to stop leak and disperse vapors.

SPILL RESPONSES

General Information: Octyl aldehyde is a flammable liquid. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited to spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

OCTYL ALDEHYDES
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The use of water in flooding quantities may reduce the generation of vapors. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Octyl aldehyde may be contained by building dikes or barriers using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained product may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible, impervious material.

OCTYL ALDEHYDES

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

NOTE: The techniques described below are for floating, undissolved liquids. Due to the fact that some amount of the chemical is expected to dissolve, other techniques should be considered, such as aeration and adsorption.

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

OCTYL ALDEHYDES

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Sorbent pads or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating product.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Sorbent pads, peat or commercial sorbent materials compatible with product may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

March 1995

OLEUM

Class 8 (Corrosive Material)

GENERAL INFORMATION

Oleum, also known as fuming sulfuric acid, consists of sulfuric acid with various amounts of dissolved sulfur trioxide that may combine with water in the air or in solution to produce additional sulfuric acid. It is a colorless to cloudy or even black fuming liquid that has a sharp, penetrating and choking odor, and is used in petroleum refining and the making of various chemicals, dyes, and explosives. It is not flammable but is a strong oxidizer and highly reactive substance that will char wood upon contact and may ignite various combustible materials, particularly if they are finely divided. Contact with most metals generates flammable and potentially explosive hydrogen gas. There is some limited potential that containers may rupture due to overpressure if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 16-16.6 pounds per gallon depending on the amount of sulfur trioxide present.

Oleum reacts vigorously or violently with water with the generation of much heat and spattering. The product is highly corrosive to most metals and may react with explosive violence in contact with cast iron. It is also highly corrosive to bodily tissues, and is reactive with a wide variety of chemicals and substances, possibly causing fires and explosions. Toxic and irritating vapors are generated upon heating and in fires.

If oleum is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. These fumes and vapors may be heavier than air. (Note: Oleum is available in various grades containing from 20-65% free sulfur trioxide. These are equivalent to grades with 104.5-114.63% sulfuric acid. The 65% grade of oleum has the lower boiling point and the higher vapor pressure. Cretain grades between 20 and 65% oleum may solidify at room temperatures.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions but reacts (see below).

Solubility in Other Chemicals: Decomposes in alcohol

Specific Gravity (Liquid): 1.915-1.992 at 60°F (15.6°C)

Boiling Point: 136.4-287.6°F (58-142°C) at 1 atm; may decompose

Melting Point: 23°F (– 5°C) for 20%; 35.6°F (2°C) for 65%

Freezing Point: over 90°F (32°C) for 45%

Molecular Weight: 98.08 for H_2S0_4; 80.06 for S03

Heat of Combustion: Not flammable

Vapor Pressure: 1-145 mm Hg (0.019-2.80 psia) at 77°F (25°C); varies with grade.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Normally stable

Corrosiveness: Highly corrosive to many metals, plastics, and rubbers, particularly in the presence of water. Compatible with glass and teflon.

Reactivity with Water: Reacts vigorously or violently producing much heat and spattering.

Reactivity with Other Chemicals: Reacts with organic compounds, combustible materials, carbides, chlorates, sulfides, fulminates, nitrates, picrates, metals, cyanides, sodium, sodium carbonate, bases, potassium permanganate, phosphorus, saltpeter, lithium silicide, mercuric nitride, nitrotoluene, acetone cyanohydrin, acetone and nitric acid, and numerous other chemicals and materials. Many reactions are extremely hazardous.

IDENTIFICATION

Shipping Names: Sulphuric acid, fuming (USDOT and IMO).

Synonyms and Tradenames: Fuming sulfuric acid; fuming sulphuric acid.

Chemical Formula: H_2S0_4 (sulfuric acid); $S0_3$ (sulfur trioxide).

Constituent Components(% each): Various grades with 20-65% free $S0_3$ (104.5-114 63% H_2SO_4).

UN/NA Designation: UN1831

IMO Designation: 8, corrosive

Physical State as Shipped: Liquid

Physical Shte as Released: Liquid

Color of the Shipped Material: Colorless to cloudy and even black

Odor Characteristics: Sharp, penetrating, choking

Common Uses: Petroleum refining; mfg. various chemicals, dyes, and explosives.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

OLEUM
Class 8 (Corrosive Material)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 1 mg/m^3

Unusual Hazards: Highly corrosive acid and oxidizer. May char or ignite combustible materials. Reacts violently or vigorously with water and many other substances. Contact with metals may generate flammable hydrogen gas. May react explosively with cast iron.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): 1 mg/m^3 H_2S0_4 over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat or fire; sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with oleum or its concentrated fumes or vapors in air may result in severe, deep, and painful burns. Extensive burns may cause shock and collapse.

Hazards of Inhalation: Fumes and vapors of oleum may cause irritation of the eyes, nose, throat and upper respiratory tract as well as erosion of the teeth and soreness of the mouth. High concentrations in air may cause sneezing, coughing, difficult breathing, and laryngeal, tracheobronchial and pulmonary edema with possibly severe consequences.

Hazards of Ingestion: Ingestion of oleum may result in severe burns of the mouth and throat, perforation of the esophagus or stomach, staining and erosion of teeth, nausea and vomiting of blood and eroded tissue, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: There is some limited potential that containers may rupture violently in fire due to overpressurization. May generate large quantities of corrosive vapors and fumes upon release.

Hazardous Combustion Products: Toxic and irritating gases may evolve in fires.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: There is some limited potential that containers may rupture violently in fire due to overpressurization. Contact with various other chemicals and substances may result in violent or explosive reactions (see General Information section). Contact with many metals produces hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, neoprene, nitrile rubber, chlorinated polyethylene, polyvinyl chloride, styrene-butadiene rubber, Viton, and nitrile-butadiene rubber for concentrated (more than 70%) sulfuric acid.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 50 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask

1831

OLEUM
Class 8 (Corrosive Material)

FIRST AID

Nonspecifc Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but note that oleum may react violently with water. Water (if used) should be applied in flooding quantities as fog or spray.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may be dangerous. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that oleum is highly corrosive and reactive. Contact with metals may produce flammable and potentially explosive hydrogen gas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Oleum spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts of fumes and vapors are evolved.

CONSEQUENCE

Need to notify, organize, transport, and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Oleum may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if only small amounts have spilled.

CONSEQUENCE

Hazardous levels of oleum may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

OLEUM

Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to oleum vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of oleum as this may cause a violent reaction.

CONSEQUENCE

Water runoff may contain sulfuric acid from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid oleum may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid oleum may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Oleum may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained oleum may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

These may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

OLEUM
Class 8 (Corrosive Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

OLEUM
Class 8 (Corrosive Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Hydroxide based anion exchangers may also be effective.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

October 1991

OXYGEN
Division 2.2 (Nonflammable Gas)

GENERAL INFORMATION

Oxygen is a colorless, odorless, nonflammable and practically nontoxic element of nature that makes up about 21% of the atmosphere by volume. It is handled in commerce as a compressed gas under high pressure or as a refrigerated cryogenic liquid at extremely low temperatures. It is has a wide variety of uses in making various chemicals, to enhance combustion processes, as an inhalant in medicine and in high altitude and deep sea operations and for oxidizing organic substances. Due to its slight solubility in water and a boiling point of approximately –287.4 F spills of liquid oxygen on land or water or ruptures of compressed gas containers may generate large amounts of gas that may appear white at first due to condensation of water vapor in the air. Any gas that is very cold may be heavier than air and may persist in pits, hollows and depressions, but will approach the density of air as it warms. Containers of compressed or liquid oxygen may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The refrigerated liquid weighs about 9.52 pounds per gallon at its boiling point temperature.

Since compressed oxygen gas is shipped at temp eratures far in excess of its critical temperature of –181.4°F –118.6°C), this being the temperature above which it cannot be liquefied regardless of the pressure applied, the weight of gas within a container is a function of the volume of the container, the temperature of the gas, and the degree to which it is pressurized. These pressures can vary, but usually approximate or exceed 137 atmospheres (2000 psig) at room temperature within gas cylinders. Gaseous oxygen may also be shipped in bulk in tube trailers at pressures up to 181 atmospheres (2640 psig). Conversely, most liquid oxygen is shipped in bulk at very cold temperatures and at pressures below 2.66 atmospheres (25 psig) in specially insulated cargo tanks on trucks and truck trailers or in specially insulated tank cars. Be advised, however, that some insulated tank cars transporting liquid oxygen may have internal pressures as high as 14.6 atmospheres (200 psig) with temperatures on the order of –232°F (–146.5°C).

Oxygen is fully stable in transportation and noncombustible. It is a strong oxidizer, however, that will actively support the burning of combustible materials. Some materials that will not burn in air will burn in an oxygen-enriched atmosphere and materials that burn in air will burn more vigorously. A wide variety of combustible materials may ignite and/or explode if exposed to high levels of oxygen. Liquid oxygen presents a high risk of explosion in contact with combustible or oxidizable materials. Of special interest is that a violent re action and possibly an explosion may occur if liquid oxygen is spilled on asphalt or spilled on another surface contaminated with combustibles (such as oil-soaked concrete or gravel), and if the surface is then subjected to shock or impact. Do not walk on or roll equipment over a surface thus contaminated for at least one-half hour after all visible signs of frost have disappeared.

Although oxygen is essentially nontoxic it may cause tissue damage and burns due to frostbite.

If a bulk container of oxygen is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently. If a compressed gas cylinder is so threatened, evacuate for a radius of one-third (1/3) mile.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; one volume of gas dissolves in 32 volumes of liquid water at 68°F (20°C)

Solubility in Other Chemicals: Very slightly soluble in alcohol and other organic liquids

Speciric Gravity (Liquid): 1.14 at –297.4°F (–183°C)

Boiling Point: –297.4 to –297.3°F (–183 to –182.9°C) at 1 atm.

Melting Point: –361.8 to –360.4°F (–218.8 to –218°C)

Freezing Point: See melting point

Molecular Weight: 32.0 as O_2; (the form found naturally in nature)

Heat of Combustion: Not flammable

Vapor Pressure: Approx 49.77 atm (731.1 psia) at –181.4°F (–118.6°C). This is the critical pressure and related critical temperature of oxygen. See the General Information section above for further details.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Not corrosive to common metals but systems containing oxygen must be constructed to withstand the high pressures and/or low temperatures that may be present.

Reactivity with Water: *No* reaction, but contact of very cold liquid oxygen with water may result in vigorous or violent boiling and extremely rapid vaporization of the oxygen due to the large temperature differences involved. Pressures may build to dangerous levels if this occurs in a closed container.

Reactivity with Other Chemicals: Oxygen is a very strong oxidizing agent that may at the very least react violently with or cause the ignition of combustible materials. Mixt ures with combustible organic materials such as oil, grease, coal dust, and many other substances may explode or burn with nearly explosive violence in oxygen if ignited.

IDENTIFICATION

Shipping Names: Oxygen (USDOT and IMO); oxygen, compressed (USDOT and IMO); oxygen, refrigerated liquid (USDOT and IMO)

Synonyms and Tradenames: Liquid oxygen may be referred to as LOX

Chemical Formula: O_2 (the form found naturally in nature)

Constituent Components (% each): Typically 9910 or more pure by volume; remain der may include traces of a wide variety of other gases.

49 STCC: 49 043 50 (oxygen); 49 043 50 (oxygen, compressed); 49 043 60 oxygen, refrigerated liquid, (cryogenic liquid).

UN/NA Designation: UN1072 (USDOT and IMO for oxygen or oxygen, compressed); UN1073 (USDOT and IMO for refrigerated liquid)

IMO Designation: 2.2, nonflammable gas

Physical State As Shipped: Compressed gas or refrigerated cryogenic liquid

Physical State As Released: Boiling liquid, gas, or mixture of gas and aerosols (small liquid droplets) depending upon release conditions and physical state of cargo.

Color of the Shipped Material: Pale blue liquid; a normally colorless gas that may appear white upon release due to condensation of water vapor and possibly other gases from the atmosphere if the oxygen is discharged at a low temperature.

Odor Characteristics: Odorless

Common Uses: Making various chemicals; oxidizer for rocket propellants; inhalant in medicine and in oxygen deficient atmospheres.

OXYGEN
Division 2.2 (Nonflammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Oxygen is odorless

Unusual Hazards: Oxygen is a strong oxidizer that is highly reactive with a wide variety of substances when concentrated or when in liquid form. It is not itself combustible but will support and accelerate the burning of combustible materials. Some substances that do not burn in air may burn in oxygen. A violent reaction and possible explosion may occur if liquid oxygen is spilled on asphalt or other surfaces contaminated with combustibles (such as oil-soaked concrete or gravel) and the surface is then subjected to impact or shock. Many common clothing materials exposed to oxygen-enriched atmospheres or liquid oxygen may be ignited or caused to explode.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Conditions to Avoid: Heat or fire; contact with combustible, oxidizable, reactive or otherwise incompatible materials; ingestion or direct physical contact; excessively prolonged inhalation of highly enriched oxygen atmospheres.

HEALTH HAZARDS

Public Health Hazards: The major hazard appears to be from direct contact with liquid oxygen, very cold oxygen gas, or very cold equipment surfaces that may cause frostbite and other types of burns. It also appears that inhalation of very cold gas for even brief periods may be hazardous. With respect to oxygen gas at normal pressure and temperatures, it appears that inhalation of even pure oxygen for a few hours (at the very least) is unlikely to cause harm, except possibly to premature infants and people with chronic obstructive pulmonary disease.

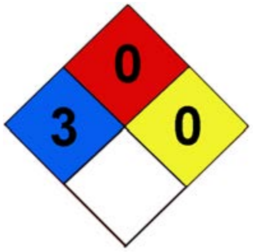
Hazards of Skin or Eye Contact: Contact with liquid oxygen or very cold gas may cause frostbite, freeze burns, and possibly other burn-like injuries of the skin or eyes due to the cold temperatures involved as well as the strong oxidizing properties of the substance. There is some potential for permanent eye injury. Frostbite may also occur from contact with the surface of a very cold container of the product. Be advised and take heed that many types of common clothing materials exposed to an oxygen-rich atmosphere or contaminated with liquid oxygen may be subject to reaction with the oxygen and possible ignition and accelerated burning or explosion, thus potentially causing serious injury to the wearer of the clothing. Exposed clothing should be removed immediately and not used until it has been sufficiently aired out.

Hazards of Inhalation: Most authorities agree that the majority of adult humans can inhale very high concentrations of oxygen at normal atmospheric pressure and temperatures for at least several hours (some claim much longer), either without toxic effect or simply with irritation of mucous membranes due to dryness. After a few hours, and possibly only after 5 to 6 hours, early significant symptoms and signs of exposure are reported to include nasal stuffiness, nausea, coughing, sore throat, chest pain, dizziness, and cramps. As exposures are prolonged and approach 24 hours, more serious effects such as breathing difficulties, bronchial irritation, hypothermia, slowed heart rate, increased depth of respiration, dimness or loss of vision, epileptic seizures, pulmonary edema, pneumonia, collapse, and death may variously be expected. Note, however, that there are indications in the literature that only "brief" exposures to cold oxygen gas are required to potentially produce breathing difficulties and that prolonged inhalation of cold gas may injure the lungs and lead to serious illness. Note also that certain groups of people may be at greater risk than normal. For example, premature infants may suffer permanent visual impairment or blindness from inhalation of oxygen at high concentrations after some unspecified period of time. People with chronic obstructive pulmonary disease retain carbon dioxide abnormally. If exposed to high levels of oxygen, increases in their blood oxygen levels may depress their breathing and possibly result in dangerous levels of retained carbon dioxide, again after an unspecified period of time.

Hazards of Ingestion: Due to its low boiling point temperature, ingestion of liquid oxygen is considered highly unlikely. If it should occur, severe frostbite and possibly burns of the lips, mouth, and other contacted tissues may be expected.

1072

OXYGEN
Division 2.2 (Nonflammable Gas)



FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Nonflammable gas that is a strong oxidizer. Will support and greatly intensify the fire. Containers may rupture violently in a fire due to overpressurization. A massive release of oxygen may catastrophically magnify the fire. Some substances that do not burn in air may burn in an oxygen enriched atmosphere. Contact of liquid oxygen with various fuels and combustible materials may result in an explosion. Ignition of various substances in an oxygen enriched atmosphere may result in an explosion.

Hazardous Combustion Products: Not pertinent

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Mixtures of liquid oxygen or concentrated oxygen gas with a wide variety of materials are subject to explosion under appropriate conditions. Containers may rupture violently in a fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of eye contact with liquid oxygen or very cold gas and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, tight-fitting safety goggles, and other impervious and resistant clothing. Clothing and equipment should be of a type that not will freeze to skin and will not ignite on contact with liquid oxygen or be subject to ignition and burning in an oxygen enriched atmosphere. Preferred materials are those with smooth surfaces which prevent the accumulation of oxygen; they should be clean, oil free, and insulated to the necessary degree. Be advised and take heed that all exposed clothing should be ventilated thoroughly after exposures to eliminate any excess oxygen that may be present. At least one authority suggests that protective clothing should provide total coverage of normal clothing. (Note: Protection from high concentrations of oxygen gas at close to normal temperatures does not necessitate equipment designed for exposure to extremely cold temperatures.)

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent) may be prudent for use where personnel may need to function in a highly enriched oxygen atmosphere for prolonged periods of time or where concentrations of very cold gas may be encountered. Some judgment must be applied for proper selection of protective clothing and equipment to suit the various circumstances under which liquid or compressed oxygen may be released. Where both excess oxygen and a toxic gas are present in air, it may be prudent not to use gas masks or other respiratory protective devices with canisters or cartridges containing oxidizable materials such as activated charcoal or carbon.

FIRST AID

Nonspecific Symptoms: Frostbite or burns of the skin, eyes, or other bodily tissues; effects of excessive and prolonged inhalation of highly oxygen enriched atmospheres or very cold gas.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration and get medical attention immediately.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of warm water. Get medical attention immediately. Do not use hot water or rub frozen areas. Handle potentially contaminated and potentially combustible clothing with appropriate caution due to the possibility of fire or explosion.

First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately. Do not use hot water or rub frozen areas.

OXYGEN
Division 2.2 (Nonflammable Gas)

FIRE RESPONSE

Extinguishing Materials: Water spray, foam, carbon dioxide or dry chemical, as appropriate for surrounding fire. Avoid using Halons; several halogenated compounds are known to react explosively when in contact with liquid oxygen and in the presence of a high energy source of ignition.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing as needed. Move container from fire area if no risk. Stop flow of liquid oxygen or compressed gas if safe to do so and then extinguish fire, unless appropriate extinguishing technique for burning material(s) indicates the fire should not be extinguished until other flows of fuels are stopped. Be alert to the possibility that the container may rupture violently and suddenly release massive amounts of product (which could disastrously magnify the fire) when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or and discoloration of tank due to fire. Avoid direct application of water on safety relief devices, particularly those fitted to liquid oxygen containers, since resultant cold exposure may cause ice to form, thus preventing proper functioning of the devices. When large pools of water-soluble fuels are present, consider using water if safe to do so to dilute the fuel and to reduce the intensity of the fire. When a non-water soluble fuel and liquid oxygen are mixed or mixing but are not yet burning, isolate the area from sources of ignition and get out quickly, allowing the oxygen to evaporate. Note that contact with water may increase vapor evolution from any pools of liquid oxygen that may form on the ground.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Choose equipment that is not damaged by the spilled product and that is suitable for oxygen service. Where necessary, use spark-proof and explosion-proof tools and equipment, eliminate ignition sources, and/or ground all equipment and transfer lines prior to use. Seek expert advice before transferring oxygen from its container to a second container. Ensure that the receiving container has been specially designed and cleaned to receive the product. Never transfer liquid oxygen where it may spill onto gravel or another porous material that may contain oil drippings. Areas where liquid oxygen may be spilled during transfer operations must be free of hydrocarbons (including asphalt) or other combustible materials. In the event liquid oxygen is spilled on asphalt or other surfaces contaminated with combustibles (such as oil-soaked concrete or gravel), do not walk on or roll equipment over the area for at least one-half hour after the frost has disappeared, since a violent reaction or explosion may occur simply by impact or shock. Open any valves on oxygen equipment slowly to avoid possible ignition of particles carried by oxygen flowing at high velocity. Avoid contact of moisture with storage containers to prevent ice from plugging pressure relief devices. Take the many unusual properties and hazards of oxygen into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Oxygen venting from gas cylinders or from relatively small holes in bulk containers may not evolve large amounts of gas in some spill situations or the gas may be released in an area in which it poses no unusual hazards. It may be advisable in such cases to simply monitor the situation until the leak is stopped or flow ceases.

CONSEQUENCE

Potentially dangerous concentrations of oxygen in air may be found in the local spill area and immediately downwind while the container is leaking. Special fire or explosion hazards may exist if the oxygen is leaking within a confined area such as a building.

MITIGATION

Remove people at risk from the various hazards posed by oxygen from the local spill area and areas immediately downwind. Eliminate ignition sources and open flames. Move leaking cylinders outdoors and ventilate confined spaces containing high concentrations of oxygen if safe to do so.

OXYGEN
Division 2.2 (Nonflammable Gas)

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow excessive gas levels to dissipate. Oxygen discharges, particularly from bulk containers or from large containers of liquid oxygen, may expose downwind areas to highly oxygen-enriched atmospheres over considerable distances in some cases. High concentrations may pose fire and explosion threats to nearby populated areas. Prolonged exposure to high concentrations of oxygen in air may be harmful to the health of certain individuals.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. Consider issuing instructions that all open flames be extinguished where practical. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Where deemed necessary to reduce various threats, water fog or spray applied to excess oxygen gas in air may accelerate its dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid oxygen pools with water spray or fog may increase gas evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid oxygen.

TECHNIQUE

FOAM . . . Where deemed necessary to control the rate of gas evolution to reduce various threats, there is a possibility that application of an appropriate firefighting foam to the surface of contained liquid oxygen pools may slow the rate of gas evolution into the atmosphere after an initial increase. (Note: High expansion foams should be considered if available.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, evolution of gas will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed or vaporized. Contain increased volume if necessary. Proceed with caution if the initial increase in gas evolution may adversely affect downwind populations or operational safety. Implement this technique with great caution. Consult qualified experts for assistance.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid oxygen may be contained by building dikes or barriers using dry sand or other compatible materials where conditions permit this action to be safely undertaken. Similarly, storm drains and sewer openings may be sealed using compatible materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product where conditions permit this action to be safely undertaken.

OXYGEN
Division 2.2 (Nonflammable Gas)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may possibly be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product and/or not suitable for liquid oxygen service may become damaged or develop leaks. Very high pressures may develop in equipment.

MITIGATION

Use compatible and appropriate equipment of proper pressure capacity. Consider precooling the equipment with nitrogen or controlled entry of liquid oxygen before initiation of full scale recovery of the liquid to avoid high initial vaporization rates upon entry of the product into the equipment. Ensure that the equipment is sufficiently clean for use with oxygen. Consult qualified experts for guidance.

WATER SPILL

Liquid oxygen will boil or rapidly vaporize from a water body with negligible dissolution. In any event, dissolved oxygen is not harmful to aquatic life.

September 2006

PENTANE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Pentane is a clear colorless liquid hydrocarbon with an odor comparable to gasoline. It is used as a fuel, as a component of aerosol propellants, in solvent extraction processes, for making other chemicals, and as a blowing agent in plastics. Only slightly soluble in water, pentane will float to form a surface slick. Its flash point of about –57°F indicates that it can easily be ignited under all ambient temperature conditions. Its normal boiling point of 97°F indicates that it will boil at high ambient temperatures and will otherwise evaporate rapidly. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapors in confined spaces such as buildings or sewers may result in explosions if ignited, and there is also some known potential for explosions involving unconfined vapor clouds of pentanes. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.2 pounds per gallon.

Pentane does not react with water or other common materials and is stable in normal transportation. It is compatible with most metals but may degrade certain rubbers and plastics. Although toxicity by all routes is generally considered low to moderate, the high volatility of pentane indicates that high vapor concentrations may be present in air. Products of combustion may include toxic constituents.

If pentane is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.04 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, ether, diethyl ether, ethanol, acetone, benzene, chloroform and most organic solvents.

Specific Gravity (Liquid): 0.626 at 68°F (20°C)

Vapor Density: 2.5

Boiling Point: 95.0 – 97.3°F (35.0 – 36.3°C) at 1 atm.

Melting Point: –201.5 to –202.0°F (–129.7 to –130.0°C)

Freezing Point: –201.0 to –201.5°F (–129.4 to –129.7°C)

Molecular Weight: 72.15

Evaporation Rate (butyl acetate=1): 28.6

Heat of Combustion: 46500 kJ/kg

Vapor Pressure: 426 mmHg at 68°F (20°C)

Flash Point: –57°F (–49.4°C), closed cup

Autoignition Temperature: 500 – 588°F (260 – 284°C)

Burning Rate: 8.6 mm/minute

Flammable (Explosive) Limits: 1.5% (LEL) – 7.8% (UEL)

Stability: Stable

Polymerization Potential: Will not occur

pH: Not applicable

Corrosiveness: Will attack some forms of plastics, rubbers and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Expected to react with chlorine, fluorine, halogens and strong oxidizers.

IDENTIFICATION

Shipping Name(s): Pentanes (USDOT); Pentanes, liquid (IMO)

Synonyms and Tradenames: Normal pentane; n-Pentane; Amyl hydride; Skellysolve

CAS Registry No.: 109-66-0

Chemical Formula: $CH_3(CH_2)_3CH_3$

Constituent Components (% each): Over 98% pure with small amounts of other hydrocarbons.

UN/NA Designation: UN1265

IMO Designation: 3, flammable liquids

RTECS Number: RZ9450000

NFPA 704 Hazard Rating: 1 (Health): 4 (Flammability): 0 (Instability)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid, gas above 97°F

Color of the Shipped Material: Colorless

Odor Characteristics: Like gasoline or petroleum

Common Uses: Fuel component and additive; mfg. of amyl chlorides and other chemicals; used as general solvent and for solvent extraction; component of aerosol propellants; blowing agent for plastic foams.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PENTANE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies widely from 2.2 – 400 ppm, therefore, caution should be used in relying on odor alone as a warning of potentially hazardous exposures.

Unusual Hazards: Pentane is highly volatile and flammable with heavier than air vapors that may travel to a source of ignition and flash back. It boils at high ambient temperatures. Vapors may persist for a time in pits, hollows and depressions. Flowing product may be ignited by self-generated static electricity.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TWA): 120 ppm (350 mg/m^3) (NIOSH); 1000 ppm (2950 mg/m^3) (OSHA)

Ceiling (C) Limit: 610 ppm (1800 mg/m^3) (NIOSH)

IDLH: 1500 ppm (10% LEL)

Conditions to Avoid: Heat, fire, and sparks; runoff to water or sewers; inhalation of high concentrations in air; contact with strong oxidizers.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of relatively high vapor concentrations in air. Pentane may be a weak cardiac sensitizer of the heart to epinephrine.

Hazards of Skin or Eye Contact: Repeated or prolonged skin contact with liquid pentane may result in drying and cracking of the skin due to the defatting action of the product. Contact of liquid pentane with the eyes may cause severe irritation, redness, tearing and blurred vision.

Hazards of Inhalation: Exposure to appreciable vapor concentrations may cause irritation of the eyes and respiratory tract. Very high pentane concentrations in air may cause narcosis involving drowsiness, fatigue, nausea, headache, possible loss of consciousness and even death.

Hazards of Ingestion: Ingestion may result in gastrointestinal irritation, nausea, vomiting, and diarrhea. Aspiration into the lungs during vomiting may cause delayed chemical pneumonia and/or pulmonary edema with possibly severe consequences. There is the possibility that pentane will vaporize when swallowed causing aspiration into the lungs, resulting in a rapid fall in oxygen saturation with asphyxia resulting in brain damage or cardiac arrest.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 1.5%

Upper Flammable (Explosive) Limit: 7.8%

Behavior in Fire: Flammable liquid. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Decomposition Products: Carbon dioxide and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. There is some known potential for unconfined vapor clouds of pentanes to explode if ignited.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

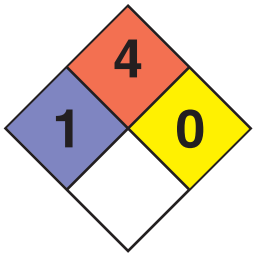
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with pentane. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: Viton®; Nitri Solve 727® gloves; Viton 890® gloves, 4H® and Silver Shield® brand gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Nitrile rubber (gloves, suits, boots); Polyvinyl alcohol (gloves).

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1500 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 1500 ppm): any supplied-air respirator operated in a continuous-flow mode; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece. For lesser concentrations (below 1200 ppm), a supplied-air respirator

1265

PENTANE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Vapor exposure may cause eye and nose irritation, drowsiness, fatigue, nausea, headache and other effects. Contact with liquid pentane may cause dry cracked skin or eye irritation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 20 minutes. Get medical attention immediately if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water and administer large quantities of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Regular foam, carbon dioxide, dry chemical or water spray or fog. Water may be ineffective, other than for cooling containers.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Pentane may float on water. Do not use direct stream of water as product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable vapors. Note that pentane has a flash point of –57°F.

SPILL RESPONSES

General Information: Pentane is a highly flammable and volatile liquid that may cause environmental contamination even though it is expected to biodegrade to a moderate extent when released into the soil or water. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of pentane may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that pentane is a highly flammable substance that may evaporate rapidly and float on water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

PENTANE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Pentane may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of pentane in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to pentane vapors or fumes may accelerate their dispersal in the atmosphere. Pentane may float on water. Do not use direct stream of water as product may be carried across water surface spreading fire or carrying product to source of ignition. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Water runoff may contain a small amount (if any) of pentane from contact with airborne vapors or fumes.

MITIGATION

Where important water sources are threatened, contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of pentane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . . Pentane may be contained by building dikes or barriers using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained pentane may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

PENTANE

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

PENTANE
Class 3 (Flammable Liquid)

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across steam and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled products.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating pentane.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with pentane may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Note that pentane is practically insoluble and, therefore, it is likely that not much has dissolved.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

September 1992

PERCHLORYL FLUORIDE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Perchloryl fluoride is a sweet smelling, toxic, noncombustible, and colorless gas that is typically shipped as a liquid under pressure in gas cylinders or possibly larger containers. Liquid perchloryl fluoride is practically insoluble in water and heavier. Due to its low boiling point temperature of about – 52°F, any spilled liquid will boil or otherwise rapidly vaporize in most cases. Thus, discharges on land or water have the potential to generate large amounts of cold vapor that is heavier than air, that may accumulate and persist in low areas, and that may appear white at first due to condensation of water vapor in air. Containers of the product may rupture violently due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The liquid product weighs approximately 12 pounds per gallon at room temperatures.

Perchloryl fluoride is stable in transportation and does not react with water. Although it is noncombustible, the product is a very strong oxidizer that is reported comparable to oxygen in strength and that will actively initiate or support the burning or explosion of numerous materials.

Contact with liquid perchloryl fluoride or very cold gas streams may result in frostbite and possibly chemical burns. Perchloryl fluoride gas or vapor is highly toxic by inhalation. Exposure to high temperatures can cause the product to decompose and evolve highly toxic and corrosive gases and fumes including such substances as hydrogen fluoride, hydrofluoric acid, and chlorine. Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, and weather conditions if perchloryl fluoride is leaking from its container.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.06 g/100 g water at 77°F (25°C).

Solubility in Other Chemicals: Not available

Specific Gravity (Liquid): 1.434 at 68°F (20°C)

Boiling Point: –52.2 to –51.7°F (–46.8 to –46.5°C) at 1 atm.

Melting Point: – 233.9 or – 230.8°F (–147.7 or –146°C); reported values vary.

Freezing Point: See melting point

Molecular Weight: 102.46

Heat of Combustion: Not combustible

Vapor Pressure: 10.49 atm (154.1 psia) at 68°F (20°C); 5.72 atm (83.98 psia) at 32°F (0°C).

Flash Point: Not combustible

Autoignition Temperature: Not combustible

Burning Rate: Not combustible

Stability: Stable when dry (anhydrous) in steel containers.

Corrosiveness: Many gasketing materials are embrittled by long contact with the gas and the product is known to attack some forms of plastics, rubber, and coatings. Teflon and Kel-F are reported to be unaffected. It is probably prudent to remove all oil, grease, and other combustible materials from piping systems and containers before putting them into service.

Reactivity with Water: No reaction, but contact of very cold liquid perchloryl fluoride with water may result in vigorous boiling and extremely rapid vaporization of the product due to the large temperature differences involved. Pressures may build to dangerous levels if this occurs in a closed container.

Reactivity with Other Chemicals: Perchloryl fluoride is a strong oxidizing material with "power" comparable to liquid or gaseous oxygen. Contact with combustible or oxidizable substances may variably result in fire or formation of substances that may explode if ignited by a spark or flame or subjected to heat, impact, or shock. Contact of the gas or liquid with oxidizable materials of high specific surface area such as carbon, charcoal, lampblack, sawdust, cloth, paper, etc., may result in spontaneous ignition. Exercise extreme caution until explosive shock and heat sensitivity has been determined before handling a material with which perchloryl fluoride may have had contact. Seek additional information from qualified experts on the interaction of the product in question with specific substances where necessary.

IDENTIFICATION

Shipping Names: Perchloryl fluoride

Synonyms and Tradenames: Chlorine fluoride oxide; chlorine oxyfluoride; and trioxychlorofluoride.

Chemical Formula: $\text{Cl-O}_3\text{-F}$

Constituent Components (% each): As best as can be determined, based on data from one maker of the product, perchloryl fluoride shipments are often at least 98.5% pure on a molar basis.

49 STCC: 49 203 45

UN/NA Designation: UN3083

IMO Designation: 2.3, poison gas

Physical State As Shipped: Compressed liquefied gas

Physical State As Released: Boiling liquid, vaporizing liquid, gas, or mixture or gas and aerosols (small liquid droplets) depending on environmental and release conditions; the normal boiling point of perchloryl fluoride is about –52°F.

Color of the Shipped Material: Colorless gas that may appear white at first due to condensation of water vapor from air; color of liquid not available.

Odor Characteristics: Sweet

Common Uses: Making fluorinated organic compounds, fuel cells, and explosives; oxidizing agent in rocket and other fuels; used in flame photometry analyses; used in metal processing and as a gaseous dielectric (i.e., insulator).

PERCHLORYL FLUORIDE
Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at levels as low as 10 ppm in air.

Unusual Hazards: Strong oxidizer that is highly reactive with a wide variety of substances when a sufficiently concentrated gas in air or when in liquid form. Not itself combustible but will support and accelerate the burning of combustible materials. Some substances that do not burn in air may possibly burn in perchloryl fluoride. Similarly, a violent reaction and explosion may possibly occur if liquid perchloryl fluoride is spilled on asphalt or other surfaces contaminated with combustibles (such as oil-soaked concrete or gravel) and the surface is then subjected to impact or shock; do not roll equipment over such surfaces until they are declared safe. Many common clothing materials exposed to concentrated perchloryl fluoride in air or the liquid product may be ignited or caused to explode. Vapors are heavier than air and may persist in low lying areas. Drains may become plugged and valves or pressure relief devices may become inoperable because of the formation of ice due to expanding vapors or vaporizing liquids, particularly in the presence of moisture or water.

Short Term Exposure Limit (STEL): 6 ppm for 15 minutes (ACGIH, 1991–92; OSHA, 1989).

Time Weighted Average (TWA) Limit: 3 ppm over each 8 hours of a 40 hour work week (ACGIH, 1991–92; OSHA, 1989).

Conditions to Avoid: Heat, fire, or sparks; contact with combustible, oxidizable, reactive or otherwise incompatible materials; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high gas or vapor concentrations that may be present in air in the immediate vicinity and over considerable downwind distances from a discharge. Direct contact with liquid perchloryl chloride, very cold gas, or very cold equipment surfaces may cause frostbite and other types of burns.

Hazards of Skin or Eye Contact: Prolonged contact of liquid perchloryl fluoride with the skin may result in moderately severe burns and that some amounts may be absorbed through the skin. Contact with liquid perchloryl fluoride or its very cold gas may cause frostbite, freeze burns, and possibly other burn-like injuries of the skin or eyes due to the cold temperatures involved as well as the strong oxidizing properties of the substance. Be advised and take heed that there is potential for some common clothing materials exposed to a concentrated perchloryl fluoride atmosphere or contaminated with the liquid product to be subject to ignition and accelerated burning or explosion, thus potentially causing serious injury to the wearer of the clothing. It is prudent to remove exposed clothing immediately and not use it or handle it haphazardly until it has been declared safe by a qualified expert.

Hazards of Inhalation: Brief inhalation of perchloryl fluoride is known to cause irritation of the upper respiratory tract in man. Severe exposures may lead to cyanosis evidenced by bluish discoloration of the lips, nose, earlobes and possibly skin, as well as drowsiness, weakness, dizziness, rapid heart beat, nausea, headache, shortness of breath, unconsciousness, convulsions, and possibly death in severe cases.

Hazards of Ingestion: Due to its low boiling point temperature, ingestion of liquid perchloryl fluoride is considered highly unlikely. If it should occur, frostbite and possibly burns of the lips, mouth, and other contacted tissues may be expected (at the very least).

FIRE HAZARDS

Lower Flammable Limit: Not combustible

Upper Flammable Limit: Not combustible

Behavior in Fire: Strong oxidizer. Will support and may greatly intensify a fire upon release. Containers may rupture violently in a fire due to overpressurization. Some substances that do not burn in air may possibly burn in a perchloryl fluoride enriched atmosphere if ignited. Contact of liquid perchloryl fluoride with various fuels and combustible materials may result in an explosion at elevated temperatures or upon ignition. Ignition of various substances in a perchloryl fluoride enriched atmosphere may also possibly result in an explosion.

Hazardous Combustion Products: *Toxic* and corrosive gases such as hydrogen fluoride and chlorine may form when perchloryl fluoride decomposes. Hydrogen fluoride gas may combine with moisture in air to form hydrofluoric acid. Measurable decomposition rates are reported to occur at temperatures above about 880°F (470°C).

3083

PERCHLORYL FLUORIDE
Division 2.3 (Poison Gas)

EXPLOSION HAZARDS

Lower Explosive Limit: Not combustible
Upper Explosive Limit: Not combustible
Explosiveness: Mixtures or reactions of liquid perchloryl fluoride or concentrated perchloryl fluoride gas with a wide variety of materials are subject to explosion under appropriate conditions. Containers may rupture violently due to overpressurization when in a fire or when exposed to excessive heat for sufficient time duration.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent eye contact with liquid perchloryl fluoride or very cold gas streams and should prevent the skin from becoming frozen or burned from contact with the product or cold containers. Clothing and equipment should be of a type that will not freeze to skin and will not ignite on contact with liquid perchloryl fluoride or be subject to ignition and burning in a perchloryl fluoride enriched atmosphere. By analogy to recommendations for oxygen, preferred materials are those with smooth surfaces which prevent accumulation of the product; they should be clean, oil free, and insulated as necessary. Fully encapsulating suits with self-contained breathing apparatus (SCBA) are recommended by the U.S. Department of Transportation in its 1990 Emergency Response Guidebook for use under emergency conditions where perchloryl fluoride has been or has the potential to be discharged. Note that many types of regular (i.e., daily wear) clothing materials and possibly some types of protective clothing materials may be subject to reaction with perchloryl fluoride and possible ignition or explosion under appropriate conditions. Remove such contaminated clothing and do not reuse until it has been declared safe by a qualified expert. Seek the advice of qualified experts with respect to suitable protective clothing materials where possible and/or make every attempt to minimize the exposure of the clothing to perchloryl fluoride.
Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Gas masks or cartridge type respirators containing activated carbon or charcoal should never be used since the carbon may ignite spontaneously or adsorb perchloryl fluoride and become explosive in atmospheres containing high concentrations of perchloryl fluoride vapor or gas.

FIRST AID

Nonspecific symptoms: Frostbite or burns of the skin, eyes, or other bodily tissues; cyanosis, drowsiness, weakness, dizziness, rapid heart beat, nausea, headache, shortness of breath, and other signs of exposure.
First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing or immediately if not frozen. Wash affected body areas with large amounts of warm water. Get medical attention immediately if irritation, burns, or frostbite are apparent after washing. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming if warm water is not available. Handle potentially contaminated oxidizable clothing with caution when appropriate due to the possibility of its ignition or explosion.
First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately. Do not use hot water or rub frozen areas.

PERCHLORYL FLUORIDE
Division 2.3 (Poison Gas)

FIRE RESPONSE

Extinguishing Materials: Do not use dry chemicals, carbon dioxide, or halons where they may contact perchloryl fluoride. Use water on small fires. Otherwise, contain and let fire burn. If fire involving the product must be fought, water spray or fog is recommended. (Note: In the absence of more detailed and specific information, these recommendations were extracted from the U.S. DOT 1990 Emergency Response Guidebook.)

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit of compatible material if contact with material or dense fumes/smoke is anticipated. Move container from fire area if no risk. Stop flow of perchloryl fluoride if safe to do so before attempting to extinguish fire unless the appropriate extinguishing techniques for burning materials indicate that the fire should not be extinguished until other fuel flows are stopped. Be alert to the possibility that the container of perchloryl fluoride may tear or rupture and suddenly release massive amounts of the product (which may greatly magnify the fire) when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of a tank due to fire. Avoid direct application of water on safety relief devices fitted to liquid perchloryl fluoride containers if possible, since resultant cold exposure may cause ice to form, thus preventing proper functioning of the devices. When large pools of water-soluble fuels are present, consider using water (if safe to do so) to dilute the fuel and to reduce the intensity of the fire. When a non-water soluble fuel and liquid perchloryl fluoride are mixed or mixing but are not yet burning, isolate the area from sources of ignition and get out quickly, allowing the perchloryl fluoride to evaporate. Before isolating and handling materials with which perchloryl fluoride has or may have reacted, be they organic or inorganic in nature, exercise extreme caution until the potential explosive shock and heat sensitivity of the material has been determined. Note that contact with water may increase vapor evolution from any pools of liquid perchloryl fluoride that may form on the ground. (Note: Many of the more unusual recommendations above were extracted from procedures recommended for response to incidents involving oxygen.)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Choose equipment that is not damaged by the spilled product and that is suitable for perchloryl fluoride service. Where necessary, use spark-proof and explosion-proof tools and equipment, eliminate ignition sources, and ground all equipment and transfer lines prior to use. Seek expert advice before transferring perchloryl fluoride from its container to a second container. Ensure that the receiving container has been specially designed and cleaned to receive the product. Never transfer liquid perchloryl fluoride where it may spill onto gravel or another porous material that may contain oil drippings. Areas where liquid may be spilled during transfer operations must be free of hydrocarbons (including asphalt) or other combustible materials. In the event liquid is spilled on asphalt or other surfaces contaminated with combustibles (such as oil-soaked concrete or gravel), do not walk on or roll equipment over the area for some time, since there is potential for a violent reaction or explosion to occur simply by impact or shock. Open any valves on equipment slowly to avoid possible ignition of particles carried by perchloryl fluoride flowing at high velocity. Take the high volatility and many unusual properties and hazards of perchloryl fluoride into account while planning the response. Beware of possible heavy gas accumulations in low areas. (Note: In the absence of more specific information, many of these precautions are those commonly recommended for handling liquid or compressed oxygen and may not be fully necessary or appropriate for perchloryl fluoride.)

PERCHLORYL FLUORIDE
Division 2.3 (Poison Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Perchloryl fluoride discharges may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to perchloryl fluoride gas or vapor in air may accelerate its dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid perchloryl fluoride pools with water spray or fog may increase gas evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid perchloryl fluoride.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid perchloryl fluoride may be contained by building dikes or barriers using dry sand or other compatible materials where conditions permit this action to be safely undertaken. Storm drains and sewer openings may be protected using similar methods.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product where conditions permit this action to be safely undertaken.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may possibly be recovered using appropriate hoses, pumps and storage containers. Any remaining traces of perchloryl fluoride on the ground will vaporize fairly quickly.

CONSEQUENCE

Equipment that is incompatible with the spilled product and/or not suitable for liquid perchloryl fluoride service may become damaged, develop leaks, or rupture or explode. Very high pressures may develop in equipment.

MITIGATION

Use compatible and appropriate equipment of proper pressure capacity. Consider precooling the equipment with cold nitrogen gas before initiation of full scale recovery of the liquid to avoid high initial vaporization rates upon entry of the product into the equipment. Ensure that the equipment is sufficiently clean for use with a strong oxidizer. Consult qualified experts for guidance.

WATER SPILL

Liquid perchloryl fluoride will boil or rapidly vaporize from the surface of a water body with very little dissolution if any in the majority of cases.

PETROLEUM CRUDE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Petroleum crude oil is a flammable, variably light to dark colored liquid hydrocarbon with properties between gasoline and kerosene. It is used as a raw material for making fuels and various chemicals. Barely soluble in water and slightly lighter, petroleum crude oil will form a floating surface slick. Flammability of this product can vary widely having a flash point range from -45 to 392ºF. The liquid may evaporate easily even at low temperatures. The vapors of the more volatile, and therefore more flammable crude oil, are heavier than air, may accumulate and persist in low areas, and may travel some distance to a source of ignition and flash back. Similarly, accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited and there is some potential that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. Typical crude oil weigh approximately 6.3-8.3 pounds per gallon.

Petroleum crude oil will not react with water or other common materials and is stable in normal transportation. It is incompatible with strong oxidizers, and may attack some forms of plastics, rubber, and coatings. Toxicity by potential routes of exposure is generally considered low to moderate. The more volatile mixtures may be present in air in high concentrations creating an inhalation hazard. There is also the possibility that the crude oil may contain some fraction of toxic benzene or hydrogen sulfide (see separate guides). Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, below 0.1%

Solubility in Other Chemicals: Soluble in various hydrocarbon liquids.

Specific Gravity (Liquid): Varies, 0.75 - 0.99

Vapor Density: 3.4 (approximately)

Boiling Point: Varies, 1000+ºF (538+ºC).

Melting Point: Unavailable

Freezing Point: Unavailable

Molecular Weight: Complex mixture, approximately 99

Heat of Combustion: 10,290 - 10,460 cal/g (Petroleum distillates)

Evaporation Rate (butyl acetate=1): 10 (approximately)

Vapor Pressure: Varies widely with composition, 40 mmHg for petroleum distillates.

Flash Point: Varies widely -45 to 392ºF (-43 to 200ºC)

Autoignition Temperature: 450 - 500ºF (232 - 260ºC)

Burning Rate: 4 mm/minute

Flammable Limits: 0.4% (LEL) - 15% (UEL)

Stability: Stable

Polymerization Potential: Will not occur.

Corrosiveness: Relatively noncorrosive but may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with strong oxidizing materials. Avoid chlorine, fluorine.

IDENTIFICATION

Shipping Name(s): Petroleum crude oil (USDOT & IMO).

Synonyms and Tradenames: Crude oil ; Mineral oil; Rock oil; Coal oil; Petroleum.

CAS Registry No.: 8002-05-9

Chemical Formula: C_6-C_{13} hydrocarbon mixture. Crude oil is a naturally occurring complex mixture of hydrocarbons whose exact composition and physical properties can vary widely depending upon its source.

Constituent Components (% each): Complex mixture of petroleum hydrocarbons; may contain 0-10% benzene.

UN/NA Designation: UN1267

IMO Designation: 3.1, 3.2 or 3.3, Flammable liquids

NFPA 704 Hazard Rating: 2(Health): 3(Flammability): 0(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Dark yellow to brown or greenish-black, oily liquid.

Odor Characteristics: Like gasoline and kerosene

Reportable Quantity: See appendix I.

Common Uses: Raw material for making fuels and various chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PETROLEUM CRUDE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies

Unusual Hazards: Properties uncertain. Vapors of some crude oil may be heavier than air and may travel to a source of ignition. Some may include significant amounts of benzene (see separate guide).

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 86 ppm (350 mg/m^3) (Petroleum distillates).

Ceiling (C) Limit: 444 ppm (1800 mg/m^3) (Petroleum distillates).

IDLH: 1100 ppm or 10% LEL (Petroleum distillates).

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air. Ingestion and direct contact are also to be avoided. (Note: Any benzene in the product increases both acute and chronic health risks.)

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid petroleum crude oil may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Contact with the eyes may result in irritation and possibly temporary corneal injury.

Hazards of Inhalation: Vapors of petroleum crude oil may be irritating to the eyes and the upper respiratory tract. High concentrations in air may result in narcosis and central nervous system depression with symptoms including inebriation, headache, nausea, dizziness, drowsiness, unconsciousness, convulsions, and possibly death. Some symptoms may be evident after 1 hour at 4000-7000 ppm in air. Acute overexposure may also result in persistent anorexia and nervousness on occasion.

Hazards of Ingestion: Ingestion may cause a burning sensation, vomiting, diarrhea, drowsiness, and symptoms listed above. Aspiration into the lungs during vomiting may result in pulmonary edema with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 0.4%

Upper Flammable Limit: 15%

Behavior in Fire: Flammable liquid. Liquid will burn but may be difficult to ignite depending on constituents. Flammable liquids may generate large quantities of flammable vapor upon release. Vapors of flammable liquids are heavier than air, may accumulate and persist in low areas, and may travel to a source of ignition and flash back. There is some potential that containers may rupture violently in fire.

Hazardous Decomposition Products: Not well-defined, may include toxic constituents such as carbon monoxide, carbon dioxide, oxides of sulfur and reactive hydrocarbons.

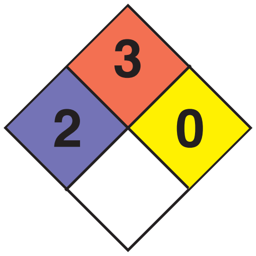
EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire. Product is sensitive to static discharge and is an extreme fire hazard. Vapors can burn with explosive violence.

1267

PETROLEUM CRUDE OIL

Class 3 (Flammable Liquid) or
Combustible Liquid



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, chlorinated polyethylene, polyurethane, polyvinyl alcohol, Viton®, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Eye Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

Note to Physician: Hydrocarbons may sensitize the heart to epinephrine and other circulating catecholamines so that arrhythmias may occur. Careful consideration of this potential adverse effect should precede administration of epinephrine or other cardiac stimulants and the selection of bronchodilators.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam, or water spray. Water may be ineffective and there is some possibility that foam or water may cause some frothing.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note: Crude oil fires may produce a highly dangerous phenomenom known as a BOILOVER, whereby light hydrocarbons burn off at the surface of the fire and heavy superheated hydrocarbons sink to the bottom and come in contact with water bottoms. The super heated product converts the water to steam and forces burning crude oil out of the tank. Burning crude oil which has accumulated in tanks or diked areas are susceptible to boilovers. Seek expert advice on how to fight a crude oil fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of petroleum crude oil may result in rupture or explosion of boilers or industrial process equipment. Use intrinsically safe equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the specific flammability hazard and possible volatility of the spilled product into account while planning the response.

PETROLEUM CRUDE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to petroleum crude oil vapors or fumes may accelerate their dispersal in the atmosphere. (Note: There is some possibility that water may cause frothing.)

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of petroleum crude oil from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of petroleum crude oil vapors into the atmosphere. (Note: There is some possibility that foam may cause frothing.)

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Petroleum crude oil may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined petroleum crude oil may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination if some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

PETROLEUM CRUDE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

PETROLEUM CRUDE OIL
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating petroleum crude oil.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with petroleum crude oil may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

September 2000

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Petroleum distillates are flammable, colorless to variably colored liquid hydrocarbon mixtures with properties between gasoline and kerosene. They are used in cleaning preparations, as a solvent, and as a raw material for making various chemicals. Barely soluble in water and lighter, petroleum distillates will form a floating surface slick. Flammability of these products can vary widely with flammable liquids having flash points below 100ºF and combustible liquids having flash points in the range of 100-199ºF. Liquid evaporates easily even at low temperatures. The vapors of the more volatile, and therefore more flammable distillates, are heavier than air, may accumulate and persist in low areas, and may travel some distance to a source of ignition and flash back. Similarly, accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited and there is some potential that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. Typical distillates weigh approximately 6.1-6.3 pounds per gallon.

Petroleum distillates do not react with water or other common materials and are stable in normal transportation. They are incompatible with strong oxidizers, and may attack some forms of plastics, rubber, and coatings. Toxicity by potential routes of exposure is generally considered low to moderate. The more volatile mixtures may be present in air in high concentrations creating an inhalation hazard. There is also the possibility that the distillates may contain some fraction of toxic benzene (see separate guide). Products of combustion may include toxic constituents.

Downwind evacuation should be considered on a case by case basis if a significant amount of highly volatile petroleum distillates is leaking but not on fire. Naphtha is the predominant material transported under this USDOT description.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, approx. 0.04 g/100 g water at 68ºF (20ºC)

Solubility in Other Chemicals: Soluble in various hydrocarbon liquids.

Specific Gravity (Liquid): Varies, 0.63 - 0.76 at 59ºF (15ºC)

Vapor Density: 3.4 (approximately)

Boiling Point: Varies, 86 - 284ºF (30 - 140ºC) or higher.

Melting Point: Varies, -100 to -30ºF (-73.3 to -34.4ºC)

Freezing Point: Varies, approximately -99ºF (-72.7ºC)

Molecular Weight: Complex mixture, approximately 99

Heat of Combustion: 10,290 - 10,460 cal/g

Evaporation Rate (butyl acetate=1): 10 (approximately)

Vapor Pressure: Varies widely with composition, approximately 40 mmHg.

Flash Point: Varies, approximately -40 to over 100ºF (-40 to over 38ºC)

Autoignition Temperature: 450 - 500ºF (232 - 260ºC)

Burning Rate: 4 mm/minute

Flammable Limits: 1.1% (LEL) - 5.9% (UEL)

Stability: Stable

Polymerization Potential: Will not occur.

Corrosiveness: Relatively noncorrosive but may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with strong oxidizing materials.

IDENTIFICATION

Shipping Name(s): Petroleum distillates, n.o.s. or Petroleum products, n.o.s. (USDOT & IMO).

Synonyms and Tradenames: Petroleum naphtha; Aliphatic petroleum naphtha; Petroleum ether; Naphtha; Petroleum. Other possibilities include light ligroin, rubber solvent, and Benzine.

CAS Registry No.: 8002-05-9 or 70592-78-8

Chemical Formula: C_6-C_{13} hydrocarbon mixture

Constituent Components (% each): Complex mixture of petroleum hydrocarbons; may contain 0-10% benzene.

UN/NA Designation: UN1268

IMO Designation: 3.1, 3.2 or 3.3, Flammable liquids

RTECS Number: SE7449000

NFPA 704 Hazard Rating: 2(Health): 3(Flammability): 0(Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless to variably colored

Odor Characteristics: Like gasoline and kerosene

Reportable Quantity: See appendix I.

Common Uses: Industrial solvent; component of cleaning preparations; raw material for making various chemicals.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies

Unusual Hazards: Properties uncertain. Vapors of some distillates may be heavier than air and may travel to a source of ignition. Some may include significant amounts of benzene (see separate guide).

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 86 ppm (350 mg/m^3)

Ceiling (C) Limit: 444 ppm (1800 mg/m^3)

IDLH: 1100 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air. Ingestion and direct contact are also to be avoided. (Note: Any benzene in the product increases both acute and chronic health risks.)

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid petroleum distillates may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Contact with the eyes may result in irritation and possibly temporary corneal injury.

Hazards of Inhalation: Vapors of petroleum distillates may be irritating to the eyes and the upper respiratory tract. High concentrations in air may result in narcosis and central nervous system depression with symptoms including inebriation, headache, nausea, dizziness, drowsiness, unconsciousness, convulsions, and possibly death. Some symptoms may be evident after 1 hour at 4000-7000 ppm in air. Acute overexposure may also result in persistent anorexia and nervousness on occasion.

Hazards of Ingestion: Ingestion may cause a burning sensation, vomiting, diarrhea, drowsiness, and symptoms listed above. Aspiration into the lungs during vomiting may result in pulmonary edema with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 0.9-1.2%

Upper Flammable Limit: 6-7%

Behavior in Fire: Flammable or combustible liquid. Combustible liquids will burn but may be difficult to ignite. Flammable liquids may generate large quantities of flammable vapor upon release. Vapors of flammable liquids are heavier than air, may accumulate and persist in low areas, and may travel to a source of ignition and flash back. There is some potential that containers may rupture violently in fire.

Hazardous Decomposition Products: Not well-defined, may include toxic constituents such as carbon monoxide, carbon dioxide, oxides of sulfur and reactive hydrocarbons.

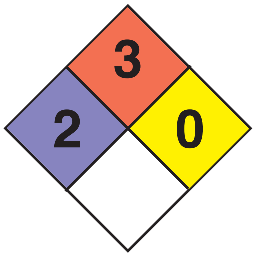
EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire. Product is sensitive to static discharge and is an extreme fire hazard. Vapors can burn with explosive violence.

1268

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid



PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, chlorinated polyethylene, polyurethane, polyvinyl alcohol, Viton®, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10,000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge (10,000 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Eye Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

Note to Physician: Hydrocarbons may sensitize the heart to epinephrine and other circulating catecholamines so that arrhythmias may occur. Careful consideration of this potential adverse effect should precede administration of epinephrine or other cardiac stimulants and the selection of bronchodilators.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam, or water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of petroleum distillates may result in rupture or explosion of boilers or industrial process equipment. Use intrinsically safe equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the specific flammability hazard and volatility of the spilled product into account while planning the response.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of petroleum distillates from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Petroleum distillates may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination if some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

PETROLEUM DISTILLATES, N.O.S. or PETROLEUM PRODUCTS, N.O.S.

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER UNDER FLOW DAMS . . . Streams may be provided with an under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating petroleum distillates.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with petroleum distillates may be used to absorb spilled product from the water surface, preferably after the spill has been confined.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

September 2006

PETROLEUM GAS, LIQUEFIED

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Liquefied petroleum gas, or LPG as it is commonly known, is a colorless, highly flammable mixture of hydrocarbon gases that is shipped as a liquid under pressure. It is odorless and colorless in its natural state, but a commercial odorant is added prior to delivery at bulk plants so it can be detected down to a concentration of air not over 20% of the Lower Explosive Limit. It is used primarily as a fuel but also has uses as a chemical industry feedstock, as an aerosol propellant, and in making synthetic rubber. It is essentially insoluble in water and lighter. Due to its low boiling point, any spilled liquid will boil or otherwise rapidly vaporize to produce large amounts of heavier than air vapors and gases that may accumulate and persist in pits, hollows, and depressions. Vapors may also travel considerable distances to a source of ignition and flash back or even explode. Accumulations in confined spaces such as buildings or sewers may explode if ignited, and containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. There is at least one case where a damaged but non-leaking container ruptured violently in the absence of heat or fire during railroad wreck clearing operations. The liquid weighs approximately 4.3 – 4.8 pounds per gallon near its boiling point.

LPG does not react with water or many other common materials, and is primarily incompatible with oxidizing materials that may cause its ignition. Toxicity of the product is low, but contact may result in frostbite or irritation and inhalation of high vapor concentrations in air may be harmful. Products of combustion may include toxic constituents.

If LPG is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 330 feet (100 meters) in all directions. If the spill is large, consider initial downwind evacuation of one-half (1/2) mile (800 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one mile (1600 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Essentially insoluble
Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform and ether.
Specific Gravity (Liquid): 0.51 – 0.61 at –58°F (–50°C)
Vapor Density: 1.52
Boiling Point: –54.4 to 31.1°F (–48 to –0.5°C) at 1 atm.
Melting Point: Very low
Freezing Point: –306°F (–188°C)
Molecular Weight: 42 – 58 (depends on mixture)
Heat of Combustion: –10990 cal/g
Evaporation Rate: Rapid
Vapor Pressure: As much as 8.6 atm (126.3 psia) at 68°F (20°C); 3725 mmHg at 95°F (35°C)
Flash Point: –153°F (–103°C)
Autoignition Temperature: 761 – 842°F (405 – 450°C)
Burning Rate: 8.2 mm/minute
Flammable (Explosive) Limits: 1.9%, 2.1% (LEL) – 8.5%, 9.5% (UEL) (butane, propane)
Stability: Stable
Polymerization Potential: Will not occur
pH: Not applicable
Corrosiveness: Relatively non-corrosive, but may attack some forms of plastics, rubber and coatings.
Reactivity with Water: No reaction
Reactivity and Incompatibility: Reacts with nitric acid, chlorine dioxide and strong oxidizing materials.

IDENTIFICATION

Shipping Names: Liquefied petroleum gas (USDOT & IMO)
Synonyms and Tradenames: LPG; Bottled gas; Pyrofax; Compressed petroleum gas; Liquefied hydrocarbon gas; Odorized propane; Propane motor fuel
CAS Registry No.: 68476-85-7
Chemical Formula: Propane (C_3H_8); butane (C_4H_{10}) propylene (C_3H_6)
Constituent Components (% each): Can be propane, butane, propylene, isobutant or isobutylene or mixtures of each, with possibly some small amount of odorant.
UN/NA Designation: UN1075
IMO Designation: 2.1, flammable gas
RTECS Number: SE7545000
NFPA 704 Hazard Rating: 2 (Health): 4 (Flammability): 1 (Instability). Rating is based on 3 main constituents of butane, propylene and propane. Propane is an asphyxiant.
Physical State as Shipped: Liquid
Physical State as Released: Boiling liquid or gas
Color of the Shipped Material: Colorless, but very cold gas may appear white.
Odor Characteristics: Odorless or mild petroleum odor, but may contain skunk-like odorant.
Common Uses: Fuel gas; chemical feedstock; mfg. of synthetic rubber; aerosol propellant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PETROLEUM GAS, LIQUEFIED

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Varies widely, several source reports 4800 – 20000 ppm, however, even with odorant added, odor is not an adequate indicator of vapor concentration.

Unusual Hazards: Extremely flammable heavier than air gas that may travel considerable distance to a source of ignition. Vapor may persist in low areas. There is some potential that unconfined vapor clouds may explode if ignited.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1000 ppm (1800 mg/m^3) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 2000 ppm (10%LEL)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentrations that may be present in air, but direct contact should also be avoided and may cause frostbite.

Hazards of Skin or Eye Contact: Contact with liquid LPG or cold concentrated gas may cause frostbite as well as irritation.

Hazards of Inhalation: High concentrations of LPG in air may cause central nervous system depression with symptoms including light-headedness, drowsiness, unconsciousness, and possibly death. Very high levels may also cause asphyxiation via displacement of air.

Hazards of Ingestion: Ingestion of LPG is unlikely.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 1.9% (butane) 2.1% (propane)

Upper Flammable (Explosive) Limit: 8.5% (butane) 9.5% (propane)

Behavior in Fire: LPG has an expansion ratio of 1 to 270 and can generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include carbon monoxide, carbon dioxide, nitrogen oxides and toxic constituents.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosions may result if vapors are ignited in a confined area. There is also known potential for explosions involving unconfined vapor clouds.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

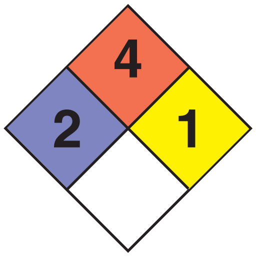
Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact with the spilled product and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, nitrile rubber, polyurethane, polyvinyl chloride, Viton®, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2000 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 2000 ppm): any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator.

1075

PETROLEUM GAS, LIQUEFIED

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Light-headedness, drowsiness, frostbite, or irritation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of lukewarm water until circulation returns. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination. (Note: Do not use hot water.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Stop flow gas or let large fires burn. Use carbon dioxide or dry chemical on small fires in open. Cooling water should be applied directly on the shell on the burning container so that all sides of the tank are protected. Use of unmanned monitors is preferred to reduce risk of personnel from Boiling Liquid Expanding Vapor Explosion (B.L.E.V.E.).

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water may increase vapor evolution from any pools of liquid LPG on the ground.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Use explosion-proof equipment where necessary. Choose equipment, where possible that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile and flammable nature of LPG into account while planning the response. Beware of possible heavy gas accumulations in low areas.

PETROLEUM GAS, LIQUEFIED

Division 2.1 (Flammable Gas)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . LPG may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of LPG in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Hoselines placed on a narrow fog pattern or spray can help disperse flammable vapors down wind of the leak or spill. Note: Water should ***not*** be applied directly to pooled liquid LPG. It will rapidly increase the rate of vaporization. Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of liquefied petroleum gas from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . LPG may be contained by building dikes using soil, dry sand or other materials.

CONSEQUENCE

Contained LPG may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination. May generate large amounts of vapors which are highly flammable and can be easily ignited.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination and loss of product from vaporization. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials. Make sure there are no sources of ignition near the area of the spill.

PETROLEUM GAS, LIQUEFIED

Division 2.1 (Flammable Gas)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination. May generate large amounts of vapors which are highly flammable and can be easily ignited.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Make sure there are no sources of ignition near the area of the spill.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. High pressures may develop in equipment. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product and of proper pressure capacity. Decontaminate equipment.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination. Note: LPG is expected to vaporize rapidly with negligible dissolution; therefore, there may not be a significant effect.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

This page may be used for notes.

March 1995

PHENYL MERCAPTAN

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Phenyl mercaptan, also shipped with the name “benzenethiol”, is a colorless to light yellow flammable liquid with a repulsive and nauseating odor resembling strong garlic or burnt rubber. It is practically insoluble in water and slightly heavier, so may be expected to sink and dissolve at an extremely slow rate. Its reported flash point range of 123 to 132°F indicates that the substance must be subjected to very high ambient temperatures in its container or somewhat preheated before it can be easily ignited. Under such conditions, phenyl mercaptan vapors may travel some distance to a source of ignition and flash back. Accumulations of vapor from sufficiently warm phenyl mercaptan may explode if ignited in confined spaces such as buildings or sewers. There appears to be some possibility that containers may rupture violently, explode, and/or rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 9 pounds per gallon. Its melting/freezing point temperature range of 5 to 5.4°F indicates it may solidify at cold ambient temperatures.

Phenyl mercaptan does not react with water or many other common materials and is considered stable in normal transportation. Upon exposure to air, it rapidly oxidizes to form unspecified amounts of diphenyl disulfide. In the absence of air, it is reported stable up to a temperature or 392°F. Phenyl Mercaptan is weakly acidic, mildly corrosive to carbon steel, and likely to attack some forms of rubber, plastics, and coatings. The substance poses a high toxic hazard by all routes of exposure but especially via inhalation.

Downwind evacuation or an alternative public protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if phenyl mercaptan is leaking from its container. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of at least one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 470 ppm at 59°F (15°C)

Solubility in Other Chemicals: Very soluble in alcohol, ether, carbon disulfide, and aromatic and aliphatic hydrocarbons.

Specific Gravity (Liquid): 1.075-1.078 at 68°F (20°C)

Boiling Point: 334.4-336.2°F (168-169°C) at 1 atm.

Melting Point: 5.0 to 5.4°F (-15 to -14.8°C)

Freezing Point: See melting point

Molecular Weight: 110.17

Heat of Combustion:Not available

Vapor Pressure: Approx 1.4 mm Hg (0.0271 psia) at 68°F 20°C); 3.4 mm Hg (0.0657 psia) at 104°F (40°C).

Flash Point: 123-132°F (50.6-55.6°C), closed-cup

Autoignition Temperature: Not available

Burning Rate: Not available

Stability: Stable in normal transportation; typically shipped in a nitrogen atmosphere. The product rapidly oxidizes upon exposure to air to form unspecified amounts of diphenyl disulfide. In the absence of air, phenyl mercaptan is reported to be stable up to a temperature of 392°F (200°C).

Corrosiveness: Available information is limited. Liquid phenyl mercaptan is weakly acidic and reported as mildly corrosive to carbon steel. It is also likely to attack some forms of rubber, plastics, and coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reported as incompatible with oxidizing agents; reacts violently with calcium hypochlorite.

IDENTIFICATION

Shipping Names: Phenyl mercaptan (USDOT & IMO)

Synonyms and Tradenames: Mercaptobenzene; phenylthiol; and thiophenol

Chemical Formula: C_6H_5-SH

Constituent Components (% each): Only determined that some commercial grades are 97% or more pure; others are 99% or more pure.

UN/NA Designation: UN2337

IMO Designation: 6.1, poisonous substance

Physical State As Shipped: Liquid

Physical State As Released: Liquid or solid (solidifies at or below 5.4°F)

Color of the Shipped Material: Usually colorless; may be light yellow at times according to one authority.

Odor Characteristics: Penetrating, repulsive, putrid, nauseating and offensive; described as resembling strong garlic or burnt rubber.

Common Uses: Making various pesticides and pharmaceutical products; in solvent formulations for removal of polysulfide sealants in aircraft production and maintenance; as an odorant in natural gas for detection of leaks.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

PHENYL MERCAPTAN

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Detectable at very low concentrations. Various sources list detection levels of 0.0002 ppm, 0.00026 ppm, 0.0094 ppm, and/or 0.022 ppm. Some tolerance to the odor may develop with time. One authority implies a median odor threshold of 13 ppm, which is inconsistent with other available data.

Unusual Hazards: Poisonous liquid by all routes of exposure; low concentrations in air can produce toxic effects or death via inhalation. Odor is foul and detectable at extremely low concentrations according to most sources of information. Indeed, a repulsive odor may be smelled at downwind distances well beyond the zone in which toxic effects may be expected.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: 0.5 ppm over each 8 hours of a 40 hour work week (ACGIH, 1991-92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the high concentrations of phenyl mercaptan that may be present in air in the immediate spill area and over considerable distances downwind. Ingestion and direct physical contact are also to be strictly avoided. Note that the odor of phenyl mercaptan may be detectable and repulsive at downwind distances well beyond those at which toxic effects may be experienced.

Hazards of Skin or Eye Contact: The vapor of phenyl mercaptan is a strong lacrimator and can be severely irritating to the eyes at high concentrations in air. When tested on rabbits, contact of the eyes with liquid phenyl mercaptan caused severe irritation, moderate to severe redness, edema of the ocular conjunctiva, pain, temporary opacity of the cornea causing blurred vision, and discharge. Contact of liquid phenyl mercaptan with the skin can cause severe skin irritation and possibly burns. Absorption of the liquid through the skin can contribute to the toxic effects of phenyl mercaptan and may be fatal in extreme cases. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Vapors of phenyl mercaptan are severely irritating to the nose, throat, airways, and lungs. Symptoms of exposure are variably reported to include restlessness, headache, dizziness, sore throat, laryngitis, a burning sensation in the lungs, coughing, wheezing, shortness of breath, labored breathing, increased respiration, incoordination, muscular weakness or paralysis, lethargy and/or sedation, respiratory depression, nausea, vomiting, spasm, coma, and possibly death. Survivors of a direct exposure may experience delayed pulmonary edema, inflammation and edema of the larynx, and chemical pneumonitis with possibly severe consequences (including death). Repeated exposures of mice to phenyl mercaptan vapors over a relatively short period of time caused systemic effects, kidney damage, fatty degeneration and necrosis of the liver, capillary enlargement, patchy edema, and occasional hemorrhages in the lungs. Exposure to only 28 ppm of phenyl mercaptan in air for 4 hours was sufficient to kill 50% of mice in laboratory experiments; exposure to 34 ppm for the same period of time was fatal to 50% of rats. The saturated vapor concentration directly over a pool of liquid phenyl mercaptan is about 1840 ppm at 68°F and 4475 ppm at 104°F.

Hazards of Ingestion: Ingestion of liquid phenyl mercaptan is variably reported to cause sore throat, severe irritation of the gastrointestinal tract, abdominal pain, nausea, vomiting, dizziness, weakness, and other symptoms similar to those observed from inhalation.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: May require some degree of preheating to be easily ignited. May generate flammable vapors upon release if heated or if released under very high ambient temperature conditions.

Hazardous Combustion Products: Not well-defined; combustion and thermal decomposition products are reported to include carbon monoxide, carbon dioxide, toxic oxides of sulfur (such as sulfur dioxide), highly toxic hydrogen sulfide, and possibly other toxic or irritating constituents.

2337

PHENYL MERCAPTAN

Division 6.1 (Poisonous Material)

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from warm or hot liquid are ignited in a confined area. Despite the high boiling point and low vapor pressure of phenyl mercaptan, there appears to be some potential for containers to rupture violently, possibly rocket, and/or explode in fires. One authority reports that phenyl mercaptan is only stable in the absence of air up to a temperature of 392°F but does not specify the consequences of exposures to higher temperatures.)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. Compatible materials may include polyvinyl alcohol.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5.5 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (for levels of 5.5 ppm or less) or a chemical cartridge respirator with a full or half facepiece and organic vapor cartridge(s) (for levels of 1.1 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation or burns of the eyes, skin, nose, throat, or respiratory system; headache, dizziness, coughing, shortness of breath, incoordination, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately if eye contact has occurred or skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, have victim immediately rinse mouth thoroughly with water and then administer several glasses of water. Do not attempt to make the victim vomit. Get medical attention immediately. If professional medical attention cannot be obtained quickly, then consider inducing vomiting if the victim is conscious and then repeat administration of water. Whether vomiting occurs naturally or is induced, have the victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, foam.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear, rupture or explode, possibly rocket, and/or suddenly release massive amounts of product when exposed to high heat such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take the highly toxic nature of phenyl mercaptan into account when planning the response.

PHENYL MERCAPTAN
Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION ... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Phenyl mercaptan discharges may expose downwind areas to toxic concentrations over considerable distances in some cases. Flammable concentrations will usually exist over lesser distances if the material is heated above its flash point before or after release.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY ... Water fog or spray applied to phenyl mercaptan vapors in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of phenyl mercaptan from contact with its airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM ... There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of phenyl mercaptan vapors into the atmosphere. (Note: The fact that foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution. Authorities disagree as to whether regular or alcohol foam should be applied; both may be effective to some degree.)

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES ... Liquid phenyl mercaptan or contaminated runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained liquid and spread of contamination.

MITIGATION

Removed contained liquid as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

PHENYL MERCAPTAN

Division 6.1 (Poisonous Material)

TECHNIQUE

EXCAVATION ... A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION ... Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Note that phenyl mercaptan will solidify at temperatures at or below 5.4°F and may clog or plug hoses or pumps in cold weather.

MITIGATION

Use equipment compatible with the spilled product. Take the ambient temperature into account when applying this technique.

TECHNIQUE

ABSORPTION ... Spreading of phenyl mercaptan may be controlled by absorbing the liquid with sand, earth, clay, activated charcoal or carbon, dry lime, soda ash, sodium carbonate, vermiculite, commercial sorbents, or other compatible substances according to various authorities. Sand, earth, clay, vermiculite, commercial sorbents, or other compatible materials may also be used to absorb contaminated water runoff.

CONSEQUENCES

Once used, some sorbent materials may pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

NEUTRALIZATION ... Application of an appropriate neutralization agent may modify remaining phenyl mercaptan residues to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL ... Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

PHENYL MERCAPTAN
Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE ... Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Liquid phenyl mercaptan is very slightly soluble in water and only slightly heavier. Though it may first travel some distance downstream, most authorities presume that the liquid will eventually sink to the bottom of a body of water and dissolve at a very slow rate. There is a possibility, however, that the phenyl mercaptan may remain suspended in the water column as various size droplets for quite some time in natural water bodies that are not completely pure. Be advised that a concentration as low as 0.000062 ppm of phenyl mercaptan by weight will impart a faint odor to the water. Higher levels may result in stronger odors.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT ... Spilled product may sink in water at some rate. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination where possible.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING ... Stream or lake beds may be dredged to remove heavier-than-water spilled products that have settled on the bottom and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES ... Water with dissolved or suspended chemicals may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

CHEMICAL TREATMENT ... Application of appropriate chemical agent(s) to the body of water containing dissolved or suspended chemicals and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

March 1995

PHOSGENE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Phosgene is a colorless to light yellow liquefied compressed poison gas with a boiling point in the range of 45.7-46.8°F and an odor that resembles freshly mown grass or musty hay in low concentrations and becomes sharp and pungent at higher levels. It is used in metallurgy and in the making of various chemicals, and was once used as a poison gas by the military. The product is very slightly soluble in water, slowly reactive (see below) and somewhat heavier, so may be expected to simultaneously boil, sink, and/or react in water with its specific actions depending upon the water temperature and depth of release. It weighs approximately 11.8 pounds per gallon.

Phosgene reacts slowly with water to form corrosive but far less toxic hydrogen chloride or hydrochloric acid together with carbon dioxide and is considered to be stable in normal transportation. Reactions with potassium or 2,4-hexadiyn-1,6-diol are known to form shock-sensitive explosives; those with iron salts can cause occasionally explosive thermal decomposition; and the product is otherwise incompatible with a wide variety of other substances. The toxicity of phosgene is extremely high by all routes of exposure. Vapors in air can be hazardous to life over considerable downwind distances and have a tendency to accumulate in pits, hollows, depressions, and other low areas. Decomposition of the nonflammable substance at high temperatures is said to produce chlorine, chlorides, carbon monoxide, carbon dioxide, carbon tetrachloride and possibly other toxic constituents, all of which may be less toxic than phosgene itself. The anhydrous product is not corrosive to ordinary metals, but exposure to moisture will cause corrosive conditions to develop rapidly.

Downwind evacuation should be considered immediately if phosgene is leaking from a container. Note that phosgene tanks in transportation are not equipped with pressure-relief devices and may rupture violently in fires due to overpressurization, thus releasing large quantities of toxic gases and vapors virtually instantaneously to the atmosphere.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very slightly soluble; reacts slowly

Solubility in Other Chemicals: Soluble in benzene, toluene, chloroform, glacial acetic acid, and most liquid hydrocarbons.

Specific Gravity (Liquid): 1.38 at 68°F (20°C)

Boiling Point: 45.7-46.8°F (7.6-8.2°C) at 1 atm

Melting Point: – 198.0 to – 194.8°F (– 127.8 to – 126°C)

Freezing Point: See melting point

Molecular Weight: 98.92

Heat of Combustion: Not flammable

Vapor Pressure: 1.55-1.60 atm (22.77-23.50 psia) at 68°F (20°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Phosgene used in anhydrous equipment with anhydrous reagents is not corrosive to ordinary metals. In the presence of moisture, hydrochloric acid is formed and corrosive conditions will develop rapidly, in which case monel, tantalum or glass-lined equipment should be used. Liquid phosgene may attack some forms of plastics, rubber, and coatings.

Reactivity with Water: Phosgene decomposes in water, but not vigorously, to form carbon dioxide and hydrochloric acid or hydrogen chloride.

Reactivity with Other Chemicals: Reacts with 2,4-hexadiyn-1,6-diol, powdered aluminum, alcohols, potassium, sodium, amines, t-butyl azidoformate, isopropyl alcohol, hexafluoroisopropylidene, amino lithium, lithium, iron salts, and possibly other substances.

IDENTIFICATION

Shipping Names: Phosgene (USDOT and IMO)

Synonyms and Tradenames: Carbonyl chloride; carbon oxychloride; chloroformyl chloride; carbonic acid dichloride; carbonic dichloride; diphosgene

Chemical Formula: $COC1_2$

Constituent Components (% each): 99-100% pure

UN/NA Designation: UN1076

IMO Designation: 2.3, poison gas

Physical State As Shipped: Liquefied compressed gas

Physical State As Released: Liquid, boiling liquid, or gas

Color of the Shipped Material: Colorless to light yellow

Odor Characteristics: Sharp, pungent odor in higher concentrations; like freshly mown grass or musty hay in low concentrations — mildly sweet. The sense of smell may be dulled quickly by phosgene.

Common Uses: Mfg. many organic chemicals such as urea, polycarbonates, urethane foam, dyestuffs, and isocyanates, acid chlorides, insecticides, herbacides, and pharmaceuticals. Also used in metallurgy; once used as war gas.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

PHOSGENE

Division 2.3 (Poison Gas)

Square background
applicable to rail cards.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.125 to 1.0 ppm; the sense of smell for phosgene may dull quickly.

Unusual Hazards: Extremely toxic and volatile material with heavier than air vapors that may persist in pits, hollows, depressions and other low areas. Can be hazardous to life over considerable downwind distances.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.1 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard to the public is from the large quantities of highly toxic gases and vapors that may be released in an accident and pose an extreme danger over considerable downwind distances. These gases and vapors are heavier-than-air and may persist in low areas.

Hazards of Skin or Eye Contact: Contact of the skin with liquid phosgene may cause severe irritation or severe burns; prolonged exposure to phosgene gas may cause skin irritation. Contact of the eyes with the liquid may cause severe irritation and corneal injury that may result in permanent impairment of vision or blindness. In laboratory experiments, high gas concentrations also caused corneal opacification in animals.

Hazards of Inhalation: Exposure to 3-4 ppm phosgene in air usually causes throat and eye irritation and coughing, but the properties of the material are inadequate to warn of dangerous exposures. Higher levels in air eventually cause dryness of the throat, coughing, choking, tightness across the chest, pain on breathing, headache, nausea, dizziness, chills, discomfort, thirst, thick and later thin and foamy sputum, grey-blue cyanosis, pulmonary edema, pneumonia, and death from respiratory or cardiac failure. A key problem is that the period between inhalation of harmful concentrations and onset of severe effects may be several hours or more almost free of symptoms. Any exposed person must therefore be treated as if the exposure is life threatening, kept under observation up to 72 hours, and given appropriate medical care. Levels of 50-90 ppm in air can be fatal in 30 minutes or less; 25 ppm can be dangerous to life after 30 minutes; 20 ppm causes severe lung injury in 1 to 2 minutes; 12.5 ppm is dangerous to life in 30 to 60 minutes.

Hazards of Ingestion: Due to the low boiling point of phosgene, the effects of ingestion are not discussed in the available literature. At the very least, severe burns of the mouth, throat, and stomach may be expected.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. Large quantities of highly toxic non-flammable gases may be released suddenly to the atmosphere.

Hazardous Combustion Products: Heating above 482°F (250°C) forms chlorides, chlorine, carbon monoxide, carbon dioxide, carbon tetrachloride, and possibly other substances, which although toxic, are less so than phosgene.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Phosgene containers do not have pressure-relief valves. Containers may rupture violently in fire due to overpressurization.

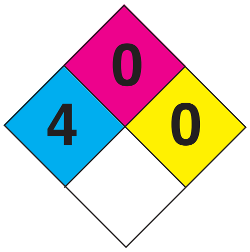
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 0.1 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1076

PHOSGENE
Division 2.3 (Poison Gas)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposures.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, including dry chemical, carbon dioxide, foam, water spray or fog.

Extinguishing Techniques: Unusual toxic vapor hazard. Material reacts relatively slowly with water to form corrosive but less hazardous product. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and safe distance to keep fire exposed containers. Be alert to the possibility that containers may rupture violently in a fire; they do not have pressure relief devices of any kind. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product and the acid formed in contact with water. Take the high volatility, extreme toxicity, and heavier-than-air nature of phosgene into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent public exposure and to allow vapors or fumes to dissipate. Phosgene spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to phosgene vapors or fumes may accelerate their dispersal in the atmosphere. Do not apply water directly to the leak area since the resulting increased corrosivity of phosgene may cause a larger leak. Do not apply water warmer than 4°F to liquid phosgene pools since this may cause an increase in vapor evolution.

CONSEQUENCE

Water runoff may contain a small amount (if any) of phosgene or hydrochloric acid from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

PHOSGENE
Division 2.3 (Poison Gas)

TECHNIQUE

WATER APPLICATION . . . Application of cold water via water spray to the surface of contained liquid pools of phosgene has some possibility of reducing emissions of phosgene vapors. Phosgene is only slightly soluble in water, somewhat heavier, and reacts slowly to form carbon dioxide and hydrochloric acid. Note, however, that this response technique has not been tested.

CONSEQUENCE

Addition of water will increase the volume of spilled product. The response may not be effective.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments. Abandon the response if it is not effective or appears to increase phosgene evolution.

TECHNIQUE

FOAM . . . There is a possibility that firefighting foam applied to the surface of liquid pools may slow the release of phosgene vapors into the atmosphere. Since foam is recommended by several sources for fighting surrounding fires, a foam blanket may have value in controlling evolution of phosgene vapors.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Cease foam application if the response is not effective or appears to increase phosgene vapor evolution.

TECHNIQUE

NEUTRALIZATION . . . There is a possibility that application of an appropriate neutralization agent to liquid phosgene may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The US DOT suggests that small spills of phosgene can be handled by flushing the area with flooding amounts of water.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid phosgene may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained phosgene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

PHOSGENE
Division 2.3 (Poison Gas)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment that is compatible with spilled product and of suitable pressure capacity.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

TECHNIQUE

DILUTION . . . The USDOT suggests that small spills of phosgene can be handled by flushing the area with flooding amounts of water.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

PHOSGENE
Division 2.3 (Poison Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake. Liquid phosgene will sink in water while simultaneously reacting and possibly boiling if the water is warmer than the boiling point of phosgene. Under certain circumstances, when the water is cold and or the phosgene is released underwater, pools of liquid phosgene may collect on the bottom and slowly react to form hydrochloric acid and carbon dioxide. It may be safest in many cases to allow the phosgene to react completely with the water and not make any attempt to recover product.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination. (Note: The water is likely to contain hydrochloric acid and slowly disappearing traces of phosgene.)

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

PHOSPHINE
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Phosphine is shipped as a liquefied compressed gas with a boiling point in the range of -126 to -121°F and an odor resembling decaying fish, garlic, and/or onion and mustard. Used in making insecticides, plastics, and electronic semi-conductors, the substance is very slightly soluble in water and lighter, so may be expected to boil or rapidly evaporate from the surface of a water body with little dissolution. It is spontaneously combustible in air under a wide variety of conditions. Nevertheless, if not immediately ignited, phosphine gas, being heavier than air, may travel a considerable distance to a source of ignition and flash back, or accumulate in pits, hollows, and depressions. Accumulations of the gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 6.2 pounds per gallon near its boiling point temperature.

Phosphine is considered stable in normal transportation when properly contained. It is said to react with water in a non-violent fashion according to one authority, while another states that it eventually self-degrades to relatively harmless phosphorus acid and water, and a third indicates that it readily oxidizes in air to toxic oxides of phosphorus. Reactions with a variety of other chemicals can result in fires or explosions. Phosphine gas is highly toxic via inhalation and contact with the liquid or concentrated cold gas may cause frostbite and possibly burns. Products of combustion may include toxic constituents, but at least one authority considers these of potentially lower toxicity than pure phosphine.

Downwind evacuation should be considered if phosphine is leaking (not on fire) until properly equipped responders have evaluated the hazard. If a fire becomes uncontrollable or a bulk container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.04 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol ether, and cuprious chloride.

Specific Gravity (Liquid): 0.746 at –130°F (– 90°C)

Boiling Point: –126 to –121°F (– 87.8 to – 85°C) at 1 atm.

Melting Point: See freezing point.

Freezing Point: – 208.8 to – 206.5°F (–133.8 to –132.5°C)

Molecular Weight: 34.0

Heat of Combustion: Unavailable (burns very hot)

Vapor Pressure: 41.3 atm (606.7 psia) at 70°F (21.1°C)

Flash Point: Spontaneously combustible; see below.

Autoignition Temperature: 212°F (100°C) reported, but see below.

Burning Rate: Unavailable

Stability: Stable in transportation but commercial phosphine containing other hydrides of phosphorus as impurities is spontaneously combustible in air, though extremely pure gas will not ignite below 300°F (150°C).

Corrosiveness: Pure phosphine appears noncorrosive to most metals but aluminum, light alloys, and copper are not recommended for use.

Reactivity with Water: Unspecified non-violent reaction may occur.

Reactivity with Other Chemicals: Reacts with oxygen, nitrous acid, nitric acid, chromium oxychloride, silver nitrate, boron trichloride, mercuric nitrate, nitrogen trichloride, oxidizing agents, chlorine oxides, dinitrogen trioxide, halogens such as chlorine or bromine, nitric oxide, and halogenated hydrocarbons. Many of these reactions produce fires or explosions. Reactions with acids produce phosphonium salts. The product readily oxidizes in air to oxides of phosphorus.

IDENTIFICATION

Shipping Names: Phosphine (USDOT and IMO)

Synonyms and Tradenames: Phosphorus trihydride; phosphorous (III) hydride, hydrogen phosphide; phosphorated hydrogen; Celphos; Delicia; Detia; Gas-Ex-B.

Chemical Formula: PH_3

Constituent Components (% each): Relatively pure

UN/NA Designation: UN2199

IMO Designation: 2.3, poison gas

Physical State As Shipped: Liquefied gas

Physical State As Released: Boiling liquid or gas

Color of the Shipped Material: Colorless gas

Odor Characteristics: Like decaying fish or garlic; unpleasant; like onions and mustard.

Common Uses: Insecticides; preparation of phosphonium halides; doping agent for electronic semi-conductors; polymerization initiator; condensation catalyst.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

PHOSPHINE
Division 2.3 (Poison Gas)

Square background
applicable to rail cards.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.02 ppm appears correct but 1.5 to 3 ppm also reported.

Unusual Hazards: Highly toxic, spontaneously combustible liquefied gas that is somewhat heavier than air and may persist in pits and depressions if not ignited. Unignited gas may travel considerable distance to a source of ignition and flash back or pose toxic hazard over considerable downwind distances.

Short Term Exposure Limits (STEL): 1 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 0.3 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentration of phosphine gas that may be present in air in the spill area and over considerable downwind distances. All other exposures should also be strictly avoided.

Hazards of Skin or Eye Contact: High concentrations of phosphine gas in air may be irritating to the eyes and skin. Contact with the liquid may cause burns of the skin or eyes and frostbite according to one authority.

Hazards of Inhalation: Inhalation of phosphine may cause faintness, weakness, apathy, nausea, coughing with green sputum, vomiting, shortness of breath, stomach pain, diarrhea, back pain, a feeling of coldness, intense thirst, oppressed feeling in the chest, stupor, convulsions, pulmonary edema, paralysis, coma, cardiac arrest, and possibly death. Concentrations of 1000 - 2000 ppm are lethal to man in a few minutes while 400 - 600 ppm levels are dangerous to life in 30 - 60 minutes. Even 7 ppm will cause serious symptoms in a few hours. Note that onset of pulmonary edema may be delayed. Severe exposures may affect the kidneys, liver, and brain.

Hazards of Ingestion: Ingestion of phosphine is considered unlikely and is not discussed in the literature.

FIRE HAZARDS

Lower Flammable Limit: 1% or 1.8%; reported values vary.

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable liquefied compressed gas. May ignite spontaneously in air. Will generate large quantities of flammable gas or vapor upon release. Gas is heavier than air and may travel a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Phosphoric acid, toxic oxides of phosphorus, and water are produced during combustion of phosphine. Thermal decomposition produces phosphorus and hydrogen at high temperatures.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from direct contact with very cold phosphine, cold gas streams, or cold equipment containing phosphine. This may include gloves, face shields, safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA)may be necessary to prevent contact with high vapor or fume concentrations in air caused by burning phosgene due to the acid and other fumes that may be generated.

Respiratory Protection: For unknown concentrations, firefighting, or high concentrations (above 15 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister providing protection against phosphine or a chemical cartridge respirator with a full facepiece providing protection against phosphine within the use limitations of these devices. Be advised that a 1% concentration of phosphine in air may generate temperatures as high as 300°F (149°C) when drawn through an all-service mask.

2199

PHOSPHINE
Division 2.3 (Poison Gas)

FIRST AID

Nonspecific Symptoms: Faintness, nausea, coughing, difficult breathing, vomiting, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution:Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention. (Note: Do not use hot water or rub any frozen areas.)

FIRE RESPONSE

Extinguishing Materials: Only safe way to extinguish phosphine fire is to stop flow of gas since reignition is highly likely. Water spray, carbon dioxide, dry chemical, or foam may be used on residual fires.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Take the highly volatile, highly toxic, and highly flammable nature of phosphine into account while planning the response. Ground and bond all electrical equipment to prevent sparks.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Phosphine discharges may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to phosphine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. This response is suitable for unburned phosphine as well as hazardous products of combustion. Apply water at a point downwind and do not allow it to contact pools of liquid phosphine as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain some amount of phosphine or other chemicals from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

PHOSPHINE
Division 2.3 (Poison Gas)

TECHNIQUE

FOAM . . . There is a possibility that application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of phosphine vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if the initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . .Where necessary and possible, liquid phosphine may be contained by building dikes or barriers using soil, sand or other materials. Note that any spilled liquid will boil vigorously at first and continue to vaporize rapidly.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may develop in equipment.

MITIGATION

Use equipment that is compatible and of proper pressure capacity.

WATER SPILL

TECHNIQUE

MONITOR SITUATION . . . Phosphine will boil or rapidly evaporate from the water surface with very little (if any) dissolution in most cases. Any small amounts dissolved will eventually self-degrade to relatively harmless phosphorus acid and water. The following responses may only be necessary where critical water bodies are impacted.

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

PHOSPHINE
Division 2.3 (Poison Gas)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2006

PHOSPHORIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Phosphoric acid is a colorless, odorless, nonflammable, and nonvolatile liquid (may be solid) used for making fertilizers, soaps and detergents, pharmaceuticals, animal feed, rust inhibitors, and a variety of other products and chemicals. It is fully soluble in water. Solid phosphoric acid has a melting point of about 108°F, but shipments in tank vehicles are likely to be solutions in water. Although the product is not flammable, it may react with certain metals to evolve flammable and potentially explosive hydrogen gas. The product weighs approximately 15.3 pounds per gallon as a solution.

Phosphoric acid is stable in normal transportation. It reacts mildly with water with some evolution of heat, but reactions with strong caustics can cause violent spattering and considerable heat release. It is a corrosive substance that may irritate or burn bodily tissues upon contact. Products of decomposition may be toxic and may include acid fumes. Properties given below are for 75–85% concentrated solutions in water except where indicated otherwise.

If phosphoric acid is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions for liquids and at least 75 feet (25 meters) for solids. For larger spills, increase in the downwind direction as conditions warrant. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol
Specific Gravity (Liquid): 1.892 at 77°F (25°C) (pure); 1.33 at 77°F (25°C) (50% solution)
Vapor Density: 3.4
Boiling Point: Greater than 266°F (130°C) at 1 atm. Will vary with % solution.
Melting Point: 108.2°F (42.4°C) for solid acid
Freezing Point: See melting point
Molecular Weight: 98.0
Heat of Combustion: Not flammable
Evaporation Rate: Slower than water
Vapor Pressure: 5.5 mmHg at 68°F (20°C) for 45% acid
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable (Explosive) Limits: Not flammable
Stability: Stable
Polymerization Potential: Will not occur
pH: 1.5 (0.1 N)
Corrosiveness: Very corrosive to ordinary ferrous metals and alloys, particularly when hot. May attack some plastics, rubber and coatings. May also attack porcelain and graniteware when hot.
Reactivity with Water: Mild reaction with heat evolution
Reactivity with Other Chemicals: Reacts with strong caustics and certain metals (possibly producing hydrogen gas). Can react violently with sodium tetrahydroborate. Exothermic reactions with aldehydes, amines, amides, alcohols and glycols, azo-compunds, carbamates, esters, caustics, phenols and cresols, ketones, organophosphates, epoxides, explosives, combustible materials, unsaturated halides and organic peroxides. Do not mix with bleach or ammonia.

IDENTIFICATION

Shipping Names: Phosphoric acid, solid (USDOT & IMO); Phosphoric acid, liquid (USDOT); Phosphoric acid, solution (IMO)
Synonyms and Tradenames: Ortho-phosphoric acid; White phosphoric acid; Hydrogen phosphate solution
CAS Registry No.: 7664-38-2
Chemical Formula: H_3P0_4
Constituent Components (% each): Most typically 75–85% phosphoric acid with remainder water. Some grades may contain less acid.
UN/NA Designation: UN1805 liquid; UN3453 solid
IMO Designation: 8, corrosive substances
RTECS Number: TB6300000
NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 0 (Instability)
Physical State as Shipped: Solid or liquid solution
Physical State as Released: Solid or liquid solution
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless
Reportable Quantity: See Appendix I
Common Uses: Mfg. of fertilizers, soaps and detergents, phosphate compounds, activated carbon, sugar, pharmaceuticals, gelatin, animal feed, rust inhibitors, soft drinks, wax, latex, ceramics, dental cements, water treatment chemicals, food additives and numerous other products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PHOSPHORIC ACID

Class 8 (Corrosive Material)

*UN1805 (liquid); UN3453 (solid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Reactions with metals may evolve hydrogen gas that is flammable and may explode if ignited when confined.

Short Term Exposure Limits (STEL): 3 mg/m^3 (NIOSH)

Time Weighted Average (TLV-TWA): 1 mg/m^3 (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 1000 mg/m^3

Conditions to Avoid: Contact with incompatible materials; fire or sparks where hydrogen may be present when phosphoric acid comes in contact with metals; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from direct physical contact or ingestion unless acid mist is somehow evolved into the air (mist is only likely in high concentration solutions).

Hazards of Skin or Eye Contact: Strong solutions of phosphoric acid may cause severe skin burns and may also be expected to cause significant injury to the eyes, such as redness, pain, blurred vision, eye burns and permanent eye damage.

Hazards of Inhalation: A mist of phosphoric acid in air may cause irritation of the eyes, nose and throat. Severe exposure can lead to chemical pneumonitits.

Hazards of Ingestion: Ingestion of concentrated acid may result in burns of the mouth and throat, nausea, vomiting, abdominal pains, bloody diarrhea, convulsions, difficult breathing, collapse, shock and possibly death.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Not flammable

Upper Flammable (Explosive) Limit: Not flammable

Behavior in Fire: Not flammable. Some remote chance that containers may rupture in fire.

Hazardous Combustion Products: May evolve toxic vapors or acid fumes, such as phosphorous oxides, upon decomposition.

EXPLOSION HAZARDS

Explosiveness: Contact with metals may evolve hydrogen gas that may explode if ignited while confined. Some remote chance that containers may rupture in fire.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® (CPF 1; CPF 2; SL; BR; LV; Responder®; Responder® CSM; TK; F; CPE; ThermoPro); Trellchem HPS® suits; butyl rubber (gloves, suits, boots); natural rubber (gloves); neoprene rubber (gloves, suits, boots); nitrile rubber (gloves, suits, boots); polyethylene (gloves, suits, boots); polyvinyl chloride (gloves, suits, boots); Viton® (gloves, suits); Saranex® coated suits; Ultraflex Nitrile 22R gloves; Viton® 890 gloves; Neoprene 6780 gloves; Viton® 892 gloves; Nitty Gritty 65NFW gloves; Butyl 878 gloves; Hustler PVC 725R gloves; N-DEX 8005 gloves; Ultraflex Neop. 32 gloves; Nitri Solve 727 gloves; Chloroflex 723 gloves; Neo. Chloroflex N5/N8 gloves; 4H® and Silver Shield® brand gloves. The following materials are ***not*** recommended for use: Tychem® CPF 3.

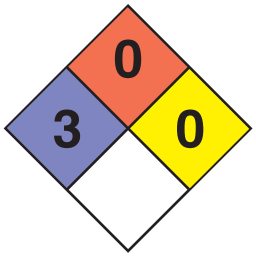
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 1000 mg/m^3): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 1000 mg/m^3), any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive pressure mode. For lesser concentrations (below 50 mg/m^3): any air-purifying, full-facepiece respirator with an N100, R100, or P100 filter; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece. For lesser concentrations (below 25 mg/m^3), any supplied-air respirator operated in a continuous-flow mode (may require eye protection).

1805

3453

PHOSPHORIC ACID

Class 8 (Corrosive Material)



FIRST AID

Nonspecific Symptoms: Irritation of burns of bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid using mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact do not delay, remove contaminated clothing immediately and wash skin with plenty of cold water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Give large amounts of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, alcohol-resistant foam or water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool. Do not get water inside containers.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the corrosiveness and reactivity of the product with many common metals when deciding on the appropriate response and equipment. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust. Consult a qualified specialist on neutralization techniques. Use explosion-proof and spark-proof equipment where necessary. Take into account while planning the response that phosphoric acid is highly corrosive and may evolve explosive hydrogen gas upon contact with metals. It may also have heavier than air vapors that may persist for a time in low areas.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Phosphoric acid, especially the solid, may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill by checking for pH until the spilled product is removed.

CONSEQUENCE

Hazardous levels of phosphoric acid in air may be found in the local spill area and immediately downwind, particularly if an acid mist is somehow generated in higher concentration solutions.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

PHOSPHORIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover ***solid*** phosphoric acid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to phosphoric acid vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water spray should be applied to vapors present downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain phosphoric acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL-RESISTANT FOAM . . . There is a possibility that alcohol-resistant foam applied to the surface of liquid pools may slow the release of phosphoric acid vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid phosphoric acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Phosphoric acid may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained phosphoric acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

PHOSPHORIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

PHOSPHORIC ACID
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land. Dredge or otherwise remove precipitates as necessary.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water precipitates and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

January 1989

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Phosphorus oxychloride is a colorless or slightly yellow fuming liquid that has a pungent, musty, disagreeable, and lingering odor and which solidifies at 34.2 – 35.6°F when pure. It is used for making a variety of products and other chemicals and as a doping agent for electronic semi-conductors. Although the substance is not itself flammable, various authorities strongly imply that it is an oxidizer that may ignite combustible organic matter (particularly fibrous materials like wood) upon contact. Contact with most metals in the presence of water or moisture may generate flammable and potentially explosive hydrogen gas. There is also a possibility that reactions with water may produce flashes of fire at times. The product weighs approximately 14 pounds per gallon. Phosphorus oxychloride is stable in normal transportation. It reacts violently with water or moisture to form phosphoric acid, hydrogen chloride or hydrochloric acid, and possibly spontaneously flammable phosphine gas while splattering and generating heat and fumes. The product and its vapors and fumes are highly corrosive to all bodily tissues and will also attack many common metals and some forms of plastics, rubber, and coatings. Reactions with a wide variety of other chemicals may also be vigorous or violent. There is a limited possibility that containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. Decomposition of the product in fire conditions may form toxic and irritating hydrogen chloride, oxides of phosphorus, phosgene, and possibly other toxic substances.

Downwind evacuation should be considered if a spill of phosphorus oxychloride is generating large amounts of vapors and fumes until properly equipped responders have evaluated the hazard. Note that fumes and vapors may be heavier than air.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.
Solubility in Other Chemicals: Soluble in carbon tetrachloride
Specific Gravity (Liquid): 1.68 at 68°F (20°C)
Boiling Point: 221.5 – 226.2°F (105.3 –107.9°C) at 1 atm; reported values vary.
Melting Point: 34.2–35.6°F (1.2–2°C)
Freezing Point: See melting point
Molecular Weight: 153.33
Heat of Combustion: Not flammable
Vapor Pressure: 28 – 29.3 mm Hg (0.541– 0.566 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable, but reacts with water or moisture
Corrosiveness: Corrosive to most metals except lead or nickel when dry. Corrodes steel and most metals while evolving hydrogen gas in presence of water or moisture. Stainless steel containers are acceptable for short term use, nickel or glass-lined steel for longer use. Piping may be nickel, glass, glass-lined or Teflon-lined steel with Teflon-lined plug or ball valves. Only virgin teflon or Kalrez alastomeric materials may be used, and pumps should be of nickel, Hastelloy C, or 316 stainless.
Reactivity with Water: Reacts violently with water or moisture to form phosphoric acid, hydrogen chloride or hydrochloric acid, and possibly spontaneously flammable phosphine gas while generating heat and fuming or splattering.
Reactivity with Other Chemicals: Reacts vigorously or violenty with boron triiodide, mixture of dimethyl formamide and 2,5-dimethylpyrrole, dimethyl sulfoxide, sodium, potassium, alcohols, acids, amines, alkaline materials, aluminum, alkali metals, or phenols. Also considered incompatible with carbon disulfide, 2,6-dimethylpyridine N-oxide; ferrocene-1,1,-dicarboxylic acid, and zinc. Reacts with organic matter and may possibly ignite fibrous matter such as wood.

IDENTIFICATION

Shipping Names: Phosphorus oxychloride (USDOT and ***IMO) Synonyms and Tradenames:*** Phosphorus chloride; phosphoryl chloride; phosphorus oxytrichloride; phosphorus chloride oxide; phosphorus oxide trichloride; phosphorus trichloride oxide; trichlorophosphine oxide; trichlorophophorus oxide.
Chemical Formula: $POCl_3$
Constituent Components (l each): 99% to almost 100% pure
49 STCC: 49 323 52
UN/NA Designation: UN1810
IMO Designation: 8, corrosive
Physical State As Shipped: Liquid
Physical State As Released: Solid or liquid (solidifies at 34.2–35.6°F)
Color of the Shipped Material: Colorless to pale yellow oily liquid.
Odor Characteristics: Pungent; musty; disagreeable; lingering
Common Uses: Chlorinating agent; cryoscopic solvent; making other chemicals for gasoline additives, plasticizers, pesticides, pharmaceuticals, hydraulic fluids, fire retardants, etc.; doping agent for electronic semi-conductors.

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive substance. Reacts violently with water. Contact with many metals in presence of water or moisture generates hydrogen gas.

Short Term Exposure Limits (STEL): 0.5 ppm

Time Weighted Average (TLV-TWA): 0.1 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat or fire; sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Phosphorus oxychloride is highly corrosive to bodily tissues by all routes of exposure. Major hazard is from inhalation of the high vapor and fume concentrations that may be present in air in the spill area and downwind, but ingestion and direct physical contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Phosphorus oxychloride is highly irritating and corrosive to the skin and eyes. Contact may cause tissue destruction and severe slow healing burns. Damage to the eyes may cause blindness.

Hazards of Inhalation: Vapor and fumes of phosphorus oxychloride are highly irritating and corrosive to the eyes, skin, mucous membranes, and respiratory tract. Inhalation may result in cough, burning throat, chest pain, dizziness, headache, weakness, shortness of breath, nausea, vomiting, wheezing, bronchitis, inflammation and edema of the larynx and bronchi, pulmonary edema (which may be delayed in onset), pneumonitis, and possibly death. Exposure of rats to 48 ppm in air for four hours was fatal to *50%* of the animals in laboratory experiments.

Hazards of Ingestion: Ingestion of phosphorus oxychloride may result in severe burns of the mouth, esophagus and stomach, shock, and possibly death.

FIRE HAZARDS

Lower Flammable Limit (LFL): Not flammable

Upper Flammable Limit (UFL): Not flammable

Behavior in Fire: Nonflammable liquid. There is a limited possibility that containers may rupture violently in fire due to overpressurization. May generate large quantities of corrosive fumes and vapors upon release. There is a possibility that contact with organic matter may cause ignition.

Hazardous Combustion Products: Nonflammable but decomposition in fire conditions may form irritating and toxic hydrogen chloride, oxides of phosphorus, phosphine, and possibly other hazardous substances.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Not flammable

Upper Explosive Limit (UEL): Not flammable

Explosiveness: There is a limited possibility that containers may rupture violently in fire due to overpressurization. Any hydrogen gas evolved in contact with metals may explode if ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations. Compatible materials may include neoprene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid gas canister and containing nonoxidizable sorbents providing protection against phosphorus oxychloride within the use limitations of these devices.

1810

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first-aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. Give more water if vomiting occurs naturally.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, or sand on adjacent fires. Reacts violently with water or foam but may consider rapid application of flooding quantities of water (very cautiously) if large quantities of combustibles are involved. Note that water may cause splattering, fume generation, and evolution of heat.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool. Note that addition of water may increase evolution of fumes from leaking product.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that phosphorus oxychloride may possibly ignite certain organic matter upon contact. Flammable and potentially explosive hydrogen gas may be liberated upon contact with certain metals. Use explosion-proof and spark-proof tools and equipment where necessary. Take the highly reactive and corrosive nature of the product into account when planning the response. Use insulated tanks in cold weather to prevent solidification. Keep water or moist air out of containers or equipment.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Phosphorus oxychloride spills may expose downwind areas to toxic concentrations over considerable distances in some cases if large amounts of corrosive fumes are evolved. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE .

WATER FOG OR SPRAY . . . Water fog or spray applied to phosphorus oxychloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of liquid product as this may increase fume evolution.

CONSEQUENCE

Water runoff may contain various chemicals from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

BURIAL . . . Under appropriate conditions, the spilled product may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of vapors or fumes.

CONSEQUENCE

An additional quantity of sand, earth, or similar material will become contaminated. Vapor or fume emissions may continue when the cover material is removed.

MITIGATION

Consult qualified experts. Consider adding water and neutralizing agent to surface of cover material to dilute and neutralize spilled product.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid phosphorus oxychloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid phosphorus oxychloride from a safe distance may eventually slow the release of vapors or fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may possibly be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Phosphorus oxychloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained phosphorus oxychloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Solidification of the product may clog lines or pumps. Any moisture or water in equipment may react and cause high pressures to develop.

MITIGATION

Use equipment compatible with the spilled product. Keep product warm as necessary. Use dry equipment purged of moist air.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, vermiculite, fullers earth, kitty litter, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded.. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Apply this technique only to remove final traces of spilled product.

PHOSPHORUS OXYCHLORIDE
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

PHOSPHORUS PENTASULFIDE

Division 4.3 (Dangerous When Wet)

GENERAL INFORMATION

Phosphorus pentasulfide is a light greenish yellow, greenish gray, or grayish yellow solid with an odor of rotten eggs that may paralyze the sense of smell at hazardous concentrations in air. It is used for making lube oil additives, insecticides, flotation agents, safety matches, blown asphalt, and other products and chemicals. It is heavier than water and will slowly react with water or moist air to form toxic hydrogen sulfide (H_2S) gas and corrosive phosphoric acid. It may also spontaneously heat and ignite in the presence of moisture. Phosphorus pentasulfide is a flammable solid that can be ignited by sparks or friction and its dust presents an explosion hazard in air at sufficient concentrations. Hydrogen sulfide gas evolved from reactions with water may also form explosive mixtures with air. The product weighs approximately 126.7 pounds per cubic foot.

Phosphorus pentasulfide is highly reactive and can produce heat, fire, explosions, toxic gases, and/or flammable gases in reactions with a wide variety of other chemicals and substances. The solid is noncorrosive when dry, and is shipped in aluminum or steel containers. The major public health hazard of a spill is due to the evolution of hydrogen sulfide gas that is considered highly toxic. Products of combustion may also be toxic and may include sulfur dioxide, phosphorus pentoxide, phosphoric acid, and unburned hydrogen sulfide.

Downwind evacuation should be considered on a case by case basis if the product is leaking and in contact with water or moist air. If phosphorus pentasulfide is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.

Solubility in Other Chemicals: Soluble in solutions of alkali hydroxides; slightly soluble in carbon disulfide.

Specific Gravity (Solid): 2.03 at 68°F (20°C)

Boiling Point: 955-961°F (513-516°C) at 1 atm.

Melting Point: 527-547°F (257-286°C)

Freezing Point: 527-547°F (257-286°C)

Molecular Weight: 222.27 or 444.56

Heat of Combustion: – 6050 cal/g

Vapor Pressure: Negligible for solid (not counting H_2S)

Flash Point: Flammable solid

Autoignition Temperature: 500-554°F (260-290°C)

Burning Rate: Unavailable

Stability: Unstable; can be ignited by friction or sparks. Reacts with moist air or water.

Corrosiveness: Noncorrosive when dry and shipped in aluminum or steel containers. Contact with water forms corrosive phosphoric acid.

Reactivity with Water: Reacts slowly with formation of hydrogen sulfide gas and phosphoric acid. May heat and spontaneously ignite in presence of moisture.

Reactivity with Other Chemicals: Reacts with acids, oxidizing materials, alcohols, and a very wide variety of other chemicals and substances.

IDENTIFICATION

Shipping Names: Phosphorus pentasulfide (USDOT); phosphorus pentasulphide (IMO).

Synonyms and Tradenames: Phosphoric sulfide; phosphorus persulfide; thiophosphoric anhydride; phosphorus sulfide; phosphorus pentasulphide.

Chemical Formula: P_2S_5 or P_4S_{10}

Constituent Components(% each): Various forms and mixtures; regular (low reactivity) is 99% or more pure.

UN/NA Designation: UN1340

IMO Designation: 4.1, flammable solid

Physical State as Shipped: Solid

Physical State as Released: Solid

Color of the Shipped Material: Light greenish yellow or gray; grayish yellow; light yellow.

Odor Characteristics: Rotten eggs

Common Uses: Mfg. of lube oil additives, insecticides, flotation agents, safety matches, ignition compounds, blown asphalt, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

PHOSPHORUS PENTASULFIDE

Division 4.3 (Dangerous When Wet)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.13-0.77 ppm for hydrogen sulfide.

Unusual Hazards: Reaction with water or moisture produces flammable and toxic gas and corrosive acid; may lead to spontaneous ignition. Solid product is subject to ignition by friction and sparks. Dust and hydrogen sulfide gas may form explosive mixtures with air. Hydrogen sulfide numbs the sense of smell.

Short Term Exposure Limits(STEL): 3 mg/m^3 for 15 minutes. (ACGIH) (Note: 15 ppm for H_2S.)

Time Weighted Average(TLV-TWA): 1 mg/m^3 over each 8 hours of a 40 hour work week.(ACGIH) (Note: 10 ppm for H_2S.)

Conditions to Avoid: Heat, fire, sparks, and friction; contact with water, moisture, or incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of hydrogen sulfide gas. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Prolonged skin contact with phosphorus pentasulfide may cause mild to moderate irritation. Contact with the eyes may result in severe irritation and possible corneal injury that may be delayed for a matter of hours.

Hazards of Inhalation: Hydrogen sulfide gas evolved from phosphorus pentasulfide is a rapidly acting systemic poison that numbs the sense of smell after smelling of rotten eggs. Symptoms of coughing, dizziness, eye irritation, headache, fatigue, lacrimation, and respiratory system irritation are common. High levels may cause respiratory paralysis and death or severe breathing difficulties (pulmonary edema) that may be delayed in onset.

Hazards of Ingestion: Symptoms of ingestion may range from minor irritation and coughing to death due to respiratory failure depending on the amount ingested.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable solid. Easily ignited.

Hazardous Combustion Products: Sulfur dioxide, phosphorus pentoxide, phosphoric acid, and unburned hydrogen sulfide.

EXPLOSION HAZARDS

Lower Explosive Limit: 0.05 ounce/ft^3 for 200 mesh dust

Upper Explosive Limit: Unavailable

Explosiveness: Dust may form explosive mixtures with air. Explosion may result if hydrogen sulfide gas is ignited in a confined area. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section.)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air if the product is burning.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations), a self-contained breathing apparatus (SCBA) with full facepiece(or the equivalent).

1340

PHOSPHORUS PENTASULFIDE

Division 4.3 (Dangerous When Wet)

FIRST AID

Nonspecifc Symptoms: Irritation of the eyes, skin, or respiratory system; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Remove loose powder. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: Be careful not to ignite powder by causing friction.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately, induce vomiting and give more water. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry sand, carbon dioxide, dry chemical. Reacts with water or foam but may consider using water spray or fog for large fires. Note that some authorities suggest withdrawal and letting large fires burn out.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated when product is burning. Move container from fire area if no risk. Note that addition of water to nonburning product may evolve flammable gas.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Remove all sources of heat, sparks, or open flames. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water.Note that intake of high contaminated water may result in damage or rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the reactivity, toxicity, and flammability hazards of the product into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Phosphorus pentasulfide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small quantitites have spilled and the product is kept dry.

CONSEQUENCE

Hazardous levels of phosphorus pentasulfide or hydrogen sulfide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Keep spilled product as dry as possible.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow gases to dissipate. Phosphorus pentasulfide spills may expose downwind areas to toxic or flammable concentrations of hydrogen sulfide over considerable distances, particularly if large quantities have spilled in a moist or wet environment.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

PHOSPHORUS PENTASULFIDE
Division 4.3 (Dangerous When Wet)

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid phosphorus pentasulfide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly. Avoid friction that may ignite phosphorus pentasulfide.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to hydrogen sulfide gas from a point downwind of the spill may accelerate its dispersal in the atmosphere. Keep water away from phosphorus pentasulfide.

CONSEQUENCE

Water runoff may contain a small amount (if any) of chemical from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for treatment or disposal techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Phosphorus pentasulfide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Liquid phosphoric acid formed by reaction of phosphorus pentasulfide with water may percolate into soil or seep through dike material. This may result in spreading of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Keep phosphorus pentasulfide as dry as possible by covering with plastic sheet or other compatible material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases, particularly if moisture or water is present.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material. Keep product as dry as possible.

PHOSPHORUS PENTASULFIDE
Division 4.3 (Dangerous When Wet)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Friction may ignite phosphorus pentasulfide. Excessive agitation may cause phosphorus pentasulfide dust to become airborne. Spilled product poses a fire hazard.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation and friction. Eliminate ignition sources. Do not operate motorized removal equipment in potentially unsafe atmospheres. Consult qualified experts for advice and assistance where necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product or any phosphoric acid formed to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture hydrogen sulfide that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

PHOSPHORUS PENTASULFIDE
Division 4.3 (Dangerous When Wet)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

PHOSPHORUS TRICHLORIDE

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Phosphorus trichloride is a colorless or slightly yellow fuming liquid with a pungent and irritating odor resembling hydrochloric or muriatic acid. It is highly toxic by inhalation. It is used during electrodeposition of metal on rubber and for making pesticides, surfactants, gasoline additives, plasticizers, dyestuffs, textile finishing agents, germicides, medicinal products, and other chemicals. Although the substance is not itself flammable, it is a strong oxidizer that may ignite combustible organic materials upon contact. In addition, contact with many common metals except nickel and lead may generate flammable and potentially explosive hydrogen gas. It hydrolyzes with water to form hydrochloric acid and phoshoric acid and may produce flashes of fire. The product weighs approximately 13.1 pounds per gallon.

Phosphorus trichloride is fairly volatile and reacts violently with water or moisture in air to generate heat, spontaneously flammable phosphine gas, hydrogen chloride, phosphorus acids, and even free spontaneously flammable phosphorous. The product and its fumes and vapors are highly corrosive to all bodily tissues and will also attack many common metals and some forms of plastics, rubber, and coatings. Reactions with acetic acid, nitric or nitrous acid, chromyl chloride, or sodium may be explosive and the product is also reactive with a wide variety of other chemicals and substances. Excessive heat may cause rupture of containers.

Downwind evacuation should be considered if a spill of phosphorus trichloride is generating large amounts of vapors and fumes. Fumes and vapors are heavier than air.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts violently; see below.

Solubility in Other Chemicals: Soluble in benzene, carbon disulfide, carbon tetrachloride, chloroform and ether.

Specific Gravity (Liquid): 1.575 at 68ºF (20ºC)

Vapor Density: 4.75

Boiling Point: 168.8ºF (76ºC) at 1 atm.

Melting Point: See freezing point.

Freezing Point: -169.2ºF (-111.8ºC)

Molecular Weight: 137.35

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): One source reports 1.

Vapor Pressure: 100 mmHg (1.93 psia) at 69.8ºF (21ºC)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Flammable Limits: Not flammable

Stability: Stable, but reacts with water or moisture.

Polymerization Potential: Will not occur.

pH: Unavailable

Corrosiveness: Attacks most common metals except nickel and lead with formation of hydrogen. Will attack some forms of plastics, rubber, and coatings. Not corrosive to iron when dry. Shipped in lined or clad steel, nickel, or bare carbon steel with less than 0.31% carbon.

Reactivity with Water: Violent reaction producing heat, phosphine gas, hydrogen chloride, phosphorus acids, phosphorous, and flashes of fire.

Reactivity and Incompatibility: Reacts with acetic acid, nitric and nitrous acid, chromyl chloride, sodium, hydroxlamine, powdered aluminum, potassium, dimethyl sulfoxide, fluorine, iodine monochloride, lead dioxide, oxidizing acids, alkalis, organic matter, and a wide variety of other chemicals and substances.

IDENTIFICATION

Shipping Name(s): Phosphorus trichloride (USDOT & IMO)

Synonyms and Tradenames: Chloride of phosphorus; Phosphorus chloride; Phosphorus (III) chloride.

CAS Registry No.: 7719-12-2

Chemical Formula: PCl_3

Constituent Components (% each): 8.5% or more pure with some $POCl_3$.

UN/NA Designation: UN1809

IMO Designation: 6.1, Toxic substances

RTECS Number: TH3675000

NFPA 704 Hazard Rating: 4(Health): 0(Flammability): 2(Reactivity): Reacts with water

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless or light yellow.

Odor Characteristics: Pungent, sharp, irritating; like hydrochloric acid.

Reportable Quantity: See appendix I.

Common Uses: Electrodeposition of metal on rubber; iridescent metallic deposits; mfg. of pesticides, surfactants, gasoline additives, plasticizers, dyestuffs, textile finishing agents, germicides, medicinal products, and other chemicals and products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PHOSPHORUS TRICHLORIDE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic by inhalation and corrosive. Reacts violently with water. Contact with many metals generates hydrogen. Heat may cause containers to burst.

Short Term Exposure Limit (STEL): 0.5 ppm (3 mg/m^3)

Time Weighted Average (TLV-TWA): 0.2 ppm (1.5 mg/m^3)

Ceiling (C) Limit: Unavailable

IDLH: 25 ppm

Conditions to Avoid: Heat; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Phosphorus trichloride is highly corrosive to bodily tissues by all routes of exposure. Major hazard to public is inhalation of fumes or vapors in air but ingestion and direct physical contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Phosphorus trichloride is highly irritating and corrosive to the skin and eyes. Contact may cause severe irreversible injury or burns.

Hazards of Inhalation: Vapor and fumes of phosphorus trichloride are highly irritating and corrosive to the skin, eyes, mucous membranes, and lungs. Inhalation may cause injury ranging from mild bronchial spasm to pulmonary edema. Effects may be delayed up to 24 hours and may include symptoms of temporary toxic hepatitis. Exposure to only 50 ppm in air for 4 hours was fatal to 50% of guinea pigs in laboratory experiments.

Hazards of Ingestion: Ingestion may result in severe burns of the mouth, throat, and stomach.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to over pressurization. May generate large quantities of corrosive vapors and fumes upon release. Contact with organic matter may cause ignition.

Hazardous Combustion Products: Thermal decomposition may produce toxic fumes of phosphorous oxides and/or phosphine. Also see decomposition products of water reaction.

EXPLOSION HAZARDS

Explosive Potential: Very reactive. Containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures (see general information section). Explosive hydrogen gas evolved in reactions with some metals and may explode if ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Teflon® is reported to provide more than 4 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 25 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use of limitations of these devices and containing nonoxidizable sorbents providing protection against phosphorus trichloride.

1809

PHOSPHORUS TRICHLORIDE

Division 6.1 (Poisonous Materials)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. Give more water if vomiting occurs naturally.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, or sand on adjacent fires. Reacts with water or foam but may consider using large amounts of water spray or fog if large quantities of combustibles are involved.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool. Note that addition of water may increase evolution of corrosive fumes from leaking product.

SPILL RESPONSES

General Information: Phosphorus trichloride is a highly toxic and corrosive liquid that may cause environmental contamination. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that phosphorus trichloride may ignite organic matter upon contact and that hydrogen gas may be liberated upon contact with certain metals. Use intrinsically safe equipment where necessary.

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

PHOSPHORUS TRICHLORIDE
Division 6.1 (Poisonous Materials)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases. Phosphorus trichloride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to phosphorus trichloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point upwind of the spill and should not be allowed to contact pools of phosphorus trichloride.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of phosphorus trichloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

BURIAL . . . Under special emergency conditions, the spilled product may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of vapors or fumes. The material must be recovered and disposed of in a proper manner.

CONSEQUENCE

An additional quantity of sand, earth, or similar material will become contaminated. Vapor or fume emissions may continue when the cover material is removed.

MITIGATION

Consult qualified experts. Consider adding neutralizing agent to surface of cover material to dilute and neutralize spilled product. Consult a qualified expert on the appropriate neutralizing agents.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid phosphorus trichloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The use of water with phosphorus trichloride may react and create a toxic vapor cloud. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time. Flashes of fire may be observed.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

PHOSPHORUS TRICHLORIDE
Division 6.1 (Poisonous Materials)

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Phosphorus trichloride may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined phosphorus trichloride may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth, or other absorbent compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

PHOSPHORUS TRICHLORIDE
Division 6.1 (Poisonous Materials)

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

PHOSPHORUS, WHITE OR YELLOW

Division 4.2 (Spontaneously Combustible)

GENERAL INFORMATION

Yellow or white phosphorus is a soft waxy solid with a sharp pungent odor resembling garlic. It may be shipped in a container of water or as a solid or liquid in an atmosphere of inert gas. Uses include the manufacture of munitions, pyrotechnics, explosives, smoke bombs, artificial fertilizers, rat poisons, and other products and chemicals. White or yellow phosphorus is barely soluble in water and heavier, so may be expected to sink and dissolve at an extremely slow rate. Upon exposure to air, the dry product or wet product that has dried will ignite spontaneously at a temperature at or above 86°F and generate intense white smoke and a greenish light. The product weighs approximately 15.2 pounds per gallon.

White or yellow phosphorus does not react with water and is stable as long as it is kept wet or otherwise excluded from air. Contact of the product with oxidizing materials (including elemental sulfur) may cause a vigorous reaction or explosion. Contact with strong caustics may result in evolution of poisonous and flammable phosphine gas, and the product is otherwise reactive with a wide variety of substances. Smoke of the burning product is irritating and toxic by inhalation, and the product is highly hazardous if physically contacted or ingested.

If phosphorus, white or yellow, is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, 0.0003 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alkali, ammonia, benzene, carbon disulfide, chloroform, ether, and toluene.

Specific Gravity (Solid): 1.82 at 68°F (20°C)

Boiling Point: 535.5°F (279.7°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: 111.4°F (44.1°C)

Molecular Weight: 123.89

Heat of Combustion: – 5900 cal/g

Vapor Pressure: 0.026 mm Hg (0.0005 psia) at 68°F (20°C)

Flash Point: Ignites spontaneously in air

Autoignition Temperature: 86°F (30°C)

Burning Rate: Unavailable

Stability: Stable when excluded from air

Corrosiveness: Not corrosive in absence of air or water.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with oxidizing materials, strong caustics, air, sulfur, beryllium, thorium, zirconium, various halogens, oxides, fluorides, azides, iodates, nitrides, acids, iodides, chlorides, carbides, chlorates, bromates, acid anhydrides, iodides, and other chemicals.

IDENTIFICATION

Shipping Names: Phosphorus, white or yellow, under water or solution (USDOT & IMO); phosphorus, white or yellow, dry (USDOT & IMO);phosphorus (IMO); phosphorus white, molten (USDOT & IMO).

Synonyms and Tradenames: Phosphorus; WP; white phosphorus; yellow phosphorus; elemental phosphorus.

Chemical Formula: P_4

Constituent Components(% each): 99.8-99.9% pure

UN/NA Designation: UN1381 (USDOT, IMO); UN2447 (molten liquid), (IMO)

IMO Designation: 4.2, spontaneously combustible

Physical State as Shipped: Liquid or waxy solid

Physical State as Released: Solid, or liquid that solidifies

Color of the Shipped Material: White to yellow

Odor Characteristics: Sharp, pungent, like garlic

Common Uses: Mfg. of munitions, pyrotechnics, explosives, smoke bombs, other incendiaries, artificial fertilizers, rat poisons, phosphor bronze alloy, semiconductors, electroluminescent coating, and various chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:

PHOSPHORUS, WHITE OR YELLOW

Division 4.2 (Spontaneously Combustible)

See "UN/NA Designation"
for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: May ignite spontaneously upon contact with air. Smoke is highly toxic.

Short Term Exposure Limits(STEL): 0.3 mg/m^3 for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 0.1 mg/m^3 over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Drying of product; entry to sewers or water bodies; contact with incompatible materials; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: All exposures to white or yellow phosphorus and its fumes or smoke should be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with solid white or yellow phosphorus may cause deep thermal burns and blisters. Fumes may cause severe eye irritation involving blepharospasm, sensitivity to light, and lacrimation. Contact of the eyes with the solid product may result in severe injury.

Hazards of Inhalation: Smoke and fumes are irritating to the eyes and respiratory tract. High concentrations in air may cause severe breathing difficulties that may be delayed in onset. Asphyxiation may occur if oxygen is depleted in confined areas due to phosphorus burning.

Hazards of Ingestion: Ingestion may cause nausea, vomiting, low blood pressure, jaundice, depression, delirium, abdominal pain, and possibly coma after a delay of a few hours with breath and vomit smelling of garlic. Victim may get well in 24-36 hours and then become ill again. Death may occur in severe exposures.

FIRE HAZARDS

Lower Flammable Limit: Flammable solid

Upper Flammable Limit:: Flammable solid

Behavior in Fire: May ignite spontaneously in air.

Hazardous Combustion Products: Highly irritating and toxic, may include phosphoric acid fumes and phosphorus pentoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Flammable solid

Upper Explosive Limit:: Flammable solid

Explosiveness: Contact with other chemicals such as oxidizing materials may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Use fire resistant clothing where possible.

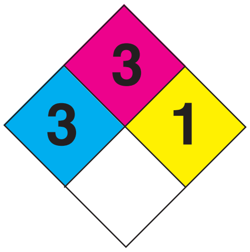
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency particulate filter respirator with a full facepiece within the use limitations of these devices.

1381

See "UN/NA Designation"
for other ID numbers.

PHOSPHORUS, WHITE OR YELLOW

Division 4.2
(Spontaneously Combustible)



FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues; other symptoms of ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. (Note: The skin should be kept wet until medical attention is obtained to prevent any remaining phosphorus from burning.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Flood with water but do not scatter material. Cover with wet sand or wet dirt.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of phosphorus may be dangerous. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that all physical contact with white or yellow phosphorus should be avoided and that the product may ignite spontaneously in air when dry. Water in containers should be maintained between pH 5.5 and 6.5 if possible to prevent evolution of hydrogen from action of any phosphoric acid present on metal and the evolution of toxic and flammable phosphine gas.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . White or yellow phosphorus may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the product has not ignited and is kept wet or buried under wet sand or dirt.

CONSEQUENCE

Hazardous levels of white or yellow phosphorus in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

PHOSPHORUS,
WHITE OR YELLOW
Division 4.2 (Spontaneously Combustible)

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. White or yellow phosphorus spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts are burning and the smoke may affect populated areas.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECNNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to white or yellow phosphorus smoke or fumes may absorb vapors, knockdown smoke or fumes or accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of chemicals from contact with smoke or fumes in the atmosphere.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . White or yellow phosphorus may be contained by building dikes or barrier using earth, sand or similar materials, and then covered with water, wet sand or dirt.

CONSEQUENCE

Any phosphorus that escapes may ignite upon drying.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Keep product wet before and after removal.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product. The phosphorus may be covered with water or wet sand or dirt.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines. Work should be conducted carefully and the spilled product should be kept wet at all times.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination or fires.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Keep product under water.

PHOSPHORUS,
WHITE OR YELLOW
Division 4.2 (Spontaneously Combustible)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may ignite if permitted to dry.

MITIGATION

Consult qualified experts for guidance. Keep spilled product wet.

October 1993

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Phthalic anhydride is shipped in the form of colorless, white, or pale yellow solid flakes, crystals or powders, or as a hot molten liquid with an odor that is variably described as mild or choking and acrid. The substance is heavier than water and slightly soluble, so most may be expected to sink to the bottom of a water body and dissolve at a fairly slow but appreciable rate. Once dissolved, phthalic anhydride slowly combines with water to form phthalic acid which corrodes ordinary iron and mild steel while generating flammable and potentially explosive hydrogen gas. Clouds of phthalic anhydride dust dispersed in air may easily be ignited and either burn or explode. Spills of molten liquid may evolve flammable vapors immediately upon release or after a relatively small degree of preheating. Such vapors may travel some distance to a source of ignition and flash back; accumulations in confined spaces such as building or sewers may explode if ignited. Contact of the burning liquid with water or firefighting foam may result in violent frothing, spattering, steam generation, and other possible hazards. Solid forms weigh about 95.5 pounds per cubic foot while the hot molten liquid weighs about 10 pounds per gallon.

It is stable in normal transportation and reported as capable of attacking some forms of plastics, rubber and coatings. Reactions with copper (II) oxide, sodium nitrite, or fuming nitric acid and sulfuric acid may explode or form explosive materials upon heating. It is reported as being reactive with strong oxidizing agents, alkalis, or mineral acids and may be reactive with a broad range of other chemical substances. Toxic vapors evolved from the hot molten liquid and thermal burns from contact with hot liquid are of most concern. Products of combustion are not well-defined but are likely to include corrosive phthalic acid fumes, carbon monoxide, carbon dioxide, and other harmful substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if phthalic anhydride (and particularly the hot molten liquid) is leaking from its container.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble; 0.62 g/100 g water and 0.6% by wgt at 68°F (20°C).

Solubility in Other Chemicals: Soluble in alcohol and carbon disulfide.

Specific Gravity: Approx 1.53 at 68°F (20°C) as solid; 1.2 at 275°F (135°C) as molten liquid.

Boiling Point: 543 - 545°F (284 - 285°C) at 1 atm.

Melting Point: 267.4 - 268.9°F (130.8 - 131.6°C).

Freezing Point: See melting point.

Molecular Weight: 148.12.

Heat of Combustion: - 5,263 cal/g.

Vapor Pressure: Values range from 0.0002 - 0.03 mm Hg at 68°F (20°C).

Flash Point: 304 - 305°F (151.1 - 151.7°C), closed-cup; 329°F (165°C), open-cup.

Autoignition Temperature: 1,058 to 1,083°F (570 to 583.9°C).

Burning Rate: Not available. Stability: Stable.

Corrosiveness: Compatible with most materials when dry but forms phthalic acid in presence of moisture or water and this corrodes ordinary iron and mild steel while generating flammable and potentially explosive hydrogen gas. Phthalic anhydride may attack some forms of plastics, rubber and coatings.

Reactivity with Water: Combines slowly with water to form corrosive phthalic acid while generating some amount of heat.

Reactivity with Other Chemicals: Mixture with copper (II) oxide or sodium nitrite may explode violently upon heating. Addition of fuming nitric acid to phthalic anhydride dissolved in sulfuric acid at an elevated temperature is reported to have caused an eruptive decomposition to occur after a 2 hour delay and may result in formation of potentially explosive substances. Otherwise reported as incompatible with strong oxidizing materials (which may cause a fire or explosion), alkalis (strong bases or caustics), mineral acids, and a broad range of other materials.

IDENTIFICATION

Shipping Names: Phthalic anhydride.

Synonyms and Tradenames: 1,3-Dihydro-1,3-dioxoisobenzofuran; 1,2-benzenedicarboxylic acid anhydride; benzene-o-dicarboxylic acid anhydride; 1,2-benzenedicarboxylic anhydride; 1,3-dioxophthalan; 1,3-isobenzofurandione; PAN; phthalandione; 1,3-phthalandione; phthalanhydride; phthalic acid anhydride.

Chemical Formula: $C_6H_4(CO)_20$.

Constituent Components (% each): Typically 99% or more pure.

UN/NA Designation: UN2214.

IMO Designation: 8, corrosive material.

Physical State As Shipped: Solid flakes, crystals or powder, or molten liquid.

Physical State As Released: Same as shipped.

Color of the Shipped Material: Usually colorless crystals, white flakes or powder, or colorless molten liquid. May be pale yellow at times.

Odor Characteristics: Variably described as mild or choking and acrid.

Common Uses: Making plasticizers, resins, dyes, pharmaceuticals, polyesters, insecticides, pigments, and various other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.050 to 0.115 ppm (0.32 to 0.72 mg/m^3)
Unusual Hazards: Phthalic anhydride may remain molten under a solid crust; check carefully before walking on such crusts. Use of water or foam on fires must be undertaken carefully to avoid frothing, spattering, and potential tank boilover hazards. Entry of water or other volatile liquids into closed tanks of the molten liquid may result in rapid steam or vapor generation and potential container rupture. Pressure relief valves on tanks of hot molten liquids may be susceptible to plugging with solid and subsequent malfunction. Flammable and potentially explosive hydrogen gas may be generated if phthalic acid contacts and corrodes iron or mild steel. Concentrated hot vapors of phthalic anhydride, upon cooling, may cover a wide area with a fluffy deposit of the solid material. The substance has several unusual toxicological characteristics.
Short Term Exposure Limit (STEL): Not established
Time Weighted Average (TWA) Limit: 1 ppm (6 mg/m^3) over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989).
Ceiling (C) Limit: Not established
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; actions that create phthalic anhydride to become an airborne dust. See "Unusual Hazards" for additional information.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the vapor, dust, and/or fume concentrations that may be present in air in the spill area and over some downwind distances, particularly and especially if molten phthalic anhydride has been discharged at a high temperature. Direct contact and ingestion should also be avoided.
Hazards of Skin or Eye Contact: Available data on this topic are not entirely consistent. The dust, vapor, or fumes of phthalic anhydride are reported to cause persistent eye irritation, stinging, lacrimation, inflammation, and possibly severe burns and permanent damage to the cornea if not immediately removed. The effects of skin contact with phthalic anhydride at normal temperatures is aggravated by moisture. As best as can be determined, contact with dry skin may not result in any pain or sensation of irritation for a time but may lead to delayed reddening of the skin, blistering, peeling, and possibly itching, swelling, brown staining of the skin, and/or a rash; superficial burns may progress to severe and deep burns as the time of contact increases. When the skin is moist or wet, irritation is felt more quickly and the above effects may occur more rapidly. Confinement of the chemical under clothes or in shoes may additionally aggravate its effects. The skin of some susceptible people may become sensitized upon repeated exposure such that they become allergic. Contact of molten phthalic anhydride with eyes or skin can result in severe thermal burns and possibly permanent injury. It may adhere to skin, hair and clothes, causing burns of severity depending on amount and extent of contact. Do not wear contact lenses when working with this chemical.
Hazards of Inhalation: The dust, vapor, or fumes of phthalic anhydride are reported to cause eye irritation and signs of nose, throat, and mouth irritation at concentrations of 4 to 5 ppm (25 to 30 mg/m^3) in air. Symptoms of exposure at higher levels are variably reported to include irritation and ulcers of the respiratory tract, coughing, sneezing, drowsiness, vomiting, excessive discharge and bleeding from the nose, atrophy of the nasal mucosa, sore throat, hoarseness, inflammation of the larynx and lungs, bloody sputum on occasion, difficulty in breathing, bronchitis, possible liver or kidney injury, cyanosis, and/or death in extreme cases. Exposures may cause asthma attacks in those who have previously had asthma. Repeated exposures may cause bronchitis and asthma and/or may result in sensitization of the respiratory system in some people such that they become allergic to the chemical and may experience bronchial asthma attacks if exposed again to even small amounts. Exposures may also aggravate the conditions of people with preexisting bronchitis or emphysema. The NIOSH IDLH (1990) for the substance is 10,000 mg/m^3, which is approximately equivalent to 1,625 ppm. Note that the saturated vapor concentration of phthalic anhydride is somewhere in the range of 0.26 - 39.5 ppm at 68°F (20°C); 1,315 ppm at 205.7°F (96.5°C); 7,895 ppm at about 267.8°F (131°C); and roughly 14,080 ppm at 280°F (137.8°C). At 68°F, 1 ppm is approximately equal to 6.16 mg/m^3 in air.
Hazards of Ingestion: Phthalic anhydride is of low to moderate toxicity by ingestion. Reported symptoms include severe irritation and possibly burns of the mouth and throat, irritation of the gastrointestinal tract, stomach cramps, nausea, vomiting, general weakness, dizziness, drowsiness, diarrhea, possible liver and kidney injury, shock, convulsions, coma, and death in extreme cases. Laboratory experiments have shown that single oral doses required to kill 50% of rats are in the range of 1.1 to 4.0 grams of phthalic anhydride per kilogram of an animal's body weight.

FIRE HAZARDS

Lower Flammable Limit: 1.7% by volume as vapor in air.
Upper Flammable Limit: 10.4 - 10.5% by volume as vapor in air.
Behavior in Fire: Solid phthalic anhydride requires considerable heating for ignition but powders and dusts, if dispersed in air, may possibly be easily ignited and burn or explode. Molten liquid may be at or above its flash point or require some heating upon release to be easily ignited or to produce flammable vapors which may travel to a source of ignition and flash back.
Hazardous Combustion Products: Not well-defined; likely to include phthalic acid fumes, carbon monoxide, carbon dioxide, and other harmful substances.

EXPLOSION HAZARDS

Explosiveness: A cloud of phthalic anhydride dust or powder dispersed in air and at or above its lower explosive limit concentration may burn or explode if ignited. An explosion may result if vapors evolved from molten phthalic anhydride at or

2214

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS *(CONTINUED)*

above its flash point are ignited in a confined area. Contact with certain other chemicals may result in an explosion. Only one of many sources of information reviewed indicated containers may explode or rupture violently in a fire; the risk is therefore deemed to be limited but not negligible. Potentially explosive hydrogen gas may be generated while phthalic acid corrodes certain metals. Entry of water or another volatile liquid into a closed tank of the molten liquid may possibly result in rapid steam or vapor generation and potential container rupture due to overpressurization.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with solid forms of phthalic anhydride at normal temperatures. This may include rubber boots, gloves, face shields, vapor-tight or dust-proof safety goggles, and other clothing including aprons or coveralls. Equipment should prevent any possibility of skin or eye contact with molten phthalic anhydride; this may include but not be limited to hard hats, face shields, vapor-tight safety goggles, and heat-resistant gloves, boots without open tops, and other appropriate clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor concentrations in emergencies involving spills of molten phthalic anhydride or contact with products of combustion in air during fires. Note that the temperature of molten phthalic anhydride may be sufficiently high that many synthetic plastic or rubber materials may melt or lose their strength upon contact. According to manufacturers of the chemical, neoprene is chemically compatible with phthalic anhydride. Be advised that many factors affect the suitability of a material for any given application. Ensure that the specific protective clothing and devices chosen will provide adequate protection under actual conditions to be encountered.

Respiratory Protection: For unknown concentrations, general use, fire fighting, or emergencies involving molten phthalic anhydride, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). Consult experts for advice on the types of respirators that may provide adequate protection against various levels of dust and/or vapors in air during normal or other non-emergency type operations.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, drowsiness, dizziness, nasal discharge or bleeding, sore throat, difficulty in breathing, nausea, vomiting, stomach cramps, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Relief of nose or throat irritation may be achieved by spraying or gargling with water if victim is conscious.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get immediate medical attention if eye contact has occurred or skin irritation persists or develops after washing; contact with molten phthalic anhydride may require immediate treatment for thermal burns. If liquid has solidified over burns, remove as much as possible manually and soak off remainder in cold water before burn treatment. Be advised that removal of solidified molten material from the skin or the area of the eyes may require professional medical assistance. Contaminated leather clothing should be discarded.

First Aid for Ingestion: Get medical attention immediately or advice on whether water should be administered and/or whether vomiting should be induced if the victim is conscious. If vomiting occurs naturally or is induced, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Steam is an effective extinguishing agent for molten product fires in tanks. Otherwise, use dry chemical, carbon dioxide, water spray or foam. Authorities disagree as to whether regular or alcohol foam should be used; it is possible that both may be effective to some degree. Note that application of water or foam as a direct stream onto burning phthalic anhydride may result in potentially violent frothing or spattering; entry into burning tanks of the product may possibly result in violent frothing or boilover that may hazardous to nearby personnel. Apply water or foam as a spray with caution and from a distance at first.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes or smoke is anticipated. Move container from fire area if no risk. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after the fire is out but do not direct water streams into burning containers. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, use professional judgment to decide whether to withdraw and let fire burn based on the intensity of the fire, the high boiling point and low vapor pressure of phthalic anhydride, and whether or not it was initially a hot molten liquid in its container. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire. Based on the properties and specified hazards of other molten liquids, it is probably not prudent to depend on tank safety pressure relief devices to limit pressures in tanks; these may possibly become plugged with solid material.

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product or phthalic acid. Ground all equipment and transfer lines as necessary prior to use. Obtain expert advice with respect to cargo transfer procedures in the case of molten product. Note there is some small possibility that discharge of a carbon dioxide fire extinguisher at the point of leakage of molten phthalic anhydride has the potential to solidify and stop the leak, at least temporarily. Other means of attempting to solidify the leaking product via cooling and then plugging the hole may also work. Whether or not a "plug" or solid phthalic anhydride by itself will hold depends on several factors including the amount of liquid remaining in the container and its temperature. It may become necessary to repeat the procedure several times until the leak can be patched or to ultimately abandon the effort. Use professional judgment in attempting this type of response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Solid phthalic anhydride or smaller quantities of the rapidly cooling molten product will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in these cases to simply monitor the situation until the product is removed.

CONSEQUENCE

Hazardous levels of phthalic anhydride vapor or dust may be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind. Avoid activities that generate airborne dust.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Large discharges of molten phthalic anhydride may expose downwind areas to toxic concentrations (and possibly flammable concentrations if the liquid is well above its flash point temperature) over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid phthalic anhydride with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly. Consider first covering the spilled product with dry sand or earth.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to phthalic anhydride dust, vapors, or fumes may knock them down and/or accelerate their dispersal in the atmosphere. Application of water fog to the surface of molten liquid may help control its spreading, absorb heat, and help form a solid crust over the material that may assist in reducing vapor emissions. Maintenance of a layer of water on top of a contained pool of molten liquid that has solidified on its surface may further reduce vapor emissions. Wetting down of exposed phthalic anhydride powder may reduce generation of airborne dust. Note previous warnings about frothing and other hazards of applying water to very hot molten liquids. Be advised that firefighting foams may have similar benefits and effects if applied to the surface of molten phthalic anhydride pools.

CONSEQUENCE

Some phthalic anhydride will dissolve in any water applied or used to generate foam and then combine with the water to form corrosive phthalic acid.

MITIGATION

Contain contaminated runoff and neutralize and/or remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Use caution when at first applying water or foam to the molten liquid.

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Solid or molten phthalic anhydride or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting (capable of withstanding the temperature of molten liquid where necessary) covered with rocks and dry soil or sand, or via other appropriate methods. It may be prudent to permit molten phthalic anhydride to solidify before attempting cleanup. Consider use of a fine water fog or spray to accelerate solidification and cooling of molten liquid pools, keeping in mind the potential frothing problem and the fact that any water used will dissolve some of the phthalic anhydride and form corrosive phthalic acid.

CONSEQUENCE

Contained liquids, particularly contaminated water runoff, may percolate into soil or seep through dike material. This may result in spread of contamination.

MITIGATION

Remove contained product or neutralize and/or remove contaminated runoff to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product, particularly liquid phthalic anhydride and any contaminated water runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained product or neutralize and/or remove contaminated runoff as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated pools of contaminated water runoff may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. This response is unlikely to be appropriate for molten phthalic anhydride since cooling of the product may result in its solidification and subsequent plugging or clogging of transfer or storage equipment (unless it is specially designed for this purpose).

CONSEQUENCE

Incompatible equipment may become damaged or develop leaks. Note that any phthalic acid formed is not only corrosive but may generate flammable and potentially explosive hydrogen gas in contact with certain metals.

MITIGATION

Use equipment compatible with the spilled product. Take appropriate precautions against fires or explosions caused by generation of hydrogen.

TECHNIQUE

ABSORPTION . . . Spreading of contaminated water runoff may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil, solid or solidified phthalic anhydride, and/or various chemical residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors or gases present in the area (such as vapors from very hot molten phthalic anhydride or any hydrogen gas that may evolve when metals are corroded by phthalic acid) may be ignited by motorized removal equipment. Similarly, the dust of phthalic anhydride may be ignited under appropriate conditions.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product and phthalic acid as necessary. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

TECHNIQUE

NEUTRALIZATION. . . Application of an appropriate neutralization agent may modify water containing phthalic acid to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

PHTHALIC ANHYDRIDE
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid phthalic anhydride is heavier than water and slightly soluble therein. Most may be expected to sink to the bottom of a water body and dissolve at a slow yet appreciable rate. Molten phthalic anhydride will solidify upon contact with water and behave similarly.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Hoses and pumps or vacuum trucks may also be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air. Any phthalic acid in recovered materials will corrode some metals while generating hydrogen gas.

MITIGATION

Consult qualified experts for guidance. Use compatible equipment or take other precautions if hydrogen gas may pose a fire or explosion hazard.

TECHNIQUE

CONTAINMENT DIKES . . . Water containing suspended contaminant particles or dissolved contaminants may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

PINE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Pine oil is a colorless to light amber liquid with the penetrating odor of pine. It is used as a wetting or dispersing agent in processing various textiles and paper, and has similar uses in the rubber and dye industries. It is also used as a flotation agent in metallurgical operations and for making soaps, polishes, deodorants, coatings, insecticides, and disinfectants. The product is lighter than water and practically insoluble, so may be expected to form a floating surface slick. Its flash point is between 100 and 199°F, thus indicating that some amount of preheating may be necessary for the product to be ignited easily. Accumulations of vapor from warmed liquid in confined spaces such as buildings or sewers may result in explosions if ignited. There is some limited potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs 6.8-7.8 pounds per gallon depending on specific composition.

Pine oil does not react with water or many other common materials and is relatively noncorrosive. It is incompatible with strong oxidizing agents, is irritating to the eyes, skin, and mucous membranes, and may be toxic if inhaled or ingested in excess. Note that the composition of pine oil is somewhat variable and that its physical and chemical properties are dependent upon specific composition.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble or very slightly soluble
Solubility in Other Chemicals: Various components of pine oil may be soluble in alcohol, ether, benzene, petroleum ether, etc.
Specific Gravity (Liquid): 0.81-0.94
Boiling Point: 367-439°F (186-226°C)
Melting Point: Unavailable
Freezing Point: Unavailable
Molecular Weight: 154.25 for primary component (alpha-terpineol)
Heat of Combustion: Unavailable
Vapor Pressure: Unavailable
Flash Point: Between 100-199°F (37.8-92.8°C)
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Assumed to be stable
Corrosiveness: Assumed to be noncorrosive
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizers.

IDENTIFICATION

Shipping Names: Pine oil (USDOT and IMO)
Synonyms and Tradenames: Oil of pine; synthetic pine oil; deumabietis, oil of five-Siberian; Yarmar.
Chemical Formula: Mixture, primarily $C_{10}H_{17}OH$
Constituent Components(o each): Typically 65-70% alpha-terpineol; 10% dihydro-alpha-terpineol and other tertiary alcohols; 10-15% borneol and fenchyl alcohols, 5% estragole, and 5-10% ketones.
UN/NA Designation: UN1272
IMO Designation: 3.3, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to light amber
Odor Characteristics: Penetrating, like pine
Common Uses: Wetting, dispersing and antibacterial agent in processing cotton,silk, rayon, and wool; wetting or leveling agent in paper, rubber, and dye industries; flotation agent; used to make soaps, polishes, deodorants, coatings,insecticides, and disinfectants.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

PINE OIL

Class 3 (Flammable Liquid) or
Combustible Liquid

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Combustible liquid that is a weak allergen and may induce allergic reactions.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Available data are limited. It appears that pine oil is an irritant and may be toxic if inhaled or ingested in excess. The NFPA considers health hazards to be low. Others report the product may be a weak allergen.

Hazards of Skin or Eye Contact: Pine oil is expected to be irritating to the skin and eyes.

Hazards of Inhalation: Vapors of pine oil may be irritating to the eyes and mucous membranes. Excessive exposures may possibly result in depression of the central nervous system and respiratory failure.

Hazards of Ingestion: Ingestion of pine oil may cause hemorrhagic gastritis and possibly central nervous system depression, hypothermia, and respiratory failure.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Combustible liquid. Will burn but may be difficult to ignite. There is some limited potential that containers may rupture violently in fire. May generate flammable vapors upon release if heated.

Hazardous Combustion Products: Unknown, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of heated liquid are ignited in a confined area. There is some limited potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include polyethylene, polyvinyl alcohol, and vinyl.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or mucous membranes; weakness or other symptoms of exposure.

First Aid for Inhalation:Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

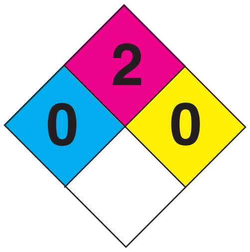
First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: Data unavailable. Get medical attention immediately.

1272

PINE OIL

Class 3 (Flammable Liquid) or Combustible Liquid



FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of pine oil may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that pine oil is a combustible liquid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Pine oil may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of pine oil in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to pine oil vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of pine oil from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of pine oil vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if response is ineffective.

PINE OIL
Class 3 (Flammable Liquid) or Combustible Liquid

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Pine oil may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained pine oil may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

PINE OIL

Class 3 (Flammable Liquid) or Combustible Liquid

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECNNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating pine oil.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

PINE OIL
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with pine oil may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

January 1988

POTASSIUM HYDROXIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Potassium hydroxide, also known as caustic potash, is a white odorless and nonvolatile solid that may be shipped in flake, bead, or granular form or dissolved in water as a colorless solution. It is used in electroplating, lithography, printing, and veterinary medicine; for making soap, wood mordant, and paint and varnish removers; and for mercerizing cotton. It is very soluble in water and will dissolve rapidly with the evolution of considerable heat that may generate steam and spattering. Although the product is not flammable, the heat generated by the solid upon contact with moisture may be sufficient to ignite adjacent combustible materials. Flammable and potentially explosive hydrogen gas may be generated upon contact of the wet product with such metals as aluminum, tin, lead, or zinc. The solid weighs approximately 127.3 pounds per cubic foot. Solutions weigh about 12.8 pounds per gallon.

Potassium hydroxide is stable in normal transportation. It is reactive with a variety of chemicals, and corrosive to various metals and bodily tissues. The solid may absorb moisture from the air and dissolve.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 107 g/100 g water at 59°F (15°C)

Solubility in Other Chemicals: Soluble in alcohol

Specific Gravity (Solid): 2.04 at 59°F (15°C); **(Solutions):** 1.45–1.50 at 68°F (20°C)

Boiling Point: Very high for solid; 293°F (145°C) for 50% solution

Melting Point: See freezing point

Freezing Point: 716°F (380°C) for solid; –45°F (–43°C) for 50% solution

Molecular Weight: 56.11

Heat of Combustion: Not flammable

Vapor Pressure: Negligible; 1 mm Hg (0.0193 psia) at 1326°F (719°C) for solid.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: Will attack wool, leather, aluminum, lead, tin, and zinc. Practically noncorrosive to iron or rubber.

Reactivity with Water: Dissolves with liberation of much heat, may steam and spatter. Solution is basic (alkaline).

Reactivity with Other Chemicals: Reacts with acetic acid, acrolein, acrylonitrile, chlorine dioxide, chloroform and methyl alcohol, 1,2-dichloroethylene, maleic anhydride, nitroethane, nitrogen trichloride, nitromethane, and trichloroethylene. Separate from acids, metals, explosives, organic peroxides, and easily ignitable materials.

IDENTIFICATION

Shipping Names: Potassium hydroxide, dry solid, flake, bead, or granular (USDOT); potassium hydroxide, liquid or solution (USDOT); caustic potash, dry, solid, flake, bead, or granular (USDOT); caustic potash, liquid or solution (USDOT); potassium hydroxide, solid or solution (IMO); caustic potash (IMO); caustic potash, solid (IMO).

Synonyms and Tradenames: Caustic potash; lye; potassium hydrate; potassa; KOH.

Chemical Formula: KOH

Constituent Components (% each): Solid is 83–90% KOH with 2–3% potassium carbonate and rest water; solutions are 45–50% KOH in water.

49 STCC: 49 352 25 (solid); 49 352 30 (solution); 49 352 44 (solution)

UN/NA Designation: UN1813 (solid); UN1814 (solution)

IMO Designation: 8, corrosive

Physical State as Shipped: Solid or liquid solution

Physical State as Released: Solid or liquid solution

Color of the Shipped Material: White solid; colorless solution

Odor Characteristics: Odorless

Common Uses: Electroplating; lithography; printing; veterinary medicine; mercerizing cotton; mfg. soap, wood mordant, and paint. and varnish removers.

POTASSIUM HYDROXIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Evolves considerable heat in reaction with water when solid. Heat may ignite combustible materials. Reaction with some metals evolves hydrogen gas.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 2 mg/m^3 over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Contact with incompatible materials; fire or sparks where hydrogen may be present; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact with solid potassium hydroxide or concentrated solutions may result in severe burns of the skin or eyes.

Hazards of Inhalation: Breathing dust from the solid or concentrated mists in air may result in irritation of the upper respiratory tract, inflammation of the lungs, and possibly pneumonitis.

Hazards of Ingestion: Ingestion may cause burns of the mouth, throat and stomach, nausea, bloody vomit, abdominal pain, perforation of the intestinal tract, diarrhea, and possibly edema of the larynx, suffocation, and death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: No special hazards apparent. Some remote chance that containers may rupture in fire due to steam pressure.

Hazardous Combustion Products: Unlikely

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Contact with metals may generate hydrogen gas that may explode if ignited in confined spaces. Some remote chance that containers may rupture in fire due to steam pressure.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing for solids or liquids (as appropriate). Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high dust or mist concentrations in air. Compatible materials may include butyl rubber, natural rubber, neoprene, neoprene/styrene-butadiene rubber, nitrile rubber, polyethylene, polyvinyl chloride, styrene-butadiene rubber, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 mg/m^3) a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency mist and particulate filter respirator with a full facepiece within the use limitations of such devices. (Note: Respiratory protection may not be required for solutions in the absence of airborne mists.)

1813

POTASSIUM HYDROXIDE

Class 8 (Corrosive Material)

FIRST AID

Nonspecific symptoms: Irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but note that much heat is evolved when water contacts solid product. NFPA suggests flooding with water, using care not to spatter or splash the product.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources where hydrogen may be present. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that contact of wet potassium hydroxide with some metals may generate hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Note that the heat of reaction of the solid with water may be sufficient to ignite some combustible materials.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Potassium hydroxide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed. (Note: Solutions do not pose a problem unless an airborne mist is somehow generated.)

CONSEQUENCE

Hazardous levels of potassium hydroxide in air may be found in the local spill area and immediately downwind, especially if dry solid has spilled on a windy day.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid potassium hydroxide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

POTASSIUM HYDROXIDE
Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Potassium hydroxide solutions or dry product may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials. Keep solid product dry.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION ....Spreading of potassium hydroxide may be controlled by absoring liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Although sorbents will immobilize the spill and help control spreading, they do not alter the hazardous nature of the spilled product. Their use adds to the volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by.mechanical means. Where necessary, neutralize sorbents under guidance of qualified experts.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

POTASSIUM HYDROXIDE
Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause potassium hydroxide dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

POTASSIUM NITRATE
Division 5.1 (Oxidizer)

GENERAL INFORMATION

Potassium nitrate is a white crystalline solid that is odorless and is used in solid rocket propellants, explosives, fertilizers, meat processing, and a variety of other products and processes. It is moderately soluble in water and heavier, so may be expected to sink and dissolve fairly rapidly. The substance is not flammable but is a strong oxidizer that may react with easily oxidizable materials to cause ignition, violent combustion, or explosion. It may also accelerate the burning of any combustible material. One authority suggests that an explosion may result if potassium nitrate is involved in a fire. The product weighs approximately 131.6 pounds per cubic foot.

Potassium nitrate is stable in normal transportation and does not react with water. It is reactive with a variety of chemicals, and as noted above, may form potentially explosive mixtures. Toxicity is apparently relatively low by the various potential routes of exposure, but the product evolves toxic nitrogen oxide gases when involved in a fire.

If a fire involving bulk amounts of potassium nitrate becomes uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from the effects of potential explosions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 13.3–247 g/100 g water in range 32–212°F (0–100°C)
Solubility in Other Chemicals: Soluble in liquid ammonia and glycerine
Specific Gravity (Solid): 2.109 at 60.8°F (16°C)
Boiling Point: Decomposes at 752°F (400°C)
Melting Point: 633°F (334°C)
Freezing Point: See melting point
Molecular Weight: *101.11*
Heat of Combustion: Not flammable
Vapor Pressure: *Low*
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable *Stability:* Stable
Corrosiveness: Data unavailable
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with oxidizable materials; mixtures with reducing agents may explode under heat or shock as may mixtures with sodium acetate and tartarates, oxalates and citrates, sodium or lead phosphite, tin solder, tin plate, stannates, or lead nitrite.

IDENTIFICATION

Shipping Names: Potassium nitrate (USDOT and IMO)
Synonyms and Tradenames: Nitric acid, potassium salt; saltpeter; niter; nitre.
Chemical Formula: $KN0_3$
Constituent Components(% each): Relatively pure
49 STCC: 49 187 37
UN/NA Designation: UN1486
IMO Designation: 5.1, oxidizing substance
Physical State as Shipped: Solid crystals or powder
Physical State as Released: Solid crystals or powder
Color of the Shipped Material: White
Odor Characteristics: Odorless
Common Uses: Solid rocket propellants; explosives; fertilizers; metal heat treatment agents; glass clarifier; pharmaceuticals; metallurgy; meat processing.

POTASSIUM NITRATE
Division 5.1 (Oxidizer)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Strong oxidizer that may ignite or form potentially explosive mixtures with reducing agents, oxidizable materials, and certain other chemicals. May explode if heated.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Potassium nitrate is apparently considered to be of low toxic hazard in normal handling. Limited data are available.

Hazards of Skin or Eye Contact: Contact with potassium nitrate may result in irritation of the skin or eyes.

Hazards of Inhalation: Breathing potassium nitrate dust may cause irritation of the mucous membranes.

Hazards of Ingestion: Ingestion of significant amounts of potassium nitrate may result in nausea, diarrhea, increased urination, muscular debility, collapse, and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May accelerate burning of combustible materials. May fuse or melt. One authority suggests that containers may explode in fire.

Hazardous Combustion Products: Include toxic oxides of nitrogen.

EXPLOSION HAZARDS

Lower Explosive Limit: Not pertinent

Upper Explosive Limit: Not pertinent

Explosiveness: Contact with certain other chemicals or oxidizable materials may result in formation of explosive mixtures (see Reactivity with Other Chemicals). Potassium nitrate may explode in fires.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For fire fighting, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For normal handling where dust is airborne, an approved dust mask may be adequate within the use limitations of such devices.

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or mucous membranes.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Get medical attention.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If victim conscious administer large quantities of water and immediately induce vomiting. Never give anything by mouth to an unconscious person. Never try to make unconscious person vomit. Get medical attention immediately.

1486

POTASSIUM NITRATE
Division 5.1 (Oxidizer)

FIRE RESPONSE

Extinguishing Materials: Flood with water, but note that large quantities of potassium nitrate may melt or fuse in fire and that water application may result in extensive scattering of molten material.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture or explosion potential. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Avoid contact with spilled product. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in corrosion of boilers or industrial process equipment. Take into account while planning the response that potassium nitrate is a strong oxidizer.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Potassium nitrate should not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of potassium nitrate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Protect product from wind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid potassium nitrate with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Potassium nitrate may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Water solutions of potassium nitrate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination.

POTASSIUM NITRATE
Division 5.1 (Oxidizer)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause potassium nitrate dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize airborne dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

January 1992

n-PROPANOL
Class 3 (Flammable Liquid)

GENERAL INFORMATION

n-Propanol, also transported with the proper shipping names "propyl alcohol normal" or "propyl alcohol", is a fairly volatile colorless liquid with a pleasant, sweet odor resembling ethyl alcohol. It is widely used as a solvent and extractant in industry and as a raw material for making other chemicals and numerous commercial products. The substance is fully soluble in water and will mix freely. Its flash point range of 71 to 84°F indicates that it may be easily ignited under moderate to high ambient temperature conditions or when heated by some means. At temperatures above its flash point, vapors of the liquid may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited under such conditions. Containers of liquid have some limited potential to rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.7 pounds per gallon. Liquid n-Propanol does not react with water or other common materials and is stable in normal transportation. It is a relatively noncorrosive substance but may attack some forms of plastics, rubber and coatings.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in acetone, alcohols, benzene, ethers, propylene glycol, and many other solvents.

Specific Gravity (Liquid): 0.803-0.806 at 68°F (20°C)

Boiling Point: 207 - 208°F (97.2 - 97.8°C) at 1 atm.

Melting Point: - 196.6 to - 195.2°F (- 127 to - 126.2°C)

Freezing Point: See melting point

Molecular Weight: 60.1

Heat of Combustion: - 7296 cal/g

Vapor Pressure: Most sources report 14.5 - 15.0 mm Hg (0.2803 - 0.2899 psia) at 68°F (20°C); one maker reports 13 mm Hg (0.2513 psia) at this temperature for its product. Other values include 5 mm Hg (0.0966 psia) at 41°F (5°C) and 60 mm Hg (1.160 psia) at 110.3°F (43.5°C).

Flash Point: 71 - 77°F (21.7 - 25.9°C), closed-cup; 77 - 84°F (25 - 28.9°C), open-cup.

Autoignition Temperature: 700, 775, or 824°F (371, 413, or 440°C); reported values vary.

Burning Rate: 2.9 mm/minute

Stability: Stable

Corrosiveness: Reported as not corrosive to common metals. May attack some forms of plastics, rubber, and coatings. Similar alcohols are reported to react with metallic aluminum at high temperatures.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Various sources list incompatible materials as including strong oxidizing agents (which are said to increase the risk of fire or explosion), strong acids (including nitric acid and sulfuric acid), aldehydes, halogens, and active halogen compounds.

IDENTIFICATION

Shipping Names: n-Propanol; propyl alcohol normal; propyl alcohol

Synonyms and Tradenames: Ethyl carbinol; 1-hydroxypropane; normal propanol; normal propyl alcohol; propanol; n-propyl alcohol; 1-propanol; propanol-1; 1-propyl alcohol; propylic alcohol; and various tradenames.

Chemical Formula: $CH_3CH_2CH_2OH$

Constituent Components (% each): As best as can be determined, the product is generally 95% or more pure. Some grades are 99.8% or more pure.

49 STCC: 49 092 67

UN/NA Designation: UN1274

IMO Designation: 3, flammable liquid

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Clear, colorless liquid

Odor Characteristics: Pleasant or sweet; mild alcohol odor; resembles odor of ethyl alcohol (ethanol).

Common Uses: Solvent for printing inks, natural or synthetic gums and resins, rosin, shellac, insecticides, waxes, cellulose esters, nail polishes, and other products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

n-PROPANOL
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Many respected sources of information suggest that the odor of n-propanol can be detected and/or recognized in the range of 30 to 45 ppm in air. Overall, threshold odor concentrations reported in the literature range from a small fraction of 1 ppm to about 80 ppm.

Unusual Hazards: Somewhat volatile flammable liquid. Rather typical of a simple alcohol in properties and hazards.

Short Term Exposure Limit (STEL): (Skin) 250 ppm for 15 minutes (ACGIH, 1991-92; OSHA, 1989).

Time Weighted Average (TWA) Limit: (Skin) 200 ppm over each 8 hours of a 40 hour work week (ACGIH, 1991 - 92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard in spill situations is from exposure to the high vapor concentrations of n-propanol vapors in air that may be present in the spill area and over some distance downwind. Ingestion and physical contact should also be avoided.

Hazards of Skin or Eye Contact: High concentrations of n-propanol vapors in air cause irritation of the eyes. Contact of liquid n-propanol with the eyes may cause moderate to severe irritation, redness, inflammation, pain, lacrimation, corneal opacities, blurred vision, and possibly corneal burns or ulcerations.

Hazards of Inhalation: The vapors of n-propanol may cause irritation of the nose and throat. High concentrations in air may cause narcosis and central nervous system depression with symptoms including drowsiness, dizziness, weakness, fatigue, headache, nausea, stupor, incoordination, prostration, unconsciousness, and even death in extreme cases.

Hazards of Ingestion: n-Propanol is of comparatively low toxicity by ingestion. Nevertheless, ingestion of sufficient amounts may variably cause dizziness, drowsiness, headache, incoordination, stupor, nausea, vomiting, gastrointestinal irritation and pain, cramps, diarrhea, paralysis, reduced respiration and body temperature, unconsciousness, coma, and even death in severe cases. The single oral dose reported to kill a human woman was 5.7 grams per kilogram of body weight (over half pound of the alcohol for a 110 lb person).

FIRE HAZARDS

Lower Flammable Limit: 2 - 2.2%

Upper Flammable Limit: 12 - 14%

Behavior in Fire: Flammable liquid. May generate flammable vapors when at temperatures at or above its flash point. Such vapors may travel some distance to a source of ignition and flash back. There is some limited potential for containers to rupture violently and possibly rocket in fires.

Hazardous Combustion Products: Not well-defined; may include carbon monoxide, carbon dioxide, and other toxic constituents. One authority reports that n-propanol evolves acrid smoke and irritating fumes when heated to decomposition.

EXPLOSION HAZARDS

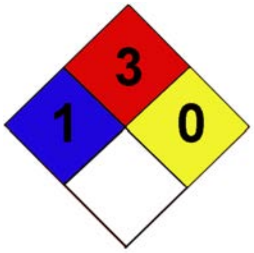
Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from liquid n-propanol at or above its flash point are ignited in a confined area. There is some limited potential for containers to rupture violently and possibly rocket in fires.

1274

n-PROPANOL
Class 3 (Flammable Liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, butyl rubber/neoprene, neoprene, neoprene/styrene-butadiene rubber (SBR), nitrile rubber, polyurethane, polyvinyl acetate, SBR, SBR/neoprene, teflon, Viton, and Viton/neoprene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 4000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (for levels of 4000 ppm or less) or a chemical cartridge respirator with organic vapor cartridge(s) with a full facepiece (for levels of 1000 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, or upper respiratory tract; drowsiness, dizziness, headache, nausea, stupor, or other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs naturally, have the victim lean forward with head below hips to reduce the risk of aspiration of fluids into the lungs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or promptly if skin irritation persists after washing.

First Aid for Ingestion: If conscious, have victim rinse mouth thoroughly with water and then administer several glasses of water to dilute material in stomach. Get medical attention immediately. If qualified medical attention is not immediately available, a significant quantity of n-propanol has been ingested, and the victim is still conscious, induce vomiting and then give water again. Do not make an unconscious person vomit. Whether vomiting occurs naturally or is induced, have victim lean forward with head below hips to reduce the risk of aspiration of fluids into the lungs. (Note: Authorities consulted had several different opinions on the proper course of action in the event of ingestion. The above recommendation is a compromise position that gives special attention to reducing the risk of aspiration into the lungs yet recognizes that ingestion of a large quantity of n-propanol can have rapid and significant effects. Seek advice from a physician on how to proceed, if rapid communication is possible, before implementing the recommended response.)

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, alcohol foam. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind.. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

n-PROPANOL
Class 3 (Flammable Liquid)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Take the volatility, flammability, and toxicity of n-propanol into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. n-Propanol discharges may expose downwind areas to toxic and flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm or hot weather or the liquid is somehow heated.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION . . . Liquid n-propanol may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled or in cold weather.

CONSEQUENCE

Hazardous levels of n-propanol in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to n-propanol in air may absorb vapors as well as accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of n-propanol from contact with its vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

n-PROPANOL
Class 3 (Flammable Liquid)

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid n-propanol may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of n-propanol vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid n-propanol may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

n-PROPANOL
Class 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of afire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Propionaldehyde is a colorless liquid with a pungent, suffocating, and overpoweringly fruity odor. It is used to make plastics, rubber chemicals, disinfectants, and preservatives. It is quite soluble in water and will rapidly dissolve. Its lowest reported flash point of - 22°F (15 - 19°F also reported) indicates the product is easily ignited under a wide range of ambient temperature conditions. A boiling of 118.4°F and a significant vapor pressure indicate that the substance is quite volatile. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 6.7 pounds per gallon.

Propionaldehyde does not react with water or many other common materials and is stable in normal transportation. It is vigorously reactive with oxidizing materials, however, and may self-polymerize (possibly violently) in the presence of acids or caustics. Toxicity of the product is low to moderate by the various potential routes of exposure but high concentrations may be present in air. Products of combustion may include toxic constituents.

Downwind evacuation should be considered if propionaldehyde is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 21 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in diethyl ether and ethyl alcohol.
Specific Gravity (Liquid): 0.805 at 68°F (20°C)
Boiling Point: 118.4°F (48°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: - 112°F (- 80°C)
Molecular Weight: 58.08
Heat of Combustion: - 6930 cal/g
Vapor Pressure: 235 mm Hg (4.54 psia) at 68°F (20°C)
Flash Point: Min. - 22°F (- 30°C); max. 15 - 19°F (- 9.4 to - 7.2°C); open cup.
Autoignition Temperature: 405°F (207°C)
Burning Rate: 4.4 mm/minute
Stability: Stable
Corrosiveness: Relatively noncorrosive. Compatible with stainless steel and aluminum.
Reactivity with Water: *No* reaction
Reactivity with Other Chemicals: Reacts vigorously with oxidizers. May self-polymerize in the presence of acids or caustics.

IDENTIFICATION

Shipping Names: Propionaldehyde (USDOT and IMO)
Synonyms and Tradenames: Propyl aldehyde; propanal; propionic aldehyde; methyl acetaldehyde; propional; propylic aldehyde.
Chemical Formula: CH_3CH_2CHO
Constituent Components(% each): 97 - 99% or more pure
49 STCC: 49 082 70
UN/NA Designation: UN1275
Uses: Mfg. plastics, rubber chemicals, disinfectants, and preservatives.
IMO Designation: 3.1 or 3.2, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent, suffocating, overpoweringly fruity.
Common

CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.009 ppm (absolute perception limit)

Unusual Hazards: Volatile flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. May self-polymerize in the presence of acids or caustics.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the high vapor concentrations that may be present in the local spill area and some distance downwind. Ingestion and direct contact are also to be avoided.

Hazards of Skin or Eye Contact: Contact with liquid propionaldehyde may cause irritation and inflammation of the skin or eyes. Based on data for similar aldehydes, there is a possibility that some degree of eye injury may occur.

Hazards of Inhalation: Vapors of propionaldehyde are severely irritating to the eyes, nose, and mucous membranes. High concentrations in air may cause coughing, lung congestion, drowsiness, lethargy, some incoordination, nausea, and vomiting. Saturated vapors in air were lethal to rats within two minutes in laboratory experiments. Exposure to 8000 ppm killed most rats in four hours. One authority indicates that 200 ppm is the maximum allowable concentration for humans.

Hazards of Ingestion: Ingestion may result in nausea, vomiting, diarrhea, drowsiness, lethargy, some incoordination, and possibly respiratory failure.

FIRE HAZARDS

Lower Flammable Limit: 2.6 - 2.9%

Upper Flammable Limit: 16.1 - 17%

Behavior in Fire: Flammable liquid. Will generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Acids or caustics may initiate possibly violent polymerization that may result in container rupture.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, polyethylene, polyurethane, polyvinyl chloride, styrene-butadiene rubber, and nitrite-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1275

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific symptoms: Irritation of eyes, skin, nose, or mucous membranes; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Get medical attention immediately. (Note: First aid procedures for ingestion are not well documented. Contact a physician for advice and treatment as soon as possible.)

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, alcohol foam, water spray. Water may be ineffective but may be used to dilute spills to nonflammable mixture.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the volatility, flammability, and toxicity of propionaldehyde into account while planning the response. (Note: In some rare spills, there may be time to apply oil spill containment and cleanup techniques to propionaldehyde floating on water before the chemical dissolves. This guide presumes that dissolution will be rapid.) Note that the product may polymerize under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Propionaldehyde spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large amounts have spilled.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

MONITOR THE SITUATION... Propionaldehyde may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if small amounts have spilled in cold weather.

CONSEQUENCE

Hazardous levels of propionaldehyde in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may absorb propionaldehyde vapors and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of propionaldehyde from contact with its vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid propionaldehyde may slow the release of vapors into the atmosphere. (Note: All propionaldehyde must be dissolved in water.)

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of propionaldehyde vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Propionaldehyde may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained propionaldehyde may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL.. . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

PROPIONALDEHYDE
Class 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

PROPIONIC ACID
Class 8 (Corrosive Material)

GENERAL INFORMATION

Propionic acid is a colorless oily liquid with a sharp, rancid, acrid and irritating odor. It is used for making preservatives and fungicides, herbicides, emulsifying agents, perfumes, artificial flavors, pharmaceuticals, plastics, and other chemicals and products. It is fully soluble with water. The 126-130°F flash point of the product indicates that propionic acid must be moderately heated or exposed to very high ambient temperatures before ignition may occur easily. Accumulations of vapors from warmed liquid in confined spaces such as sewers or buildings may result in explosions if ignited. Containers have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.3 pounds per gallon.

Propionic acid does not react with water and is stable in normal transportation. Reactions with alcohols, glycols, aldehydes, epoxides, explosives, or polymerizable compounds may be violent or explosive, and the acid is reactive with a variety of other chemicals. It corrodes ordinary steel and many other metals in a reaction that is not hazardous. Vapors are highly irritating and the liquid may have a corrosive effect on eyes, skin and mucous membranes when concentrated. Products of combustion may include irritating fumes of unburned acid and toxic constituents.

Downwind evacuations should be considered on a case by case basis if propionic acid is leaking but not on fire.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in alcohol, chloroform, ether, and inert organic solvents.

Specific Gravity (Liquid): 0.992 - 0.997 at 68°F (20°C)

Boiling Point: 285.3-286.5°F (140.7 - 141.4°C) at 1 atm.

Melting Point: - 5.4°F (-20.8°C) to - 7.6°F (- 22°C)

Freezing Point: - 5.4°F (- 20.8°C) to - 8.3°F (- 22.4°C)

Molecular Weight: 74.08

Heat of Combustion: - 4935 cal/g

Vapor Pressure: 2.4 - 3.0 mm Hg (0.046 - 0.058 Asia) at 68°F (20°C)

Flash Point: 126-130°F (52.2 - 54.4°C), closed cup; 130 - 134°F (54.4 - 56.7°C), open cup.

Autoignition Temperature: min. 870°F (466°C); max. 1105°F (596°C); reported values vary

Burning Rate: 2.2 mm/minute (undiluted)

Stability: Stable

Corrosiveness: Corrodes ordinary steel and many other metals. Carbon steel, brass, or bronze not acceptable from color and contamination standpoint.

Reactivity with Water: *No* reaction

Reactivity with Other Chemicals: Reacts with oxidizing agents, alkalies, mineral acids, azo and diazo compounds, hydrazines, isocyanates, amines, caustics, nitrites, alcohols, glycols, aldehydes, epoxides, polymerizable compounds, strong reducing agents, nitrides, cyanide, dithiocarbamates, inorganic fluorides or sulfides, alkaline earth elemental metals, and explosives.

IDENTIFICATION

Shipping Names: Propionic acid (USDOT or IMO); propionic acid solution (USDOT).

Synonyms and Tradenames: Propanoic acid, methylacetic acid; ethane carboxylic acid; carboxyethane; ethylformic acid; metacetonic acid; prozoin; pseudoacetic acid; sentry grain preserver; Tenox P grain preservative.

Chemical Formula: CH_3CH_2COOH

Constituent Components (% each): 99+% for technical grade; may also be water solution

49 STCC: 49 314 48 (undiluted); 49 314 47 (solution)

UN/NA Designation: UN1848

IMO Designation: 8, corrosive

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Acrid, sour, sharp, rancid, irritating.

Common Uses: Grain and wood chip preservative; electroplating solutions; mfg. of mold inhibitors, fungicides, herbicides, emulsifying agents, perfumes, artificial fruit flavors, pharmaceuticals, plastics, and other chemicals.

PROPIONIC ACID
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 5.8-34 ppb

Unusual Hazards: Combustible liquid with irritating vapors and a corrosive effect on tissue.

Short Term Exposure Limits (STEL): 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 10 ppm over each *8* hours of a *40* hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazards are from inhalation of irritating vapors and physical contact with corrosive liquid. The product is not highly volatile.

Hazards of Skin or Eye Contact: Liquid propionic acid is a skin irritant with the potential to cause moderate to severe damage or burns after short contact. Contact with the eyes may cause severe irritation, redness, tearing, blurred vision, and possible necrosis.

Hazards of Inhalation: Vapors of propionic acid are highly irritating to the eyes, nose, and respiratory tract.

Hazards of Ingestion: Propionic acid may cause severe damage to mucous membranes when concentrated but is not very toxic when dilute. Swiss cheese may contain up to 1% of this chemical.

FIRE HAZARDS

***Lower Flammable Limit*:** 2.9-3.7%

Upper Flammable Limit: 12.1-14.8%

Behavior in Fire: Combustible liquid. Will burn but difficult to ignite unless heated. There is some limited potential that containers may rupture violently in fire.

Hazardous Combustion Products: Irritating fumes of unburned acid and possibly other toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors of warmed liquid are ignited in a confined area. There is some limited potential that containers may rupture violently in fire. Reactions with various other chemicals may be explosive (see General Information section).

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For short-term low-level exposure, a gas mask with chin-style or front or back mounted canister or a chemical cartridge respirator with a full facepiece within the use limitations of these devices. The canister or cartridge should provide protection from propionic acid.

FIRST AID

Nonspecific symptoms: Irritation of eyes, nose, or respiratory tract due to vapor exposure. Irritation or burns due to ingestion or physical contact with liquid.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

1848

PROPIONIC ACID
Class 8 (Corrosive Material)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, dry chemical, carbon dioxide. Water spray may be used for dilution to nonflammable concentration.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Eliminate ignition sources. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the reactivity of propionic acid into account while planning the response.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION... Propionic acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of propionic acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Propionic acid spills may expose downwind areas to toxic or flammable concentrations, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to propionic acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain propionic acid from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

PROPIONIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of propionic acid vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

J Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid propionic acid may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid propionic acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES. . . Propionic acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained propionic acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Reinforce diked walls as needed.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

PROPIONIC ACID
Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES. . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

PROPIONIC ACID
Class 3 (Flammable Liquid)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Neutralize to pH 7 before applying carbon.)

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

March 1995

PROPYL ACETATE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Propyl acetate is a colorless liquid with a pleasant, mild fruity odor like pears. It is used as a solvent and has uses in flavoring agents, perfumes, adhesives, plastics, resins, lacquers, and other products, as well as for making other chemicals. Slightly soluble in water and lighter, propyl acetate will float to form a surface slick that slowly dissolves. Its flash point of 55-58°F indicates that it can easily be ignited under many ambient temperature conditions. At warmer temperatures, vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. There is some potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.1-7.4 pounds per gallon.

Propyl acetate does not react with water or many other common materials but will attack various plastics and resins and react with a variety of other chemicals. It is stable in normal transportation and of low to moderate toxicity via the various potential routes of exposure. Products of combustion may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 1.89 g/100 g water (2.3%W) at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohols, esters, ether, hydrocarbons, and ketones.

Specific Gravity (Liquid): 0.855-0.887 at 68°F (20°C)

Boiling Point: 204.8-215.6°F (96-102°C) at 1 atm.

Melting Point: –134.5 or –139.9°F (– 92.5 to – 95°C)

Freezing Point: – 133.6 to – 135.4°F (– 92 to – 93°C)

Molecular Weight: 102.13

Heat of Combustion: Unavailable

Vapor Pressure: 23-24.9 mm Hg (0.445-0.481 psia) at 68°F (20°C)

Flash Point: 55-58°F (13-14.4°C), closed cup; 58-70°F (14.4-21.1°C), open cup.

Autoignition Temperature: 842-855°F (450-457°C)

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: Brass, bronze, or lead compounds not acceptable from a color or contamination standpoint. Will attack many plastics and resins. Carbon steel, 304SS, lined carbon steel, or aluminum not attacked.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Reacts with nitrates, strong oxidizers, inorganic acids, alkali, strong reducing agents, explosives, alkaline earth elemental metals, nitrides, azo and diazo compounds, hydrazines, and caustics.

IDENTIFICATION

Shipping Names: nPropyl acetate (USDOT & IMO)

Synonyms and Tradenames: Acetic acid, propyl ester; n-propyl acetate; 1-acetoxypropane; 1-propyl acetate.

Chemical Formula: $CH_3COOCH_2CH_2CH_3$

Constituent Components(% each): 90-100% pure

UN/NA Designation: UN1276

IMO Designation: 3.2, flammable liquid

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant; mild fruity; pear odor

Common Uses: Solvent for nitrocellulose and cellulose derivatives, resins, lacquers, printing inks, adhesives, mfg. of perfumes, flavoring agents, plastics, other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

PROPYL ACETATE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: 20 ppm, but could be as low as 0.05-0.15 ppm according to some authorities.

Unusual Hazards: Moderately volatile flammable liquid. Vapors may be heavier than air and travel to a source of ignition.

Short Term Exposure Limits(STEL): 250 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 200 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air, as may occur in the immediate vicinity and directly downwind of a spill.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid propyl acetate may result in drying and cracking of the skin. Contact with the eyes may cause irritation with redness and tearing.

Hazards of Inhalation: Vapors are irritating to the eyes, nose, and respiratory tract. High concentrations in air may be narcotic with symptoms including dizziness, weakness, fatigue, nausea, headache, loss of consciousness, and possibly death. Exposure to 24,500 ppm for 30 minutes is lethal to cats. Repeated exposure to 5300 ppm causes eye irritation and salivation.

Hazards of Ingestion: Ingestion of propyl acetate may cause gastrointestinal irritation, nausea, vomiting, diarrhea, headache, drowsiness, and unconsciousness.

FIRE HAZARDS

Lower Flammable Limit: 1.7-2%

Upper Flammable Limit: 8%

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire.

Hazardous Combustion Products: Not well-defined, may include toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. There is some potential that containers may rupture violently in fire.

PROTECTIVE CLOTHING AND EQUIPMENT

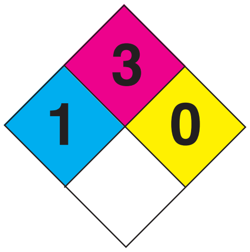
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include neoprene, polyvinyl alcohol, butyl rubber, polyethylene, polyurethane, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 8000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (8000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

1276

PROPYL ACETATE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes and nose or other symptoms of vapor exposure or ingestion. Eye or skin irritation from direct physical contact.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if irritation persists after washing of skin.

First Aid for Ingestion: If victim is conscious, administer two glasses of water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Water spray, alcohol foam, dry chemical, carbon dioxide. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of propyl acetate may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that propyl acetate is a flammable liquid.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Propyl acetate spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Propyl acetate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of propyl acetate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

PROPYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to propyl acetate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of propyl acetate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of propyl acetate vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Propyl acetate may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained proply acetate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

PROPYL ACETATE
Class 3 (Flammable Liquid)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across steam and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled products.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment. The technique will not be effective for propyl acetate that has dissolved in water.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow of dam or water body boundaries. The spilled product may all dissolve in water before the dam in completed.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

PROPYL ACETATE

Class 3 (Flammable Liquid)

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating propyl acetate before it dissolves in water.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with propyl acetate may be used to absorb spilled product from the water surface, preferably after the spill has been contained but before proply acetate dissolves in water.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equlpment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July, 1994

PROPYLAMINE*
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Propylamine is a colorless liquid with a strong ammonia odor. It is lighter than water and completely soluble in water. Liquid propylamine weighs 5.9 lbs/gal.

Propylamine is flammable, heavier than air, and with its low boiling point, can be expected to generate significant quantities of vapor. Propylamine has a very low flash point and is flammable under most circumstances. It is easily ignited by flame, sparks, or static discharges and vapors may travel considerable distances to a source of ignition. Vapors will likely concentrate in low lying areas and, if concentration is sufficient, may represent a potential for ignition and flashback to source. Vapor accumulations in confined areas, such as buildings or sewers, may present an explosion hazard. Aside from its flammability, propylamine is stable and not prone to hazardous polymerization reactions.

On direct contact, propylamine will likely result in strong irritation or burns to the skin, eyes or other mucous membranes. Damage to eyes can be permanent. If vapors are inhaled, they will irritate or burn the respiratory tract.

Propylamine is a chemical intermediate used in the manufacture of rubber processing chemicals, dyes, pharmaceuticals, textile resins, and additives to petroleum products.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Completely soluble.
Solubility in Other Chemicals: Completely soluble in alcohol and ether. Soluble in acetone, benzene, and chloroform.
Specific Gravity (Liquid): 0.718 -0.719
Vapor Density (Air =1): 2.04
Boiling Point: 48 to 49°C (118.4 to 120.2°F)
Melting Point: -83°C (-117.4°F)
Freezing Point: -83°C (-117.4°F)
Molecular Weight: 59.11
Heat of Combustion: -8763 cal/gm
Vapor Pressure: 248 mmHg@ 20°C (68°F)
Flash Point: -37.2°C to 12°C (-34.96 to 10.4°F) CC
Autoignition Temperature: 317°C (602.6°F)
Burning Rate: Unavailable.
Stability: Stable, not subject to polymerization.
Corrosiveness: Alkaline liquid, corrosive to tissues.
Reactivity with Water: Not reactive with water.
Reactivity with Other Chemicals: Reacts with oxidizers and strong acids.

IDENTIFICATION

Shipping Names: Propylamine
Synonyms and Tradenames: 1-Propanamine; I-Aminopropane; CAS 107-10-8.
Chemical Formula: $C_3H_3NH_2$
Constituent Components (% each): 99% propylamine
UN/NA Designation: UN1277
IMO Designation: 3.1, flammable liquid.
Physical State as Shipped: Liquid.
Physical State as Released: Liquid.
Color of the Shipped Material: Colorless.
Odor Characteristics: Strong ammonia odor.
Common Uses: Chemical intermediate, laboratory reagent. Used in the manufacture of pharmaceuticals, rubber processing chemicals, dyes, petroleum additives, and textile resins.

---

*Reportable Quantity (RQ) established Refer to appendix 1.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

PROPYLAMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.0089 ppm (0.022 mg/m^3)

Unusual Hazards: Propylamine is a highly flammable liquid. It is a strong irritant to skin and mucous membranes and is toxic by all routes of exposure. When ignited or exposed to heating, the combustion and decomposition products include toxic ammonia. Above the flash point, propylamine is explosive within the limits of flammability.

Short Term Exposure Limits (STEL): None determined.

Time Weighted Average (TLV-TWA): None determined.

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Toxic by ingestion, and to a lesser degree, absorption and inhalation. Irritant to skin and highly irritating to eyes and mucous membranes. Inhalation exposure may result in severe irritation to the respiratory mucous membranes, pulmonary edema, and, in severe cases, chemical pneumonia.

Hazards of Skin and Eye Contact: Liquid exposure to eyes may result in severe irritation and corneal injury. Propylamine may produce permanent eye damage. Vapors may be irritating to eyes. Skin contact may result in severe irritation, redness, blistering or burns. Severity of symptoms will increase with quantity and duration of exposure. Toxic by skin absorption on prolonged contact. May cause headache, nausea, and vomiting.

Hazards of Inhalation: Primarily an irritant to respiratory mucous membranes. Prolonged exposure to excessive vapors may result in varying degrees of respiratory impairment including burning sensation, coughing, wheezing, and shortness of breath. Severe exposures may result in pulmonary edema and chemical pneumonia. Development of pulmonary symptoms may be delayed. Risk of systemic toxicity by inhalation route. Symptoms may include headache, nausea, and vomiting.

Hazards of Ingestion: Severe irritation or burns of the mouth, throat, stomach and associated tissue. May cause nausea, vomiting, and gastrointestinal distress. May also produce symptoms of dizziness, light headedness, and nervousness or anxiety.

FIRE HAZARDS

Lower Flammable Limit: 2.0%

Upper Flammable Limit: 10.4%

Behavior in Fire: Smoke may contain toxic and irritating vapors. Vapors are heavier than air and will tend to collect in confined spaces or low lying areas. Vapor concentrations may present a source for ignition and flashback to the source under circumstances favoring vapor buildup. Sealed containers, exposed to heating may rupture.

Hazardous Combustion Products: Ammonia, unburned product, oxides of carbon and other constituents.

EXPLOSION HAZARDS

Explosiveness: Vapor mixtures within the flammable limits may ignite explosively. Otherwise stable and not subject to violent polymerization.

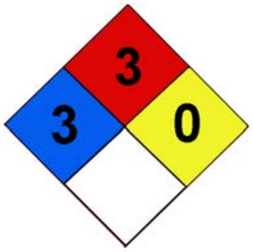
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with propylamine liquid or vapors. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Fully encapsulating suits made of compatible material are appropriate for most large spill situations. Data is limited, however, teflon and chlorinated polyethylene (CPE) compositions have been suggested as suitable materials of construction.

Respiratory Protection: OSHA/NIOSH approved organic vapor cartridge respirators can be used within the limitations of these devices. Positive pressure, self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with large spills.

1277

PROPYLAMINE
Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation or burns to skin, eyes and respiratory tract. Irritation or burns to mouth, throat and stomach, gastrointestinal distress, nausea, vomiting, dizziness and difficulty breathing in cases involving accidental ingestion.

First Aid For Inhalation: Remove victim to fresh air. Remove contaminated clothing and keep victim warm. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure resulting in increased respiratory distress with time. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance immediately. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance if skin irritation persists or exposure is severe.

First Aid for Ingestion: Do not induce vomiting. If victim is conscious, administer large quantities of water or milk. Never give anything by mouth to an unconscious person. Seek medical assistance immediately. Be alert to signs of difficulty in breathing, nervousness, or other indications of systemic toxicity.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, compatible multi-purpose foam, carbon dioxide, or dry chemical extinguishing agents. Water may be ineffective as a firefighting agent but may be used to dilute mixtures to non-flammable concentrations. Diluting with water will add significantly to the spill volume.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with propylamine. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers with water from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank. Water may be ineffective as a suppressent but can be used to dilute mixtures below their flammable range. Carbon dioxide or dry chemical extinguishing agents are suitable for small fires within limitations of the extinguishing system. Alcohol foam is appropriate for fires involving propylamine.

SPILL RESPONSES

General Information: Propylamine is highly flammable and easily ignited. Response strategies should account for the fact that flammable vapors are heavier than air and may travel some distance to a source of ignition. Intact containers containing propylamine may rupture violently if exposed to extreme heat or fire. When spilled in water, propylamine is completely soluble and will tend to disperse in the water column. All spill responses should consider that until the product is removed to safe containers, ignition is possible. Eliminate ignition sources. Notify authorities, downstream of spill, of the potential for contamination. If introduced into sewer system, notify sewer authorities. Notify affected industrial water users of the potential for contamination. If introduced into industrial water intakes, sewage treatment plants and other facilities, ignition of propylamine may result in explosion. Use only spark proof tools when working around propylamine. Be sure lighting systems are of explosion proof design (intrinsically safe). Be alert to sources of ignition and static electrical discharge. Ground all transfer equipment to prevent static charge buildup.

PROPYLAMINE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . .Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Propylamine spills may expose downwind areas to toxic or flammable concentrations over considerable distances, in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY. . .Water fog applied to propylamine vapors or fumes may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain propylamine from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . .Fire fighting or compatible hazardous materials foams applied to the surface of liquid pools may slow the release of propylamine vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As foam breaks down, the release of vapors will increase. Products of foam breakdown will add to the spill volume.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as contaminated with propylamine.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . .Spills of propylamine liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Propylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause impoundments to overflow. Where possible, line containment areas with suitable, impervious material.

PROPYLAMINE
Class 3 (Flammable Liquid)

LAND SPILL *(CONTINUED)*

TECHNIQUE

EXCAVATION . . .A trench or ditch may be excavated to intercept leaking propylamine.

CONSEQUENCE

Propylamine may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . .Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Propylamine is highly flammable and explosion proof (intrinsically safe) equipment must be used.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

Use equipment constructed of compatible materials. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION . . .Spilled propylamine can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with propylamine and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL. . .Spilled propylamine and contaminated soil may be removed by shovels, motorized graders, scrapers, loaders, bulldozers and draglines. Explosion proof (intrinsically safe) equipment must be used due to the high flammability of propylamine.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Removed materials may pose a continued risk of fire or contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Store contaminated materials in a safe and secure location.

PROPYLAMINE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . .Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION . . .Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels..

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

March 1995

PROPYLENE

Class 2.1 (Flammable Gas)

GENERAL INFORMATION

Propylene, which may be also transported in the U.S. with the shipping name “liquefied petroleum gas” or LPG for short, is a colorless and flammable liquefied gas with a boiling point of approximately 53.9°F in the open environment. It has an odor like petroleum when pure but shipments may be treated at times with a foul (skunk-like) additive for leakage warning purposes. The substance is used as an aerosol propellant and to make resins, gasoline components polypropylene plastic, synthetic rubber, and a wide variety of other chemicals.

Propylene is practically insoluble in water and lighter. Due to its very low boiling point temperature, any spilled liquid will rapidly boil from ground or water surfaces under all ambient temperature conditions to produce large amounts of vapor. These vapors will be heavier than air, may accumulate and persist in pits, hollows and depressions, and/or travel a considerable distance to a source of ignition and flash back or even explode. Accumulations of vapor or gas in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently and possibly rocket if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 5.1 pounds per gallon at its boiling point temperature.

Propylene does not react with water or many other common materials but contact of very cold liquid propylene with hot water has the potential to result in a liquid “superheat” explosion, which in simple terms, can be attributed to the large temperature differences involved and the extremely rapid and potentially violent manner in which the liquid may vaporize. The product is incompatible with oxidizing materials that may cause its ignition and may react violently or explosively with a wide variety of other chemicals. It is not corrosive to common metals but may affect some plastics, rubber, and coatings. Toxicity of the product is very low by all routes of exposure, but contact with very cold liquid or gas may result in frostbite or freeze burns. Products of combustion may include toxic constituents.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location and weather conditions if propylene is leaking from its container but not on fire. If a bulk container is exposed to direct flame or a fire become uncontrollable, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently and possibly rocket. (Note: The data and information presented below are for relatively pure propylene. The properties of propylene may be altered if it is shipped or stored as a mixture with other substances.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble, most reported values range from 200 to 790 ppm by weight at 68°F (20°C), one source reports 1400 ppm at 70°F (21.1°C)

Solubility in Other Chemicals: Reported soluble in alcohol, acetic acid, and ether; likely to be soluble in many other hydro carbons and their derivatives.

Specific Gravity (Liquid): 0.61 at –52.6°F (–47°C); 0.51-0.52 at 68°F (20°C)

Boiling Point: –53.9°F (–47.7°C) at 1 atm.

Melting Point: –301.4°F (–185.2°C)

Freezing Point: See melting point

Molecular Weight: 42.08

Heat of Combustion: –10,940 cal/g

Vapor Pressure: Approx 10 atm (146.9 psia) at 68°F (20oC)

Flash Point: –162°F (–107.8°C), closed cup

Autoignition Temperature: 851 to 860°F (455 to 460°C), 896 or 927°F (480 or 497°C), reported values vary

Burning Rate: 8 mm/minute

Stability: Stable

Corrosiveness: Not corrosive to common metals; may attack some plastics, rubber, and coatings.

Reactivity with Water: No reaction, but contact of very cold liquid propylene with water may result in vigorous or violent boiling of the product and extremely rapid vaporization due to the large temperature differences involved. If the water is hot, there is a possibility that a liquid “superheat” explosion may occur. Pressures may build to dangerous levels if liquid propylene contacts water in a closed container.

Reactivity with Other Chemicals: May react vigorously, ignite, or explode in contact with strong oxidizing agents or materials. Explosive polymerization is initiated by a lithium nitrate and sulfur dioxide mixture. Reacts violently with oxides of nitrogen and may explode or form an explosive product. Explodes when mixed with trifluoromethylhypofluorite and other hydrocarbons. Variously reported to be incompatible with molten sulfur and certain halogenated compounds, halogens, strong acids and alkalies. May possibly be incompatible with aldehydes and certain elemental metals. Several authorities report propylene may explode spontaneously when heated to high temperatures and subjected to high pressures in confinement.

IDENTIFICATION

Shipping Names: Propylene (USDOT & IMO)

Synonyms and Tradenames: Propene; 1-propene; 1-propylene; methylethylene; methylethene; may be shipped in the U.S. as liquefied petroleum gas (LPG).

Chemical Formula: $CH_3CH = CH_2$

Constituent Components (% each): About 80% or more pure for propylene concentrate or refinery grade; about 92% to 95% pure for chemical grade, about 95k or more pure for technical grade; about 99, or more pure for commercial grade; about 99.75 or more pure for polymer or research grade, reported information varies. Remainder usually consists mostly of propane with smaller amounts of ethane and methane and traces of a wide variety of other substances. According to one manufacturer, experience has shown that propylene may occasionally contain small amounts of radon (a naturally occurring radioactive gas) and its particulate decay products, some of which may be retained in contaminated equipment and pose an inhalation hazard. Gamma radiation may be detected in such cases when propylene is present and for some hours thereafter. (Note: This information was found in only one of numerous data sources. Potential radioactivity was not mentioned elsewhere.)

UN/NA Designation: UN1077 (USDOT & IMO); UN1075 (USDOT)

IMO Designation: 2.1, flammable gas

Physical State As Shipped: Liquid

Physical State As Released: Boiling liquid, gas, or mixture of gas and aerosols (small liquid droplets) depending on release conditions.

Color of the Shipped Material: Colorless, but very cold gas may appear white at first due to condensation of water vapor in the atmosphere.

Odor Characteristics: Practically odorless or like mild petroleum; some shipments may contain a foul (skunk-like) odorant for leakage warning purposes.

Common Uses: Manufacture of a wide variety of other chemicals, resins, gasoline components, raw materials for detergents, polypropylene plastic, and synthetic rubber; used as an aerosol propellant.

PROPYLENE

Class 2.1 (Flammable Gas)

See "UN/NA Designation"
for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 10 to 80 ppm; reported values vary

Unusual Hazards: Extremely volatile and flammable heavier than air gas or vapor that may travel a considerable distance to a source of ignition and flash back. Vapors and gases may persist in pits, hollows, and depressions Unconfined as well as confined vapor clouds may explode if ignited. Small amounts of radioactive gas may be present according to one manufacturer. Propylene may explode spontaneously if subjected to high temperatures and pressures in confinement. Contact of very cold liquid propylene with hot water may result in a liquid “superheat” explosion.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Listed as simple asphyxiant (ACGIH, 1989 90).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of the very high concentrations of propylene gas or vapor that may be present in air at the spill site and some distance downwind. Direct contact should also be avoided. One manufacturer of propylene reports the possibility that small amounts of radioactive radon gas may be present in its product at times.

Hazards of Skin or Eye Contact: Contact with very cold liquid propylene or very cold gas may cause frostbite or freeze burns of the skin or eyes. There is some potential for permanent eye injury. Frostbite may also occur from contact with the surface of a very cold container of the product.

Hazards of Inhalation: High concentrations of propylene gas or vapor in air may cause central nervous system depression. Very high concentrations may cause suffocation by diluting the concentration of oxygen in air below levels necessary to fully support life. Symptoms of central nervous system depression and progressively lower levels of available oxygen are reported to include dizziness, drowsiness, headache, coughing, lachrymation, nausea, fatigue, errors in judgment, excittion, fatigue, rapid pulse, gasping, confusion, giddiness, irregular heartbeat, decrease in blood pressure, vomiting, convulsions, loss of consciousness and death, possibly in seconds and without warning if oxygen levels drop too low. Experiments have shown that propylene causes some degree ot cardiac sensitization in dogs and it is therefore assumed to be a weak cardiac sensitizer in humans.

Hazards of Ingestion: Due to its low boiling point temperature, ingestion of liquid propylene is considered highly unlikely. If it should occur, frostbite of the lips, mouth, and other contacted tissues may be expected.

FIRE HAZARDS

Lower Flammable Limit: Most data sources list 2%,, but values of 1.9% and 2.4% are also reported in the literature.

Upper Flammable Limit: 10.1%-10.3% or 11%-11.1% ; reported values vary.

Behavior in Fire: Liquefied flammable gas. May generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel a a considerable distance to a source of ignition and flash back. Containers may rupture violently in fire and possibly rocket. Propylene is reported to burn with a yellow sooty flame.

Hazardous Combustion Products: Not well-defined; include carbon monoxide, carbon dioxide, and other potentially toxic constituents.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

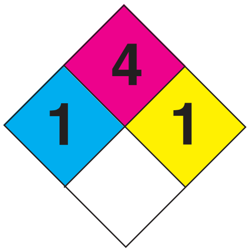
Explosiveness: Containers may rupture violently and possibly rocket in fire. Explosion may result if vapors or gases are ignited in a confined area. There is known potential for explosions involving unconfined vapor clouds. Propylene may explode spontaneously when heated to high temperatures and subjected to high pressures in confinement. Contact with certain other chemicals may result in an explosion. Contact of very cold liquid propylene with hot water may possibly result in the occurrence of a liquid “superheat” explosion.

1077

See "UN/NA Designation"
for other ID numbers.

PROPYLENE

Class 2.1 (Flammable Gas)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of eye contact with very cold liquid or gas and should prevent the skin from becoming frozen from contact with the product or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Dizziness, drowsiness, or other symptoms of central nervous system depression or oxygen deficiency; frostbite or freeze burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. Propylene may be a weak cardiac sensitizer; it may not be prudent to administer epinephrine to the victim.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing after thawing. Wash affected body areas with large amounts of warm water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas.)

First Aid for Ingestion: Wash exposed body areas with warm water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas.)

FIRE RESPONSE

Extinguishing Materials: Stop flow of gas or liquid or let fire burn if discharge is appreciable. Use carbon dioxide or dry chemical on small fires in the open involving smaller containers that can be safely extinguished and isolated from other flammables. Use water spray or foam on large fires to cool surroundings.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Note that contact with water may increase vapor evolution from any pools of liquid propylene that may form on the ground.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the extremely volatile and flammable nature of propylene into account while planning the response. Beware of possible heavy gas accumulations in low areas.

PROPYLENE
Class 2.1 (Flammable Gas)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Propylene discharges may expose downwind areas to flammable concentrations over considerable distances in some cases, particularly if the discharge is large. Distances associated with toxic levels are likely to be less for this particular material.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to propylene vapors or fumes in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Contact of liquid propylene pools with water spray or fog may increase vapor evolution.

MITIGATION

Apply water at a point downwind and do not allow it to contact pools of liquid propylene.

TECHNIQUE

FOAM . . . There is a possibility that application of firefighting foam to the surface of liquid propylene pools may slow the release of vapors into the atmosphere after an initial increase.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed or vaporized. Contain increased volume if necessary. Proceed with caution if the initial increase in vapor evolution may affect downwind populations or operational safety.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid propylene may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Very high pressures may develop in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as nitrogen or carbon dioxide to precool transfer lines and receiving containers to avoid high initial vaporization rates upon entry of product into the equip ment.

WATER SPILL

Liquid propylene will boil or rapidly vaporize from the water surface with negligible dissolution in the vast majority of cases.

October 1993

PROPYLENE DICHLORIDE
Class 3 (FLAMMABLE LIQUID)

GENERAL INFORMATION

Propylene dichloride is a colorless flammable liquid with an odor variably described as sweet, pleasant or unpleasant, and resembling chloroform. It is slightly soluble in water and heavier, so may be expected to sink in water and dissolve at a very slow rate. It may be easily ignited under moderate to high ambient temperature conditions. Vapors of propylene dichloride may be heavier than air, may persist for a time in low areas, and/or may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. The liquid weighs about 9.6 pounds per gallon.

It does not react with water and is stable in normal transportation. Although it is not expected to be generally corrosive to metals, it can react with aluminum and possibly other active metals, and may attack various forms of plastics, rubber, and coatings. It is otherwise reactive with strong acids, strong oxidizers and possibly a variety of other chemical substances. Toxicity of the substance is generally low to moderate by direct contact and ingestion but quite high via inhalation. Products of combustion are reported to include toxic carbon monoxide and carbon dioxide, hydrogen chloride (and hydrochloric acid), small amounts of chlorine, and phosgene, and possibly other harmful substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning if propylene dichloride is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently and possibly rocket.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very slightly soluble; approx 0.25 - 0.27 g/100 g water (2500 - 2700 ppm) at 68°F (20°C).

Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, ether, and many other common solvents.

Specific Gravity (Liquid): 1.1560 -1.1593 at 68°F (20°C).

Boiling Point: 205.0 - 206.2°F (96.1 - 96.8°C) at 1 atm.

Melting Point: -148.7°F (-100.4°C); other to -94°F (- 70°C).

Freezing Point: See melting point.

Molecular Weight: 112.99.

Heat of Combustion: -4,100 cal/g.

Vapor Pressure: Approx 10 mm Hg (0.1933 psia) at 21°F (-6.1°C); and 100 mm Hg (1.933 psia) at 102.9°F (39.4°C).

Flash Point: 60°F (15.6°C), closed-cup; 70°F (21.1°C), open-cup.

Autoignition Temperature: 1,035°F (557°C).

Burning Rate: 3.2 mm/minute.

Stability: Stable.

Corrosiveness: Limited data available. Not expected to be corrosive to metals but may react with aluminum and other active metals under appropriate conditions. May attack some forms of plastics, rubber, and coatings.

Reactivity with Water: No reaction.

Reactivity with Other Chemicals: Containment in unvented aluminum equipment may possibly result in an explosion after some period of time, especially but not necessarily if any aluminum chloride is or becomes present. May behave similarly with other active metals such as zinc, with metallic powders being more reactive than solid sheets. Contact with strong acids may result in product decomposition. Reactions of halogenated organic materials such as propylene dichloride with cyanides, mercaptans or other organic sulfides typically generate heat, while those with mineral acids, amines, azo compounds, hydrazines, caustics or nitrides commonly evolve heat and toxic or flammable gases. Reactions with oxidizing mineral acids may generate heat, toxic gases and fires. Those with alkali or alkaline earth metals, certain other chemically active elemental metals like aluminum, zinc or magnesium, organic peroxides or hydroperoxides, strong oxidizing agents, or strong reducing agents typically result in heat generation and explosions and/or fires.

IDENTIFICATION

Shipping Names: Propylene dichloride.

Synonyms and Tradenames: Dichloropropane; alpha, beta-dichloropropane; alpha, beta-propylene dichloride; 1,2-DCP; 1,2-dichloropropane; PDC; and propylene chloride.

Chemical Formula: $CH_3CHCICH_2C1$.

Constituent Components (% each): 99% or more pure but very crude grades are also marketed.

UN/NA Designation: UN1279.

IMO Designation: 3, flammable.

Physical State As Shipped: Liquid.

Physical State As Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Sweet, pleasant; unpleasant; like chloroform.

Common Uses: Solvent for fats, oils, waxes, gums, resins, and other substances; used in dry cleaning fluids, metal degreasing agents, and fumigant mixtures, intermediate in production of perchloroethylene and carbon tetrachloride.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

PROPYLENE DICHLORIDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Thresholds of 50 to 90 ppm have been reported.

Unusual Hazards: Reacts in an unusual manner with aluminum and possibly other active metals. Both the liquid and vapor, upon contact with a hot surface or naked flame, decompose to form extremely toxic phosgene gas and other harmful substances.

Short Term Exposure Limit (STEL): 110 ppm for 15 minutes (ACGIH, 1992 - 93; OSHA, 1989).

Time Weighted Average (TWA) Limit: 75 ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989).

Conditions to Avoid: Heat, fire, sparks, and contact with hot surfaces; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high concentrations of propylene dichloride vapors that may be present in air at the spill site and over considerable downwind distances. Direct contact and ingestion should also be avoided. This substance is suspected of being a carcinogen and mutagen.

Hazards of Skin or Eye Contact: Vapors of propylene dichloride are known to temporarily irritate the eyes of humans and cause lacrimation when exposures are of limited duration. Contact of the eyes with liquid propylene dichloride or its mists may cause smarting that may persist for several hours and damage to the cornea that is most likely to be superficial and temporary in nature. Prolonged or repeated skin contact with the liquid may cause drying and cracking (and possibly a rash) due to the defatting action of the product. More severe irritation and inflammation may occur if the liquid is confined against the skin such as by clothing. The skin of some susceptible people, may become sensitized to propylene dichloride upon repeated or prolonged exposure such that they become allergic. Liquid propylene dichloride can be absorbed through intact skin but at such a slow rate that a single exposure, unless massive and prolonged, is not likely to result in significant intoxication. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Vapors of propylene dichloride are irritating to the nose, throat, and respiratory system. Exposure to high concentrations in air may cause central nervous system depression, narcosis, and other effects with symptoms that may variably include headache, coughing, sneezing, changes in vision and speech, nausea, personality change (such as agitation or drunkenness), drowsiness, lightheadedness, dizziness, incoordination, irritation of the lungs, tremors, spasms, seizures, bronchitis, pneumonia, unconsciousness, and possibly death in severe cases. High concentrations are rapidly anesthetic but certain other effects may be delayed in onset. Prolonged overexposure may also result in anemia, fatty degeneration and biological oxidation of the liver and kidneys (and occasionally heart), possible effects on the brain (which may be permanent), effects on the adrenal glands and spleen, increased risk of serious heart rhythm changes, and "disseminated intravascular coagulation". Any alcohol consumed before or after exposure may greatly increase the severity of effects, particularly upon the liver and/or kidneys. 50% of rats died after exposure to 2000 to 3000 ppm for 8 hours. The NIOSH IDLH (1990) for propylene dichloride is 2000 ppm. The saturated vapor concentration directly over a pool of propylene dichloride is about 13,160 ppm at 21°F (- 6.1°C); 51,710 to 56,580 ppm at 68°F (20°C); and 131,580 ppm at 102.9°F (39.4°C).

Hazards of Ingestion: Ingestion of liquid propylene dichloride causes many of the same effects as excessive inhalation but the single dose oral toxicity of the substance is not high. The dosages reported to cause the death of 50% of rats and mice in laboratory experiments are respectively 1.9 - 2.2 and 0.86 grams per kilogram of an animal's body weight. Some differences in effects are that ingestion may cause vomiting, and that if any liquid is aspirated into the lungs, it may be rapidly absorbed and result in injury to other body systems. Abdominal pain, widespread small hemorrhages in the skin or mucous membranes, blood in the urine, uterine bleeding, congestion of the lungs and bladder, and hemorrhages in the stomach and respiratory tract are some of many additional effects of excessive ingestion. As in the case of inhalation, there is a possibility that consumption of alcohol before or after an exposure may greatly increase risks to the liver and/or kidneys.

FIRE HAZARDS

Lower Flammable Limit: Nominally 3.4%; 3.2% at 122°F (50°C).

Upper Flammable Limit: Nominally 14.5%; 12.2% at 122°F (50°C).

Behavior in Fire: Flammable liquid. May possibly generate large amounts of flammable vapors upon release. Such vapors may travel some distance to a source of ignition and flash back. There is some potential for containers to rupture violently and possibly rocket in fires. Both the liquid and vapor, on contact with a hot surface or a naked flame, decompose to form phosgene, an toxic gas, and other harmful substances.

Hazardous Combustion Products: Reported to include toxic carbon monoxide and carbon dioxide, corrosive hydrogen chloride (and hydrochloric acid), small amounts of chlorine, small amounts of toxic phosgene, and possibly other harmful substances.

1279

PROPYLENE DICHLORIDE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS *(CONTINUED)*

EXPLOSION HAZARDS

Explosiveness: Explosion may result if vapors from propylene chloride at or above its flash point are ignited in a confined area. There is some potential for containers to rupture violently and possibly rocket in fires. Contact with certain metals or chemicals may result in an explosion.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with products of combustion in fires involving propylene dichloride. Compatible materials for propylene dichloride itself may include polyvinyl alcohol, Teflon, Viton, and butyl rubber (less resistant than others listed). Materials that may be compatible for both hydrochloric acid and chlorine (products of combustion) include butyl rubber, neoprene, nitrite rubber, and Saranex. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of eyes, nose, throat, respiratory system, or skin; headache, coughing, nausea, vomiting, drowsiness, dizziness, tremors, abdominal pain, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. See note below on consumption of alcohol and administration of sympathomimetic drugs.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately in the case of eye contact and promptly in the case of skin contact, particularly if irritation persists after washing.

First Aid for Ingestion: Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Because rapid absorption may occur through the lungs if propylene dichloride is aspirated, the decision of whether or not to induce vomiting should be made by a physician since the danger of aspiration must be weighed against toxicity when considering emptying the stomach. If lavage is performed, endotracheal and/or esophageal control is suggested.) Be advised that exposures may increase myocardial irritability. Do not administer sympathomimetic drugs such as epinephrine (i.e., adrenalin) unless absolutely necessary. Note that alcohol consumed before or after exposure may increase toxicity and that excessive exposures may aggravate preexisting liver and kidney disease. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective. Some authorities recommend use of alcohol foam instead of regular foam; both may be effective to some degree.

Extinguishing Techniques: Corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full protective clothing if contact with dense fumes/smoke is anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent

PROPYLENE DICHLORIDE
Class 3 (Flammable Liquid)

SPILL RESPONSES *(CONTINUED)*

substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines prior to use. Take the volatility, flammability, toxicity, and reactivity of propylene dichloride into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Propylene dichloride discharges may expose downwind areas to toxic and possibly flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to propylene dichloride vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of propylene dichloride from contact with its airborne vapors.

MITIGATION

Where deemed necessary, contain contaminated water and remove it as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam (either regular or alcohol type) applied to the surface of liquid pools may slow the release of propylene dichloride vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . Propylene dichloride is heavier than water and only very slightly soluble. Gentle application of a light spray of water onto the surface of confined pools of the liquid may form a floating layer (i.e., blanket) of water that reduces vapor emissions.

CONSEQUENCE

Addition of water will increase the volume of contained liquids.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid propylene dichloride may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

PROPYLENE DICHLORIDE
Class 3 (Flammable Liquid)

LAND RESPONSES *(CONTINUED)*

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION. . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable vapors present in the area may be ignited by motorized equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Propylene dichloride is somewhat heavier than water and only very slightly soluble.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic or flammable vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

CHEMICAL TREATMENT . . . Application of appropriate chemical agent(s) to the contaminated body of water and subsequent mixing may in some cases reduce environmental hazards.

CONSEQUENCE

Some agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe treatment techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION. . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1997

PROPYLENE TETRAMER

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Propylene tetramer is a clear and colorless liquid with a hydrocarbon odor used in surfactant manufacturing. Purity of the product is nearly 100% with only .01% of an antioxidant reported as a constituent component. This material is generally stable but contact with strong oxidizers should be avoided.

The primary route of entry is inhalation, although contact can occur through skin, eye or ingestion. Severe irritation to associated organs can occur for all possible routes of entry. Prolonged exposure to the skin can cause defatting. Inhalation can lead to CNS affects or death and ingestion creates an aspiration hazard.

It is classified as a flammable liquid by US DOT and IMO, however if it is transported in bulk it can be classified as a combustible liquid. When heated to decomposition, product gives off carbon monoxide, carbon dioxide and other various hydrocarbons. It has a relatively high boiling point, low evaporation rate and vapor pressure at normal ambient temperatures and therefore, it is not expected to generate much flammable vapors beyond the immediate spill area. Under some conditions vapors are heavier than air and can travel to sources of ignition creating a flash back. Runoff from fire control or dilution water may be toxic and/or flammable and cause environmental damage.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble
Solubility in Other Chemicals: Soluble in hydrocarbon solvents, ethanol, acetone and ethane, slightly soluble in water.
Specific Gravity (Water=1): .771-.776 at 15.6°C (60.1°F)
Vapor Density (Air=1): 5.81
Boiling Point: 180-202.8°C (356-397°F)
Melting Point: -100°C (-148°F)
Freezing Point: See melting point
Molecular Weight: 168.36
Heat of Combustion: Unavailable
Evaporation Rate (n-Bu Acetate=1): Less than 0.1
Vapor Pressure: 52 mm Hg at 37.8°C (100°F)
Flash Point: 23-61°C (73.4-141.8°F); >54.4°C (130°F) also reported
Autoignition Temperature: 243°C (469°F)
Burning Rate: Unavailable
Flammable Limits: 0.2% (LEL) - 12.7% (UEL)
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Avoid contact with strong oxidizing agents.

IDENTIFICATION

Shipping Name(s): Propylene tetramer (USDOT & IMO)
Synonyms and Tradenames: Amsco tetramer; Dodecene; Dodecylene; Propene tetramer; Tetrapropylene
CAS Registry No: 68526-58-9
Chemical Formula: $C_{12}H_{24}$
Constituent Components (% each): Hydrocarbon (100%); sometimes reported to have .01% antioxidant.
UN/NA Designation: UN2850
IMO Designation: 3.3
RTECS Number: UD1860000
NFPA 704 Hazard Rating: 1 (Health): 2 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear and colorless.
Odor Characteristics: Hydrocarbon odor.
Reportable Quantity: See appendix I
Common Uses: Surfactant manufacturing.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PROPYLENE TETRAMER

Class 3 (Flammable Liquid) or Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Exposure can cause severe irritation to the eyes, skin and respiratory tract. Defatting can occur as well as central nervous system effects and aspiration.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 100ppm recommended by one manufacturer.

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as strong oxidizing agents.

HEALTH HAZARDS

Potential Health Hazards: Contact with skin or eyes can cause irritation or defatting (in the case of skin). Aspiration hazard exists if ingested. Inhalation can cause irritation to the respiratory tract as well as other symptoms.

Hazards of Skin or Eye Contact: Contact with eyes can cause severe irritation, redness, tearing and blurred vision. Prolonged or repeated contact with skin can cause moderate irritation, defatting and dermatitis.

Hazards of Inhalation: Excessive inhalation of vapors can cause nasal and respiratory irritation, central nervous system effects including dizziness, weakness, fatigue, nausea, headache and possible unconsciousness including death.

Hazards of Ingestion: Ingestion can cause gastrointestinal irritation, nausea, vomiting and diarrhea. Aspiration of material into the lungs can cause chemical pneumonitis which can be fatal.

FIRE HAZARDS

Lower Flammable Limit: 0.2%

Upper Flammable Limit: 12.7%

Behavior in Fire: Propylene tetramer is a flammable liquid with a fire potential. It will readily ignite and burn if exposed to sources of ignition, heat and flame. It has a relatively low vapor pressure at ambient temperatures, but if heated it can produce sufficient vapors which are heavier than air, can travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may be invisible and may travel to ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources and flash back. Runoff from fire control or dilution water may be flammable and/or toxic and cause environmental damage.

Hazardous Decomposition Products: Carbon dioxide, carbon monoxide, and various hydrocarbons.

EXPLOSION HAZARDS

Explosive Potential: Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas where vapors can accumulate, since it may present a vapor explosion hazard. Containers exposed to prolonged heat and flame may violently rupture.

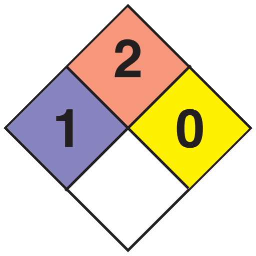
PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing

2850

PROPYLENE TETRAMER

Class 3 (Flammable Liquid) or
Combustible Liquid



(EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

FIRST AID

Nonspecific Symptoms: Primary route of entry is from inhalation.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact, wash with soap and copious amounts of water. Remove contaminated clothing. Treatment should be directed towards the control of symptoms and the clinical condition. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, do not give liquids or induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, foam or water spray (fog).

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Do not extinguish fire unless source of leak can be shut off without risk to personnel. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Containers should be cooled with water spray from a distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Propylene tetramer is a flammable liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition.

PROPYLENE TETRAMER

Class 3 (Flammable Liquid) or Combustible Liquid

Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Due to its high boiling point and low vapor pressure at ambient temperatures, propylene tetramer is not expected to release much vapor beyond the immediate spill area. However, continuous air monitoring of the immediate area and downwind should be conducted for the presence and/or spread of any hazardous concentrations of flammable and/or toxic vapors especially if the material is involved in a fire or a large spill is involved. The evacuation zone should be expanded as conditions warrant.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind if there is a large spill or the material is involved in a fire.

MITIGATION

Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used effectively to control the production of vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated runoff and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas runoff may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

PROPYLENE TETRAMER
Class 3 (Flammable Liquid) or Combustible Liquid

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor the situation for the presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

PROPYLENE TETRAMER

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

CONTAINMENT DIKES . . . If released into water sources, propylene tetramer is expected to float on the surface. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION . . . Material is not water soluble and lighter than water. Overflow dams may be used to confine or divert the spill to a limited area.

CONSEQUENCE

Some material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of any vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Booms may be an effective means to recover spilled material since the material is not water soluble and will float on the surface of the water. Barriers of suitable material may be used to confine the spill to a limited area to prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Continually monitor the integrity of the boom/barriers.

TECHNIQUE

SURFACE SKIMMING . . . Surface skimming may be effective since the material is not water soluble and is lighter than water.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Continually monitor the integrity of the boom/barriers.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat or commercial sorbent materials compatible with propylene tetramer may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Continually monitor for flammable vapors and eliminate ignition sources.

January 1990

PROPYLENEIMINE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Propyleneimine is a colorless, fuming, flammable liquid that is fully soluble in water and will mix freely. It has an odor resembling ammonia and is used as an organic intermediate in making various products for the paper, textile, rubber, agricultural, petroleum, and pharmaceutical industries. Its flash point of 25°F indicates it may be easily ignited under most ambient temperature conditions. Vapors may be heavier than air and may in any case travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 6.7 pounds per gallon.

Propyleneimine reacts with water in a slow and nonhazardous fashion to form propanolamine or methylethanolamine according to various authorities. It is stable in normal transportation when kept in contact with anhydrous caustic soda (sodium hydroxide). Exposure to excessive heat or acids may initiate a violent or explosive polymerization, as may contamination with certain other substances, when propyleneimine is not diluted with water. Besides being incompatible with oxidizing agents and silver, the product is likely to be reactive with a wide variety of other chemical substances. Toxicity of the product is very high by all routes of exposure and it must be realized that the volatility of the product indicates that high concentrations of propyleneimine vapors may be present in air. Products of combustion include toxic oxides of nitrogen, carbon monoxide, carbon dioxide, and possibly other toxic constituents.

If propyleneimine is leaking (not on fire), downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of at least one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Soluble in many organic solvents

Specific Gravity (Liquid): 0.801 - 0.807 at 68°F (20°C)

Boiling Point: 150.8 - 155°F (66 - 68.3°C) at 1 atm.

Melting Point: - 85°F (- 65°C)

Freezing Point: See melting point

Molecular Weight: 57.1

Heat of Combustion: - 8600 cal/g

Vapor Pressure: 112 mm Hg (2.165 psia) at 68°F (20°C)

Flash Point: 25°F (- 3.9°C); closed or open cup; reports vary

Autoignition Temperature: Unavailable

Burning Rate: *4.1* mm/minute

Stability: Stable in normal transportation when kept in contact with anhydrous caustic soda (sodium hydroxide) which acts as both a dehydrating agent for moisture and neutralization agent in case there is accidental exposure to an acid. May polymerize violently upon excessive heating or if contaminated by acids, acid fumes, or possibly other chemicals.

Corrosiveness: Carbon and stainless steels are preferred materials of construction; silver or silver solder should never be used since silver has been reported to react violently with imines. May attack some forms of plastics, rubber, and coatings. For ethyleneimine, a close relative, storage or handling in tin, lead, low carbon steel, polyethylene, Kel-F, or teflon is recommended; any and all contact with silver or aluminum is restricted.

Reactivity with Water: Reacts slowly and in nonhazardous fashion to form propanolamine or methylethanolamine (reported information varies).

Reactivity with Other Chemicals: Undiluted product may polymerize violently or explosively in contact with acids (including carbonic acid which is C02 gas in water), acid-forming materials, and a variety of other catalysts. Incompatible with oxidizing agents. Similar products are reactive with a wide variety of chemical substances. For ethyleneimine, a close relative, it is reported that carbon dioxide, oxidizers, silver, aluminum, other catalytically active metals, or chloride ions may initiate polymerization; that the product forms explosive compounds with silver (including silver solder), chlorine, or sodium hypochlorite; and that it is also reactive with acrolein, allyl chloride, carbon disulfide, epichlorohydrin, glyoxal, vinyl acetate, oxidizing agents, betapropiolactone, and other materials.

IDENTIFICATION

Shipping Names: Propyleneimine, inhibited (USDOT); propyleneimine (IMO)

Synonyms and Tradenames: 1,2-propyleneimine; propylenimine; 1,2-propylenimine; propylene imine; 2-methylaziridine; methylethyleneimine; 2-methylethyleneimine; 2-methylazacyclopropane

Chemical Formula: CH_3CHCH_2NH (ring structure)

Constituent Components (% each): Contains pellets or lumps of anhydrous caustic soda (sodium hydroxide) to inhibit polymerization.

49 STCC: 49 070 *40*

UN/NA Designation: UN1921

IMO Designation: 3.2, flammable liquid

Physical State As Shipped: Liqiud

Physical State As Released: Liquid

Color of the Shipped Material: Colorless, fuming

Odor Characteristics: Like ammonia

Common Uses: Organic intermediate used to make numerous products for the paper, textile, rubber, and pharmaceutical industries. Also used in producing petroleum products and agricultural chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

PROPYLENEIMINE
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Toxic, flammable, reactive, and relatively volatile fuming liquid. May polymerize violently or explosively if exposed to excessive heat or contaminated by acids or various other materials. Vapors are not inhibited and may form polymers in vents or flame arresters resulting in stoppage.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 2 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with acids or other incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Propyleneimine is a highly toxic substance that attacks the body in many ways, is a suspected human carcinogen in long term occupational exposures, and may also have mutagenic effects under such conditions. All exposures to this substance should be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid propyleneimine may result in slow healing burns. The product can be absorbed through the skin rapidly in toxic amounts causing various effects of inhalation, and possibly has the potential to cause sensitization of the skin on occasion. Some effects of exposure may be delayed. Contact with the eyes may cause burns, permanent eye damage, and possibly even death. Do not wear contact lenses when working with propyleneimine.

Hazards of Inhalation: Vapors of propyleneimine are irritating to the eyes, mucous membranes, nose, throat, and upper respiratory tract. By analogy to the effects of ethyleneimine, effects on the eyes may be expected to increase over several hours after exposure but are usually temporary and involve reddening of the whites of the eyes. Similarly, excessive inhalation may be expected to cause sore throat, swelling of the face, persistent coughing, nausea, vomiting, headache, dizziness, difficult breathing, laryngeal edema, effects on the blood, kidney damage, bronchitis, pulmonary edema, hemorrhage, bronchial pneumonia, convulsions, and possibly death. Several effects may be delayed in onset. Exposure to 500 ppm in air for one hour was lethal to some guinea pigs in laboratory experiments; exposure for four hours to 500 ppm proved lethal to some rats.

Hazards of Ingestion: Propyleneimine is highly toxic via ingestion. Effects may include burns of the mouth and throat, and (by analogy to the effects of ethyleneimine) scarring of the esophagus, kidney and liver injury, damage to the rods and cones of the retina leading to blindness, effects associated with inhalation, and possibly death.

FIRE HAZARDS

Lower Flammable Limit (LFL): Unavailable

Upper Flammable Limit (UFL): Unavailable

Behavior in Fire: Flammable liquid. May generate large quantities of flammable and highly toxic vapors upon release. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in explosive polymerization.

Hazardous Combustion Products: Not well-defined; may include toxic oxides of nitrogen, carbon monoxide, carbon dioxide, and other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit (LEL): Unavailable

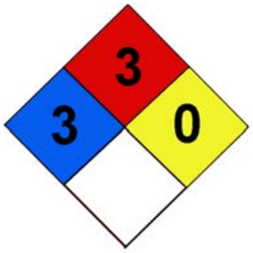
Upper Explosive Limit (UEL): Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat may cause spontaneous violent polymerization resulting in explosion. Explosive polymerization may also occur in presence of acids, acid-forming materials, and possibly other substances. Contact with certain other chemicals may result in formation of explosive mixtures.

1921

PROPYLENEIMINE

Class 3 (Flammable Liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas-tight safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; coughing, headache, dizziness, nausea, and other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or skin irritation persists after washing.

First Aid for Ingestion: *If* victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately. (Note: Although the above suggestion to induce vomiting after the ingestion of large quantities of water comes from NIOSH, other authorities recommend that vomiting not be induced, presumably to avoid the possibility of aspiration into the lungs and the attendant possibility of pulmonary edema and bronchial pneumonia. If possible, seek immediate medical advice on this issue before treatment, realizing that both courses of action expose the victim to different but serious risks.)

FIRE RESPONSE

Extinguishing Materials: Water spray or fog, dry chemical, Halon, alcohol foam. Water may be ineffective but may be used to dilute the spill to a nonflammable mixture. Note that carbon dioxide should be used with care where there is a possibility that it may form carbonic acid, since carbonic acid may initiate violent or explosive polymerization of the propyleneimine.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof tools and explosion-proof equipment where necessary. Take the volatile, flammable, reactive, and highly toxic nature of propyleneimine into account when planning the response. Exclude air from containers of propyleneimine if possible to prevent entry of carbon dioxide and possible formation of carbonic acid. Keep liquid propyleneimine in contact with solid caustic soda (sodium hydroxide) to inhibit polymerization.

PROPYLENEIMINE
Class 3 (Flammable Liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Propyleneimine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to propyleneimine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of propyleneimine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid propyleneimine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of propyleneimine vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for firefighting suggests it may have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of the foam may be short-term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES.. . Propyleneimine may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained propyleneimine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

PROPYLENEIMINE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under the guidance of a qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable gases or vapors present in air in the spill area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Propyleneimine is fully soluble in water and will mix freely to form an alkaline solution.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

PROPYLENEIMINE
Class 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to contaminated water that is alkaline, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. Cationic exchangers may be used for neutral or acidic solutions. (Note: The above recommendations by various authorities were found for spills of ethyleneimine into water. Although similar recommendations were not found for propyleneimine, there is a good chance that these remedial measures may also be appropriate for the latter product. Consult qualified experts for guidance.)

CONSEQUENCE

Recovery of adsorbents may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2003

PROPYLENE OXIDE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Propylene oxide is a highly volatile colorless liquid with the relatively low boiling point of 93.7°F. It has a sweet alcoholic and ethereal odor and is used for making propylene glycol, ingredients of polyurethane foam, detergents, brake fluids, fumigants, and synthetic lubricants. It is moderately soluble in water and will quickly dissolve. Its flash point of - 35°F indicates that the product may be easily ignited under all ambient temperature conditions. Its low boiling point suggests that the product will boil at high ambient temperatures or otherwise rapidly evaporate when spilled, thus evolving large amounts of vapor. These vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, or depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 6.9 pounds per gallon.

Propylene oxide does not react with water or many other common materials and is stable in normal transportation. Excessive heat or contamination by various chemicals may result in self-polymerization and possible violent rupture of its container. The product is otherwise reactive with a variety of chemicals. It is not considered to be highly corrosive, but no acetylide-forming metals like copper and its alloys should be allowed to contact propylene oxide. The product is a potential carcinogen and may be present in air in high concentrations. Products of combustion may include toxic constituents.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if propylene oxide is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 40.5 g/100g water at 68°F (20°C).
Solubility in Other Chemicals: Soluble in alcohol and ether
Specific Gravity (Liquid): 0.83 at 68°F (20°C)
Vapor Density: 2.0
Boiling Point: 93.7°F (34.3°C) at 1 atm
Melting Point: See freezing point.
Freezing Point: - 169.4°F (- 111.9°C)
Molecular Weight: 58.08
Heat of Combustion: - 7221 cal/g
Evaporation Rate (butyl acetate=1): >1
Vapor Pressure: 442 mm Hg (8.54 psia) at 68°F (20°C)
Flash Point: - 35°F (- 37.2°C), closed cup
Autoignition Temperature: 840 - 869°F (449 - 465°C)
Burning Rate: 3.3 mm/minute
Flammable Limits: 2.1% (LFL) - 38% (UFL)
Stability: Stable, but may polymerize under appropriate conditions.
Polymerization Potential: Polymerization may occur due to high temperatures or contamination with alkalis, aqueous acids, amines or acidic alcohols.
pH: 7
Corrosiveness: May attack some plastics, rubber, and coatings. Avoid acetylide-forming metals such as copper and its alloys.
Reactivity with Water: No reaction.
Reactivity and Incompatibility: Alkalis, acids, amines, acidic alcohols, peroxides, and anhydrous metal chlorides like iron or aluminum chloride may initiate polymerization. Also reacts with oxidizing materials, various oxides and chlorides, alkali metal hydroxides, chlorine, ammonia and acetylide forming metals.

IDENTIFICATION

Shipping Name(s): Propylene oxide (USDOT & IMO)
Synonyms and Tradenames: 1,2-Epoxypropane; Methylethylene oxide; Methyl oxirane; Propene oxide; Epoxy propane; 1,2-Propylene oxide.
CAS Registry No.: 75-56-9
Chemical Formula: CH_3CHOCH_2
Constituent Components (% each): 99.99 - 100% pure
UN/NA Designation: UN1280
IMO Designation: 3, Flammable liquids
RTECS Number: TZ2975000
NFPA 704 Hazard Rating: 3 (Health): 4 (Flammability): 2 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid (boils at 93.7°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, pungent, like alcohol or ether
Reportable Quantity: See appendix I
Common Uses: Mfg. propylene glycol, other glycols, ingredients of polyurethane foam, detergents, brake fluids, fumigants, synthetic lubricants, stabilizer for methylene chloride, treating wood for termite resistance, pH control agent and for dried fruits and food stuffs. Often used as an intermediate in the synthesis of other chemicals and polymers.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

PROPYLENE OXIDE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 9.9 - 200 ppm; reported values vary

Unusual Hazards: Highly volatile flammable liquid with heavier than air vapors that may travel considerable distance to a source of ignition. May polymerize and violently rupture container if exposed to heat or various chemical contaminants (see Reactivity With Other Chemicals section). Vapors may persist for a time in pits, hollows and depressions.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 20 ppm over each 8 hours of a 40 hour work week. (ACGIH)

IDLH: 400 ppm

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air, but direct contact and ingestion should also be strictly avoided. Material is a potential carcinogen.

Hazards of Skin or Eye Contact: Contact of liquid propylene oxide with the skin may cause irritation, blistering and burns upon short exposure, especially when the product is confined to the skin by contaminated jewelry or clothing. Contact with the eyes may cause corneal burns.

Hazards of Inhalation: Vapors of propylene oxide may cause irritation of the eyes, nose, throat and lungs. High concentrations in air may cause central nervous system depression with symptoms including loss of coordination, headache, nausea, vomiting, weakness, difficult breathing, unconsciousness and possibly death. Exposure of dogs to 2030 ppm in air for 4 hours caused some deaths in laboratory experiments.

Hazards of Ingestion: Ingestion may result in irritation and burns of the mouth and gastrointestinal tract and various symptoms of inhalation.

FIRE HAZARDS

Lower Flammable Limit: 2.1%

Upper Flammable Limit: 38%

Behavior in Fire: Containers may rupture violently in fire due to over pressurization. May generate large quantities of corrosive vapors and fumes upon release. Contact with organic matter may cause ignition.

Hazardous Combustion Products: Thermal decomposition may produce toxic fumes of phosphorous oxides and/or phosphine, carbon monoxide and carbon dioxide. Also see decomposition products of water reaction.

EXPLOSION HAZARDS

Explosive Potential: Very reactive. Containers may rupture violently in fire. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Explosive hydrogen gas evolved in reactions with some metals and may explode if ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

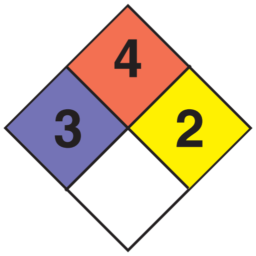
Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact and any possibility of skin contact with the spilled product. This may include rubber boots, gloves, face shields, splash- proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include polyethylene. Tychem® 9400, Tychem® BR, Tychem® 10,000 and Tychem® TK are reported to have greater than 480 minute normalized breakthrough times.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

1280

PROPYLENE OXIDE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, nose, throat or lungs; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if skin irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Get medical attention.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, alcohol-resistant foam or water spray. Water may be ineffective but may be used to dilute spills to non-flammable mixtures.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Propylene oxide may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Propylene oxide is a highly flammable and corrosive liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Propylene oxide may float on top of water. Do not use combustible materials, such as sawdust. According to one source, clay should not be used as it reported to react with propylene oxide.

PROPYLENE OXIDE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of material from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam applied to the surface of liquid pools may slow the release of propylene oxide vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

DILUTION . . . The addition of a large amount of water to propylene oxide may slow the release of vapors into the atmosphere. Use this technique only for small spills and only on the advisement of product experts.

CONSEQUENCE

Vapor or fume evolution may be increased during and immediately after water application, thus increasing downwind and local hazards for a time. Addition of water will increase the volume of material requiring recovery.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Propylene oxide may be confined by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Confined material may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

PROPYLENE OXIDE
Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth, or other absorbent non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

PROPYLENE OXIDE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

PYRIDINE
Class 3 (Flammable liquid)

GENERAL INFORMATION

Pyridine is a colorless or slightly yellow flammable liquid that has a sharp, unpleasant, nauseating, burnt odor and that is used as a solvent, as a denaturant, and in the making of paints, explosives, dyestuffs, rubber, and other products. It is fully soluble in water and will mix freely. Its flash point of 66 - 68°F indicates that is can be easily ignited under a wide range of ambient temperature conditions. Vapors of pyridine may travel some distance to a source of ignition and flash back at warmer temperatures. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 8.2 pounds per gallon.

Pyridine does not react with water, is considered stable in normal transportation, and is generally non-corrosive (although copper and its alloys, including brass, are not considered compatible and the product may cause some forms of plastics and rubber to deteriorate). Contact with strong oxidizing agents may cause fires or explosions directly or produce potentially explosive substances, and pyridine is otherwise reactive with a variety of substances. Toxicity of pyridine is generally low to moderate with the exception of exposures resulting in direct contact of the liquid with the eyes. Products of thermal decomposition include toxic cyanide fumes while those of combustion include toxic oxides of nitrogen and carbon monoxide.

If pyridine is leaking but not on fire, downwind evacuation should be considered until properly equipped responders have evaluated the hazard. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in alcohol, ligroin, ether, petroleum ether, oils, and many other organic liquids.
Specific Gravity (Liquid): 0.982 - 0.983 at 68°F (20°C)
Boiling Point: 239 - 240°F (115 - 115.5°C) at 1 arm.
Melting Point: - 43.6 to - 42.9°F (- 42 to - 41.6°C)
Freezing Point: See melting point
Molecular Weight: 79.10
Heat of Combustion: - 7992 to - 8142 cal/g
Vapor Pressure: 14 - 18 mm Hg (0.271 - 0.348 psia) at 68°F (20°C)
Flash Point: 66 - 68°F (18.9 - 20°C), closed cup
Autoignition Temperature: 900°F (482°C)
Burning Rate: 4.3 mm/minute
Stability: Stable
Corrosiveness: Non-corrosive in general but copper and its alloys are not considered compatible. Contact may cause some forms of plastics and rubbers to deteriorate.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with oxidizing materials, maleic anhydride, possibly other acid anhydrides, strong acids, formamide, sulfur trioxide, iodine, beta-propiolactone, chromium trioxide, and possibly other substances.

IDENTIFICATION

Shipping Names: Pyridine (USDOT and IMO)
Synonyms and Tradenames: Azabenzene; azine
Chemical Formula: C_55H_55N or $CH[(CHCH)_2]N$
Constituent Components (% each): Often 99% or more pure, but cruder grades may also be shipped.
49 STCC: 49 092 77
UN/NA Designation: UN1282
IMO Designation: 3.2, flammable liquid
Physical State As Shipped: Liquid
Physical State As Released: Liquid
Color of the Shipped Material: Colorless or slightly yellow liquid
Odor Characteristics: Sharp, penetrating; strong, unpleasant; burnt, pungent; nauseating. Olfactory fatigue may occur quickly.
Common Uses: Mfg. of paints, explosives, dyestuffs, rubber, vitamins, sulfa drugs, fungicides, disinfectants, and water proofing agents; solvent in chemical industry; denaturant for ethyl alcohol and antifreeze mixtures.

PYRIDINE
Class 3 (Flammable liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odo: Concentration: Less than 1 ppm; odor fatigue may occur rapidly.

Unusual Hazards: Flammable liquid of significant but not high volatility. Thermal decomposition may produce cyanide fumes.

Short Term Exposure Limits (STEL): 10 ppm (deletion proposed) for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 5 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from the high vapor concentrations that may be present in the spill area and over some distance downwind. Direct contact and ingestion are also to be avoided.

Hazards of Skin or Eye Contact: Liquid pyridine and its concentrated vapors may cause moderate to severe irritation of the skin upon repeated or prolonged contact. Significant exposures may result in absorption of toxic amounts through the skin, occasional skin sensitization, and occasional photosensitization. Contact of the eyes with liquid pyridine and its solutions may cause a severe reaction with clouding of the cornea, scarring of the conjunctiva, and possibly permanent injury.

Hazards of Inhalation: Vapors of pyridine in air are irritating to the eyes, eye lids, and upper respiratory tract. High concentrations may cause narcosis, central nervous system depression, and gastrointestinal disturbance with symptoms including headache, dizziness, nervousness, nausea, vomiting, weakness, diarrhea, low back pain, urinary frequency, insomnia, and possibly loss of consciousness. Exposure of rats to 23,000 ppm (2.3%) was lethal in 1.5 hours, while exposure to 3600 ppm for 6 hours was fatal to 2 of 3 rats tested. A woman exposed to high levels for 15 to 20 minutes experienced speech disorders and "diffused cortical afflication" which receded after thiamine therapy. The symptoms did not occur for 10 hours, intensified until the third day, and did not involve the upper respiratory tract.

Hazards of Ingestion: Pyridine has a low to moderate acute oral toxicity. Nevertheless, ingestion of several ounces may cause severe vomiting, diarrhea, delirium, symptoms similar to those for inhalation, and death. Repeated doses are known to cause liver and kidney injury.

FIRE HAZARDS

Lower Flammable Limit: 1.8%

Upper Flammable Limit: 12.4%

Behavior in Fire: Flammable liquid. Vapors are heavier than air at warmer temperatures and may travel to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable gas or vapor upon release.

Hazardous Combustion Products: Thermal decomposition produces toxic cyanide fumes while combustion results in toxic oxides of nitrogen and carbon monoxide.

EXPLOSION HAZARDS

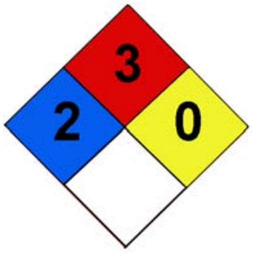
Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

1282

PYRIDINE
Class 3 (Flammable liquid)



PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor concentrations in air. Compatible materials may include butyl rubber and polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 250 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (250 ppm or less) or an organic vapor cartridge respirator with a full facepiece (250 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of eyes, skin, or upper respiratory tract; symptoms of narcosis and gastrointestinal disturbance.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention immediately if eye contact has occurred or skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: *Dry* chemical, carbon dioxide, alcohol foam, water spray or fog. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Use explosion-proof and spark-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the flammable and fairly volatile nature of pyridine into account while planning the response.

PYRIDINE
Class 3 (Flammable liquid)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent public exposure and to allow vapors or fumes to dissipate. Pyridine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases, particularly if large quantities have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Pyridine may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of pyridine in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to pyridine vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a some amount of pyridine from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . Alcohol foam applied to the surface of liquid pools may slow the release of pyridine vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid pyridine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

PYRIDINE
Class 3 (Flammable liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid pyridine may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCES

Contained pyridine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION : . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, sand and soda ash mixtures, earth, vermiculite, other inert mineral based materials, and possibly compatible cellulosic based or commercial sorbent materials.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL.. . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Motorized equipment may ignite any flammable vapors in the spill area.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Take proper precautions for the possibility of flammable vapors in the spill area.

PYRIDINE
Class 3 (Flammable liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users of contaminated water to stop or monitor water intake. Pyridine is fully soluble in water and will mix freely.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

TECHNIQUE

ABSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. Cation exchangers may also be effective where solutions are neutral or acidic. (Note: Pyridine solutions in water are normally weakly basic.)

CONSEQUENCE

Recovery of sorbents added to water may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe sorption techniques. Consider pumping water through tank containing sorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

RESIN SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid

GENERAL INFORMATION

Resin solution is a flammable usually dark brown colored liquid with an odor like hydrocarbon or solvent solutions. Resin solution covers a wide range of mixtures with varying constituents, some having more toxic constituents than others. It is used as a solvent and in manufacturing. Depending on the mixture, the liquid may be heavier than water but most sources report it to be lighter and only slightly soluble, so it may dissolve at a slow rate. Its lowest reported flash point of 0ºF indicates that the product can be ignited under all ambient temperature conditions. The product may generate heavier than air vapors and may travel a considerable distance to a source of ignition and flash back. Vapors also may persist in low areas. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat. The product weights approximately 5.8 to 9.7 pounds per gallon.

Resin solutions are not reported to react with water and is considered stable in normal transportation. It is reported to react vigorously with strong oxidizers, strong lewis or mineral acids, and strong mineral and organic bases, especially primary and secondary aliphatic amines and to be sensitive to static discharge. Products of combustion may include carbon monoxide, carbon dioxide and other gases originating from constituents. Product should be considered toxic, although it is highly dependent on the constituent components to ascertain true toxicity; primary routes of exposure are through inhalation or direct physical contact.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible, below 0.1%.
Solubility in Other Chemicals: Unavailable
Specific Gravity (Liquid): Varies; 0.7 - 1.17. Most report less than 1.
Vapor Density: Varies; one source reports 3.7
Boiling Point: Varies; 211 - 284ºF (99 - 140ºC)
Melting Point: Unavailable
Freezing Point: Unavailable
Molecular Weight: Varies
Heat of Combustion: Varies
Evaporation Rate (butyl acetate=1): 0.34
Vapor Pressure: Varies; 3.8 - 47 mmHg
Flash Point: Varies; 0 to over 100ºF (-17 to over 38ºC)
Autoignition Temperature: Varies; most sources do not report a value, however several sources suggest the range 765 - 930ºF (407 - 500ºC)
Burning Rate: Varies
Flammable Limits: Varies; 1.2% (LEL) - 28% (UEL)
pH: Most likely neutral
Stability: Stable
Polymerization Potential: Will not occur in most mixtures, however some mixtures may present the potential for polymerization.
Corrosiveness: None reported.
Reactivity with Water: No reactions reported.
Reactivity and Incompatibility: Can react vigorously with strong oxidizers, strong lewis or mineral acids, and strong mineral and organic bases, especially primary and secondary aliphatic amines. Sensitive to static discharge.

IDENTIFICATION

Shipping Name(s): Resin solution (USDOT & IMO).
Synonyms and Tradenames: Many types of resin solutions.
CAS Registry No.: Unavailable
Chemical Formula: Mixtures vary greatly
Constituent Components (% each): Constituents vary greatly between mixtures. Some common constituents are considered toxic and flammable.
UN/NA Designation: UN1866
IMO Designation: 3.1, 3.2 or 3.3, Flammable liquids
RTECS Number: Unavailable
NFPA 704 Hazard Rating: 2(Health): 3(Flammability): 0(Reactivity) Varies depending on constituents.
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Varies, common colors include dark brown and yellow and could even be colorless.
Odor Characteristics: Hydrocarbon or solvent odor.
Reportable Quantity: See appendix I.
Common Uses: Solvent and manufacturing.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

RESIN SOLUTION

Class 3 (Flammable Liquid) or
Combustible Liquid

or

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: None

Short Term Exposure Limit (STEL): No data for resin solution, refer to constituent components.

Time Weighted Average (TLV-TWA): No data for resin solution, refer to constituent components.

Ceiling (C) Limit: No data for resin solution, refer to constituent components.

IDLH: No data for resin solution, refer to constituent components.

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation or direct physical contact of high vapor concentrations that may be present. Ingestion is also to be avoided.

Hazards of Skin or Eye Contact: Skin contact with product or concentrated vapors may cause irritation, redness, and/or rashes. The product may be absorbed via skin in toxic amounts. Splashes of liquid in the eyes cause immediate and severe irritation.

Hazards of Inhalation: Inhalation may cause symptoms ranging from irritation of the respiratory tract headache, depression, nausea to coma.

Hazards of Ingestion: Ingestion may cause vomiting, diarrhea or headache and irritation of the mucous membranes.

FIRE HAZARDS

Lower Flammable Limit: 1.2%

Upper Flammable Limit: 28%

Behavior in Fire: Flammable liquid. Vapors may be heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate large quantities of flammable vapors upon release.

Hazardous Decomposition Products: Varies based on constituent products. May include carbon monoxide, carbon dioxide, silicon dioxide and formaldehyde.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

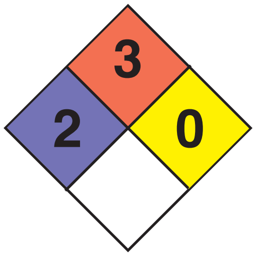
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices. This is highly dependent on the make up of the individual product mixture.

1866

RESIN SOLUTION

Class 3 (Flammable Liquid) or
Combustible Liquid



FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues and eyes; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Due to the extreme variations of the product, vomiting should be determined only by a qualified health care provider. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, water spray, foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of product may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe equipment. Take into account while planning a response that product is volatile, flammable, possibly highly toxic, and easily ignited.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

RESIN SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

COVERAGE WITH WATER . . . Coverage of confined liquid with a blanket of water may slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may be mobile in soil and may seep through dike material, which may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

RESIN SOLUTION

Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT . . . Spilled product may sink in water. Use natural deep-water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination. (Note: This technique is only for those mixtures that have a specific gravity greater than 1.)

CONSEQUENCE

Excavation of deep-water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

RESIN SOLUTION
Class 3 (Flammable Liquid) or Combustible Liquid

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product. (Note: This technique is only for those mixtures that have a specific gravity less than 1.)

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert to conditions that may lead to overflow or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

WATER UNDER-FLOW DAMS . . . Streams may be provided with a under-flow dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of under-flow tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

SILICON TETRACHLORIDE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Silicon tetrachloride, also known as silicon chloride, is a colorless to light yellow fuming liquid with a sharp acrid, pungent, and suffocating odor. It is highly toxic by inhalation and corrosive. The gas is colorless but the fumes are white in moist air. It hydrolyzes to hydrochloric acid on contact with moisture. The product is used in laboratories and in making smoke screens, ethyl silicate and similar compounds, silicones, high purity silica, and fused silica glass. Although the product is not itself flammable, containers may rupture due to increasing pressure if exposed to excessive heat or fire for sufficient time duration. The product weighs approximately 12.4 pounds per gallon.

Silicon tetrachloride is quite volatile and reacts vigorously with water to generate heat, hydrochloric acid, and a gelatinous siloxane. The product and its fumes and vapors are highly corrosive to all bodily tissues and will attack most metals when water is present, possibly with the evolution of flammable and potentially explosive hydrogen gas. Reactions with sodium or potassium may be explosive and the product is also reactive with a wide variety of other chemicals and substances. Decomposition products in a fire may include toxic chlorine, silicon dioxide, and hydrogen tetrachloride gases.

Downwind evacuation should be considered if a spill of silicon tetrachloride generates large amounts of vapors and fumes. These fumes and vapors are heavier than air and may persist in pits, hollows, and depressions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts vigorously, see below.
Solubility in Other Chemicals: Soluble in carbon tetrachloride, tin tetrachloride, titanium tetrachloride, sulfur mono and ditetrachlorides, benzene, and ether.
Specific Gravity (Liquid): 1.483 at 68ºF (20ºC)
Vapor Density: 5.9
Boiling Point: 135.7ºF (57.6ºC) at 1 atm.
Melting Point: -89.9 to -94ºF (-67.7 to -70ºC)
Freezing Point: -94ºF (-70ºC)
Molecular Weight: 169.9
Heat of Combustion: Not flammable.
Evaporation Rate (butyl acetate=1): 20
Vapor Pressure: 200 mmHg (3.87 psia) at 69.8ºF (21ºC)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable Limits: Not flammable
Stability: Stable, but reacts with water or moist air.
Polymerization Potential: Will not occur.
pH: Unavailable
Corrosiveness: Attacks most metals when water present; practically no action on iron, steel, or common metals or their alloys when dry.
Reactivity with Water: Reacts vigorously with evolution of heat, hydrochloric acid, and gelatinous siloxane.
Reactivity and Incompatibility: Reacts with sodium, potassium, alcohols, and a wide variety of other chemicals and substances. Avoid strong acids and bases. Reacts violently and/or explosively with methyl sulfoxide and dimethylformamide.

IDENTIFICATION

Shipping Name(s): Silicon tetrachloride (USDOT & IMO)
Synonyms and Tradenames: Silicon chloride, Tetrachlorosilane.
CAS Registry No.: 10026-04-7
Chemical Formula: $SiCl_4$
Constituent Components (% each): 99.5% or more pure.
UN/NA Designation: UN1818
IMO Designation: 8, Corrosives
RTECS Number: VW0525000
NFPA 704 Hazard Rating: 3(Health): 0(Flammability): 2(Reactivity): Reacts with water
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless to light yellow.
Odor Characteristics: Sharp, acrid, pungent, suffocating.
Reportable Quantity: See appendix I.
Common Uses: Smoke screens; laboratory reagent; mfg. of ethyl silicate and similar compounds, silicones, high purity silica, fused silica glass, and other products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

SILICON TETRACHLORIDE

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive, volatile, and reactive liquid with hazardous fumes and vapors. Reacts vigorously with water to produce hydrochloric acid (See separate guide on hydrochloric acid). May evolve hydrogen gas in contact with certain metals when wet.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 5 ppm (ACGIH)

Ceiling (C) Limit: Unavailable, however, hydrogen chloride which is formed by the hydrolysis of silicon tetrachloride has a ceiling of 5 ppm.

IDLH: Unavailable, however, hydrogen chloride which is formed by the hydrolysis of silicon tetrachloride has an IDLH of 50 ppm.

Conditions to Avoid: Heat; contact with incompatible materials or water; runoff to sewers or water bodies; inhalation, ingestion, and direct physical contact; sparks or fire where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Silicon tetrachloride is highly corrosive to all bodily tissues by all routes of exposure. Major hazard to public is inhalation of vapors or fumes in air, but ingestion and direct physical contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with liquid silicon tetrachloride may cause severe skin burns. Contact with the eyes may cause tearing and inflammation, swelling of tissue, and possible destruction or permanent impairment of the eyes.

Hazards of Inhalation: Vapors and fumes of silicon tetrachloride are extremely irritating and may cause difficult breathing, burning sensations, coughing, wheezing, laryngitis, headache, nausea, and vomiting. Severe exposures may be fatal as a result of spasm, inflammation of the larynx and bronchi, chemical pneumonitis, and pulmonary edema. (Note: Latter effects may be of delayed onset.)

Hazards of Ingestion: Ingestion may cause severe internal injury with pain in the throat and stomach, intense thirst, difficulty in swallowing, nausea, vomiting, and diarrhea. In severe cases, collapse and unconsciousness may occur.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. May generate large quantities of corrosive vapors and fumes upon release.

Hazardous Decomposition Products: Decomposition may produce toxic chlorine, silicon dioxide, and hydrogen tetrachloride gases.

EXPLOSION HAZARDS

Explosive Potential: Very reactive. Not flammable but containers may rupture violently in fire due to overpressurization. Contact with certain other chemicals such as sodium or potassium may result in formation of explosive mixtures. Hydrogen gas evolved in reactions with some metals may explode if ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Teflo$^{®}$ is reported to provide more than 4 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece.

1818

SILICON TETRACHLORIDE

Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If unconscious, administer artificial respiration. Administer amyl nitrite by crushing pearl in a cloth and lightly holding under nose 5 times for 15 seconds at about 15 second intervals. Repeat every 5 minutes as necessary for 3-4 pearls. Administer oxygen if victim remains unconscious or breathing is difficult. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water, lime water, or milk of magnesia immediately. Do not induce vomiting. Get medical attention immediately. Do not give sodium bicarbonate.

Note to Physician: The primary hazard from silicon tetrachloride results from formation of hydrochloric acid upon contact with moisture. Vapors may produce delayed corneal and pulmonary injury. Delayed onset pulmonary edema may occur upon massive overexposure, and secondary infection may occur in the chemically inflamed respiratory tract. Cases of overexposure should be kept under observation. Mediastinitis from esophageal perforation, or peritonitis from gastric perforation may occur upon ingestion. Aspirated silicon tetrachloride can produce severe lung damage. Due to the severely irritant nature of this material, gastric lavage should be carried out with caution.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, or dry sand on adjacent fires. Product reacts with water or foam but may consider using large amounts of water fog or spray if large quantities of combustibles are involved.

Extinguishing Techniques: Corrosive vapor of fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to container rupture potential. Use water from side and from safe distance to keep fire exposed containers cool. Note: Addition of water may increase evolution of fumes from leaking product.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note: Contact with some metals in the presence of moisture may evolve hydrogen gas. Use intrinsically safe equipment where necessary.

SILICON TETRACHLORIDE
Class 8 (Corrosive Material)

AIR RELEASE

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to silicon tetrachloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point downwind of the spill and should not be allowed to contact pools of silicon tetrachloride, as this will increase fume evolution.

CONSEQUENCE

Water runoff may contain varying amounts of silicon tetrachloride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid silicon tetrachloride from a safe distance may eventually slow the release of vapors fumes into the atmosphere. This response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

OIL APPLICATION . . . Application of a fuel oil no. 6 to the surface of liquid pools may reduce emissions of vapors or fumes. This may be done at the same time that a neutralization agent is applied.

CONSEQUENCE

Addition of oil will increase the volume of spilled product.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

SILICON TETRACHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid silicon tetrachloride may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Silicon tetrachloride may be confined by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Confined silicon tetrachloride may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Removed confined product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

SILICON TETRACHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

August 1996

SODIUM ALUMINATE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Sodium aluminate is a colorless and odorless corrosive water solution of a granular hygroscopic solid (white crystalline powder) that is produced from the reaction of hydrated alumina with sodium hydroxide. Other manufacturing processes include the fusion of sodium carbonate with aluminum acetate, or by heating bauxite with sodium carbonate and extracting sodium aluminate with water. Sodium aluminate is used primarily in printing on fabrics, manufacture of milk glass, soap, hardening building stones, sizing improver and filler retention aid in the paper industry, and in water purification processes. Sodium aluminate normally contains an excess of sodium hydroxide or soda ash to maintain a sufficiently high pH to prevent aluminum hydroxide precipitation prior to its addition as a coagulant in municipal water treatment.

Sodium aluminate is corrosive and may cause caustic burns on direct contact to the skin and eyes. Inhalation may cause severe irritation to the nose, throat and respiratory tract. The most common route of exposure is through skin contact. Exposure may cause irritation of the mouth and throat.

Although the fire potential for sodium aluminate is low when exposed to sources of heat and flame, it can react with oxidizing materials. When heated to decomposition, the burning material may generate toxic and irritating fumes. Normal structural firefighting protective clothing will provide only limited protection for releases where sodium aluminate is present. Runoff may be corrosive and/or toxic. Sodium aluminate is water soluble. This material is stable, however it will react with strong acids and generate heat and release toxic fumes.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble.
Solubility in Other Chemicals: Insoluble in alcohol.
Specific Gravity (Liquid): >1.5
Vapor Density: Not applicable.
Boiling Point: Not applicable.
Melting Point: 1650°C (3002°F)
Freezing Point: Not established.
Molecular Weight: 81.97
Heat of Combustion: Not established.
Vapor Pressure: Not established.
Flash Point: Not applicable.
Autoignition Temperature: Not applicable.
Flammable Limits: Not established.
Stability: Stable.
Polymerization Potential: Will not occur.
Evaporation Rate: Unavailable.
pH: 11.5 @ 1% aqueous solution.
Reactivity and Incompatibility: Incompatible with sources of heat and moisture, and strong oxidizers, acids, and bases.
Other Characteristics: When heated to decomposition, material emits irritating and toxic fumes.

IDENTIFICATION

Shipping Name(s): Sodium aluminate, solid or Sodium aluminate, solution
Synonyms and Tradenames: Aluminate, Sodium, Aluminum Sodium Oxide, Sodium Aluminum Dioxide, Sodium Aluminum Oxide, Sodium Metaaluminate, and Sodium-M-Aluminate. CAS Registry No: 1302-42-7
Chemical Formula: $NaAlO_2$
Molecular Formula: $NaAlO_2$
UN/NA Designation: UN2812 (solid); UN1819 (solution)
IMO Designation: 8
NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid (aqueous solution) / crystalline solid (granular or powder).
Physical Form as Released: Liquid (aqueous solution) / crystalline solid (granular or powder).
Color of the Shipped Material: Colorless to white.
Odor Characteristics: Odorless.
Common Uses: Sodium aluminate is used primarily in printing on fabrics, manufacture of milk glass, soap, hardening building stones, sizing improver and filler retention aid in the paper industry, and in water purification processes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

SODIUM ALUMINATE
Class 8 (Corrosive Material)

See "UN/NA Designation"
for other ID numbers.

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Material is corrosive to the eyes and skin upon direct contact. Prolonged exposure can cause caustic burns. Material is corrosive to tissue and metals.

Time Weighted Average (TLV-TWA): 0.6 ppm

Short Term Exposure Limit (STEL): Not established.

IDLH: Unavailable.

Conditions to Avoid: Heat, sparks, flame, moisture, incompatible materials such as strong oxidizers and acids.

HEALTH HAZARDS

Potential Health Effects: Sodium aluminate is corrosive to tissue and mucous membranes. Symptoms include caustic burns, sore throat, coughing, swelling, and itching. Individuals with preexisting eye, skin, or respiratory conditions may be more susceptible to the effects of this product.

Hazards of Skin and Eye Contact: Skin contact may cause skin irritation with rash, redness, itching, burning, swelling and caustic burns. Direct eye contact may cause severe irritation with tearing, pain or redness. Prolonged contact may cause caustic burns with permanent eye damage.

Inhalation Hazards: Inhalation may cause severe irritation in the nose, throat and respiratory tract, with sore throat pain and coughing. Potential central nervous system (CNS) effects may include nausea, headache, dizziness or general weakness.

Ingestion Hazards: Ingestion may cause caustic burns to the mucous membranes with pain. Swallowing and speech may also be difficult. Nausea, headache, vomiting and abdominal pain may also occur.

FIRE HAZARDS

Lower Flammable Limit: Not established.

Upper Flammable Limit: Not established.

Behavior in Fire: Sodium aluminate has a low fire potential. Although it will not readily ignite, it will burn if exposed to sources of heat and flame, and if it comes into contact with oxidizing materials.

Hazardous Decomposition Products: When heated to decomposition, toxic and irritating fumes may be liberated.

EXPLOSION HAZARDS

Explosive Potential: Low.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are natural rubber, nitrile rubber, polyvinyl chloride and neoprene. Structural firefighting protective clothing only provides a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

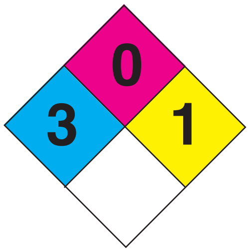
Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits.

1819

SODIUM ALUMINATE

Class 8 (Corrosive Material)

See "UN/NA Designation"
for other ID numbers.



FIRST AID

Nonspecific Symptoms: Direct skin contact can produce irritation, itching, inflammation, and burns. Central nervous system (CNS) effects may include nausea, headache, dizziness confusion or general weakness. Abdominal pain and sore throat may also occur.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician (preferably an eye specialist) from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, DO NOT INDUCE VOMITING due to the corrosive nature of the product. Give two (2) glasses of milk or water. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, or water spray.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Use water spray to cool fire-exposed containers and to protect personnel. Solid streams of water may be ineffective and scatter material. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be corrosive and/or toxic.

SPILL RESPONSES

General Information: Sodium aluminate is a corrosive material that may react with oxidizing materials, strong acids and moisture. Secure potential sources of heat, sparks, flame, impact, friction, electricity and moisture in the immediate spill area and downwind. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent contaminated runoff from entering sewers, waterways and storm drains. Underflow dams are not an effective means to dike material since it is water soluble and it is heavier than water. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered. Runoff may be corrosive and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer.

SODIUM ALUMINATE
Class 8 (Corrosive Material)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container of the liquid material is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent contaminated runoff from entering sewers, waterways and storm drains.

TECHNIQUE

MONITOR THE SITUATION...If released into the atmosphere, sodium aluminate is not expected to remain in the atmosphere for an extended period of time to present a significant hazard outside of the vicinity of the spill area. However, depending on the magnitude of the release and atmospheric/weather conditions, corrosive and/or toxic concentrations may take several hours to dissipate.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind.

MITIGATION

Evacuate the immediate area and down wind of the site of the release as conditions warrant. Personnel should conduct pH tests to determine if corrosive concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to protect tanks and exposures. Increases in spill sur face area and atmospheric conditions may increase the potential for migration of the spill away from the point of release.

CONSEQUENCE

Runoff may contain corrosive and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

FOAM...Firefighting foam may be used to control fires involving the material.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

SODIUM ALUMINATE
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, sodium aluminate is expected to undergo degradation. The time frame would depend on the size of the release and atmospheric conditions. Volatilization of sodium aluminate from water to the atmosphere is expected to be too slow to be environmentally significant. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is soluble in water. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may not be an effective means to recover spilled material since the material is 100% water soluble. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming will not be effective since the material is 100% water soluble and it is heavier than water.

CONSEQUENCE

Material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

SODIUM ALUMINATE
Class 8 (Corrosive Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...If released to soil, sodium aluminate is mobile and may leach into soil and migrate into ground water. Volatilization from either most soil or dry soil is not expected to occur to any significant extent. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Cover solid form of material with a plastic sheet or other compatible material. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be corrosive and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

October 1991

SODIUM CARBONATE
Non-Regulated

GENERAL INFORMATION

Sodium cabonate is not designated as a hazardous material in transportation but nevertheless has the potential to cause injury, and/or environmental pollution if improperly handled. It is ranked among the top 15 chemicals produced in the United States and may therefore be encountered comparatively frequently in transportation or other accidents resulting in a chemical discharge.

Solid sodium carbonate is shipped as white to greyish powders or lumps, some forms of which may appear as small white crystals or crystalline powders. Shipments may also consist of solutions in water or other liquids. This guide only addresses solid forms of sodium carbonate and solutions of the product in water.

Sodium carbonate is not flammable and has no odor. Its many uses include the making of aluminum, glass, other sodium compounds, substances derived from petroleum, soaps and cleaning agents, water softeners, paper, textiles, and other products. Solid forms are partially soluble in water and heavier. Aqueous solutions are soluble in all proportions.

Sodium carbonate does not react with water but dissolves therein with very considerable evolution of heat. Reactions with several other chemicals are known to be hazardous. It is of particular interest that sodium carbonate may explode on contact with red-hot aluminum. Aqueous solutions are highly caustic and therefore irritating and corrosive to bodily tissues with potentially immediate and severe effects. The substance is also reported to corrode aluminum, lead and iron. There appears to be a possibility that excessive heat may have the potential to cause sealed containers of solutions to rupture due to excessive steam pressure. Products of thermal decomposition in a fire may include toxic constituents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Partially soluble (solid); 7.1 g/100 g water at 32°F (0°C); 22 at 68°F (20°C); 45.5 at 212°F (100°C) for anhydrous sodium carbonate; a 1% solution of this substance in water has a pH of 11.5 which is strongly caustic (i.e., alkaline or basic). Solutions of hydrates with water will also be strongly caustic if in sufficient concentration. The solubility of hydrates vary with greater degrees of hydration associated with greater degrees of solubility. Aqueous solutions are soluble in water in all proportions.

Solubility in Other Chemicals: Soluble in glycerol

Specific Gravity (Solid): 2.53 at 68°F (20°C) for anhydrous sodium carbonate. Sodium carbonate monohydrate is somewhat lighter; reported values vary and include both 1.55 and 2.25 at unspecified temperatures. Values of 1.44 to 1.46 are reported for sodium carbonate decahydrate at unspecified temperatures.

Boiling Point: Anhydrous sodium carbonate is reported to slowly begin decomposing at 752°F (400°C); resulting substances include carbon dioxide (CO_2) and sodium oxide (Na20). The latter is a solid which is highly caustic and a strong irritant when wet with water.

Melting Point: 1563.8°F (851°C) is reported for both the anhydrous and monohydrate products; this temperature is well above that at which the anhydrous product is said to begin decomposing; 93.2°F (34°C) is reported by one authority as the melting point for the solid decahydrate.

Freezing Point: See melting point

Molecular Weight: 106.0 for anhydrous; 124.0 for the monohydrate; 286.0 for the decahydrate

Heat of Combustion: Not flammable

Vapor Pressure: Apparently negligible

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable with respect to any sort of hazardous activity in normal transportation. On exposure to air, the anhydrous product will gradually absorb moisture from the atmosphere (which is why the substance is considered hygroscopic). The monohydrate dries out somewhat in warm, dry air or above 122°F (50°C) and becomes anhydrous at about 212°F (100°C) or so. Elevated temperatures will also cause the decahydrate to lose water. Exposure to air will cause transparent crystals of the decahydrate to effloresce (i.e., to change to a powder from loss of water or to become covered with a powdery crust).

Corrosiveness: Sodium carbonate is reported to corrode aluminum, lead, or iron. It is not clear whether moisture must be present to cause corrosion when the anhydrous product is involved.

Reactivity with Water: No reaction; sodium carbonate dissolves in water with the evolution of considerable heat. Improper mixing with water has the potential to result in boiling and splattering. This can be avoided by mixing small amounts of sodium carbonate at a time into water.

Reactivity with Other Chemicals: One authority reports that reactions with acids generate heat and carbon dioxide; another states that sodium carbonate is decomposed by acids with effervescence. Caustics are generally considered reactive with varying results with a wide variety of other substances including acids, aldehydes, carbamates, esters.

IDENTIFICATION

Shipping Names: No particular name is standard but "Chemicals, n.e.c. (non-regulated)" is one possibility. The shipper may or may not provide the specific chemical name of the product. Do not confuse sodium carbonate with sodium percarbonate which is a regulated hazardous material classified as an oxidizer.

Synonyms and Tradenames: Anhydrous sodium carbonate is also known as carbonic acid, disodium salt; carbonic acid, sodium salt; soda; soda ash; Solvay soda; calcined soda; disodium carbonate; bisodium carbonate; anhydrous sodium carbonate; and sodium carbonate, anhydrous. Sodium carbonate monohydrate is also called crystal carbonate, soda monohydrate, and soda crystals. Sodium carbonate decahydrate is also known as washing soda, sal soda, soda, natron, natrite, and nevite.

Chemical Formula: Na_2CO_3 for anhydrous sodium carbonate; $Na_2CO_3.H_2O$ for the monohydrate; $Na_2CO_3.10H_2O$ for the decahydrate

Constituent Components (% each): Various grades exist, these being dense, light, extra light, natural, and refined according to one authority; these are likely to contain various amounts of the anhydrous and hydrated products.

28 STCC: 28 123 22 for anhydrous sodium carbonate or sodium carbonate monohydrate; 2812349 for sodium carbonate decahydrate

UN/INA Designation: Not established

IMO Designation: Not established

Physical State As Shipped: Solid powders, crystals, or lumps; solutions in water. (Note: Solutions with other liquids are not addressed in this guide.)

Physical State As Released: Same as shipped

Color of the Shipped Material: Solid forms of sodium carbonate are typically white to greyish powders or lumps; some forms may appear as small white crystals or crystalline powder. Aqueous solutions are most likely to be colorless.

Odor Characteristics: Odorless

Common Uses: Making aluminum, glass, sodium hydroxide, and other sodium compounds; used in soaps and strong cleaning agents, water softeners, pulp and paper manufacture, textile treatments, petroleum refining, photography, and various chemical processes; catalyst in coal liquefaction; food additive; reagent in analytical chemistry; used to control pH of water (in swimming pools and elsewhere).

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

SODIUM CARBONATE
Non-Regulated

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Although not designated as hazardous materials for transportation purposes, sodium carbonates may cause severe injury or death if improperly handled or if their known dangers of use are not heeded.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limit: Not established

Conditions to Avoid: Generation of airborne dust or mist; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion or direct physical contact; excessive heat or contamination of any kind.

HEALTH HAZARDS

Public Health Hazards: The primary hazard of the product is the irritation and potential burns it may cause to bodily tissues due to its alkalinity.

Hazards of Skin or Eye Contact: Relatively brief contact of the eyes with sodium carbonate or its highly alkaline (i.e., caustic) solutions may cause anywhere from mild irritation to severe irritation and reversible corneal injury depending on the nature and extent of exposure. Permanent injury may result if the substance is not quickly rinsed from the eyes with water. The solid and its dusts can cause mild to moderate skin irritation with redness and blistering, particularly if the exposure is repeated or prolonged. Authorities disagree on the effects of skin contact with concentrated alkaline solutions. Most report that these solutions are corrosive and may cause severe irritation and burns with development of what are referred to as "soda ulcers". Others report that a 50% solution applied to the intact skin of human volunteers caused little effect after exposure periods as long as 48 hours. Moderate redness and blistering occurred only if the skin had earlier been abraded; one-third of the volunteers showed tissue destruction at the abraded sites. One authority reports that sensitivity reactions may occur from repeated topical skin contact.

Hazards of Inhalation: Inhalation of dusts or mists containing sodium carbonate may cause irritation of the nose, throat and lungs with symptoms including coughing, sneezing, chest discomfort, and difficulty in breathing. Repeated or prolonged inhalation of moderate to high concentrations of sodium carbonate dust in air may result in damage or perforation of the nasal septum. The substance is considered moderately toxic by inhalation but it must be recognized that inhalation requires that an airborne dust or mist be somehow generated during or after discharge of the product. Laboratory experiments have shown that concentrations of 800, 1200, and 2100-2500 mg/m^3 of highly concentrated (91-95%) sodium carbonate aerosols were respectively required to cause deaths in 50% of guinea pigs, mice, and rats in two-hour exposures.

Hazards of Ingestion: Sodium carbonate is generally considered as mildly toxic by ingestion. Ingestion of large quantities of the product may produce corrosion and burns of the gastrointestinal tract resulting in abdominal pain, cramps, vomiting, diarrhea, circulatory system collapse, and possibly death. The oral LD^{50} for rats, the single dose causing death of 50% of the animals, is reported to be 4.09 g/kg of body weight.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Not flammable. Although not reported in the literature, it is conjectured that exposure of well-sealed containers of aqueous solutions to excessive heat may possibly cause generation of sufficient steam pressure to cause rupture of the container. The rupture may possibly take place with violence if the container is of strong construction (such as a metal drum).

Hazardous Combustion Products: Thermal decomposition of sodium carbonate is expected to produce carbon dioxide gas and solid sodium oxide (Na_20), a highly caustic and normally solid substance that is a strong irritant in the presence of moisture. One authority reports that sodium carbonate may liberate carbon monoxide or carbon dioxide and oxides of sodium in a fire. Hydrated products will also evolve water vapor or steam.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: May explode in contact with various other chemicals. Note especially that sodium carbonate may explode on contact with red-hot aluminum. See Behavior in Fire section directly above for a discussion of container rupture potential.

SODIUM CARBONATE
Non-Regulated

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye or skin contact with the spilled product. This may include rubber boots, gloves, face shields, tight-fitting dust or splash-proof safety goggles as needed, and other appropriate protective clothing such as coveralls, aprons, long-sleeved shirts, and so forth.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations of dusts or mists in air, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For other conditions, a NIOSH approved dust or mist respirator appropriate for the airborne contaminant levels present and selected by a qualified individual for use within the limitations of these devices.

FIRST AID

Nonspecific symptoms: Irritation of any bodily tissues

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward to reduce risk of aspiration into the lungs and then repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Most extinguishing agents may be used on fires involving sodium carbonate. Various authorities list dry chemicals, carbon dioxide, alcohol foam, and water spray as appropriate. There is no readily apparent reason why regular foam cannot be used on adjacent fires involving other substances if it is appropriate for such substances. Keep in mind that substantial heat may be generated when solid sodium carbonate dissolves in water.

Extinguishing Techniques: Stay upwind. Avoid bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use professional judgment to decide if sealed metal drums or other containers or tanks exposed to excessive heat or fire should be kept cool via use of water sprays to avoid the possibility of container rupture due to buildup and pressurization of gases or steam in the container. If deemed necessary, use water from side and from safe distance to keep containers cool until well after fire is out. For a massive fire in the cargo area under these circumstances, it may be prudent to use unmanned hose holders or monitor nozzles. In any case, stay away from ends of tanks involved in fire (especially of solutions), but realize that shrapnel may travel in any direction. Be especially aware that contact of sodium carbonate with red-hot aluminum has been reported to result in an explosion.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers and water bodies. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or other hazard to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Keep the solid product dry if practical to avoid spread of contamination. The anhydrous product should be kept in tightly closed containers to avoid absorption of water from the atmosphere if practical. Take the alkalinity and corrosivity of sodium carbonate and its hydrates into account while planning the response. Note that substantial heat may be generated when solid sodium carbonate dissolves in water.

SODIUM CARBONATE
Non-Regulated

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium carbonate and its solutions may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed. (Note: In order to pose a significant downwind inhalation hazard when not involved in a fire, fairly large quantities of sodium carbonate dusts or mists must somehow become airborne.)

CONSEQUENCE

Hazardous levels of sodium carbonate may possibly be found in air in the local spill area and immediately downwind, particularly if solid product has been discharged.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

PROTECT10N FROM WIND . . . If necessary, cover solid sodium carbonate with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY.. . Water fog or spray applied to sodium carbonate dusts or mists in air may knock them down and accelerate their dispersal in the atmosphere. Apply water at a point downwind if solid sodium carbonate is exposed to prevent dissolution in water, attendant generation of heat, and spreading of contamination.

CONSEQUENCE

Water runoff may contain sodium carbonate from contact with its dusts or mists.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sodium carbonate and its solutions may be contained by building dikes or barriers using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Keep solid sodium carbonate dry to the extent possible. Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

SODIUM CARBONATE
Non-Regulated

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product, particularly solutions.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of solutions may be controlled by absorbing the liquid with sand, earth, clay, vermiculite, perlite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of a qualified expert. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques. (Note: Consult environmental authorities. It may be acceptable at times to carefully dilute sodium carbonate with water, to properly neutralize it with agents such as acetic acid or hydrochloric acid, and to flush the resulting liquid into a sewer.)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product or its residues may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause sodium carbonate dusts to become airborne.

MITIGATION

Select removal procedures that do not cause sodium carbonate dusts to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

SODIUM CARBONATE
Non-Regulated

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid sodium carbonate will sink in water and dissolve at a fairly rapid rate, particularly if water is plentiful compared to the amount of sodium carbonate spilled. Solutions of the product will dissolve freely in water and are highly caustic. A 1% solution of anhydrous sodium carbonate in water has a pH of 11.5.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: This may not be necessary in naturally acidic waters.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier- than-water solids that have not dissolved and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

January 1988

SODIUM CHLORATE
Division 5.1 (Oxidizer)

GENERAL INFORMATION

Sodium chlorate is an odorless pale yellow to white crystalline solid used for making herbicides, explosives, dyes, matches, inks, cosmetics, pharmaceuticals, defoliants, paper, and leather. It is appreciably soluble in water and heavier, so may be expected to sink and dissolve at a rapid rate. Although it is not itself flammable, the solid product and even 30% solutions in water are powerful oxidizing agents. Contact with wood, organic matter, ammonium salts, sulfur, sulfuric acid, various metals, and other chemicals may result in fires or explosions, particularly if any solid materials are finely divided. Excessive heat, as in fires, may cause evolution of oxygen gas that may increase the intensity of fires and may also result in explosions. Mixtures with combustible materials are very flammable and may be ignited by friction. The solid product weighs approximately 155.4 pounds per cubic foot.

Sodium chlorate does not react with water and is stable in normal transportation. Toxicity of the product varies with the route of exposure. Toxic fumes may be generated if it is involved in a fire.

If a fire involving bulk amounts of sodium chlorate becomes uncontrollable, evacuate for a radius of one-third (1/3) mile for protection from the effects of potential explosions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 79-230 g/100 g water in range 32-212°F (0-100°C)
Solubility in Other Chemicals: Soluble in alcohol, ammonia and glycerin.
Specific Gravity (Solid): 2.49 at 59°F (15°C)
Boiling Point: Decomposes
Melting Point: 478-502°F (248-261°C)
Freezing Point: 478-502°F (248-261°C)
Molecular Weight: 106.44
Heat of Combustion: Not flammable
Vapor Pressure: Data unavailable; probably very low
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Decomposes at or above 572°F (300°C) with evolution of oxygen; decomposition may be self-sustaining.
Corrosiveness: Corrosive to steel; moisture accelerates corrosion.
Reactivity with Water: *No* reaction
Reactivity with Other Chemicals: Reacts with wood, organic matter, oxidizable materials, ammonium salts, sulfur, sulfides, phosphorus, acids, arsenic, copper, zinc, aluminum, possibly other metals, manganese dioxide, potassium cyanide, and thiocyanates.

IDENTIFICATION

Shipping Names: Sodium chlorate (USDOT and IMO); chlorate of soda (USDOT); sodium chlorate, solution (IMO).
Synonyms and Tradenames: Chloric acid, sodium salt; soda chlorate; chlorate of soda; Drop leaf; De-fol-ate; Fall; Klorex; Kusatol; Ortho C-11; Shed-a-leaf; Tumbleaf; Val-drop.
Chemical Formula: $NaC10_3$
Constituent Components(% each): 99-99.5% pure solid; various strength solutions with water.
49 STCC: 49 187 23
UN/NA Designation: UN1495; UN2428 (IMO) (aqueous solution)
IMO Designation: 5.1, oxidizing substance
Physical State as Shipped: *Solid* or aqueous solution
Physical State as Released: Solid or aqueous solution
Color of the Shipped Material: Pale yellow to white solid; colorless solution.
Odor Characteristics: Odorless
Common Uses: Mfg. herbicides, explosives, dyes, matches, inks, cosmetics, pharmaceuticals, defoliants, paper; tanning of leather.

SODIUM CHLORATE
Division 5.2 (Oxidizer)

See UN/NA Designation for
other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Powerful oxidizer. May cause fires or explosions in contact with a wide variety of materials. May explode if heated.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, sparks or friction; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: The toxic hazard of sodium chlorate is apparently considered to be low during normal handling, but limited data are available. It is best, therefore, to minimize exposures.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with sodium chlorate may cause some degree of irritation. Tissues may be damaged due to thermal and oxide effects.

Hazards of Inhalation: Data unavailable. Expect inhalation of dusts or mists to minimally cause irritation of mucous membranes.

Hazards of Ingestion: Ingestion of a toxic dose may cause gastrointestinal pain, vomiting, diarrhea, respiratory difficulties, kidney and liver injury, gastrointestinal congestion and corrosion, possible cyanosis, and possibly death. One authority reports that only ingestion produces symptoms of poisoning. The lethal oral dose for adults is about 15 grams (0.5 ounce).

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May melt and then decompose to emit oxygen gas that increases fire intensity. Prolonged exposure to fire or heat may result in container explosion. Reacts explosively with all organic matter and some metals.

Hazardous Combustion Products: Toxic fumes generated; may include chlorine and chlorine dioxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Not pertinent

Upper Explosive Limit: Not pertinent

Explosiveness: Very reactive. Contact with certain other chemicals, oxidizable materials or finely divided metals may result in formation of explosive mixtures. Containers may explode if exposed to prolonged fire or heat.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing. Do not use leather gloves or shoes, or oils, greases or protective creams that may form explosive mixtures with chlorates.

Respiratory Protection: For fire fighting, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For normal handling, an approved particulate or dust respirator within the use limitations of such devices.

1495

See UN/NA Designation for
other ID numbers.

SODIUM CHLORATE
Division 5.2 (Oxidizer)

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or mucous membranes; symptoms of ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: Get medical attention immediately. If victim is conscious and without convulsions, induce vomiting. Do not make an unconscious or convulsing person vomit.

FIRE RESPONSE

Extinguishing Materials: Flood with water from safe distance.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Avoid contact with spilled product. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may be dangerous. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Keep spilled product away from combustible and other incompatible materials. Give special attention to the fact that sodium chlorate is a powerful oxidizer.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium chlorate may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of sodium chlorate in air may be found in the local spill area and immediately downwind if sodium chlorate dust becomes airborne.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium chlorate with a plastic sheet or other compatible material to prevent airborne dust. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

SODIUM CHLORATE
Division 5.2 (Oxidizer)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sodium chlorate and its solutions may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. Keep solid product dry.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of solutions may be controlled by absorbing liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause dust to become airborne. Mixtures of product with organic matter may be ignited by friction.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust. Take special precautions where incompatible materials are present.

SODIUM CHLORATE
Division 5.2 (Oxidizer)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES. . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques. (Note: Anion exchangers are of fair effectiveness.)

SODIUM CYANIDE, solid

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Sodium cyanide is a nonflammable white solid with a faint almond odor. It is used for treating metals and electroplating, for extraction of gold and silver from ore, and for making fumigants, insecticides, dyes, pigments, and a variety of other products and chemicals. The substance is highly soluble in water and heavier, so may be expected to sink and rapidly dissolve. It weighs approximately 99.8 pounds per cubic foot.

Sodium cyanide is stable in normal transportation but reacts mildly with water or moisture to evolve poisonous hydrogen cyanide (HCN) gas and form hydrocyanic acid. The rate of HCN production is generally slow unless the water or other liquid present is acidic, at which time large amounts of HCN may be evolved. Reactions with molten nitrates, molten nitrite salts, chlorates, nitric acid, other strong oxidizing agents, and peroxides may be explosive, and the product is reactive with a variety of other chemicals. Sodium cyanide is extremely poisonous by ingestion or by inhalation of its dust in air (or of any HCN gas evolved). Products of decomposition in a fire may include nitrogen oxides and carbon monoxide.

Downwind evacuation should be considered on a case by case basis if sodium cyanide has spilled. See Air Spill section.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 58.7 g/100 g at 68°F (20°C)
Solubility in Other Chemicals: Soluble in ammonia; slightly soluble in alcohol.
Specific Gravity (Solid): 1.6 at 68F (20°C)
Boiling Point: 2725°F (1496°C) at 1 atm.
Melting Point: 1044-1047°F (562-563.7°C)
Freezing Point: 1047°F (564°C)
Molecular Weight: 49.02
Heat of Combustion: Not flammable
Vapor Pressure: Negligible
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: Data unavailable.
Reactivity with Water: Reacts mildly to produce toxic hydrogen cyanide gas and hydrocyanic acid. Gas evolution accelerated by acidic water.
Reactivity with Other Chemicals: Reacts with nitrates, nitrite salts, chlorates, fluorine, nitric acid, other acids and acid salts, nitrides, alkali and alkaline earth elemental metals, expoxides, polymerizable compounds, peroxides, strong oxidizing agents, and a variety of other chemicals.

IDENTIFICATION

Shipping Names: Sodium cyanide (USDOT & IMO)
Synonyms and Tradenames: Cyanide of sodium; hydrocyanic acid, sodium salt; sodium cyanide, cyanobrik.
Chemical Formula: NaCN
Constituent Components(% each): Various grades available.
UN/NA Designation: UN1689
IMO Designation: 6.1, poisonous substance
Physical State as Shipped: Solid
Physical State as Released: Solid, granular or briquettes.
Color of the Shipped Material: White
Odor Characteristics: Faint bitter almond odor
Common Uses: Electroplating; metal treatment; gold and silver extraction; fumigants and insecticides; mfg. of dyes, pigments, other products and chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

SODIUM CYANIDE, solid

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly toxic HCN gas is evolved in reactions with moisture or water. Product is extremely poisonous by ingestion or inhalation.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): (Skin) 5 mg/m^3 as CN over each 8 hours of a 40 hour work week (ACGIH)

Conditions to Avoid: Contact with water, moisture, or incompatible materials; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Sodium cyanide is poisonous by all routes of exposure, particularly inhalation and ingestion. Another major hazard to public from spills may be the poisonous hydrogen cyanide gas evolved in reactions with water or moisture in air.

Hazards of Skin or Eye Contact: Skin contact with sodium cyanide may cause itching, discoloration, corrosion, allergic contact dermititis, and caustic burns if exposure is prolonged. Contact with the eyes may result in severe injury. Sodium cyanide can be absorbed through the skin or eyes in toxic and fatal amounts.

Hazards of Inhalation: Sodium cyanide dust in air is irritating to the upper respiratory tract and eyes. High concentrations may cause symptoms of ingestion (see below) or death.

Hazards of Ingestion: Ingestion of very small amounts may result in weakness, dizziness, headache, vomiting, coma, convulsions, and or death. Effects may occur rapidly (if stomach empty) or may be delayed up to an hour. Relapses may occur after treatment.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Non-flammable solid

Hazardous Combustion Products: Decomposes to nitrogen oxides and carbon monoxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Contact with various other chemicals may result in formation of explosive mixtures. See General Information section.

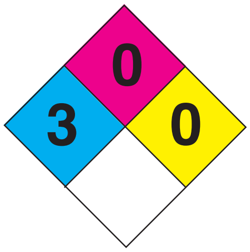
PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 5 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1689

SODIUM CYANIDE, solid
Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Eye or skin irritation, weakness, dizziness, headache, vomiting, others.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Get medical attention immediately. If unconscious, administer artificial respiration. Administer amyl nitrite by crushing pearl in a cloth and lightly holding under nose 5 times for 15 seconds at about 15 second intervals. Repeat every 5 minutes as necessary for 3-4 pearls. Administer oxygen if victim remains unconscious or breathing is difficult. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: Keep victim quiet and warm. Get medical attention immediately. If victim is conscious, administer large quantities of water and induce vomiting. Give victim one pint of 1% solution of sodium thiosulfate and repeat in 15 minutes. If victim is unconscious, see treatment described above for inhalation.

FIRE RESPONSE

Extinguishing Materials: Foam, carbon dioxide, or dry chemical as appropriate for surrounding fire. Water may evolve HCN gas, but may consider using large quantities of water fog or spray if large quantities of combustibles are involved.

Extinguishing Techniques: Unusual toxic hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Note that addition of water may accelerate evolution of poisonous HCN gas from sodium cyanide.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Consider using a buddy system due to the HCN hazard. Keep solid sodium cyanide as dry as possible. Keep product distant from all acidic materials.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Solid sodium cyanide may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the solid is kept dry and a small amount is spilled.

CONSEQUENCE

Hazardous levels of sodium or hydrogen cyanide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

SODIUM CYANIDE, solid
Division 6.1 (Poisonous Material)

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow cyanide dust or gas to dissipate. The spilled product may expose downwind areas to toxic concentrations over considerable distances in some cases if it becomes wet with water or contacts acids.

CONSEQUENCE

Avoidance of exposure of cyanide dust or gas in air. Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance. Keep sodium cyanide as dry as possible.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium cyanide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to cyanide dust or gas in air may absorb vapors, knockdown dusts and or accelerate their dispersal in the atmosphere. Water should be applied at a point downwind of the spill site and should not be allowed to contact solid sodium cyanide on the ground.

CONSEQUENCE

Water runoff may contain varying amounts of cyanide from contact with dusts or gases.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Solid sodium cyanide or its solutions may be contained by building dikes or barriers using earth, sand, or similar materials.

CONSEQUENCE

Contained liquid solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. Keep solid sodium cyanide as dry as possible. Cover with plastic sheet or other compatible material as necessary to prevent wetting with water or acids.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material. Keep spilled product as dry as possible.

SODIUM CYANIDE, solid
Division 6.1 (Poisonous Material)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Agitation may cause toxic dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

SODIUM HYDROSULFIDE

Division 4.2 (Spontaneously Combustible) or Class 8 (Corrosive Material)

GENERAL INFORMATION

Sodium hydrosulfide is shipped as a colorless to lemon colored solid or as a pale yellow to dark greenish black (or amber to red) solution in water. Solutions are classified as corrosive materials, as is one form of the solid. A second form is classed as a flammable solid and exhibits the hazards common to such substances. In any case, the product is fully soluble in water and has the odor of rotten eggs. Solutions are not themselves flammable but continuously and slowly evolve hydrogen sulfide gas that is toxic, flammable, and potentially explosive if ignited while confined. Containers exposed to excessive heat for sufficient time duration may rupture violently. Solutions weigh about 10.8 pounds per gallon. The solid weighs about 111.7 pounds per cubic foot.

Sodium hydrosulfide is considered stable in normal transportation. Solutions containing 45% of this product are slightly corrosive to iron and steel and very corrosive to aluminum, zinc, and copper. Contact of sodium hydrosulfide with acids may result in the evolution of large quantities of hydrogen sulfide gas. Reactions with diazonium salts may be violent or explosive. The product is highly toxic and irritating and corrosive to bodily tissues. A key hazard is that inhalation of hydrogen sulfide gas numbs the sense of smell at high concentrations in air that are rapidly fatal. Decomposition under fire conditions produces additional hydrogen sulfide. Products of combustion are likely to include toxic sulfur compounds.

If sodium hydrosulfide is leaking (not on fire) and generating large amounts of hydrogen sulfide gas, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. Judgements must be made on case by case basis.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions.

Solubility in Other Chemicals: Soluble in alcohol and ether.

Specific Gravity (Liquid): 1.79 for solid; 1.3 at 60.1°F (15.6°C) for 45% solution.

Boiling Point: Solution boils at 212°F (100°C)

Melting Point: Varies with form.

Freezing Point: Solution is frozen mush at 59°F (17°C)

Molecular Weight: 56.06, 92.10, or 110.11; varies with form.

Heat of Combustion: Unavailable; solution not flammable

Vapor Pressure: Unavailable

Flash Point: Unavailable; solution not flammable

Autoignition Temperature: Unavailable; solution not flammable

Burning Rate: Solution not flammable

Stability: Stable, but evolves hydrogen sulfide.

Corrosiveness: 45% solution slightly corrosive to iron and steel, very corrosive to aluminum, zinc, and copper. Avoid alternate exposure of iron and steel to air and solution.

Reactivity with Water: Solution in water continuously and slowly evolves hydrogen sulfide gas. Crystals hydrolyze in moist air to sodium hydroxide and sodium sulfide.

Reactivity with Other Chemicals: Acids or heat accelerate gas evolution. Oxidizing agents precipitate elemental sulfur. Reactions with diazonium salts are violent or explosive.

IDENTIFICATION

Shipping Names: Sodium hydrosulfide (USDOT); sodium hydrosulphide (IMO)

Synonyms and Tradenames: Sodium sulhydrate; sodium bisulfide; sodium hydrogen sulfide; sodium mercaptan; sodium mercaptide.

Chemical Formula: NASH or $NASH.2H_20$ or $NASH.3H_20$

Constituent Components(% each): 40-45% in water 70-72% flakes.

UN/NA Designation: UN2318 IMO, USDOT, 4.2, spontanaously combustible; UN2949 (IMO, USDOT, 8, corrosive)

IMO Designation: 4.2, flammable solid; 8, corrosive

Physical State as Shipped: Liquid (solution) or solid

Physical State as Released: Liquid (solution) or solid

Color of the Shipped Material: Colorless needles to lemon colored flakes; pale yellow to dark greenish black or amber to red solution.

Odor Characteristics: Rotten eggs

Common Uses: Paper pulping; processing dyestuffs; dehairing hides; bleaching; ore flotation; fining agent in flint glass; mfg. of rayon, cellophane, chemical milling solutions, and other chemicals.

(Spontaneously Combustible)
or Class 8 (Corrosive Material)

See "UN/NA Designation"
for other ID numbers.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration:: 0.0047 ppm

Unusual Hazards: Evolves toxic hydrogen sulfide gas. One form of solid is flammable and may be spontaneously combustible.

Short Term Exposure Limits(STEL): 15 ppm (hydrogen sulfide) for 15 minutes (ACGIH)

Time Weighted Average(TLV-TWA): 10 ppm (hydrogen sulfide) over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with acids or incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of sodium hydrosulfide or hydrogen sulfide. Ingestion and direct physical contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with solid sodium hydrosulfide or strong solutions may cause stains and slow healing burns of skin with scar formation. Dilute solutions, mists, or hydrogen sulfide gas may cause skin irritation. Eye contact with product may result in pain, tearing, sensitivity to light, conjunctival edema, and possibly corneal destruction.

Hazards of Inhalation: Inhalation may result in coughing, choking, irritation, headache, dizziness, weakness, and difficult breathing. Lung congestion, cyanosis, bloody sputum and chest tightness may follow in 6-8 hours. Severe exposures may cause brain damage and permanent loss of sense of smell. High levels of hydrogen sulfide in air numb the sense of smell and may be rapidly fatal.

Hazards of Ingestion: Ingestion may cause burns of the gastrointestinal tract, pain in throat and abdomen, nausea, vomiting, and diarrhea. Collapse, unconsciousness, and death due to respiratory paralysis may occur in severe cases.

FIRE HAZARDS

Lower Flammable Limit: 4.3% (hydrogen sulfide)

Upper Flammable Limit: 45% (hydrogen sulfide)

Behavior in Fire: Heat accelerates evolution of flammable hydrogen sulfide gas. Containers may rupture violently in fire.

Hazardous Combustion Products: Hydrogen sulfide and sulfur compounds.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Explosion may result if hydrogen sulfide gas is ignited in a confined area. Contact with diazonium salts may result in formation of explosive mixtures. Some unconfirmed possibility that dust of flammable solid may form explosive mixtures with air.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

SODIUM HYDROSULFIDE

Division 4.2
(Spontaneously Combustible)
or Class 8 (Corrosive Material)

2318

See "UN/NA Designation"
for other ID numbers.

FIRST AID

Nonspecific Symptoms: Eye, skin, or other irritations or burns; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of milk or water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Give fluids again if vomiting occurs naturally.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, water spray, or foam for flammable solid.

Extinguishing Techniques: Unusual toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Eliminate ignition sources. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that one form of the product is a flammable solid and that all forms may generate flammable and toxic hydrogen sulfide gas.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium hydrosulfide may not evolve large amounts of hazardous airborne contaminants in some outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of hydrogen sulfide in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

SODIUM HYDROSULFIDE

Division 4.2 (Spontaneously Combustible) or Class 8 (Corrosive Material)

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow dusts or gases to dissipate. Spills of this product may expose downwind areas to toxic concentrations over considerable distances, particularly if large amounts have spilled or conditions are correct for accelerated evolution of hydrogen sulfide gas.

CONSEQUENCE

Avoidance of exposure to hydrogen sulfide in air. Need to notify, organize, transport and house displaced persons. Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium hydrosulfide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

TECHNIQUE WATER FOG OR SPRAY . . . Water fog or spray applied to gases or dusts in air may absorb gases, knockdown dusts, and/or accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of chemicals.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sodium hydrosulfide may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained sodium hydrosulfide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. Keep solid product dry.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material. Keep solid sodium hydrosulfide dry.

SODIUM HYDROSULFIDE
Division 4.2 (Spontaneously Combustible)
or Class 8 (Corrosive Material)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled liquid may be controlled by absorbing liquid with sand, earth clay, fly ash, cement powder, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Solid product may pose fire and toxic dust hazard.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation. Eliminate ignition sources.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

SODIUM HYDROSULFIDE

Division 4.2 (Spontaneously Combustible)
or Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

SODIUM HYDROSULFITE

Division 4.2 (Spontaneously Combustible)

GENERAL INFORMATION

Sodium hydrosulfite is a white to yellowish or greyish crystalline powder (or flakes) with a faint sulfurous odor. It is used in the dyeing of fibers and textiles, for stripping dyes, for bleaching sugar, soap, oils or wood, and in making rubber and other products. It is moderately soluble and will dissolve rapidly in water. The product is a flammable solid that burns slowly. It may heat spontaneously in contact with moisture or air to the extent that nearby combustible materials may be ignited. Sodium bisulfite formed in contact with water is also likely to ignite upon drying. Decomposition of sodium hydrosulfite upon heating may release oxygen which supports combustion and reduces the effectiveness of suffocation type extinguishing agents like carbon dioxide. Under prolonged exposure to fire or heat, containers of the product may rupture violently.

Sodium hydrosulfite is incompatible with oxidizing agents, strong mineral acids, and strong inorganic acids. It forms an acidic corrosive solution in water. It is irritating to the skin and eyes and may damage nasal and respiratory passages if inhaled. Products of combustion include toxic sulfur dioxide gas.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 22-25.4 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alkalies

Specific Gravity (Solid): Unavailable

Boiling Point: Decomposes violently at 374°F (190°C) to SO_2, sodium sulfite, and thiosulfate.

Melting Point: Decomposes at 125.6°F (52°C)

Freezing Point: Unavailable

Molecular Weight: 174.13 for $Na_2S_2O_4$

Heat of Combustion: Unavailable

Vapor Pressure: Unavailable

Flash Point: Flammable solid

Autoignition Temperature: Unavailable

Burning Rate: Burns slowly, about like sulfur.

Stability: Stable when dry

Corrosiveness: Forms corrosive acidic solution with water.

Reactivity with Water: Oxidizes to sodium bisulfite and later to sodium bisulfate with evolution of heat. May ignite combustible materials in contact with moisture or air.

Reactivity with Other Chemicals: Incompatible with oxidizing agents, strong mineral acids, and strong organic acids.

IDENTIFICATION

Shipping Names: Sodium hydrosulfite (USDOT); Sodium hydrosulphite (IMO); Sodium dithionite (USDOT & IMO).

Synonyms and Tradenames: Sodium dithionite; sodium hydrosulphite; sodium sulfoxylate; vatrolite dithionous acid, disodium salt; dithionite, hyposulfite; hydrosulfite of soda.

Chemical Formula: $Na_2S_2O_4$; $Na_2S_2O_4.2H_2O$; $Na_2S_22O_4.7H_2O$

Constituent Components(% each): Various grades available.

UN/NA Designation: UN1384

IMO Designation: 4.2, spontaneously combustible

Physical State as Shipped: Solid

Physical State as Released: Solid

Color of the Shipped Material: White to grayish crystals, yellowish-white powder or flakes.

Odor Characteristics: Faint sulfurous odor, like SO_2.

Common Uses: Vat dyeing; stripping of dyes; bleaching sugar, soap, oils, groundwood; reagent; oxygen scavenger for synthetic rubber.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

SODIUM HYROSULFITE

Division 4.2

(Spontaneously Combustible)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Flammable solid. Heats spontaneously in moisture or air. Containers may rupture violently in fire.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, and sparks; contact with moisture, air, or incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major apparent hazard is from inhalation of dust in air. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with sodium hydrosulfite may cause irritation.

Hazards of Inhalation: Breathing sodium hydrosulfite dust may damage nasal and respiratory passages.

Hazards of Ingestion: Ingestion may result in gastrointestinal irritation, nausea, vomiting, and diarrhea.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Flammable solid. Containers may rupture violently in fire.

Hazardous Combustion Products: Toxic sulfur dioxide (SO_2) gas.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Containers may rupture violently in fire. Some unconfirmed possibility that dust may form explosive mixture with air.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). An approved dust respirator is apparently acceptable for normal handling

FIRST AID

Nonspecific symptoms: Irritation of eyes, skin, nose, or respiratory passages; symptoms of ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer water, milk, or salt water and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

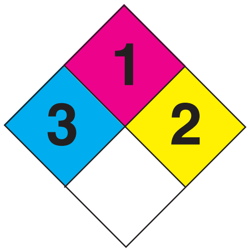
SODIUM HYROSULFITE

Division 4.2

(Spontaneously Combustible)



FIRE RESPONSE

Extinguishing Materials: Dry sand, carbon dioxide, dry chemical, and water. CO_2 and dry chemical may be ineffective. Avoid use of water unless flooding amounts are available.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Eliminate ignition sources. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that sodium hydrosulfite is a flammable solid.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium hydrosulfite may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of sodium hydrosulfite in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium hydrosulfite with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray may knockdown the dust of sodium hydrosulfite in air and or accelerate its dispersal. Try to keep water away from spilled solid on ground.

CONSEQUENCE

Water runoff may contain varying amounts of sodium hydrosulfite from contact with its dusts in the atmosphere.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

SODIUM HYROSULFITE

Division 4.2 (Spontaneously Combustible)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sodium hydrosulfite may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained solutions of sodium hydrosulfite may percolate into soil or seep through dike or material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material. Keep solid product dry.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Solid product poses fire and toxic hazards.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Eliminate ignition sources. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal .

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2000

SODIUM HYDROXIDE, (SOLID OR SOLUTION)

Class 8 (Corrosive Material)

GENERAL INFORMATION

Sodium hydroxide, also known as caustic soda, is a colorless, odorless and nonvolatile solid that may be shipped in flake, bead, or granular form or dissolved in water as a colorless solution. It is used in making rayon, cellophane, plastics, mercerized cotton, paper, explosives, dyestuffs and in a wide variety of other products and processes. It is quite soluble in water and will dissolve rapidly with the evolution of considerable heat that may generate steam and spattering. Although the product is not flammable, the heat generated by the solid upon contact with moisture may be sufficient to ignite adjacent combustible materials. Flammable and potentially explosive hydrogen gas may be generated upon contact of the wet product with metals such as aluminum, tin, lead, zinc, magnesium, chromium, brass, and bronze. The solid weighs approximately 132.9 pounds per cubic foot. Solutions weigh about 12.5 pounds per gallon.

Sodium hydroxide is stable in normal transportation. It is reactive with a variety of chemicals and corrosive to various metals, plastics, rubbers and coatings, and bodily tissues. Contact with nitromethane and other similar nitro compounds may result in the formation of shock-sensitive explosive salts. Sodium hydroxide will absorb moisture from the air and react with CO_2 from the air to form sodium carbonate.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Very soluble, 42-347 g/100 g H_2O for temperature range 32 - 212ºF (0 - 100ºC).

Solubility in Other Chemicals: Soluble in alcohol and glycerine.

Specific Gravity: 2.13 at 68ºF (20ºC) for solid; about 1.1 - 1.5 for solutions.

Vapor Density: >1

Boiling Point: Very high for solid, 2534ºF (1390ºC). Varies greatly for solution depending on concentration, 293 - 388ºF (145 - 198ºC).

Melting Point: See freezing point

Freezing Point: 604ºF (318ºC) for solid. Varies greatly for solution depending on concentration, 50 - 144ºF (10 - 62ºC).

Molecular Weight: 40.0 for NAOH

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): Unavailable

Vapor Pressure: Negligible; 1 - 1.5 mmHg

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Flammable Limits: Not flammable

Stability: Stable

Polymerization Potential: Will not occur.

pH: Solution is basic (alkaline); for a 50% solution the pH is 13-14.

Corrosiveness: Slowly corrosive to iron, copper, and monel. Will react with clothing, leather, and some metals. Will attack some plastics, rubber, and coatings.

Reactivity with Water: Dissolves in water with liberation of much heat, may steam and spatter.

Reactivity and Incompatibility: Avoid water or moisture. May react violently with acids, a number of organic compounds and some metals, such as tin, zinc, aluminum, bronze and brass - reactions with the these metals can generate flammable or explosive hydrogen gas. Reacts violently with many organics especially nitrogen containing organics, halogenated organics trichloroethylene and glycols. Reacts with acetaldehyde, acrolein, acrylonitrile, allyl alcohol, chloroform and methyl alcohol, chloronitrotoluene, maleic anhydride, nitromethane and other nitroparaffins, pentol, phosphorus, explosives, and organic peroxides.

IDENTIFICATION

Shipping Name(s): Sodium hydroxide, solid (USDOT & IMO); Sodium hydroxide, solution (USDOT & IMO).

Synonyms and Tradenames: Caustic soda; Lye; Soda lye; Sodium hydrate; White caustic; Spent sodium hydroxide; Spent neutralizing agent; Petroleum neutralizing agents.

CAS Registry No.: 1310-73-2

Chemical Formula: $NaOH$

Constituent Components (% each): $NaOH$ in water when solution. Percentage in solution varies widely.

UN/NA Designation: UN1823 (solid); UN1824 (solution)

IMO Designation: 8, Corrosives

RTECS Number: WB4900000

NFPA 704 Hazard Rating: 3(Health): 0(Flammability): 1(Reactivity); Reacts with water.

Physical Form as Shipped: Solid or liquid solution

Physical Form as Released: Solid or liquid solution

Color of the Shipped Material: White solid, flakes, sticks or pellets; colorless or milky solution.

Odor Characteristics: Odorless

Reportable Quantity: See appendix I.

Common Uses: Mfg. mercerized cotton, paper, explosives, dyestuffs, rayon, cellophane, plastics; used in petroleum refining, rubber reclamation, metal cleaning, zinc extraction, tin plating, oxide coating, laundering, bleaching, dishwashing, and in chemical processing.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

SODIUM HYDROXIDE,
(SOLID OR SOLUTION)

Class 8 (Corrosive Material)

*1823 (Solid) 1824 (Solution)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Solid evolves considerable heat in contact with water when solid. Heat may ignite combustible materials. Reaction with some metals evolves hydrogen gas.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: 2 mg/m^3

IDLH: 10 mg/m^3

Conditions to Avoid: Contact with incompatible materials; fire or sparks where hydrogen may be present; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact of the skin with sodium hydroxide as a solid or in dusts, mists, or solutions may cause skin irritation, and with greater exposure, severe burns with scarring. Similarly, contact with the eyes may result in irritation, severe burns, and possible blindness. YOU MAY HAVE 10 SECONDS OR LESS TO AVOID SERIOUS PERMANENT EYE DAMAGE.

Hazards of Inhalation: Breathing of sodium hydroxide dust or mist may cause effects ranging from mild irritation of the nose at 2 mg/m^3 in air to severe pneumonitis depending on the severity of exposure.

Hazards of Ingestion: Ingestion may result in severe burns of the mouth, throat and stomach, severe pain, vomiting of large pieces of mucosa, and possibly death. Scarring of the throat has caused squamous cell carcinomas of the esophagus in some cases many years after ingestion.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: No special hazards apparent. Some remote chance that containers may rupture in fire.

Hazardous Combustion Products: Sodium oxide. Decomposition by reaction with certain metals, such as aluminum, magnesium, tin and zinc, releases flammable and explosive hydrogen gas.

EXPLOSION HAZARDS

Explosive Limit: Not flammable

Explosive Potential: Contact with nitromethane, other similar nitro compounds, and certain other chemicals may result in formation of explosive mixtures. Contact with metals may generate hydrogen gas that may explode if ignited in confined spaces. Some remote chance that containers may rupture in fire.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing for solids or liquids (as appropriate). Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high dust or mist concentrations in air. Butyl rubber, neoprene, nitrile rubber and polyvinyl chloride are reproted to provide more than 8 hours of protection. Other compatible materials may include natural rubber, neoprene/styrene-butadiene rubber, polyethylene, chlorinated polyethylene, polyurethane and polyvinyl alcohol for the solid and its solutions, as well as nitrile rubber/PVC, styrene-butadiene rubber, Viton®, nitrile-butadiene rubber, and Saranex® for 30-70% solutions.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 mg/m^3) a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, a high efficiency mist and particulate filter respirator with a full facepiece within the use limitations of such devices. (Note: Respiratory protection may not be required for solutions in the absence of airborne mists.)

1823

1824

SODIUM HYDROXIDE, (SOLID OR SOLUTION)

Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 30 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: As necessary for surrounding fire, but note that much heat is evolved when water contacts solid product. NFPA suggests flooding with water, using care not to spatter or splash the product.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources where hydrogen may be present. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that contact of wet sodium hydroxide with some metals may generate hydrogen gas. Use intrinsically safe equipment where necessary. Note that the heat of reaction of the solid with water may be sufficient to ignite combustible materials.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists. (Note: Solutions do not pose a problem unless an airborne mist is somehow generated. In the event a mist is generated, follow guidelines for water fog or spray below.)

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

SODIUM HYDROXIDE, (SOLID OR SOLUTION)

Class 8 (Corrosive Material)

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium hydroxide with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid sodium hydroxide may slow the release of vapors into the atmosphere in some cases. Apply water cautiously at first to ensure that a hazardous reaction does not take place.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to sodium hydroxide vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Note: Sodium hydroxide has the potential to react with water, and should be used with caution and applied upwind from source of spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of sodium hydroxide from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may confine spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may seep through dike material, which may result in loss of confined product and spread of contamination. There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. (Note: Sodium hydroxide has the potential to react with water, and should be used with caution and applied upwind from source of spill.) Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil. Keep solid product dry.

SODIUM HYDROXIDE, (SOLID OR SOLUTION)
Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination if some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. (Note: Sodium hydroxide has the potential to react with water, and should be used with caution and applied upwind from source of spill.) Be alert to condition such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled liquid pools confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid sodium hydroxide may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Excessive agitation may cause sodium hydroxide dust to become airborne.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors. Organize work to minimize dust generation.

SODIUM HYDROXIDE, (SOLID OR SOLUTION)
Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

SODIUM (METAL)

Division 4.3 (Dangerous When Wet)

GENERAL INFORMATION

Sodium is a silvery waxy metal that becomes grayish white upon exposure to air and may be shipped as a solid or molten liquid. It is used for making gasoline additives, electric power cable, sodium lamps, and various chemicals, and has several other specialized uses. The product may ignite spontaneously in air, and if ignited, burns violently with explosions that may cause spattering of the material. Contact with moisture or water causes a violent reaction that produces sodium hydroxide solution (see separate guide) and hydrogen gas. The heat of reaction may be sufficient to cause ignition or explosion of the hydrogen. The solid product weighs approximately 60.6 pounds per cubic foot and is slightly lighter than water.

Sodium is stable in normal transportation. Besides its reactivity with water, it is reactive with a very wide variety of chemicals and other products. Contact with nitromethane or other similar nitro compounds in the presence of moisture may cause formation of shock-sensitive explosive salts. Contact with any bodily tissues rapidly causes thermal and chemical burns. The fumes of burning sodium are highly irritating to the eyes, skin, and mucous membranes.

Due to the reactivity of sodium, do not use water, carbon dioxide, or halogenated extinguishing agents to fight sodium fires. Use dry graphite, soda ash, powdered sodium chloride (table salt), or other appropriate dry powder such as dry limestone. Note that sodium can be safety stored by submerging it in an oxygen free liquid such as kerosene or naphtha.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below
Solubility in Other Chemicals: Decomposes in alcohol; insoluble in benzene and ether.
Specific Gravity (Solid): 0.971 at 68°F (20°C)
Boiling Point: 1621°F (883°C) at 1 atm.
Melting Point: See freezing point
Freeing Point: 207.5°F (97.5°C)
Molecular Weight: 22.99
Heat of Combustion: Unavailable
Vapor Pressure: Negligible, 1 mm Hg (0.0193 psia) at 822°F (439°C)
Flash Point: Not pertinent
Autoignition Temperature: About 250°F (121°C) in moist air; 1637°F (892°C) in dry air.
Burning Rate: Unavailable
Stability: Stable when dry
Corrosiveness: Sodium hydroxide solution attacks clothing, leather, metals such as aluminum, lead, tin, zinc, chromium, brass, bronze and magnesium, and some plastics, rubbers, and coatings. Contact with metals may evolve hydrogen gas.
Reactivity with Water: Violent reaction generating sodium hydroxide solution, hydrogen gas, and much heat. Hydrogen may ignite.
Reactivity with Other Chemicals: Reacts with air, water, and a wide variety of halogens, oxides, azides, chlorides, halogenated organic compounds, acid, oxidizing materials, fluorides, bromides, metals, and iodides, as well as sulfur, selenium, hydrazine hydrate, hydroxylamine, carbon dioxide, nitromethane and similar compounds in the presence of moisture, and other substances.

IDENTIFICATION

Shipping Names: Sodium (USDOT & IMO)
Synonyms and Tradenames: Sodium; sodium atom; metallic sodium; natrium.
Chemical Formula: Na
Constituent Components(% each): About 99.95% pure
UN/NA Designation: UN1428
IMO Designation: 4.3, dangerous when wet
Physical State as Shipped: Molten liquid or soft solid
Physical State as Released: Molten liquid or soft solid
Color of the Shipped Material: Silvery white, grayish white
Odor Characteristics: Odorless
Common Uses: Tetramethyl and tetraethyl lead; titanium reduction; polymerization catalyst; nuclear reaction coolant; electric power cable; sodium lamps; sodium hydride and peroxide; photoelectric cells; automobile engine exhaust valve coolant; radioactive forms used in tracer studies and medicine.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

SODIUM (METAL)

Division 4.3 (Dangerous When Wet)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Reacts violently with water or moisture producing hydrogen gas and sodium hydroxide (NaOH) solution. May ignite spontaneously and burn violently. Sodium hydroxide solution may produce hydrogen gas in contact with some metals.

Short Term Exposure Limits(STEL): Unavailable

Time Weighted Average(TLV-C): 2 mg/m^3 (as NaOH) absolute ceiling limit. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with air, water, or incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact of sodium or resulting sodium hydroxide solutions with the skin or eyes may result in severe thermal and chemical burns.

Hazards of Inhalation: Although the risk of inhaling sodium in accidents not involving fire is low, the dust of sodium or mists of sodium hydroxide in air may be expected to cause effects ranging from mild irritation of the nose to severe pneumonitis depending upon the severity of exposure. The fumes of burning sodium are highly irritating to the eyes, skin, and mucous membranes.

Hazards of Ingestion: Ingestion of sodium may result in severe thermal and chemical burns of the mouth, throat, and stomach, severe pain, vomiting of large pieces of mucosa, and possibly death. Scarring of the throat by sodium hydroxide has caused squamous cell carcinomas of the esophagus in some cases many years after ingestion.

FIRE HAZARDS

Lower Flammable Limit: Not pertinent (4% for hydrogen)

Upper Flammable Limit: Not pertinent (75% for hydrogen)

Behavior in Fire: Flammable solid. May generate flammable gas upon release. Burns violently with explosions that may spatter material.

Hazardous Combustion Products: Highly irritating and toxic sodium oxides and sodium hydroxide.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Very reactive. Contact with nitromethane or other similar nitro compounds and moisture, or certain other chemicals, may result in formation of explosive mixtures. Contact with water and/or metals may generate hydrogen gas that may explode if ignited in confined spaces.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles, and other impervious and resistant clothing for solids or liquids (as appropriate). Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high dust or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 mg/m^3 in air for sodium hydroxide), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a high efficiency mist and particulate filter respirator with a full facepiece within the use limitations of these devices.

1428

SODIUM (METAL)

Division 4.3 (Dangerous When Wet)

FIRST AID

Nonspecifc symptoms:: Irritation or burns of bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution:Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing and carefully brush off any loose sodium on the skin. Wash affected body areas with copious amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Dry graphite, soda ash, powdered sodium chloride (table salt), or other dry powder like dry limestone. Do not use water, carbon dioxide, or halons. Avoid using soda-acid or conventional dry chemical (bicarbonate) extinguishers.

Extinguishing Techniques: Reacts violently with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent product from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account that contact with water and/or some metals may generate hydrogen gas. The solid may spontaneously ignite. Do not attempt to sweep up dry material.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium is unlikely to evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the sodium is kept dry and is not burning.

CONSEQUENCE

Hazardous levels of sodium in air may be found in the local spill area and immediately downwind under appropriate conditions.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

SODIUM (METAL)

Division 4.3 (Dangerous When Wet)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Molten sodium or sodium hydroxide solutions may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination. Contact of sodium with water may result in fire or explosion.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Keep solid dry and cover with oxygen free liquid like kerosene or naphtha.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Pools of sodium hydroxide solution may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of sodium hydroxide solutions may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify sodium hydroxide to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

SODIUM (METAL)

Division 4.3 (Dangerous When Wet)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper handling may result in fires or explosions. Excessive agitation may cause sodium dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for guidance in all cases. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Alkaline sodium hydroxide solution and hydrogen gas are formed by the reaction of sodium with water.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

January 1988

SODIUM NITRATE
Division 5.1 (Oxidizer)

GENERAL INFORMATION

Sodium nitrate is a white crystalline solid that is odorless and is used for making solid propellants, explosives, fertilizers, pharmaceuticals, and food additives. It is appreciably soluble in water and heavier, so may be expected to sink and rapidly dissolve. The substance is not flammable but is a strong oxidizer that may react with easily oxidizable materials (such as hydrocarbons or cellulosic materials) to cause ignition, violent combustion, or explosion. It also increases the flammability of any combustible substance and may accelerate burning. An explosion may result if sodium nitrate is involved in a fire. The product weighs approximately 141.5 pounds per cubic foot.

Sodium nitrate is stable in normal transportation and does not react with water. It is reactive with a variety of chemicals, and as noted above, may form potentially explosive mixtures, particularly if a combustible material is finely divided.

Toxicity is apparently relatively low by the various routes of exposure, but the product evolves toxic nitrogen oxide gases when involved in a fire.

If a fire involving bulk amounts of sodium nitrate becomes uncontrollable, evacuate for a radius of one-half (½) mile for protection from the effects of potential explosions.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 92-180 g/100 g water in range 77-212°F (25-100°C)
Solubility in Other Chemicals: Soluble in alcohol, methanol, and ammonia
Specific Gravity (Solid): 2.261
Boiling Point: 716°F (380°C); decomposes
Melting Point: 584°F (307°C)
Freezing Point: 584°F (307°C)
Molecular Weight: 84.99
Heat of Combustion: Not flammable
Vapor Pressure: Low
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable, may explode when heated in excess of 1000°
Corrosiveness: Data unavailable; relatively noncorrosive
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with oxidizable materials; mixtures with reducing agents may explode under heat or shock; may react explosively upon heating with aluminum, aluminum oxide, antimony, sodium thiosulfate, magnesium, sulfur and charcoal, cyanides, sodamide, acetates, thiocyanates, and hypophosphites.

IDENTIFICATION

Shipping Names: Sodium nitrate (USDOT and IMO)
Synonyms and Tradenames: Chile saltpeter; chile niter; caliche; chile nitrate; soda saltpeter; cubic niter; soda niter; nitratine.
Chemical Formula: $NaN0_3$
Constituent Components(% each): Relatively pure
49 STCC: 49 187 46
UN/NA Designation: UN1498
IMO Designation: 5.1, oxidizing substance
Physical State as Shipped: Solid granules or powder
Physical State as Released: Solid granules or powder
Color of the Shipped Material: White or transparent
Odor Characteristics: Odorless
Common Uses: Mfg. solid propellants, explosives, fertilizers, pharmaceuticals; food additive.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

SODIUM NITRATE
Division 5.1 (Oxidizer)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless

Unusual Hazards: Strong oxidizer that may ignite or form potentially explosive mixtures with a variety of materials. May explode if heated above 1832°F (1000°C).

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Sodium nitrate is apparently considered to be of low toxic hazard in normal handling. Limited data are available.

Hazards of Skin or Eye Contact: Contact with sodium nitrate may result in irritation of the skin or eyes.

Hazards of Inhalation: Breathing sodium nitrate dust may cause irritation of the mucous membranes.

Hazards of Ingestion: Ingestion of significant amounts of sodium nitrate may result in nausea, increased urination, diarrhea, collapse and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May accelerate burning of combustible materials. May fuse or melt. May explode

Hazardous Combustion Products: Include toxic oxides of nitrogen.

EXPLOSION HAZARDS

Lower Explosive Limit: Not pertinent

Upper Explosive Limit: Not pertinent

Explosiveness: Contact with certain other chemicals or oxidizable materials may result in formation of explosive mixtures. The product may explode in fire particularly when heated in excess of 1000° F. (See General Information) .

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, safety goggles and other impervious and resistant clothing.

Respiratory Protection: For fire fighting, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For normal handling where dust is airborne, an approved dust respirator may be adequate within the use limitations of such devices.

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or mucous membranes.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Data unavailable. Get medical attention immediately.

1498

SODIUM NITRATE
Division 5.1 (Oxidizer)

FIRE RESPONSE

Extinguishing Materials: Flood with water, but note that large quantities of sodium nitrate may melt or fuse in fire and that water application may result in extensive scattering of molten material.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Avoid contact with spilled product. Eliminate ignition sources. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may corrode boilers or industrial process equipment. Take into account while planning the response that sodium nitrate is a strong oxidizer.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sodium nitrate should not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of sodium nitrate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Protect product from wind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sodium nitrate with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES'... Sodium nitrate may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Water solutions of sodium nitrate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination.

SODIUM NITRATE
Division 5.1 (Oxidizer)

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause sodium nitrate dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize airborne dust generation.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment or neutralizing techniques.

September 2003

STYRENE MONOMER, STABILIZED

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Styrene monomer is a clear, flammable liquid with a sharp pungent and disagreeable odor that may seem sweet at low concentrations. It is used to make resins, polyesters, plastics, paints and coatings, synthetic rubber, insulators, concretes and pharmaceuticals. It is slightly soluble in water and lighter, so may be expected to form a floating surface slick that dissolves very slowly. Its flash point of 88°F indicates that the product can be easily ignited at warmer ambient temperatures. Vapors may be slightly heavier than air at or above such temperatures and may travel some distance to a source of ignition and flash back. Accumulations of vapors in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 7.6 pounds per gallon.

Styrene monomer does not react with water or many other common materials. It is stable in normal transportation when inhibited to prevent self-polymerization. Polymerization may occur, however, if the product is heated above 149°F or contaminated by metal salts, peroxides or strong acids (and possibly other substances). The resulting reaction may result in violent container rupture. Styrene monomer may otherwise react with various chemicals, is corrosive to copper and its alloys and may dissolve certain rubber materials. Toxicity of the product is low to moderate via the various routes of exposure. Products of combustion may include acrid styrene fumes and other toxic gases.

Initial downwind evacuation should be considered for at least 300 meters (1000 feet) if styrene monomer is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.03 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, carbon disulfide, ether and petroleum ether.

Specific Gravity (Liquid): 0.906 at 68°F (20°C)

Vapor Density: 1.02 - 1.22

Boiling Point: 293.4°F (145.2°C) at 1 atm

Melting Point: See freezing point.

Freezing Point: – 23.1°F (– 30.6°C)

Molecular Weight: 104.15

Heat of Combustion: – 9782 cal/g

Evaporation Rate (butyl acetate=1): .5

Vapor Pressure: approx. 6 mm Hg (0.116 psia) at 68°F (20°C)

Flash Point: 88°F (31.1°C), closed cup; 93°F (33.9°C), open cup

Autoignition Temperature: 914°F (490°C)

Burning Rate: 5.2 mm/minute

Flammable Limits: 1.1% (LFL) - 6.1% (UFL)

Stability: Stable under normal temperatures and pressures. Forms peroxides or aldehydes in air and light.

Polymerization Potential: May occur. Uninhibited material may polymerize which becomes self-sustaining at temperatures above 149°F (65°C). Exposure to butyllithium, dibenzoyl peroxide, azoisobutyronitrile or di-tert-butylperoxide may cause violent polymerization.

Corrosiveness: Copper and its alloys are corroded. Some rubber materials may dissolve.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Reacts with metal salts, peroxides, strong acids, halogens, hydrogen halides, sodium hydroxide, glycols, catalysts for vinyl polymers, aluminum chloride and oxidizing agents.

IDENTIFICATION

Shipping Name(s): Styrene monomer, stabilized (USDOT & IMO)

Synonyms and Tradenames: Vinylbenzene; Vinylbenzol; Ethenylbenzene; Styrene; Phenylethene; Phenylethylene; Phenethylene; Styrol; Styrolene; Styron; Styrole; Styropol; Cinnamene; Cinnamol; Cinnamenol; Diarex HF 77.

CAS Registry No.: 100-42-5

Chemical Formula: $C_6H_5CH=CH_2$

Constituent Components (% each): 99.5% or more pure with trace of tert-butylcatechol as inhibitor.

UN/NA Designation: UN2055

IMO Designation: 3, Flammable liquids

RTECS Number: WL3675000

NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 2 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless to yellow oily liquid

Odor Characteristics: Pungent, sharp, disagreeable, sweet at low concentrations.

Reportable Quantity: See appendix I

Common Uses: Mfg. of resins, polyesters, plastics, paints and coatings, synthetic rubber, insulators, drugs, concretes and drugs.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

STYRENE MONOMER, STABILIZED
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.02-0.47 ppm

Unusual Hazards: Flammable liquid with vapors that may be heavier than air at warmer temperatures and that may travel to a source of ignition. May polymerize with violent container rupture if heated or contaminated by certain chemicals. Vapors are uninhibited and may form polymers in vents or flame arrestors resulting in stoppage. Toxic gases are produced in fire.

Short Term Exposure Limit (STEL): 100 ppm (425 mg/m^3) over 15-minute work period. (NIOSH)

Time Weighted Average (TLV-TWA): 50 ppm (215 mg/m^3) over each 8 hours of a 40 hour work week. (NIOSH)

Ceiling (C) Limit: 200 ppm (15-minute maximum peak in any 3 hours) 600 ppm (5-minute maximum peak in any 3 hours) (OSHA)

IDLH: 700 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in the spill area and immediately downwind. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid styrene monomer may result in drying, cracking and inflammation of the skin due to the defatting action of the product. Some amount may be absorbed through the skin. Contact with the eyes may cause irritation and possibly temporary corneal injury.

Hazards of Inhalation: Vapors of styrene monomer above 200 ppm in air may irritate the eyes and upper respiratory tract. Higher concentrations may cause narcosis and central nervous system depression with symptoms including headache, nausea, cramps, incoordination, dizziness, drowsiness, unconsciousness and possibly death due to respiratory paralysis. Exposure to only 376 ppm for one hour is sufficient to cause headache, nausea, loss of coordination and certain other effects.

Hazards of Ingestion: Moderately toxic. Ingestion may cause nausea, vomiting and loss of appetite (and possibly other symptoms of narcosis.)

FIRE HAZARDS

Lower Flammable Limit: 1.1%

Upper Flammable Limit: 6.1%

Behavior in Fire: Flammable liquid. May generate flammable vapors upon release. Vapors may be heavier than air and may travel to a source of ignition and flash back. Exposure of containers to fire or excessive heat may result in polymerization and violent container rupture. This material is lighter than water and insoluble in water. The fire could easily be spread by the use of water in an area where the water cannot be contained.

Hazardous Combustion Products: Include carbon monoxide, carbon dioxide, acrid styrene fumes and possibly other toxic gases.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Loss of inhibitor or excessive heat may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in the presence of certain chemical contaminants (see General Information section).

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

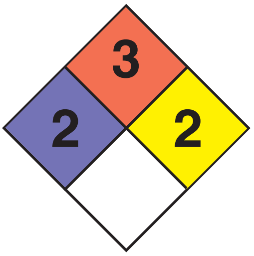
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This should include impervious and resistant clothing. Compatible materials may include polyethylene, polyvinyl alcohol, ethyl vinyl laminate and Viton®.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations (above 700 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted organic vapor canister or an organic vapor cartridge respirator with a full facepiece within the use limitations of these devices.

2055

STYRENE MONOMER, STABILIZED

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin or respiratory tract; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if skin irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Use water fog, dry chemical, carbon dioxide or foam concentrate suitable for hydrocarbon fires. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. This material is lighter than water and practically insoluble. The fire could easily be spread by the use of water in an area where the water cannot be contained. Dike fire control water for proper disposal since it may be flammable and/or toxic.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of styrene may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that styrene monomer is a flammable liquid subject to violent self-polymerization under conditions described in the General Information section. Consider not flushing spills since the material may float on water and may be carried off-site spreading the fire. Overflow dams may be used to dike material since it does not mix well with water and it is lighter than water. Spills may be absorbed with sand, clay or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with qualified experts. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Styrene monomer may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of styrene monomer in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

STYRENE MONOMER, STABILIZED
Class 3 (Flammable Liquid)

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Styrene spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to styrene vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point upwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of styrene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of styrene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, or in high wind conditions, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Styrene may be confined by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Confined material may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

STYRENE MONOMER, STABILIZED
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

STYRENE MONOMER, STABILIZED

Class 3 (Flammable Liquid)

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Sorbent pads or peat placed on upstream side of mesh should absorb and retard spreading of spilled product

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

WATER BY-PASS DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating styrene monomer.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Sorbent pads, peat or commercial sorbent materials compatible with styrene monomer may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

September 1992

SULFUR or MOLTEN SULFUR
Class 4.1 (Flammable Solid) or Class 9 (Miscellaneous Hazardous Material)

GENERAL INFORMATION

Sulfur, as addressed in this Guide, is shipped in the form of solid crystals, powders or prills; as a hot molten liquid; or as an emulsified solution of sulfur in water. Pure sulfur is odorless but common impurities may cause a rotten egg type odor, an oily odor, or even a sweet odor. All forms of sulfur are heavier than water and insoluble therein. Pure sulfur is yellow and changes to orange to red to black as its temperature increases according to one authority. Other possible colors, depending on the form, temperature, and purity of the product are reported to include amber, tan, brown, and gray. All forms of sulfur are combustible. Clouds of sulfur dust in air may burn or explode if ignited. Molten liquid above its flash point may evolve vapors that may travel to a source of ignition and flash back. It is conjectured that sealed tanks of emulsified aqueous solutions may possibly rupture if exposed to excessive heat for sufficient time duration due to steam pressure. Molten sulfur is typically shipped and stored at temperatures between 280°F (138°C) and 300°F (149°C) and may cause severe thermal burns upon contact. Violent generation of steam may result from introduction of water or another volatile liquid into molten sulfur or hot tanks, leading to tank rupture, personnel burns, and other hazards.

Sulfur reacts in a hazardous fashion with a wide variety of other chemicals and many metals, that molten sulfur may contain highly toxic and potentially flammable and explosive gases that are dissolved in the liquid and which may evolve from its surface, and that the gases, fumes, and smoke generated by burning sulfur are highly irritating and toxic. Indeed, these products of combustion (based on amount of sulfur burning, location, and weather conditions) may provide cause for a downwind evacuation or alternative public protective action ifa cargo of sulfur is ignited.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible; no specific data available.

Solubility in Other Chemicals: The best solvents are reported to be benzene, carbon disulfide, and carbon tetrachloride according to one authority.

Specific Gravity (Liquid): Depending on form and purity, reported values for solid sulfur range from 1.92 to 2.08 at room temperatures; approx 1.8 for the molten liquid.

Boiling Point: 832 - 832.5°F (444.4 - 444.7°C) at 1 atm.

Melting Point: Depending on the form and purity of the sulfur, reported values range from 224.2 - 251.6°F (106.8 - 122.0°C).

Freezing Point: See melting point

Molecular Weight: Elemental sulfur is considered to have an atomic weight of 32.06. The molecular weight of monoclinic and rhombic forms of sulfur (as Ss) is 256.5.

Heat of Combustion: - 2634 cal/g

Vapor Pressure: Less than 0.0001 mm Hg at 68°F (20°C) for pure solid; 1 mm Hg(0.01933 psia) at 362.84°F (183.8°C) for pure molten liquid without dissolved gases.

Flash Point: Reported as low as 335°F (168°C), closed-cup, for impure sulfur; the value reported for pure sulfur by several authorities is 405°F (207°C), closed-cup; yet others provide a value as high as 502°F (261°C).

Autoignition Temperature: 374°F (190°C) reported for sulfur dust in air; values reported for molten sulfur range from 450°F (232°C) to 511°F (266°C).

Burning Rate: Not available

Stability: Stable

Corrosiveness: Corrosive to copper and copper alloys and combines with nearly all metals under appropriate conditions. Molten sulfur may be stored in steel or stainless steel when corrosion is limited by avoiding exposure to air and moisture; it is also reported as generally compatible with iron and solid aluminum. Sulfur is both an oxidizing and reducing agent; it will form sulfides with most metals, including iron, and may react vigorously with metals in the sodium and magnesium groups of the periodic table. Molten sulfur may attack and degrade certain rubber and plastic substances. Its temperature is sufficiently high that some of these substances may melt or lose their strength.

Reactivity with Water: *No* reaction

Reactivity with Other Chemicals: Reactive with a very large number of other chemicals and substances. At higher temperatures, sulfur may react with hydrocarbons evolving poisonous hydrogen sulfide gas and carbon disulfide. Mixtures with powdered carbon or charcoal may ignite spontaneously. Seek additional information from qualified experts on the interaction of sulfur with specific substances where necessary. Space does not permit a full discussion of all known incompatible materials and their individual hazards.

IDENTIFICATION

Shipping Names: Sulfur; sulfur, molten

Synonyms and Tradenames: Flowers of sulphur; liquefied sulfur; precipitated sulfur; sublimed sulfur; sulfur flour; sulfur flower; and many tradenames and names reflecting the source or nature of the product.

Chemical Formula: "S" for elemental sulfur; "S_8" for monoclinic or rhombic crystals.

Constituent Components (% each): Solid sulfur is sold in many varieties and grades; molten sulfur is apparently 99% or more pure. One shipper of molten sulfur reports its product may contain some amounts (less than 1%) of dissolved hydrogen sulfide and/or sulfur oxide gases that may evolve from the liquid with time. These gases are highly toxic. Hydrogen sulfide is also flammable.

49 STCC: 49 457 70; 49 174 02; 49 174 03; 49 453 56

UN/NA Designation: NA1350 or UN1350 for "sulfur", which refers to the solid product; NA2448 or UN2448 for "sulfur, molten".

IM0 Designation: 9, miscellaneous hazardous material, for US shipments; 4.1, flammable solid, for international shipments.

Physical State As Shipped: Various forms of dry solid; emulsions of solid sulfur mixed with water; or hot molten sulfur.

Physical State As Released: As shipped; hot molten sulfur will solidify as it cools below its melting point. Be advised that a solid crust may form over molten sulfur and that the liquid underneath may remain hot for an extended period of time.

Color of the Shipped Material: Relatively pure sulfur is yellow and changes from lemon yellow to orange to red to black as its temperature increases according to one shipper. Another reports its product is bright yellow when solid and turns a yellow-amber color when molten.

Odor Characteristics: Pure sulfur is odorless; impurities may cause a rotten egg type odor, an oily odor, or even a sweet odor. Burning sulfur smells like burning match heads.

Common Uses: Making sulfuric acid and other chemicals, insecticides, plastics, enamels, metal-glass cements, dyes, gunpowder, matches, detergents, pharmaceutical products, explosives, rodent repellants and soil conditioners.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

SULFUR or MOLTEN SULFUR
Class 4.1 (Flammable Solid) or Class 9 (Miscellaneous Hazardous Material)

The Class 9 placard may
e used instead

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not available; pure sulfur is odorless. Impurities may have different characteristics.

Unusual Hazards: The space above the liquid in tanks of molten sulfur may contain toxic and flammable hydrogen sulfide gas under pressure; it is necessary to check carefully for pressure or vacuum before releasing all hatch hold-downs; the cover may try to spring open forcefully and/or material or gas may eject forcefully. Sulfur may remain molten under a solid crust for extended periods; check carefully before walking on such crusts. Violent generation of steam may result from introduction of water or another volatile liquid into molten sulfur or hot tanks, leading to tank rupture and/or personnel burns. Products of combustion are toxic, may irritate exposed skin, and may cause visibility problems in area of burning sulfur. Pressure relief devices on tanks of the molten liquid may be susceptible to plugging with solid and subsequent malfunction.

Short Term Exposure Limit (STEL): 5 ppm for sulfur dioxide; 15 ppm for hydrogen sulfide; both for 15 minutes (ACGIH, 1991- 92; OSHA, 1989). Not established for sulfur.

Time Weighted Average (TWA) Limits: For solid sulfur dusts, 10 mg/m^3 (total dust) over each 8 hours of a 40 hour work week (ACGIH TLV, 1990-91); 15 mg/m^3 (as total dust) and 5 mg/m^3 (as respirable fraction) under similar circumstances (OSHA PEL, 1989); all as exposure limits for "nuisance dusts". For other gases, 2 ppm for sulfur dioxide and 10 ppm for hydrogen sulfide over each 8 hours of a 40 hour work week (ACGIH, 1991-92; OSHA, 1989).

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, or direct physical contact. See "Unusual Hazards" for additional information.

HEALTH HAZARDS

Public Health Hazards: Pure sulfur poses a relatively low toxic hazard to the public when not burning and when not physically contacted as a molten liquid. Of far greater concern is the presence of dissolved hydrogen sulfide gas that may evolve from the molten liquid and the generation of sulfur dioxide and possibly other gases during combustion of the substance. These gases are highly toxic and pose a substantial risk to response personnel and downwind populations. See the Emergency Action Guides for sulfur dioxide and hydrogen sulfide for the respective inhalation hazards of these highly toxic gases.

Hazards of skin or Eye Contact: Contact of the eyes with sulfur dust may cause slight to severe irritation. According to one highly respected authority, an individual may be exposed for several hours or days to sulfur dust before beginning to develop a scratchy discomfort in the eyes which may progress to a burning sensation, lacrimation, blurring of vision, inflammation of the cornea, and loss of patches of the outer layer of the cornea. Recovery is usually spontaneous and complete within two or three days when exposure is discontinued. Contact of the eyes with molten sulfur may cause severe burns and permanent injury. Solid sulfur is only slightly irritating if at all to skin in brief exposures. Repeated or prolonged contact may cause reddening, itching, inflammation, and dryness of the skin, as well as possibly an allergic reaction in some people. Damaged, abraded, or cut skin may aggravate problems. Molten sulfur can adhere to skin, hair and clothes, causing thermal burns of severity depending on the amount and extent of contact. It is generally recognized that contact lenses should not be worn when working with chemicals because they may contribute to the severity of an eye injury.

Hazards of Inhalation: Sulfur dusts and mists may be irritating to the nose, throat and respiratory system, including the lungs, at relatively high concentrations in air. Repeated exposures may cause bronchitis to develop with symptoms including coughing, production of phlegm, and/or shortness of breath. Prolonged chronic exposures may cause bronchopulmonary disease potentially complicated by emphysema and lung injury (bronchiectasis). See the Emergency Action Guides for sulfur dioxide and hydrogen sulfide for the respective inhalation hazards of these highly toxic gases.

Hazards of Ingestion: Sulfur is of relatively low toxicity by ingestion. Single oral doses are reported to cause gastrointestinal disturbances with symptoms including irritation, nausea, vomiting, and diarrhea. Ingestion of large amounts (15 grams or more, presumably for an average adult) may result in formation of highly toxic hydrogen sulfide in the colon due to bacterial action if not removed via vomiting or other means. Other potential symptoms are reported to include convulsions, unconsciousness, an odor of hydrogen sulfide on the breath, changes in blood pressure and respiration, respiratory arrest, and possibly death. The lowest dosage reported to cause deaths among rabbits in laboratory experiments is 175 mg of sulfur per kilogram of the animal's body weight. Ingestion of molten sulfur will obviously result in severe burns of the mouth, throat, and internal organs.

1350

SULFUR or MOLTEN SULFUR
Class 4.1 (Flammable Solid) or Class 9 (Miscellaneous Hazardous Material)

FIRE HAZARDS

Lower Flammable Limit: 3.3 to 4.3% for hydrogen sulfide; reported values vary.

Upper Flammable Limit: 44 to 46% for hydrogen sulfide; reported values vary.

Behavior in Fire: Easily ignitable combustible solid or molten liquid. Additional heating of molten liquid may result in vapors that travel some distance to a source of ignition and flash back. Sulfur fires appear deep blue at night and have short flames. During daylight, the flames are pale blue and may be difficult to see or even invisible if not for the smoke and heat generated. The smoke from a fire is not only highly toxic via inhalation but may hinder visibility in the spill area. Upon contact with moisture or sweat, it may cause irritation and a burning sensation involving exposed skin areas, especially in the neck area of personnel in regular turnout gear. Emulsified solutions in water pose less of a hazard until such time as the water vaporizes upon release. Although the hazard is not reported in the literature, it is conjectured that exposure of well-sealed containers of emulsified sulfur solutions to excessive heat or fire may possibly cause generation of sufficient steam pressure to cause rupture of the container. The rupture may take place with violence if the container is of strong construction.

Hazardous Combustion Products: Normal combustion of pure sulfur is reported to produce highly toxic sulfur dioxide gas that may behave as if it is heavier than air. One authority reports that carbon bisulfide and highly toxic hydrogen sulfide gases may also be generated upon decomposition (both of these gases are themselves flammable).

EXPLOSION HAZARDS

Lower Explosive Limit: 35 mg/m^3 for sulfur dust in air.

Upper Explosive Limit: 1400 mg/m^3 for sulfur dust in air. These limits may vary considerably depending on the particle size and dispersion of sulfur dust in air.

Explosiveness: A cloud of sulfur dust in air may burn or explode if ignited by a flame, sufficiently hot surface, or spark. Contact of sulfur with certain other chemicals may result in an explosion. Accumulations of flammable hydrogen sulfide gas evolved from molten sulfur may explode if ignited in a confined area. See Behavior in Fire section directly above for a discussion of container rupture potential.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with solid sulfur or its aqueous solutions at normal temperatures; this may include rubber boots, gloves, face shields, splash-proof or dust-proof safety goggles, and other clothing including long pants and long sleeved shirts. Equipment should prevent any possibility of skin or eye contact with molten sulfur; this may include hard hats, face shields, splash-proof safety goggles, and heat-resistant gloves, boots without open tops, and other appropriate clothing. Fire retardant clothing is preferable when handling sulfur in any form. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high concentrations of combustion products in air. Note that the temperature of molten sulfur is sufficiently high that many synthetic plastic or rubber materials may melt or lose their strength. Protective equipment and clothing designed for chemical exposures may not be effective against the thermal hazard posed by direct contact with molten sulfur. Materials that may chemically be compatible with sulfur include neoprene and butyl rubber according to one authority.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent) is preferred for all emergency situations involving molten or burning sulfur. For other conditions in which exposures may occur, a NIOSH-approved dust or mist respirator appropriate for the airborne contaminant levels present may be adequate within the use limitations of these devices. Note that no protection may be necessary if the non-molten product has spilled in a non-fire situation and dusts or mists have not become airborne.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, nose, and/or throat; coughing; and various symptoms of ingestion for exposure to sulfur. Irritation of the eyes, nose, or throat; headache, dizziness, upset stomach, or other symptoms of hydrogen sulfide inhalation. Irritation of the eyes, nose, throat, and/or lungs; coughing, choking, difficult breathing, or other symptoms of sulfur dioxide exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's

FIRST AID (continued)

First Aid for Inhalation (continued): lungs or vomit.) If vomiting occurs naturally, have victim lean forward with head below hips to avoid aspiration of fluids into lungs.

First Aid for Skin and Eye Contact: If irritation occurs, flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing. Contact with molten sulfur may require treatment for thermal burns. Be advised that removal of solidified molten material from the skin or the area of the eyes may require professional medical assistance. Soap is not necessary when treating contact of the skin with molten sulfur.

First Aid for Ingestion: The majority of references recommend that large amounts of water should be administered immediately and that vomiting be induced if the victim is conscious. One suggests that a strong solution of baking soda (sodium bicarbonate) in water be used to reduce gastric acidity and prevent the formation of hydrogen sulfide in the gastrointestinal tract. Conversely, some references recommend that water be administered and that a physician be consulted before vomiting is induced. Use professional judgment if qualified, considering the amount of sulfur ingested, or consult a physician to determine which course of action to take. Do not make an unconscious person vomit. Get medical attention as soon as possible. If vomiting occurs naturally or is induced, have victim lean forward with head below hips to avoid aspiration of fluids into lungs.

FIRE RESPONSE

Extinguishing Materials: Water fog or spray; sand or dirt; special mixtures of dry chemical; carbon dioxide; saturated steam; an inert gas such as nitrogen; or foam (both regular and alcohol are mentioned by authorities). Some fires involving solid sulfur may possibly be extinguished by using additional sulfur to cover the burning product. Do not use a solid stream of water which may scatter the material. Note that water or foam may cause frothing; application into a tank of hot molten sulfur may result in boilover. A fire inside a tankcar may possibly be extinguished by closing the dome lid and letting the fire smother itself. One authority reports that water fog works better than water spray and that foam works better than water fog.

Extinguishing Techniques: Stay upwind. Avoid bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes or smoke is anticipated. Move container from fire area if no risk. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction if the container should rupture. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire in the case of emulsified solutions of sulfur. Post a fire watch for about four hours after the fire is controlled; sulfur fires may smolder and reignite. See the Unusual Hazards, Behavior in Fire, and Explosiveness sections of this Guide for additional information. Do not depend on installed transport tank pressure relief devices to limit pressures in tanks. These may easily become plugged with solid sulfur.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment compatible with the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Ground all equipment and transfer lines as necessary prior to use. Be advised that both the dry solid and molten liquid may generate static electricity. Liquid sulfur, especially when handled near or above its flash point in air, should be directed to the bottom of containers using a siphon breaking, electrically conductive internal fill pipe rather than being permitted to cascade down in free fall (to minimize generation of static electricity). Avoid handling solid sulfur at high velocities. Thoroughly melt all cargo before unloading of a vehicle is attempted if molten sulfur is being conveyed. Avoid heating sulfur above 300°F during transfer

SULFUR or MOLTEN SULFUR
Class 4.1 (Flammable Solid) or Class 9 (Miscellaneous Hazardous Material)

SPILL RESPONSES (continued)

General Information (continued): operations. Unload by gravity or pressure. Use regulated air or nitrogen pressure no more than that reasonably required for unloading. Be familiar with all hazards and characteristics of the product before initiating a cleanup effort. Be advised that solidified molten sulfur can be quite difficult to remove from pavement and other surfaces. There is some small possibility that discharge of a carbon dioxide fire extinguisher at the point of leakage of molten sulfur has the potential to solidify and stop the leak, at least temporarily. Other means of attempting to solidify the leaking product via cooling may also work. Whether or not the "plug" of solid will hold will depend on several factors including the amount of liquid remaining in the container and its temperature. It may become necessary to repeat the procedure several times until the leak can be patched or to ultimately abandon the effort. Use professional judgment in attempting this type of response. Molten sulfur temperatures can be quite high.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Sulfur and its solutions in water will not evolve significant amounts of hazardous airborne contaminants in many non-fire spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed. (Note: In order to pose a significant downwind inhalation hazard, molten sulfur that has discharged must contain and evolve significant quantities of toxic gases and/or toxic products of combustion must be generated from burning sulfur.)

CONSEQUENCE

Hazardous levels of various gases, dusts, and/or mists may possibly be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

EVACUATION . . . In the event of afire, it may become necessary to evacuate local and downwind areas as conditions warrant to prevent exposure and to allow smoke and fumes to dissipate. Burning sulfur may expose downwind areas to toxic gas and fume concentrations over considerable distances in some cases. So may spills of molten sulfur containing significant amounts of dissolved toxic gases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Extinguish fire if safe to do so. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow gases and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary. Note that the vapor pressure of the molten product and its vapor emission rate will decrease as it solidifies and cools in the ambient environment or if various means (see below) are used to accelerate its rate of cooling.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid sulfur with a plastic sheet or other compatible material to prevent airborne dust. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to dusts, mists, or gases in air may knock them down and/or accelerate their dispersal in the atmosphere. Application of water fog to the surface of molten sulfur may help control spreading, absorb heat, and help form a solid crust over the material that reduces toxic gas evolution. Wetting down of exposed sulfur powder may reduce generation of

TECHNIQUE (continued)

airborne dust. Note previous warnings about frothing and other hazards of applying water to very hot molten sulfur. Be advised that firefighting foams may have similar benefits and effects if applied to the surface of molten sulfur pools.

CONSEQUENCE

Water runoff may contain some amounts of sulfur and possibly other chemicals that may render soil toxic to plants.

MITIGATION

Contain contaminated water where deemed necessary and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments. Use caution when first applying water or foam to hot molten sulfur.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Solid sulfur, its emulsified solutions with water, and/or liquid molten sulfur may be contained by building dikes or barriers using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting (capable of withstanding the temperature of molten sulfur where necessary) covered with rocks and soil or sand, or via other appropriate methods. Let molten sulfur solidify before attempting cleanup. Consider use of a fine water fog or spray to accelerate solidification and cooling of molten sulfur pools, keeping in mind the potential frothing problem discussed earlier.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product, particularly liquids.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated pools of emulsified sulfur solutions or contaminated water runoff (where deemed necessary) may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. This response is unlikely to be appropriate for molten sulfur since cooling of the product may result in its solidification and subsequent plugging or clogging of transfer or storage equipment (unless specially designed for this purpose).

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged, develop leaks, or react with the sulfur.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of emulsified sulfur solutions or contaminated water runoff (where deemed necessary) may be controlled by absorbing the the liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and solid or solidified sulfur or its residues may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded, or alternatively, may react with the sulfur. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause sulfur dust to become airborne. Use of motorized equipment may possibly result in heating and ignition of sulfur dust under appropriate conditions.

MITIGATION

Select removal procedures that do not cause dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply caution if using any equipment that may result in heating and possible ignition of the sulfur. Consult qualified experts for advice where necessary.

TECHNIQUE

NEUTRALIZATION . . . Excessive amounts of sulfur may render soil toxic to certain types of plants. Where deemed necessary, application of an appropriate neutralization agent to contaminated soil may reduce adverse environmental impacts.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consult environmental officials about the need for neutralization.

SULFUR or MOLTEN SULFUR
Class 4.1 (Flammable Solid) or Class 9
(Miscellaneous Hazardous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Molten sulfur is expected to thicken, solidify, and sink to the bottom of water bodies, potentially releasing some hydrogen sulfide into the water. Powdered sulfur or emulsified sulfur solutions may result in particles of sulfur remaining dispersed in the water column. Some portions of powdered sulfur may float on the surface of the water for a time. All of these phenomena have been associated with adverse impacts on aquatic life with the degree of problems caused a function of conditions at the spill site and the nature of the aquatic system. They may also cause problems or hazards for users of the water.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination when the spilled material sinks in water.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water solids and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery. [Note: There may be occasions, especially when the water is very cold, that the molten liquid will form an amorphous "plastic" sulfur. If removal is not possible, let the sulfur solidify and apply a preferably inert and alkaline cover material such as limestone to the spill area until recovery procedures begin. This will reduce the possible formation and release of sulfuric acid into the water.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water containing suspended sulfur particles or dissolved contaminants may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Potentially suitable methods for suspended sulfur particle recovery include filtration and settling.

January 1988

SULFUR CHLORIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Sulfur chloride is an amber to yellowish red fuming liquid with an irritating, nauseating, pungent and penetrating odor. It is used in laboratories, for hardening wood, for gold extraction from ore, for purifying sugar juices, and for making vulcanized rubber or oils, military gases, insecticides, dyes, lube additives, and other products and chemicals. Its flash point of 245°F indicates that the product must be preheated before ignition may occur easily. Nevertheless, sulfur chloride may ignite organic matter spontaneously upon contact. Decomposition of the product due to excessive heat may result in rupture of containers. Contact with certain metals in the presence of moisture may generate flammable and potentially explosive hydrogen gas. The product weighs approximately 14.1 pounds per gallon.

Although stable in normal transportation, sulfur chloride reacts violently with water to produce heat, hydrochloric acid, sulfur, flammable hydrogen sulfide gas, sulfurous acid, sulfites, and other substances, and is highly reactive with a wide variety of other chemicals. It is also corrosive to many metals in the presence of moisture and to all bodily tissues. Products of combustion include toxic sulfur dioxide, chlorine, and hydrogen chloride gases.

If sulfur chloride is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard. Vapors and fumes may be heavier than air.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below.

Solubility in Other Chemicals: Soluble in alcohol, amyl acetate, benzene, carbon disulfide, and most organic solvents.

Specific Gravity (Liquid): 1.69 at 59.9°F (15.5°C)

Boiling Point: 280°F (137.8°C) at 1 atm; decomposes.

Melting Point: - 105°F (- 76.1°C) or - 112°F (- 80°C); reported values vary.

Freezing Point: See melting point

Molecular Weight: 135.03

Heat of Combustion: Unavailable

Vapor Pressure: 6.8 mm Hg (0.131 psia) at 68°F (20°C)

Flash Point: 245°F (118°C), closed cup; 266°F (130°C), open cup.

Autoignition Temperature: 453°F (233.9°C)

Burning Rate: Unavailable

Stability: Stable, but reacts with water.

Corrosiveness: Attacks metals in presence of moisture with evolution of hydrogen gas. Use materials compatible with hydrochloric acid.

Reactivity with Water: Decomposes violently to evolve heat and hydrochloric acid, sulfur, hydrogen sulfide, sulfurous acid, sulfites, etc. May ignite organic matter.

Reactivity with Other Chemicals: Reacts with alkalis, phosphorus trioxide, sodium peroxide, chromyl chloride, and a wide variety of other chemicals and substances.

IDENTIFICATION

Shipping Names: Sulfur chloride (USDOT); chloride of sulfur (USDOT); sulphur chlorides (IMO)

Synonyms and Tradenames: Sulfur monochloride; sulfur subchloride; disulfur dichloride; triosulfurous dichloride.

Chemical Formula: S_2Cl_2

Constituent Components(% each): May be up to 5% dissolved free sulfur in commercial material.

49 STCC: 49 323 80

UN/NA Designation: UN1828

IMO Designation: 8.0, corrosive

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Amber to yellowish red

Odor Characteristics: Penetrating, pungent, irritating, nauseating

Common Uses: Reagents; rubber and oil vulcanizing; purifying sugar juices; hardening of soft woods; gold extraction from ore; mfg. military poison gas, insecticide, pharmaceuticals, dyes, lube additives, and rubber substitutes; sulfur solvent.

SULFUR CHLORIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable, but 2 - 9 ppm in air is mildly irritating to eyes.
Unusual Hazards: Highly water-reactive and corrosive fuming liquid. Fumes are hazardous. Contact with metals may evolve hydrogen gas. May ignite organic matter upon contact. Hydrogen may be present in containers.
Short Term Exposure Limits (STEL): 3 ppm for 15 minutes. (ACGIH)
Time Weighted Average (TLV-TWA): 1 ppm over each 8 hours of a 40 hour work week. (ACGIH)
Conditions to Avoid: Heat, fire, and sparks; contact with water or incompatible substances; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive liquid that may produce large amounts of toxic, corrosive, and potentially flammable fumes or vapors, particularly if in contact with water.
Hazards of Skin or Eye Contact: Sulfur chloride may produce irritation or burns of the skin if not removed. Contact with the eyes may cause severe immediate damage which may result in permanent scarring.
Hazards of Inhalation: Exposure to sulfur chloride vapors or fumes may cause severe irritation, coughing, and tearing and burning of the eyes. High levels in air may cause severe breathing difficulty and symptoms of pulmonary edema or chemical pneumonia. All symptoms may be delayed in onset to various degrees.
Hazards of Ingestion: Ingestion of sulfur chloride may cause severe damage to the mouth and stomach.

FIRE HAZARDS

Lower Flammable Limit: Unavailable
Upper Flammable Limit: Unavailable
Behavior in Fire: *Will* burn but difficult to ignite. High temperatures cause decomposition to toxic chlorine gas and solid sulfur. Containers may rupture violently in fire. May generate large quantities of corrosive vapors or fumes upon release.
Hazardous Combustion Products: Toxic sulfur dioxide, chlorine, and/or hydrogen chloride gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable
Explosiveness: Very reactive. Containers may rupture in fire. Hydrogen gas evolved in reactions with some metals may explode if ignited in a confined area, as may hydrogen sulfide gas evolved in reactions with water. Vapors from hot sulfur chloride may explode if ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.
Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations {above 10 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted canister (10 ppm or less) or a chemical cartridge respirator with a full facepiece (10 ppm or less) within the use of limitations of these devices and with a canister or cartridge(s) for hydrogen chloride and sulfur dioxide.

1828

SULFUR CHLORIDE
Class 8 (Corrosive Material)

FIRST AID

Nonspecific symptoms: Irritations or burns; other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. (Note: If available, give milk, milk of magnesia, egg white, or olive oil after giving water. Give more water if vomiting occurs naturally.)

FIRE RESPONSE

Extinguishing Materials: Dry sand, carbon dioxide, dry chemical. Product reacts with water or foam but may consider using large amounts of water fog or water spray if large quantities of combustibles are involved.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. Note that addition of water may increase evolution of fumes from leaking product.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage; rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Note that contact with metals in the presence of water may evolve flammable hydrogen gas and that flammable hydrogen sulfide gas may be evolved in reactions with water. Use explosion-proof and spark-proof equipment where necessary. Take the reactivity of sulfur chloride into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Sulfur chloride spills may expose downwind areas to toxic concentrations over considerable distances if large amounts of heavier than air, corrosive vapors or fumes are evolved due to contact with water or moist air.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

SULFUR CHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to sulfur chloride vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point downwind of the spill and should not be allowed to contact pools of sulfur chloride, as this will increase fume evolution.

CONSEQUENCE

Water runoff may contain sulfur chloride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sulfur chloride may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained sulfur chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

SULFUR CHLORIDE
Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply this technique only to remove final traces of spilled product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

March 1995

SULFUR DIOXIDE
Poison Gas
(Division 2.3)

GENERAL INFORMATION

Sulfur dioxide is a colorless poison toxic gas that is shipped as a liquid under pressure and has a sharp odor like burning sulfur. It is used to make disinfectants, fumigants, glass, wine, processed foods, and a variety of other chemicals and products. Sulfur dioxide is fairly soluble in water. Liquid sulfur dioxide is heavier than water, and due to its boiling point of 14°F, may be expected to sink in water while simultaneously boiling and reacting to form a corrosive acid solution (reaction is not considered hazardous). The low boiling point also indicates that most spills can be expected to produce large amounts of gas and fumes. These are heavier than air, may expose downwind populations to toxic concentrations over considerable distances, and may persist in pits and depressions. Containers may rupture due to overpressurization if exposed to fire or excessive heat for sufficient time duration. The liquid weighs approximately 12.1 pounds per gallon at its boiling point temperature.

Sulfur dioxide forms sulfurous acid in reactions with water, and this acid may corrode aluminum and some other metals. Contact of sulfur dioxide with some powdered metals and with alkali metals such as sodium or potassium may result in fires or explosions, and the product is also reactive with a variety of other chemicals. Liquid sulfur dioxide may attack some forms of plastics, rubber and coatings, and is corrosive to bodily tissues.

If bulk container is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of 2500 feet. If cylinder is exposed to direct flame or fire becomes uncontrollable, evacuate for a radius of 1500 feet. If sulfur dioxide is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 10 g/100 g water at 68°F (20°C); decreases with increasing temperature.
Solubility in Other Chemicals: Soluble in acetic acid, ethyl alcohol, sulfuric acid, and organic solvents.
Specific Gravity (Liquid): 1.45 at 14°F (–10°C)
Boiling Point: 14°F (–10°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: –103.9°F (– 75.5°C)
Molecular Weight: 64.06
Heat of Combustion: Not flammable
Vapor Pressure: 3.27 atm. (48.1 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: Stable
Corrosiveness: Acidic reaction with water corrodes aluminum and several other metals. Liquid sulfur dioxide may attack some plastics, rubber, and coatings.
Reactivity with Water: Forms sulfurous acid in a nonhazardous reaction, then slowly oxidizes to sulfuric acid.
Reactivity with Other Chemicals: Reacts with cesium acetylene carbide, cesium monoxide, chlorates, chromium, ferrous oxide, lithium acetylene carbide, manganese, sodium, potassium, potassium acetylene carbide, potassium chlorate, sodium carbide, stannous oxide, halogens, acrolein, aluminum, chlorine trifluoride, and certain other substances.

IDENTIFICATION

Shipping Names: Sulfur dioxide (USDOT); sulphur dioxide (IMO)
Synonyms and Tradenames: Sulfurous acid anhydride; sulfur oxide; sulfurous anhydride; sulfurous oxide; fermenicide liquid.
Chemical Formula: SO_2
Constituent Components(% each): 99.90-99.98% pure
UN/NA Designation: UN1079
IMO Designation: 2.3, poison gas
Physical State as Shipped: Liquefied gas
Physical State as Released: Gas or liquid (boils at 14°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Sharp, pungent, like burning sulfur; may deaden sense of smell.
Common Uses: Mfg. sulfur compounds, disinfectants, fumigants, glass, wine, ice, proteins, vapor pressure thermometers; bleaching of beet sugar, flour, fruit, grain, oil, other products; tanning leather; insecticide; fungicide.

SULFUR DIOXIDE
Poison Gas
(Division 2.3)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 3 ppm

Unusual Hazards: Extremely volatile substance with heavier than air gases and vapors. May expose downwind areas to toxic concentrations in air over considerable distances. Gas may persist in pits and depressions.

Short Term Exposure Limits(STEL): 5 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 2 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Heat or fire; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the toxic gas concentrations that may be present in the spill area and over considerable downwind distances. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with liquid sulfur dioxide may result in burns of the skin from the freezing effect of rapid evaporation. Contact with the eyes may cause corneal burns and opacification resulting in possible loss of vision.

Hazards of Inhalation: Sulfur dioxide gas is a severe irritant of the eyes, nose, throat and lungs at concentrations as low as 10 ppm in air. Higher levels may cause choking, coughing, difficult breathing, chest tightness, delayed chemical bronchopneumonia, and possibly death due to respiratory paralysis. Concentrations of 400-500 ppm are immediately dangerous to life; 50-100 ppm is maximum permissible level for 30-60 minute exposures.

Hazards of Ingestion: Although unlikely, burns of internal tissues would be expected if liquid sulfur dioxide were somehow ingested.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to overpressurization. Will generate large quantitites of toxic gases upon release.

Hazardous Combustion Products: Not flammable

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may rupture violently in fire due to overpressure. Contact with other substances such as sodium or potassium or powdered metals may result in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

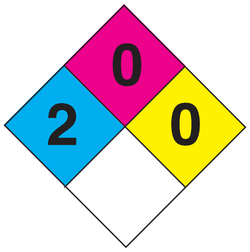
Protective Clothing Required: Equipment should prevent any possibility of eye contact with liquid sulfur dioxide and prevent the skin from becoming frozen from contact with the liquid or cold containers. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. For unknown or extremely high concentrations use chemically compatible, fully encapsulating suit.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 100 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with (SCBA) with full facepiece (or eqivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted sulfur dioxide canister or a sulfur dioxide cartridge respirator with a full facepiece within the use limitations of these devices.

1079

SULFUR DIOXIDE

Poison Gas
(Division 2.3)



FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately if eye contact has occurred or if skin irritation or burns persist after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water or milk immediately. Do not attempt to make the victim vomit, but if vomiting occurs naturally, give more water or milk. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but note that water applied to pools of liquid sulfur dioxide may increase gas evolution.

Extinguishing Techniques: Unusual toxic gas hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the toxic and extremely volatile nature of sulfur dioxide into account while planning the response. Note that gas may persist in pits and depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Sulfur dioxide spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to sulfur dioxide vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point downwind and should not be allowed to contact pools of liquid sulfur dioxide as this may increase gas evolution.

CONSEQUENCE

Water runoff may contain sulfur dioxide from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

SULFUR DIOXIDE
Poison Gas (Division 2.3)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Sulfur dioxide may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained sulfur dioxide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment.

MITIGATION

Use compatible equipment of proper pressure capacity.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels motorized graders and scrapers, loaders, bulldozers, and draglines. The response is best suited for removing final traces of a spill where necessary.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

SULFUR DIOXIDE

Poison Gas (Division 2.3)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECNNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

JULY, 1994

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

GENERAL INFORMATION

Sulfur trioxide is a thick, oily, colorless liquid with an acrid, irritating odor. It is not flammable, however, it is extremely corrosive. On contact with water, sulfur trioxide will react vigorously, generating substantial vapors composed predominately of sulfuric acid mist and un-reacted sulfur trioxide. While sulfur trioxide is not flammable, it is a powerful oxidizer and will react with most organic materials, including wood, and may cause ignition. Sulfur trioxide is extremely corrosive to living tissues and corrosive to, and may react violently with metals, generating heat and hydrogen gas. Reactions involving sulfur trioxide can proceed at an explosive rate.

When dealing with spills of sulfur trioxide, great care should be exercised in the use of water. Attempts to dilute large concentrations of sulfur trioxide with water may result in the development of substantial releases of vapors and acid mists. This can result in greatly expanding the threat of exposure well beyond the spill area. On dilution, depending on the amount of water involved, sulfur trioxide will form varying strengths of sulfuric acid.

In an accident situation, if sulfur trioxide is leaking and generating fumes, downwind evacuation of the spill area should be considered until properly equipped responders have assessed the nature of the threat. The spill assessment must account for the generation of large quantities of sulfuric acid mist, should sulfur trioxide combine with water.

Sulfur trioxide is used in the manufacture of oleum and sulfuric acid. It is also used as a sulfonating reagent in the manufacture of organic compounds and in the manufacture of non-ionic detergents.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Decomposes to 100% sulfuric acid.

Solubility in Other Chemicals: Soluble in sulfuric acid.

Specific Gravity (Liquid): 1.84 @ 37.8°C (100°F)

Vapor Density (Air=1): 2.8

Boiling Point: á -Sulfur trioxide 44.8°C (112.64°F); â-Sulfur trioxide 50°C (122°F), sublimes; ã -Sulfur trioxide 44.8°C (112.64°F).

Melting Point: á -Sulfur trioxide 16.83°C (62.3°F); (â-Sulfur trioxide 62.4°C (144.3°F); ã-Sulfur trioxide 16.8 (62.24°F).

Freezing Point: á -Sulfur trioxide 16.83°C (62.3°F), forms asbestos-like needles; (â -Sulfur trioxide 62.4°C (144.3°F), forms asbestos-like needles; ã -Sulfur trioxide 16.8 (62.24°F), forms ice-like mass.

Molecular Weight: 80.06

Heat of Combustion: Not flammable.

Vapor Pressure: @ 25°C (77°F) - á -Sulfur trioxide - 73 mmHg (â -Sulfur trioxide - 344 mmHg; ã -Sulfur trioxide - 433 mmHg.

Flash Point: Not flammable.

Autoignition Temperature: Not flammable.

Burning Rate: Not flammable.

Stability: á -Sulfur trioxide is the stable form, (â - and ã-forms tend to convert to á -Sulfur trioxide.

Corrosiveness: Highly corrosive to tissues, may produce hydrogen gas in contact with some metals.

Reactivity with Water: Decomposes violently. Reacts readily to form sulfuric acid, evolves heat. Evolves dense white fumes of sulfuric acid.

Reactivity with Other Chemicals: Oxidizing agent. Reacts readily with organic materials including wood. Heat of reaction sufficient to char or ignite wood.

IDENTIFICATION

Shipping Names: Sulfur trioxide

Synonyms and Tradenames: Sulfan, sulfuric anhydride, sulfan A ((â -sulfur trioxide, stabilized); sulfan B (ã - Sulfur trioxide, stabilized); sulfan C (not stabilized); CAS 7449-11-9.

Chemical Formula: $S0_3$

Constituent Components (% each): 99.8% sulfur trioxide.

UN/NA Designation: UN1829

IMO Designation: 8, corrosive.

Physical State as Shipped: Liquid.

Physical State as Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Acrid, burning.

Common Uses: Used in the sulfonation of organic compounds such as detergents.

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Not found.

Unusual Hazards: Highly reactive with water, liberating heat, to form dense cloud containing sulfuric acid and un-reacted sulfur trioxide. Highly corrosive to living tissues. Potent oxidizer. Reacts with most organic materials. May cause ignition of organic fuels including wood. May generate flammable hydrogen gas through the corrosion of metals.

Short Term Exposure Limits (STEL): None established.

Time Weighted Average (TLV-TWA): None established.

Conditions to Avoid: Contact with water or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Extremely corrosive to (issues. Contact with vapors may result in severe burns to skin and respiratory system. Acts quickly to produce damage. Atmospheres of 1 ppm (3 mg/m^3) are sufficient to cause coughing, choking and severe discomfort. Reactions with water may result in the evolution of a substantial acid vapor cloud increasing the threat of downwind exposure.

Hazards of Skin and Eye Contact: Eye exposure can result in severe burns to eye tissue. Extent and duration of exposure will determine the severity of the injury which could result in permanent blindness. Severe acid burns to the skin are likely to result from sulfur trioxide exposures. Burns may be deep, penetrating below the skin depending on the nature of the exposure.

Hazards of Inhalation: Severe respiratory irritant. Corrosive to respiratory mucous membranes. Symptoms include cough and wheezing. May progress to acute pulmonary edema and chemical pneumonia. Inhalation exposures may be fatal depending on the concentration and duration of exposure. Burns may progress even after removal from exposures due to the continued action of sulfuric acid residues.

Hazards of Ingestion: Highly corrosive to tissues in the mouth, esophagus, and stomach. May result in severe burns to the exposed tissues.

FIRE HAZARDS

Lower Flammable Limit: Not flammable.

Upper Flammable Limit: Not flammable.

Behavior in Fire: May form hydrogen gas in contact with most metals. Will not burn but may ignite organic materials including wood. Reacts violently with water to form dense, white, acid mist cloud.

Hazardous Combustion Products: Not flammable, products will relate to fuel involved.

EXPLOSION HAZARDS

Explosiveness: May evolve hydrogen gas in contact with most metals. Usually stabilized to inhibit crystallization. Reactions with water will evolve substantial amounts of sulfuric acid mist. Reaction will be intense and violent.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: *Full* acid suit or comparable protective equipment is necessary when dealing with sulfur trioxide releases. Equipment should protect from all direct contact with sulfur trioxide. Suitable materials of construction may include butyl rubber, neoprene, nitrite rubber, CPE, Viton, and polyvinyl chloride.

Respiratory Protection: *Full* respiratory protection. Positive pressure, self contained breathing apparatus or supplied air systems with full facepiece (or equivalent) are recommended for handling spills and fires involving sulfur trioxide.

1829

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Severe burns to any tissues involved depending on the level of exposure. Eye contact may result in permanent damage or blindness. Severe corrosion of respiratory tissues with symptoms including coughing, wheezing, choking, pulmonary edema, and chemical pneumonia. Symptoms may progress after removal from exposure due to residual contamination. Pulmonary symptoms may continue to develop after removal from exposure and victims should be observed for development/progression of pulmonary edema and delayed chemical pneumonia.

First Aid For Inhalation: Remove victim to fresh air. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure, resulting in increased respiratory distress with time. Symptoms of pulmonary edema and chemical pneumonia may continue to develop for some time (1 - 2 days) after exposure. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Severe exposures may result in permanent eye damage or blindness. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance immediately.

First Aid for Ingestion: *Do* not induce vomiting. If victim is conscious, administer large quantities of water or milk. Never give anything by mouth to an unconscious person. Seek medical assistance immediately.

FIRE RESPONSE

Extinguishing Materials: Not flammable. Materials should be appropriate to the fuel involved.

Extinguishing Techniques: The use of water to control fire in the vicinity of spilled sulfur trioxide should be weighed against the threat of vapor generation from the reaction of sulfur trioxide and water. Introducing water into containers containing sulfur trioxide should be avoided. Spilled sulfur trioxide should be protected from contact with water runoff to minimize the generation of acid mists.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to spill area. Avoid contact with spilled material. Prohibit unprotected personnel from entering spill area. Seek expert assistance. Protect sewers and waterways from spilled sulfur trioxide or contaminated runoff. Notify authorities, downstream of spill, of the potential for contamination. Be alert to conditions which may result in the mixing of water with spilled sulfur trioxide. Protect spills from contact with water, if possible, to avoid excess acid mist generation. Keep in mind that sulfur trioxide reacts with water to form sulfuric acid. Choose equipment which is compatible with sulfur trioxide. Contact with metals can result in the generation of hydrogen gas.

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

AIR SPILL

TECHNIQUE

EVACUATION... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Sulfur trioxide, when reacting with water, will form dense acid mists. Releases may expose downwind areas to toxic concentrations over considerable distances depending on the rate of mist generation.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Seek expert assistance. Stop leak if without risk and if proper equipment and trained personnel are available. Allow vapors and gas to dissipate completely before reentering spill area without special protective gear.

TECHNIQUE

WATER FOG OR SPRAY... Water fog may be used to control vapors and mists from sulfur trioxide spills. Sulfur trioxide will likely react with water to form sulfuric acid.

CONSEQUENCE

Water fog or spray for vapor control will react with vapors and mists to form sulfuric acid. Water fog or runoff from sprays added to spilled sulfur trioxide liquids will result in the generation of significant quantities of acid mist. Water runoff may contain levels of sulfuric acid from contact with sulfur trioxide. Water will become acidic and the pH will depend on the levels of acid generated. High levels of sulfuric acid in solution will pose a significant hazard. Refer to the **Sulfuric acid**, *Emergency Action Guide* for further information.

MITIGATION

Do not expose standing pools of sulfur trioxide to water. Do not spray water in containers of sulfur trioxide. Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may contact spilled sulfur trioxide and take steps to prevent such contact. Refer to the **Sulfuric acid, *Emergency Action Guide*** for further information.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Spills of sulfur trioxide on land may be contained by building dikes or barriers using soil, sand, or other materials. Where sulfur trioxide is likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Sulfur trioxide may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may react with contained sulfur trioxide. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking product.

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Sulfur trioxide may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination. Excavations will expose moist soil to sulfur trioxide and may increase the rate of vapor generation. Excavations exposing groundwater will promote the generation of large amounts of acid mist.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may cause increased vapor generation. Where possible, line containment areas with suitable, impervious material. Do not excavate deep enough to risk exposing product to groundwater.

TECHNIQUE

PUMPING/VACUUM SUCTION... Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Care should be taken to use equipment which is compatible with sulfur trioxide as it may react with metals to generate flammable hydrogen gas. Equipment should be dry to avoid contact with water.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed. Reaction with metals may generate hydrogen gas. Water contained in equipment may increase the generation of mist or vapor.

MITIGATION

Use equipment constructed of compatible materials. Insure equipment is free from water. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION... Spilled sulfur trioxide can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with sulfur trioxide and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

WATER SPILL

Sulfur trioxide will react in water to form sulfuric acid. Refer to the **Sulfuric acid, *Emergency Action Guide*** for further information.

TECHNIQUE

STOP USE... Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

SULFUR TRIOXIDE, INHIBITED
Class 8 (Corrosive Material)

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION... Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

September 2003

SULFURIC ACID

Class 8 (Corrosive Material)

GENERAL INFORMATION

Sulfuric acid is a colorless to dark brown oily liquid that is odorless when cool but may evolve choking vapors when hot. Commercial preparations may contain as much as 93 - 98% sulfuric acid in water. The product is fully soluble in water and is used to make fertilizers, explosives, artificial fibers, dyes, pharmaceuticals, detergents, glue, paint, paper and a wide variety of other chemicals and products. It is not flammable but is a strong oxidizer and highly reactive substance that may char wood upon contact and occasionally ignite combustible materials. Contact with most metals generates flammable and potentially explosive hydrogen gas. The product weighs 13 - 15.3 pounds per gallon depending on concentration.

Concentrated sulfuric acid reacts violently with water with the evolution of heat. Never add water to acid, spattering may occur. The product is highly corrosive to many metals, is also highly corrosive to bodily tissues, and is reactive with a wide variety of chemicals and substances, possibly causing fires or explosions. Toxic vapors are generated when sulfuric acid is heated to decomposition.

Initial downwind wind evacuation should be considered on a case by case basis if the product is leaking and large amounts of fumes are generated. Fumes and vapors may be heavier than air. If container of sulfuric acid is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile in all directions for protection from flying debris if the container should rupture violently. (Note: "Fuming sulfuric acid" is a term used for sulfuric acid with considerable amounts of dissolved sulfur trioxide. This latter product is also commonly known as "oleum" and is addressed by a separate guide in this series.)

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions

Solubility in Other Chemicals: Decomposes in alcohol.

Specific Gravity (Liquid): 1.56 - 1.84 at 68°F (20°C); 1.84 for 98% acid

Vapor Density: 3.4

Boiling Point: 644°F (340°C) for 98% acid at 1 atm

Melting Point: 37.4°F (3°C) for 98% acid

Freezing Point: 50.6°F (10.4°C) for 100% acid

Molecular Weight: 98.08

Heat of Combustion: Not flammable

Evaporation Rate (butyl acetate=1): <1

Vapor Pressure: .001 mmHg at 68°F (20°C)

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Flammable Limits: Not flammable

Stability: Stable

Polymerization Potential: Will not occur

pH: Very acidic. Varies between .3 to 2.1, depending on percent solution.

Corrosiveness: Highly corrosive acid, may generate hydrogen gas in contact with metals.

Reactivity with Water: Reacts violently with evolution of heat. Hygroscopic liquid.

Reactivity and Incompatibility: Reacts with organic materials and compounds, carbides, chlorates, fulminates, nitrates, picrates, metals, sodium, sodium carbonate, potassium permanganate, phosphorus, saltpeter, lithium silicide, mercuric nitride, nitrotoluene, acetone cyanohydrin, acetone and nitric acid and numerous other chemicals.

IDENTIFICATION

Shipping Name(s): Sulfuric acid (USDOT); Sulphuric acid (IMO)

Synonyms and Tradenames: Battery acid; Chamber acid; Fertilizer acid; Oil of vitriol; Dipping acid; Dithionic acid; BOV; Brown oil

CAS Registry No.: 7664-93-9

Chemical Formula: H_2S0_4

Constituent Components (% each): 5 - 100% acid with any remainder mostly water.

UN/NA Designation: UN1830 (> 51% sulfuric acid); UN2796 (<51% sulfuric acid)

IMO Designation: 8, Corrosive substances

RTECS Number: WS5600000

NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 2 (Reactivity): Reacts with water

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless (pure) to dark brown

Odor Characteristics: Odorless unless hot, then choking.

Reportable Quantity: See appendix I

Common Uses: Synthetic fertilizers, nitrate explosives, artificial fibers, dyes, pharmaceuticals, detergents, glue, paint, paper, and numerous chemicals; dehydrating agent; electrolyte in batteries; petroleum refineries; etching; making iron steel; various other uses.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive oxidizing mineral acid. May char and possibly ignite combustible materials. Reacts violently with water when concentrated. Contact with metals may generate hydrogen gas.

Short Term Exposure Limit (STEL): 3 mg/m^3

Time Weighted Average (TLV-TWA): 1 mg/m^3 over each 8 hours of a 40 hour work week (ACGIH)

IDLH: 15 mg/m^3

Conditions to Avoid: Heat, fire, or sparks where hydrogen may be present; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Highly corrosive to bodily tissues by all routes of exposure.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with liquid sulfuric acid may result in severe, deep and painful burns. Extensive burns may result in shock and collapse.

Hazards of Inhalation: Fumes and mists of sulfuric acid may cause irritation of the eyes, nose, throat and upper respiratory tract as well as teeth erosion and soreness of the mouth. High concentrations in air may cause sneezing, coughing, difficult breathing and laryngeal, tracheobronchial and pulmonary edema with possibly severe consequences.

Hazards of Ingestion: Ingestion of concentrated sulfuric acid may result in severe burns of the mouth and throat, perforation of the esophagus or stomach, staining and erosion of teeth, nausea and vomiting of blood and eroded tissue and possibly death.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: May generate large quantities of corrosive fumes or vapors upon release.

Hazardous Combustion Products: Toxic fumes of oxides of sulfur when heated to decomposition. Will react with water or steam to produce toxic and corrosive fumes. Reacts with carbonates to generate carbon dioxide gas, and with cyanides and sulfides to form poisonous hydrogen cyanide and hydrogen sulfide respectively.

EXPLOSION HAZARDS

Explosive Potential: Contact with most metals produces hydrogen gas that may explode if ignited in confined spaces. Contact with certain other chemicals may result in formation of explosive mixtures.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include butyl rubber, neoprene, nitrile rubber, chlorinated polyethylene, polyvinyl chloride, styrene-butadiene rubber, Viton® and nitrile-butadiene rubber for concentrated (more than 70%) acid as well as less concentrated solutions.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations (above 15 mg/m^3), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with chin-style or front or back mounted acid gas canister and high efficiency particulate filter or a high efficiency particulate filter respirator with a full facepiece.

1830 *

*Also 2796

SULFURIC ACID

Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Irritation or burns of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. Excess acid on skin can be neutralized with a 2% solution of bicarbonate of soda.

First Aid for Eye Contact: Flush eyes immediately with water for at least 30 minutes, occasionally lifting the eyelids. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: As suitable for surrounding fire, but note that concentrated sulfuric acid reacts violently with water. Water (if used) should be applied in flooding quantities as fog or spray.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire-exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Sulfuric acid is a highly corrosive liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Prevent liquid from entering sewers and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that sulfuric acid is highly corrosive and reactive. Contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Underflow dams are not an effective means to dike material since it is soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust.

SULFURIC ACID
Class 8 (Corrosive Material)

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Sulfuric acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly if the acid is not fuming or small quantities have spilled.

CONSEQUENCE

Hazardous levels of sulfuric acid in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases. Fumes may be heavier than air.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Water should be applied at a point upwind of the spill and should not be allowed to contact pools of sulfuric acid.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of sulfuric acid from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Sulfuric acid may be confined by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Confined sulfuric acid may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

SULFURIC ACID

Class 8 (Corrosive Material)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

SULFURIC ACID

Class 8 (Corrosive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

September 2006

SULFURIC ACID, SPENT†

Class 8 (Corrosive Material)

†Also see sulfuric acid guide

GENERAL INFORMATION

Spent sulfuric acid is a colorless to dark brown or black liquid that is the residue resulting from the use of sulfuric acid in leaching metal ores, pickling steel, acid dipping or electroplating metals, treating wool, making various chemicals or processing petroleum products. Consequently, such liquids may contain a considerable amount of sulfuric acid but might also contain various amounts of metal salts, organic substances such as fatty acids, or petroleum sulfonates. Since the specific composition of the spent acid varies, this guide is an attempt to provide an approximate set of response recommendations that should be adequate in most cases but may require interpretation and modification in the field based on professional judgment. It is strongly suggested that the shipper of the spent acid be contacted to determine the specific composition and any unusual or unexpected hazards of the substance. Other guides in this series or additional data sources may then be used to obtain further data on components. The guide for sulfuric acid in this series is especially relevant.

In many cases, spent sulfuric acid may not be combustible, however, some spent sulfuric acid contains combustible materials and so this should be considered. Note that the acid may be reactive with a variety of substances, and that contact with many metals may generate flammable and potentially explosive hydrogen gas. Concentrated sulfuric acid may react violently with water, and may char and occasionally ignite combustible materials. Any spilled material should be considered highly corrosive and reactive until proven otherwise.

If spent sulfuric acid is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions for liquids and at least 75 feet (25 meters) for solid. For larger spills, increase in the downwind direction as conditions warrant. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Expect that much will dissolve in water, some may not.
Solubility in Other Chemicals: Varies with composition
Specific Gravity (Liquid): Est. 1.39 at 68°F (20°C), may vary
Vapor Density: Heavier than air
Boiling Point: Est. >212°F (100°C), varies greatly
Melting Point: Varies
Freezing Point: Varies
Molecular Weight: 98.08 for sulfuric acid (H_2S0_4)
Heat of Combustion: Unknown, may or may not be combustible.
Evaporation Rate: Slow for acid component
Vapor. Pressure: 0.001 mmHg (sulfuric acid)
Flash Point: Acid component is not flammable but some products report >200°F (93°C) open cup
Autoignition Temperature: Acid component is not flammable but some products report 450 – 853°F (232 – 456°C)
Burning Rate: Unknown
Flammable (Explosive) Limits: 1% (LEL) – 8% (UEL)
Stability: Stable
Polymerization Potential: Should not occur
pH: Expected to be around 1
Corrosiveness: Strong acid may be highly corrosive to many metals, plastics, and rubber materials.
Reactivity with Water: Depends on particular product. Stronger acids may react violently with water.
Reactivity with Other Chemicals: Varies with composition. Sulfuric acid reacts with a wide variety of organic compounds, combustible materials, metals, oxidizable materials, bases, nitrates, chlorates, carbides, sulfides, cyanides, fulminates, picrates and other chemicals. Some reactions may be violent or explosive.

IDENTIFICATION

Shipping Names: Sulfuric acid, spent (USDOT); Sulphuric acid, spent (IMO)
Synonyms and Tradenames: Sulphuric acid, spent
CAS Registry No.: 7664-93-9 (sulfuric acid)
Chemical Formula: H_2S0_4 for sulfuric acid
Constituent Components (% each): Composition may vary widely
UN/NA Designation: UN1832
IMO Designation: 8, corrosive substances
RTECS Number: WS5600000 (sulfuric acid)
NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 2 (Instability): Water reactive. Note: Flammability rating is for sulfuric acid, but some spent products will contain components that may raise its flammability rating.
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless to dark brown or black
Odor Characteristics: Varies, may be odorless
Reportable Quantity: See Appendix I
Common Uses: Results from leaching of metal ores, pickling steel, acid dipping or electroplating metals, treating wool, making various chemicals, or processing petroleum products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

SULFURIC ACID, SPENT

Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unknown, one source reports >1 mg/m^3

Unusual Hazards: Composition uncertain; may contain toxic substances. May or may not be combustible. Contact with metals may generate hydrogen gas. Strong acid may be highly corrosive and reactive. Some products may contain carcinogens.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 1 mg/m^3 (sulfuric acid) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 15 mg/m^3 (sulfuric acid)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials and water; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Concentrated sulfuric acid is highly corrosive to bodily tissues by all routes of exposure. Spent acid may or may not be less corrosive and may have additional toxic effects due to other constituents. Data presented here are primarily for pure concentrated acids.

Hazards of Skin or Eye Contact: Contact of the skin or eyes with liquid sulfuric acid, or its concentrated fumes in air, may result in severe, deep, and painful burns and blistering. Extensive burns may result in shock and collapse. May cause corneal opacity.

Hazards of Inhalation: Fumes and mists of sulfuric acid may cause irritation of the eyes, nose, throat, and upper respiratory tract, as well as erosion of the teeth and soreness of the mouth. High concentrations in air may cause sneezing, coughing, difficult breathing, and laryngeal, tracheobronchial and pulmonary edema with possibly severe consequences. Victims should be followed for delayed appearance of pulmonary edema and chemical pneumonitis.

Hazards of Ingestion: Ingestion of concentrated sulfuric acid may result in severe burns of the mouth and throat, perforation of the esophagus or stomach, staining and erosion of teeth, nausea and vomiting of blood and eroded tissue and possibly death.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Varies by product and may not be flammable, some reported ranges: 1%

Upper Flammable (Explosive) Limit: Varies by product and may not be flammable, some reported ranges: 8%

Behavior in Fire: May or may not burn. There is some remote potential for containers to rupture in fire. May generate corrosive or toxic fumes upon release.

Hazardous Combustion Products: Depends largely on particular product. May include carbon dioxide, carbon monoxide, nitrogen and sulfur oxides, particulate matter, volatile organic compounds and other toxic and corrosive fumes.

EXPLOSION HAZARDS

Explosiveness: Contact with various other chemicals and materials may result in the formation of explosive mixtures or violent reactions. Vapors of any flammable components or hydrogen gas generated by contact with metals may explode if ignited in confined spaces. There is some remote potential for containers to rupture in fires.

1832

SULFURIC ACID, SPENT

Class 8 (Corrosive Material)

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials for sulfuric acid (more than 70%) may include butyl rubber, neoprene, nitrile rubber, latex, natural rubber, chlorinated polyethylene, polyvinyl chloride, styrene-butadiene rubber, Viton®, and nitrile-butadiene rubber. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 1; Tychem® QC; Tychem® CPF 2; Tychem® SL; Tychem® CPF 3; Tychem® CPF 4; Tychem® BR; Tychem® LV; Tychem® Responder®; Tychem® Responder® CSM; Tychem® TK; Tychem® F; Tychem® Reflector®; Tychem® CPE; Tychem® ThermoPro; Trellchem HPS® suits; CPF3® suits; Barricade® coated suits; butyl rubber (gloves, suits, boots); polyethylene (gloves, suits, boots); Teflon® (gloves, suits, boots); Saranex® coated suits; Viton 890® gloves; Viton® 892 gloves; Neop. Chloroflex 723 gloves; Chem Master gloves; Butyl 878 gloves; Butyl 874R gloves; Chloroflex II gloves; Neoprene 6780 gloves; 4H® and Silver Shield® brand gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Viton® (gloves, suits).

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 15 mg/m^3): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 15 mg/m^3): any supplied-air respirator operated in a continuous-flow mode (eye protection needed); any powered air-purifying respirator with acid gas cartridge(s) in combination with a high-efficiency particulate filter (eye protection needed); any chemical cartridge respirator with a full facepiece and acid gas cartridge(s) in combination with an N100, R100, or P100 filter; any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter; any self-contained breathing apparatus with a full facepiece; or any supplied-air respirator with a full facepiece.

FIRST AID

Nonspecific Symptoms: Irritation or burns of bodily tissues; any other unusual symptoms that may be related to chemical exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid using mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: In case of skin contact do not delay, remove contaminated clothing immediately and wash skin with plenty of cold water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 20 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire, but note that concentrated sulfuric acid may react violently with water. Water (if used) should be applied in flooding quantities as fog or spray. For small fires, dry chemical or carbon dioxide.

Extinguishing Techniques: Possible corrosive vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SULFURIC ACID, SPENT
Class 8 (Corrosive Material)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the corrosiveness and reactivity of the product with many common metals when deciding on the appropriate response and equipment. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Do not use combustible materials, such as sawdust. Consult a qualified specialist on neutralization techniques. Take into account while planning the response that spent acid may be highly corrosive and reactive and that there is some chance that the substance may be combustible. Contact with metals may produce flammable and potentially explosive hydrogen gas. Use explosion-proof and spark-proof equipment where necessary. Vapors may be heavier than air and may persist for a time in low areas.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . Spent sulfuric acid may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill by checking for pH until the spilled product is removed.

CONSEQUENCE

Hazardous levels of chemical in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to spent sulfuric acid vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind and do not allow it to contact pools of spent sulfuric acid if it is suspected that this may cause a violent reaction.

CONSEQUENCE

Water runoff may contain chemicals from contact with vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid spent sulfuric acid may eventually slow the release of vapors or fumes into the atmosphere.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

SULFURIC ACID, SPENT

Class 8 (Corrosive Material)

TECHNIQUE

DILUTION . . . The rapid addition of flooding quantities of water to liquid spent sulfuric acid may eventually slow the release of vapors or fumes into the atmosphere. This response has special risks and is better suited to smaller spills.

CONSEQUENCE

Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spent sulfuric acid may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained spent sulfuric acid may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

SULFURIC ACID, SPENT

Class 8 (Corrosive Material)

TECHNIQUE

NEUTRALIZATION. . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES. . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. (Note: Additional treatment methods may be necessary for non-acidic components of spent sulfuric acid.)

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Proceed with caution. Consult shipper as to constituents of spilled material. Consult qualified experts for safe neutralizing and treatment techniques.

September 1992

TEREPHTHALIC ACID
Non-Regulated

GENERAL INFORMATION

Terephthalic acid is not designated as a hazardous material in transportation but nevertheless has some potential to cause injury and/or environmental pollution if improperly handled. It is consistently ranked among the top 25 chemicals produced in the United States and may therefore be encountered comparatively frequently in transportation or other accidents resulting in a chemical discharge.

Terephthalic acid is usually shipped in the form of solid white or off-white crystals or powders. It may be odorless or have a slight odor resembling acetic acid. It is used for making various plastic products and other chemicals, as an additive in poultry food, in analytical chemistry, and as a reagent for alkali in wool. The acid is practically insoluble in water and heavier, so may be expected to sink and dissolve at an extremely low rate. Even small amounts dissolved in water are reported to greatly lower the pH of the resulting solution. The solid acid is generally reported to sublime as it is heated and is therefore expected to vaporize before melting. Its flash point of 500°F indicates that substantial heating is necessary before its vapors can easily be ignited. Of concern, however, is that the dust of terephthalic acid can form combustible or explosive mixtures with air that may be ignited by a strong spark or other source of ignition. The product weighs approximately 93.6 pounds per cubic foot as a solid. Its vapor pressure at room temperatures is extremely low.

Terephthalic acid does not react with water or other common materials and is stable in normal transportation. It is specifically reported to react violently or explosively, or else ignite, in reactions with strong oxidizing agents, to react vigorously with strong bases, and to react with active metals such aluminum or zinc in a manner that evolves flammable and potentially explosive hydrogen gas. It is also probable that terephthalic acid may attack some forms of plastics, rubber, and coatings. Toxicity of the product is low by all routes of exposure. Products of combustion may include toxic substances.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; 0.002 g/100 g water at 77°F (25°C).

Solubility in Other Chemicals: Soluble in alkalies or dimethyl sulfoxide; slightly soluble in alcohol, formic acid, or sulfuric acid.

Specific Gravity (Solid): 1.5 at 68°F (20°C)

Boiling Point: Sublimes at temperatures above 572°F (300°C) according to some authorities; others report sublimation occurs at 755°F (402°C). (Note: A solid material that sublimes is one that vaporizes as its temperature is increased without ever melting to become a liquid. Its hot vapor in air will condense to a solid rather than a liquid as its temperature decreases.)

Melting Point: Two authorities, somewhat inconsistently, provide a melting point of 801°F (427°C); others repeat the information given above regarding sublimation of the material.

Freezing Point: See melting point

Molecular Weight: 166.13

Heat of Combustion: - 4,397 cal/g as standard net heat of combustion

Vapor Pressure: Less than 0.01 mm Hg (0.000193 psia) at 68°F (20°C); 0.5 mm Hg (0.0097 psia) at 248°F (120°C).

Flash Point: 500°F (260°C), open-cup

Autoignition Temperature: Most sources report 925°F (496°C); one notes that the minimum ignition temperature for a terephthalic acid dust cloud is 1250°F (678°C).

Burning Rate: Not available

Stability: Stable

Corrosiveness: No specific data are available but corrosivity to some metals may be presumed in the presence of moisture or water. A saturated solution (0.002%) of terephthalic acid in water has been calculated to have a pH of 2.16. See "Reactivity with Other Chemicals" below. It is probable but unconfirmed that the substance may attack some forms of plastics, rubber, or coatings.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Terephthalic acid is specifically reported to react violently or explosively with strong oxidizing agents and/or to increase the risk of fire; to react vigorously with strong bases; and to react with active metals such as aluminum or zinc to evolve flammable and potentially explosive hydrogen gas.

IDENTIFICATION

Shipping Names: No particular name is standard but "chemicals, n.e.c." The shipper may or may not provide the specific chemical name of the product.

Synonyms and Tradenames: Benzene-p-dicarboxylic acid; p-benzenedicarboxylicacid; 1,4-benzenedicarboxylic acid; p-dicarboxybenzene; p-phthalic acid; TPA; and various tradenames.

Chemical Formula: $C_6H_4(COOH)_2$ or HO-CO-C_6H_4-CO-OH; terephthalic consists of a benzene ring with two attached -COOH groups.

Constituent Components (% each): Apparently available in various grades of 97% or more purity. One particular product is described as containing 98.5% terephthalic acid, a maximum of 0.5% water, 25 ppm 4-formylbenzoic acid, and 10 ppm metals.

28 STCC: 28 186 71 (for both terephthalic acid and terephthalic anhydride; this guide only addresses the acid).

UM/NA Designation: Not established

IMO Designation: Not established

Physical State As Shipped: Solid crystals or powder

Physical State As Released: Solid crystals or powder

Color of the Shipped Material: White or off-white

Odor Characteristics: None to slight acetic acid odor

Common Uses: Making polyester (i.e., plastic) fibers, films, sheets, and bottle resins; making other chemicals; additive in poultry food; reagent for alkali in wool; used in analytical chemistry.

TEREPHTHALIC ACID
Non-Regulated

POTENTIAL HAZARDS
GENERAL HAZARDS

Threshold Odor Concentration: Not available

Unusual Hazards: Ignition of a sufficient concentration of dust in air may result in fire or explosion. The solid product sublimes as it is heated. Very small amounts of the product in water are reported to substantially lower the pH of the water and form a fairly strong acid. Reactions of terephthalic acid with active metals may evolve flammable and potentially explosive hydrogen gas.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limits: 10 mg/m^3 (total dust) over each 8 hours of a 40 hour work week (ACGIH TLV, 1990-91); 15 mg/m^3 (as total dust) and 5 mg/m^3 (as respirable fraction) under similar circumstances (OSHA PEL, 1989); all as exposure limits for "nuisance dusts".

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; buildup of static electricity where dust in air may form flammable or explosive mixtures.

HEALTH HAZARDS

Public Health Hazards: The health hazards of terephthalic acid have not been thoroughly investigated according to one authority. Hazards attributable to the substance under normal conditions appear to be comparatively minimal in the case of episodic spills into the environment, but it is always prudent to minimize unnecessary exposures to chemical substances.

Hazards of Skin or Eye Contact: A major manufacturer of terephthalic acid reports that contact of the solid product with the eyes is not expected to cause significant irritation, and this appears accurate if the substance is promptly removed. Standard tests involving rabbits caused only mild eye irritation; causation of moderate irritation required continuous contact for 24 hours. The product did not cause skin irritation in tests with animals, and according to the same manufacturer is not expected to cause significant irritation of human skin.

Hazards of Inhalation: A major manufacturer of terephthalic acid reports that its dust is not expected to cause toxic effects via inhalation under normal conditions of use.

Hazards of Ingestion: The single dose oral toxicity of terephthalic acid is very low with the LD^{50} for rats, the dosage causing death of 50% of the animals in laboratory experiments, being in excess of 15.4 g/kg of body weight and that for the mouse being 6.4 mg/kg on the same basis. Nevertheless, a government authority reports that solutions (presumably in water) may produce irritation to the mouth and throat and that large amounts may cause gastric pain, nausea, and vomiting.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: *Will* burn but requires heating to its flash point of 500°F, or dispersal in air as a dust cloud, and then encounter with a suitable source of ignition. One government authority cautions that contact of the burning material with water or foam may cause frothing.

Hazardous Combustion Products: Not well-defined; reported to include carbon monoxide, carbon dioxide, and possibly other toxic constituents. One authority reports that terephthalic acid emits acrid smoke and irritating fumes when heated to decomposition.

EXPLOSION HAZARDS

Lower Explosive Limit: 50 grams of dust per cubic meter of air

Upper Explosive Limit: Unavailable

Explosiveness: Terephthalic acid dust can form explosive mixtures with air. The lower explosive limit (LEL) concentration shown above is equivalent to 0.0031 pounds of the acid dust per cubic foot of air. The minimum autoignition temperature for a cloud of dust is reported to be 1250°F (678°), but it must be cautioned that a high-voltage spark, even one generated from static electricity, may be adequate for ignition.

TEREPHTHALIC ACID
Non-Regulated

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include gloves, dust goggles (if high dust concentrations are present in air), and other appropriate clothing as required. No specific guidance is available with respect to compatible materials. One government authority states the belief that most materials commonly used in protective clothing will probably be adequate, then recommends that the chemical manufacturer or supplier be asked for specific advice.

Respiratory Protection: For fire fighting, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For high concentrations of dust in air, an approved respirator that will prevent dust inhalation.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, and upper respiratory tract; coughing; various symptoms of ingestion.

First Aid for Inhalation: If necessary, remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes with water for at least 15 minutes, occasionally lifting the eyelids. When deemed necessary, remove contaminated clothing, gently blot or brush away excess chemical, and wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: If conscious, have victim rinse mouth thoroughly and then drink large glass of water. Do not induce vomiting. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into the lungs; have victim rinse mouth again and repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Water spray, dry chemical, carbon dioxide, alcohol foam. Be advised that water or foam may cause frothing. Water should be applied gently as a fog or mist. Solid streams of water may be ineffective.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Protect sewers and waterways from contamination. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use spark-proof and explosion-proof tools and equipment where necessary. Precautionary measures against static electricity discharges, including thorough electrical interconnecting, grounding of equipment, and conveyance under inert gas are advised where terephthalic acid dust is present.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Terephthalic acid spills do not appear likely or capable of generating significant amounts of hazardous airborne contaminants in most outdoor spill situations. It may be advisable to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Irritating levels of terephthalic dust in air may be found in the local spill area and immediately downwind in some few cases.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind as necessary.

TEREPHTHALIC ACID
Non-Regulated

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid terephthalic acid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Where deemed necessary, water fog or spray applied to terephthalic dusts or vapors in air may knockdown dust and accelerate dispersal of vapors in the atmosphere. A gentle mist of water used to dampen the surface of exposed terephthalic acid may reduce dust evolution.

CONSEQUENCE

Water runoff may contain varying amounts of terephthalic acid.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Spills of terephthalic acid or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other materials. Storm drains may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate means.

CONSEQUENCE

Any contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product or contaminated water runoff.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Keep in mind that even small amounts of terephthalic acid dissolved in water will form a rather strong acidic solution.

MITIGATION

Use equipment compatible with the spilled product and its acidic solutions in water as necessary.

TEREPHTHALIC ACID
Non-Regulated

TECHNIQUE

ABSORPTION . . . Spreading of liquids may be controlled by absorbing them with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of afire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil, spilled product, and its residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines. (Note: At least one authority provides data indicating that certain types of soil microorganisms will decompose residues of terephthalic acid in soil in a matter of days, but these microorganisms may not be present at all spill sites.)

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause terephthalic acid dust to become airborne. Use of motorized removal equipment may possibly result in overheating and/or ignition of terephthalic acid or its dust under appropriate conditions.

MITIGATION

Select removal techniques that do not cause terephthalic acid dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply caution if using any equipment that may result in overheating and/or possible ignition of terephthalic dust. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Solid terephthalic acid will sink in water and dissolve at an extremely slow rate. Self purification of water bodies is reported to be affected by concentrations of terephthalic acid in water as low as 0.1 mg/liter. Keep in mind that even small amounts of terephthalic acid dissolved in water will form a rather strong acidic solution. Pay special attention to the "Note" below at the end of the text associated with adsorption techniques.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap solid material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TERETHTHALIC ACID
Non-Regulated

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Use compatible equipment. Consult qualified experts for guidance. See "Note" below at the end of the text associated with adsorption techniques.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through a tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary. (Note: An EPA publication cited by one authority is reported to recommend that contaminants brought up from the bottom via pumping methods first be passed through a gravity separation tank to remove the bulk of heavier than water contaminants and other sediments, be passed through a dual filtration system for further removal of solid particles, and then be passed through an activated carbon filter to remove dissolved chemicals. Be advised that terephthalic acid dissolved in water even in very small amounts may greatly lower the pH of the water. Unless planned by a qualified expert, attempts to neutralize the water may have the potential to increase the toxic hazard associated with the terephthalic acid. This product consists of a benzene ring to which two -COOH groups are attached yet is relatively non-toxic.)

March 1995

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Tetrachloroethylene, also well known by the name perchloroethylene, is a colorless liquid that is practically insoluble in water and heavier. It is not flammable according to standard testing procedures. Its odor is usually described as mildly sweet and as resembling ether or chloroform but can be intense and unpleasant at high concentrations in air. The product is widely used as a solvent, particularly in the dry cleaning industry and where vapor degreasing of metals is conducted, and has numerous other uses. It is of particular concern to environmental officials and occupational health professionals because it is classified as a potential or probable human carcinogen in long-term exposures. Vapors of tetrachloroethylene may be slightly heavier than air, particularly at warmer ambient temperatures. There is a limited possibility that containers exposed to fire or excessive heat for sufficient time duration may rupture violently due to overpressurization. The liquid weighs approximately 13.5 pounds per gallon.

Tetrachloroethylene does not react with water but will decompose extremely slowly in this medium to form trichloroacetic acid and hydrochloric acid. It is stable in transportation and does not react with other common materials. It is reactive with a variety of other chemical substances, however, and forms explosive mixtures or substances with several; reactants of most common concern include chemically active metals, strong oxidizers, strong acids, and caustic substances such as sodium hydroxide and potassium hydroxide. One authority reports the commercial product, which is usually "stabilized" with one or more chemical substances, may be handled in the" presence or absence of air, water, and light with any of the common construction materials at temperatures up to 284°F (140°C). Another reports that the unstabilized material, in the presence of water, is corrosive to aluminum, iron, or zinc. All agree that tetrachloroethylene will attack some forms of plastics, rubber, and coatings. Tetrachloroethylene poses a low to moderate toxic hazard in acute exposures. Products of thermal decomposition which form when the substance is exposed to fire or high temperatures are highly toxic and irritating and are reported to include carbon monoxide, chlorine, hydrogen chloride, phosgene, and possibly other hazardous materials. One major chemical company observes that the amounts of chlorine and phosgene generated are likely to be small.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Practically insoluble; most authorities report 0.016 g/100 g water (160 ppm) at 68°F (20°C) and 0.015 g/100 g water (150 ppm) at 77°F (25°C). One reports 400 ppm at 77°F (25°C).

Solubility in Other Chemicals: Reported as soluble in acetone, alcohol, benzene, carbon disulfide, carbon tetrachloride, chloroform, ether, hexane, and oils.

Specific Gravity (Liquid): 1.62-1.63 at 68°F (20°C)

Boiling Point: 249.8-250.5°F (121.0-121.4°C) at 1 atm.

Melting Point: – 8.86 to – 8.23°F (– 22.7 to – 22.35°C)

Freezing Point: See melting point

Molecular Weight: 165.83

Heat of Combustion: Not flammable

Vapor Pressure: 13-14 4 mm Hg (0.2513-0.2783 psia) at 68°F (20°C); approx 24 mm Hg at 86°F (30°C), these values translate to a saturated vapor concentration of 17,100 to 18,950 ppm at 68°F and about 31,580 ppm at 86°F directly over pools of liquid tetrachloroethylene.

Flash Point: Not flammable

Autoignition Temperature: Not flammable

Burning Rate: Not flammable

Stability: Stable

Corrosiveness: One authority reports the product may be handled in the presence or absence of air, water, and light with any of the common - construction materials at temperatures up to 284°F (140°C). Another reports that the unstabilized material, in the presence of water, is corrosive to aluminum, iron, or zinc. A third notes that the commercial product usually contains stabilizers. Tetrachloroethylene will attack some forms of plastics, rubber, and coatings. One maker of the product recommends use of steel or stainless steel pumps, seamless stainless steel, Teflon or bronze hose, with a note that Viton and cross-linked polyethylene hoses may be used with caution.

Reactivity with Water: No reaction, decomposes extremely slowly in water to form trichloroacetic acid and hydrochloric acid.

Reactivity with Other Chemicals: Tetrachloroethylene forms an impact sensitive explosive when mixed with finely divided barium or lithium; mixture with beryllium powder will flash or spark upon heavy impact; reported to react violently with concentrated nitric acid; when any trichloroethylene is present as an impurity, reactions of tetra chloroethylene with substances such as sodium hydroxide or potassium hydroxide can form dichloroacetylene, a heat-sensitive explosive gas which ignites upon contact with air; may explode if mixed with nitrogen tetroxide and subjected to a shock, incompatible with aluminum under special conditions which may result in fire or explosion and appear to require presence of heat and/or water and/or other substances; generally reported as reactive and incompatible with strong oxidizers, liquid oxygen, strong aclds, and metals such as magnesium and potassium.

IDENTIFICATION

Shipping Names: Tetrachloroethylene (USDOT and IMO)

Synonyms and Tradenames: Carbon bichloride, carbon dichloride; ethylene tetrachloride; perchlorethylene; tetrachloroethene; tetrachlorethylene; 1,1,2,2- tetrachloroethylene, and tradenames and abbreviations such as Ankilostin, Antisol, Didakene, Dow-per, Nema, PCE, Perc Perchlor, Perclene, Perdene, Perk, TCE, Tetracap, Tetralex Tetraleno, Telravec, and Tetropil, among many others.

Chemical Formula: $CI_2C=CCI_2$

Constituent Components (% each): Typically 95% or more pure for dry cleaning and industrial grades. More refined grades may be 99% or more pure. Commercial products often contain minor amounts of various unspecified stabilizers that may be toxic.

UN/NA Designation: UN1897

IMO Designation: 6.1, poisonous material

Physical State As Shipped: Liquid

Physical State As Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Mildly sweet; like ether or chloroform; can be intense and unpleasant at higher concentrations

Common Uses: Dry cleaning solvent; vapor-degreasing solvent; drying agent for metal, wood, and certain other solids general industrial solvent in rubber, printing, soap, paint remover and other industries.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Variably reported as approximately 5 ppm or 50 ppm; odor may become inconspicuous after a short period of exposure at lower levels.

Unusual Hazards: A widely used substance which is highly suspected of causing cancer in humans in long-term exposures and which is of considerable concern as an environmental pollutant.

Short Term Exposure Limit (STEL): 200 ppm for 15 minutes (ACGIH, 1990 – 91)

Time Weighted Average (TWA) Limits: 50 ppm (ACGIH TLV, 1990 – 91) over each 8 hours of a 40 hour work week, 25 ppm (OSHA PEL, 1989) being phased in over time for similar circumstances.

Conditions to Avoid: Contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; contact of vapors with open flames, hot surfaces, welding arcs and similar sources of high heat which may cause thermal decomposition and evolution of toxic and corrosive gases.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to high concentrations of tetrachloroethylene vapors that may be present in the spill area and over some distance downwind. Ingestion and direct contact should also be avoided. Tetrachloroethylene is classified by various authorities as a probable or potential human carcinogen in long-term exposures, such as in the occupational environment. In one case, tetrachloroethylene was detected in human breast milk after the mother experienced a brief exposure to the substance. Her baby developed jaundice and an enlarged liver but quickly recovered after discontinuation of breast feeding. Exposures having no effect on expectant women are reported as not expected to have an effect on the fetus.

Hazards of Skin or Eye Contact: A short single exposure of the skin is not likely to cause significant irritation. Prolonged contact of the skin with liquid tetrachloroethylene results in a progressively severe burning sensation that begins within 5 to 10 minutes of exposure and may result in reddening and occasional blistering. Repeated or prolonged contact may also cause drying, scaling, cracking, and inflammation of the skin due to the defatting action of the product. This can sometimes lead to skin infections. Some amounts may be absorbed through the skin but are considered unlikely by most authorities to pose a significant hazard in single exposures. In the occupational environment, they may contribute to damage of the liver and kidneys. High concentrations of tetrachloroethylene vapors in air may produce varying degrees of eye irritation. Contact of the eyes with the liquid may cause immediate pain, a burning sensation, lachyrmation, inflammation, and possibly temporary corneal injury. Momentary spraying of the liquid into the eyes of a rabbit caused pain and closing of the eyelids; the corneal epithelium became granular and optically irregular with patches being lost, but the eyes recovered completely within two days.

Hazards of Inhalation: Tetrachloroethylene vapors are irritating to the eyes, nose, throat and upper respiratory tract. Exposure to high levels of vapors in air may result in narcosis, central nervous system depression, and other effects with symptoms variously and somewhat inconsistently including flushing of the face and neck, dizziness, headache, drowsiness, fatigue, sweetish metallic taste, tightness in frontal sinuses, numbness around the mouth, increased perspiration of the hands, increased secretions from nasal passages, loss of appetite, nausea, vomiting, an attitude of irresponsibility, an appearance resembling alcoholic intoxication, ringing in the ears, hilarity and/or exhilaration, incoordination, a feeling of fullness in the head, mental confusion, unconsciousness, respiratory failure, and possibly death if the exposure is massive. Non-lethal exposures may result in liver damage with such findings as yellow jaundice and dark urine becoming evident several weeks after the exposure. Damage to the kidneys is also a possibility. Exposure of healthy human adults to 100 ppm for 7 hours causes mild irritation of the eyes, nose and throat, flushing of the face and neck, headache, drowsiness, and slurred speech. Exposure to 475 ppm for 130 minutes causes increased salivation, metallic taste, mild eye irritation, sinus tightness, increased hand perspiration, and increased mucous from nasal passages. A concentration of 600 ppm is reported to have a strong unpleasant odor and to cause definite eye and nasal irritation, dizziness, and loss of inhibition in 10 minutes. At 1000 ppm, the odor said to be intense and markedly irritating; considerable dizziness occurs in about 2 minutes and unconsciousness follows with in 30 minutes according to one authority another reports that 934 ppm causes definite exhilaration, among other effects, after 45 minutes. A concentration of 2000 ppm is reported to cause mild narcosis within 5 minutes. Human volunteers were unable to tolerate 5000 ppm in a chamber for 6 minutesand experienced vertigo, nausea, and mental confusion during the 10 minutes following cessation of exposure. A major chemical company reports that single brief (minutes) exposure to levels above 6000 ppm may be immediately dangerous to life. Rats did not survive when exposed for longer that 12-18 minutes to 12,000 ppm in laboratory experiments. Authorities disagree as to whether excessive exposure may potentially increase sensitivity to epinephrine and increase myocardial irritability. Some conclude that this particular product does not appear to cause this effect while others cite animal experiments which caused cardiac arrhythmias and/or note the similarity of tetrachloroethylene to substances that cause cardiac sensitization. See the “Vapor Pressure” of the product for information on its saturated vapor concentrations at various temperatures.

Hazards of Ingestion:The single dose oral toxicity of tetrachloroethylene is low to moderate. Ingestion may cause irritation of the gastrointestinal tract which in turn may cause nausea, vomiting, diarrhea, and bloody stools. Absorption into the body may cause central nervous system depression and narcosis with many of the symptoms described for inhalation, and especially exhilaration and drunkenness. Liver damage may follow. Aspiration into the lungs during vomiting may result in rapid absorption of the substance and injury to other body systems. It has been reported that any alcohol consumed by the victim before or after the exposure may increase resulting adverse effects. The lowest oral dosage (LDLo) reported to cause deaths among cats and dogs is 4.0 g/kg of body weight; the LDLo for rabbits is reported as 5.0 g/kg. Laboratory experiments have indicated that 2.63 g/kg causes death of 50% of rats while 8.1 g/kg is required to cause a similar effect among mice.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

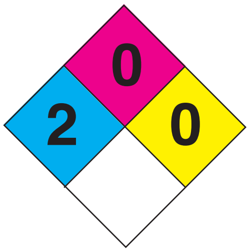
Behavior in Fire: Not flammable. There is a limited possibility that containers exposed to fire may rupture violently due to overpressurization. May generate large quantities of toxic gases upon release.

Hazardous Combustion Products: Highly toxic and irritating gases may be generated if tetrachloroethylene thermally decomposes in a fire. Various authorities list carbon monoxide, chlorine, hydrogen chloride, and phosgene among decomposition products. One major chemical company observes that the amounts of chlorine and phosgene generated are likely to be small.

1897

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)



EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Not flammable. There is a limited possibility that containers exposed to fire may rupture violently due to overpressurization. Contact with other chemicals or certain metals may result in formation of explosive mixtures or substances.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervous and resistant clothing. Compatible materials for tetrachloroethylene may include chlorinated polyethylene, Viton, Viton/neoprene, and Silvershield. Fully encapsulating suits with self-contained breathing apparatus (SCBA) should be considered where personnel may be exposed to dense smoke from a fire that may include large quantities of the irritatlng and corrosive thermal decomposition products of tetrachloroethylene. Such suits may require acid-resistant materials of construction.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent. For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (500 ppm or less) or a chemical cartridge respirator with a full facepiece and with organic vapor cartridges (500 ppm or less) within the use limitations of these devices.

FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues; narcosis and symptoms of central nervous system depression; numerous other symptoms associated with inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit. It may be prudent not to administer sympathomimetic drugs such as epinephrine without specific instructions from a physician since exposure to tetrachloroethylene is said by some authorities to increase myocardial irritability.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if eye or skin irritation persists after washing.

First Aid for Ingestion: Authorities disagree over the proper treatment. As a general course of action, NIOSH says get medical attention immediatelv. If it is not available immediately, induce vomiting if the victim is conscious. Because rapid absorption through the lungs and resultant systemic effects may occur if tetrachloroethylene is aspirated, it is probably best that the decision of whether to induce vomiting or not be made by a physician if one is readily available. The health hazards of aspiration into the lungs must be weighed against the toxicity of the product when considering emptying the stomach. In any case, if vomiting occurs naturally or otherwise, have the victim lean forward to reduce risk of aspiration into the lungs. Do not make an unconscious person vomit.

FIRE RESPONSE

Extinguishing Materials: As necessary for surrounding fire

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Fully-encapsulating suits with self-contained breathing apparatus (SCBA) should be considered where personnel may be exposed to dense smoke from a fire that includes large quantities of the irritating or corrosive thermal decomposition products of tetrachloroethylene. Move container from fire area if no risk. Stop leak if you can do it without risk. Be alert to the possibility, although limited, that the container may rupture violently and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, it may be prudent to an use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate heat sources that may cause thermal decomposition of tetrachloroethylene. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contamination or contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may esult in damage, rupture or other hazard to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the toxicity of tetrachloroethylene into account when planning the response and note that environmental officials are likely to desire an exceptionally thorough cleanup effort, particularly if a surface water body or groundwater is contaminated or at risk of contamination.

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. Tetrachloroethylene discharges may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts have spilled and/or the product is hot when released.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

MONITOR THE SITUATION . . . Tetrachloroethylene may not evolve large amounts of hazardous airborne contaminants in some out door spill situations. It may be advisable in these cases to simply monitor the situation until the spilled product is removed, particularly if only small amounts have spilled in cold weather.

CONSEQUENCE

Hazardous levels of tetrachloroethylene may be found in air in the local spill area and immediately downwind .

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to tetrachloroethylene vapors in air may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of tetrachloroethylene from contact with airborne vapors.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination where deemed necessary. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of tetrachloroethylene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . Liquid tetrachloroethylene is heavier than water and of very low solubility. Application of water via a light spray to the surface of contained liquid pools may reduce emissions of vapors by forming a floating surface layer of water that acts as a vapor blanket.

CONSEQUENCE

Addition of water will increase the volume of liquid contained.

MITIGATION

Contain spilled product and water and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid tetrachloroethylene may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained liquid and spread of contamination.

MITAGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material .

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, vermiculite, perlite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred to reduce the hazard in the event of a fire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination .

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

TETRACHLOROETHYLENE

Division 6.1 (Poisonous Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Liquid tetrachloroethylene will sink in water, dissolve over a long period of time at a very slow but potentially environmentally significant rate, and decompose extremely slowly to form trichloroacetic acid and hydrochloric acid if not recovered. Although the solubility of the product is low, levels of only 5 ppm or so in water may be harmful to some forms of aquatic life in acute exposures and may bioaccumulate in tissues. Due to the probable carcino genicity of the substance, environmental officials are likely to prefer no detectable contamination of drinking water over prolonged periods of time.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2000

1,1,1,2-TETRAFLUOROETHANE

Division 2.2 (Non-Flammable Gas)

GENERAL INFORMATION

Tetrafluoroethane, also known as Halocarbon 134A, is an odorless, colorless non-flammable, liquefied gas. It is used for general analytical/synthetic chemical uses and as a plastic foaming agent and as a refrigerant. The substance is only negligibly soluble in water, most sources reporting only 15% solubility. It is incompatible with strong oxidizers as well as active, alkali or alkaline earth metals, powdered aluminum, magnesium, zinc, beryllium. It is shipped as a liquefied gas and upon release undergoes rapid evaporation (its boiling point is -15.7°F). Tetrafluoroethane is stable and will not undergo hazardous polymerization. The product weighs approximately 10.8 pounds per gallon.

This gas is not flammable or reactive in normal emergency response situations. However, if involved in a fire, tetrafluoroethane can decompose to produce toxic gases (e.g., hydrogen fluoride, phosgene). Tetrafluoroethane is not flammable at temperatures up to 212°F (100°C) at atmospheric pressure. Experimental data have been reported which indicate combustibility of tetrafluoroethane in the presence of certain concentrations of chlorine. Fumes and vapors may be heavier than air. There is a limited potential for containers of liquid to rupture violently if exposed to fire or excessive heat for sufficient time duration.

Tetrafluoroethane is not irritating; however, contact with rapidly expanding gases or the liquefied gas can cause frostbite to exposed tissue. The most significant route of overexposure for tetrafluoroethane is by inhalation. It can cause central nervous system depression after inhalation exposures. Symptoms of such overexposure can include drowsiness, fatigue, and weakness. At high concentrations, the gas can act as an asphyxiant, by displacing oxygen; therefore, exposure to high concentrations of this gas can be fatal.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Negligible (0.15%)
Solubility in Other Chemicals: Reported to be soluble in common solvents.
Specific Gravity (Liquid): 1.20
Vapor Density: 3.6
Boiling Point: -15.7°F (-26.5°C)
Melting Point: -149.8°F (-101°C)
Freezing Point: See melting point.
Molecular Weight: 102
Heat of Combustion: Not flammable
Evaporation Rate (butyl acetate=1): Not applicable (gas).
Vapor Pressure: 4971 mmHg at 77ºF (25ºC)
Flash Point: Not flammable
Autoignition Temperature: >1382°F (750°C)
Burning Rate: Not flammable
Flammable Limits: Not flammable
Stability: Stable
Polymerization Potential: Will not occur.
pH: Not applicable (gas).
Corrosiveness: Unavailable.
Reactivity with Water: No reaction.
Reactivity and Incompatibility: Reacts with strong oxidizers, active metals (sodium, potassium and calcium), alkali or alkaline earth metals, powdered aluminum, magnesium, zinc, beryllium. Freshly abraised aluminum surfaces may cause strong exothermic reactions. Prior to using any plastics, confirm their compatibility with tetrafluoroethane.

IDENTIFICATION

Shipping Name(s): 1,1,1,2-Tetrafluoroethane or Refrigerant gas R 134a (USDOT & IMO)
Synonyms and Tradenames: Tetrafluoroethane; Halocarbon 134A; HFC-134a; Formacel®.
CAS Registry No.: 811-97-2
Chemical Formula: CF_3CH_2F
Constituent Components (% each): Generally 99-100% pure.
UN/NA Designation: UN3159
IMO Designation: 2.2, Non-flammable gases
RTECS Number: TE1008365
NFPA 704 Hazard Rating: 1(Health): 0(Flammability): 0(Reactivity)
Physical Form as Shipped: Compressed liquefied gas
Physical Form as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Odorless, some sources report it to have a slight ethereal odor.
Reportable Quantity: See appendix I.
Common Uses: For general analytical/synthetic chemical uses, as a plastic foaming agent and as a refrigerant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1,1,1,2-TETRAFLUOROETHANE

Division 2.2 (Non-Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: At high concentrations, the gas can act as an asphyxiant, by displacing oxygen; therefore, exposure to high concentrations of this gas can be fatal.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable; Dupont recommends 1000 ppm over an 8 - 10 hour period.

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat; contact with incompatible materials; runoff to sewers or water bodies; inhalation or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard to public is inhalation of fumes or vapors in air or frostbite due to direct physical contact with liquid or fumes. Overexposure may aggravate preexisting disorders of the heart or central nervous system.

Hazards of Skin or Eye Contact: Vapors may irritate the skin. Liquid tetrafluoroethane may cause frostbite; harmful amounts may be absorbed if skin contact is prolonged or widespread. Vapors may irritate the eyes. The liquid may cause severe corneal injury due to frostbite.

Hazards of Inhalation: Asphyxiant. High concentrations can cause headaches, dizziness, drowsiness, and loss of consciousness. Very high concentrations may cause suffocation and can be fatal.

Hazards of Ingestion: An unlikely route of exposure. This product is a gas at normal temperature and pressure, but frostbite of the lips and mouth may result from contact with the liquid.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may rupture violently in fire due to over pressurization. May generate large quantities of toxic vapors and fumes in fire conditions.

Hazardous Combustion Products: Thermal decomposition or burning may produce hydrogen fluoride, hydrogen chloride, carbon monoxide, carbon dioxide, and phosgene-like compounds.

EXPLOSION HAZARDS

Explosive Potential: Not flammable. However, fire conditions can build pressure in container and cause it to rupture. No part of container should be subjected to a temperature higher than 125°F (52°C).

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

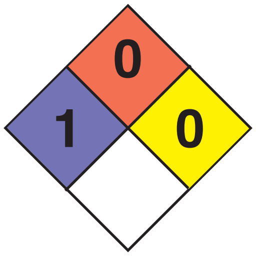
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece may suffice.

3159

1,1,1,2-TETRAFLUOROETHANE

Division 2.2 (Non-Flammable Gas)



FIRST AID

Nonspecific Symptoms: Headaches, dizziness, drowsiness, or frostbite.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Reports vary regarding removal of clothing, due to possibility of frostbite. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water or rub frozen areas.) Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: An unlikely route of exposure. This product is a gas at normal temperature and pressure.

Note to Physician: Do not administer adrenaline due to the sensitizing effect of fluorocarbons on the myocardium. Treatment of overexposure should be directed at the control of symptoms and the clinical condition. Exposure to fluorocarbon pyrolosis products should be considered in the diagnostic evaluation of occupationally related fever of short duration and unknown origin. Signs of exposure include tachycardia, hyperpnea, and pharyngeal congestion; investigation may reveal pulmonary edema and leucocytosis.

FIRE RESPONSE

Extinguishing Agents: Use extinguishing media appropriate for surrounding fire.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the low boiling point of the product into account while planning the response. Beware of possible heavy gas concentrations in pits, hollows, and depressions.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of tetrafluoroethane in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to tetrafluoroethane vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of tetrafluoroethane from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

1,1,1,2-TETRAFLUOROETHANE
Division 2.2 (Non-Flammable Gas)

TECHNIQUE

FOAM . . . Application of an appropriate firefighting foam to the surface of quiescent liquid pools may slow the release of tetrafluoroethane vapors into the atmosphere after an initial increase in vapor evolution.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Proceed with caution if initial increase in vapor evolution may affect downwind populations.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . If released to soil, material may rapidly evaporate or undergo extensive leaching in moist soil, possibly contaminating ground water supplies. Building dikes or barriers using soil, sand or other related materials may confine spills of material. Where liquids are likely to come in contact with water from runoff or rain, confinement barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Confined tetrafluoroethane may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders. (Note: Most residue will rapidly evaporate.)

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

1,1,1,2-TETRAFLUOROETHANE

Division 2.2 (Non-Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with dissolved chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

This page may be used for notes.

January 1988

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Tetrahydrofuran is a volatile colorless liquid with an ether-like faint fruity odor. It is used as a solvent for resins, pharmaceuticals, and inks, and for making other chemicals. It is fully soluble in water. Its flash point of 6°F (or less) indicates that it is easily ignited under most ambient temperature conditions. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.4 pounds per gallon.

Tetrahydrofuran is stable in normal transportation but should not be placed in prolonged storage in the presence of air. This may result in the formation of peroxides that may explode if the solution is later concentrated by evaporation or distillation. The product does not react with water or other common materials, but reactions with sodium or potassium hydroxide, a mixture of sodium and aluminum, borane, or heated metallic hydrides may be explosive under appropriate conditions, and the product otherwise reacts (and may polymerize in some cases) with various acids, strong oxidizers, and lithium aluminum hydride. Tetrahydrofuran is generally noncorrosive to metals at normal temperatures, but may attack some forms of plastics, rubber and coatings. It is of low to moderate toxicity by the various routes of exposure, but high concentrations may be present in air. Products of combustion are toxic and include peroxides.

Downwind evacuation should be considered if tetrahydrofuran is leaking but not on fire. If a fire becomes uncontrollable or the container is exposed to direct flame, evacuate for a radius of one-third (1/3) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble in all proportions
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, ether, and organic solvents.
Specific Gravity (Liquid): 0.886 - 0.889 at 68°F (20°C)
Boiling Point: 149 - 152.6°F (65 - 67°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: - 163.3°F (- 108.5°C)
Molecular Weight: 72.1
Heat of Combustion: - 8330 cal/g
Vapor Pressure: 143 - 145 mm Hg (2.76 - 2.80 psia) at 68°F (20°C)
Flash Point: 6°F (- 14.5°C), closed cup; - 4°F (- 20°C) or 5°F (- 15°C), open cup.
Autoignition Temperature: 610°F (321°C)
Burning Rate: 4.7 mm/minute
Stability: Stable unless peroxides have accumulated due to prolonged presence in air.
Corrosiveness: Noncorrosive to metals at ordinary temperatures. Will attack some forms of plastics, rubber and coatings.
Reactivity with Water: *No* reaction
Reactivity with Other Chemicals: Reacts with many acids, lithium aluminum hydride, sodium or potassium hydroxide, sodium and aluminum mixture, borane, heated metal hydrides, and strong oxidizers.

IDENTIFICATION

Shipping Names: Tetrahydrofuran (USDOT and IMO)
Synonyms and Tradenames: Butane, 1,4-epoxy; butylene oxide; cyclotetramethylene oxide; diethylene oxide; furanidine; hydrofuran; oxacyclopentane; oxolane; tetramethylene oxide; THF.
Chemical Formula: $-CH_2(CH_2)_2CH_20$
Constituent Components (% each): Mostly pure with traces of water, THF hydroperoxide, and butylated hydroxytoluene (to prevent peroxide formation).
49 STCC: 49 082 90
UN/NA Designation: UN2056
IMO Designation: 3.1, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Ether-like; faint fruity odor; similar to acetone.
Common Uses: Solvent for resins, topcoating solutions, cellophane, adhesives, magnetic tapes, inks, pharmaceuticals, etc.; mfg. of other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 20 - 50 ppm

Unusual Hazards: Potentially explosive peroxides form upon prolonged exposure to air. Product is a volatile flammable liquid with heavier than air vapors.

Short Term Exposure Limits (STEL): ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; prolonged exposure to air.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations in air that may result from spillage of this product. Ingestion and direct physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated skin contact with liquid tetrahydrofuran may result in drying and cracking of the skin due to the defatting action of the product. Contact with the eyes results in irritation and possible burns.

Hazards of Inhalation: Vapors of tetrahydrofuran are irritating to the eyes and nose. High concentrations in air are narcotic and may cause nausea, dizziness, headache, weakness, unconsciousness, and possibly asphyxiation. Concentrations above 25000 ppm (2.5%) in air produce anesthesia with small margin of safety between anesthesia and death.

Hazards of Ingestion: Ingestion may result in gastrointestinal irritation, nausea, vomiting, and diarrhea. Aspiration into the lungs during vomiting may cause severe lung irritation or chemical pneumonitis (possibly delayed).

FIRE HAZARDS

Lower Flammable Limit: 1.8 - 2% at 77°F (25°C)

Upper Flammable Limit: 11.8% at 77°F (25°C)

Behavior in Fire: Flammable liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. May generate significant quantities of flammable vapors upon release.

Hazardous Combustion Products: Include peroxides and other toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: 2.3%

Upper Explosive Limit: 11.8%

Explosiveness: Containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area. Contact with certain other chemicals may result in formation of explosive mixtures (see General Information section). Peroxides form upon prolonged exposure of the product to air. These may explode if concentrated by evaporation of the product.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 10000 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted organic vapor canister (10,000 ppm or less) or an organic vapor cartridge respirator with a full facepiece (1000 ppm or less) within the use limitations of these devices.

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

FIRST AID

Nonspecific symptoms: Irritation of the eyes or nose; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Do not induce vomiting. Keep victim warm and at rest. Get medical attention immediately. (Note: NIOSH suggests that vomiting be induced only if the victim is conscious and immediate medical attention is not available.)

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, dry chemical, carbon dioxide; water fog. Water may be ineffective but may be used to dilute spills to nonflammable mixtures.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that tetrahydrofuran is a volatile flammable liquid with heavier than air vapors. Also, that it is reactive and explosive under conditions described in the General Information section.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Tetrahydrofuran spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to tetrahydrofuran vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain varying amounts of tetrahydrofuran from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid tetrahydrofuran may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of tetrahydrofuran vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Apply alternative technique if the response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Tetrahydrofuran may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained tetrahydrofuran may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal. Consult qualified experts for safe treatment techniques.

TETRAHYDROFURAN
Class 3 (Flammable Liquid)

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1997

4-THIAPENTANAL

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

4-Thiapentanal, also known as methylmercaptopropionaldehyde, is a colorless liquid with an extremely foul and persistent odor. It is used as a food additive. Sources vary on its solubility from being completely insoluble to only negligibly soluble at .05%. With a specific gravity of 1.054, it is only slightly heavier than water. It has a vapor density of 3.5 making it much heavier than air and can expected to be found in low laying areas in the vapor phase. However, considering that it has a low evaporation rate, a low vapor pressure and a high boiling point, not much vapor is expected to be generated. It has a high boiling point of 161.4°C and a low melting point of -58°C (-72.4°F). It has a relatively wide range of flammable limits, ranging from 1.3% to 36.1%. Although it is generally reported to be stable, it will slowly polymerize on standing and at least one source reports that hazardous polymerization will occur while the others report that hazardous polymerization will not occur. It will decomposes rapidly in contact with acids and bases, and may produce sulfur dioxide. Although 4-thiapentanal will not readily ignite, it will burn if exposed to sources of heat and flame. During a fire, methylmercaptan and acrolein may be produced, as well as carbon dioxide and carbon monoxide.

4-Thiapentanal is moderately toxic. Contact with the eyes can, in severe and untreated exposure, result in permanent eye damage. All routes of entry apply and result in some level of irritation.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble, <.05%; one source reports 75 g/l

Solubility in Other Chemicals: Unavailable

Specific Gravity: 1.054

Vapor Density (Air=1): 3.5

Boiling Point: 161.4°C (322.5°F)

Melting Point: -58°C (-72.4°F)

Freezing Point: See melting point

Molecular Weight: 104.18

Heat of Combustion: Unavailable

Evaporation Rate (Butyl Acetate=1): .08

Vapor Pressure: 2 mm Hg;1mm Hg at 20°C (68°F)

Flash Point: 60°C (140°F) (cc); 85°C (185°F) (open cup)

Autoignition Temperature: Not available

Burning Rate: Not available

Flammable Limits: 1.3% (LUL) - 36.1% (UEL)

Stability: Stable, although will slowly polymerize on standing.

Polymerization Potential: Slowly polymerizes on standing producing strong bases, although hazardous polymerization will not occur. One source reports that it will occur.

pH: Not available

Corrosiveness: Not available

Reactivity and Incompatibility: Decomposes rapidly in contact with acids and bases.

Other Characteristics: May produce sulfur dioxide.

IDENTIFICATION

Shipping Name(s): 4-Thiapentanal (USDOT & IMO)

Synonyms and Tradenames: MMP; Methionol; beta-(Methylmercapto) propionaldehyde; 3-(Methylmercapto) propionaldehyde; Methylmercaptopropionaldehyde; 3-(Methylthio) propanol; beta-(Methylthio) propionaldehyde; 3-(Methylthio) propionaldehyde; Propanal, 3-(methylthio)-(9Cl); Thia-4-pentanal.

CAS Registry No: 3268-49-3

Chemical Formula: $CH_3SCH_2CH_2CHO$

Constituent Components (% each): over 97%

UN/NA Designation: UN2785

IMO Designation: 6.1

RTECS Number: UE2285000

NFPA 704 Hazard Rating: Not reported (Health); 2 (Flammability); 0 (Reactivity)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Extremely foul and persistent odor.

Reportable Quantity: See appendix I

Common Uses: Flavor and fragrance use in foods

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

4-THIAPENTANAL

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.2 - 0.5 ppb.

Unusual Hazards: During a fire, methylmercatan and acrolein may be produced. Moderately toxic.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): 2ppb (Based on extreme foul odor which causes nausea.)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Inhalation, ingestion, eye or skin contact; strong bases or acids; prolonged exposure to high temperatures (above 75°C (167°F) for 4-5 hours).

HEALTH HAZARDS

Potential Health Hazards: Material is moderately toxic. Contact with the eyes, in severe and untreated exposure, may result in permanent eye damage. All routes of entry apply and result in some level of irritation.

Hazards of Skin or Eye Contact: Contact with skin may cause local redness and swelling. Contact with eyes may cause stinging or burning sensations with excessive tearing and blinking. Liquid can cause severe irritation, experienced as discomfort or pain, excess tearing or blinking, marked excess redness and swelling of the conjunctiva, and chemical burns of the cornea. Corneal injury may be severe, extensive and if not treated promptly, could result in permanent impairment of vision.

Hazards of Inhalation: Inhalation may cause headache, excess salivation, nausea, vomiting, diarrhea and possibly dizziness and weakness. There may be nasal discomfort with discharge, cough, discomfort and tightness in the chest, and difficulty with breathing. Extremely foul odor at very low concentrations can cause nausea.

Hazards of Ingestion: This product is moderately toxic. Ingestion may cause abdominal discomfort, nausea, vomiting, diarrhea, dizziness, drowsiness, faintness, weakness, collapse and coma. May cause moderate to marked irritation of the mouth, throat, esophagus and stomach. Aspiration may occur during ingestion or vomiting, resulting in lung injury.

FIRE HAZARDS

Lower Flammable Limit: 1.3%

Upper Flammable Limit: 36.1%

Behavior in Fire: Although 4-thiapentanal will not readily ignite, it will burn if exposed to sources of heat and flame. During a fire, methylmercaptan and acrolein may be produced, as well as carbon dioxide and carbon monoxide.

Hazardous Decomposition Products: Produces acrid fumes and smoke.

Hazardous Combustion Products: During a fire, methylmercaptan and acrolein may be produced, as well as carbon dioxide and carbon monoxide.

EXPLOSION HAZARDS

Explosive Potential: Moderate, however containers exposed to prolonged heat and flame may explode and violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

Protective Clothing Required: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots and gloves may be worn.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

2785

4-THIAPENTANAL

Division 6.1 (Poisonous Material)

*Not reported

FIRST AID

Nonspecific Symptoms: Material can cause irritation by all routes of entry. Aspiration hazard exists if material is swallowed

First Aid for Inhalation: In case of inhalation, remove patient to fresh air. If patient is having difficulty breathing, administer oxygen or if patient is not breathing give artificial respiration. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material is gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: In case of ingestion, have victim drink large quantities of milk or water if victim is conscious. Do not induce vomiting. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Water spray (fog) and alcohol or all purpose foam is recommended for large fires, while carbon dioxide or dry chemical is recommended for smaller fires.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or re-ignition may occur. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable and/or toxic. Underflow dams are not an effective means to dike material since it soluble in water. As a result, recovery efforts from water borne releases are difficult. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . 4-Thiapentanal, usually, will not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of 4-thiapentanal in air may be found in the local spill area and immediately downwind under appropriate circumstances. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of toxic vapors.

MITIGATION

Remove spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Personnel should conduct periodic air monitoring of the area to determine if toxic concentrations exist and when conditions are safe to reenter the area.

TECHNIQUE

WATER SPRAY OR FOG . . . Water spray or fog applied to 4-thiapentanal in air may reduce vapor generation.

CONSEQUENCE

Water build-up could cause material to spread.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Foam or compatible hazardous materials foam agents may be applied to the surface of liquid pools to reduce vapor generation.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Building dikes or barriers using soil, sand or other related materials may contain spills of material. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material may be mobile in soil and may seep through dike material, which may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches.

4-THIAPENTANAL

Division 6.1 (Poisonous Material)

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to condition such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Continually monitor for the presence of flammable vapors. Decontaminate equipment.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Material is slightly heavier than water. Use natural deep water pockets, excavated lagoons or sand bag barriers to trap material on bottom and limit spread of contamination.

4-THIAPENTANAL
Division 6.1 (Poisonous Material)

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may spread contaminate.

MITIGATION

Excavate as last resort, unless adverse environmental impacts can be minimized.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottoms sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Since the material is just slightly heavier than water booms may be an effective means to recover spilled material since some may remain on the surface. Barriers of suitable material may be used to confine the spill to a limited area to prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July, 1994

THIONYL CHLORIDE
Class 8 (Corrosive Material)

GENERAL INFORMATION

Thionyl chloride is a colorless or pale yellow to red liquid with a sharp, suffocating, irritating odor. It is not flammable, however, it is extremely corrosive and reacts violently with water. This reaction may result in the generation of substantial volumes of hydrogen chloride and sulfur dioxide gas with a reported liquid to vapor expansion ratio of 1:3700. As a result, reactions with water in closed containers can generate substantial pressures. This may result in the pressure rupture of the container. Thionyl chloride may react with metals in the presence of moisture to form hydrogen chloride, sulfur dioxide, and hydrogen gases.

On the release of liquid thionyl chloride, vapor generation is likely to be confined to the immediate spill vicinity. When dealing with spills of thionyl chloride, great care should be exercised in the use of water. Attempts to dilute spills of thionyl chloride with water may result in the development of substantial releases of vapors and acid mists. This can result in greatly expanding the threat of exposure well beyond the spill area.

Thionyl chloride is extremely corrosive to living tissues and may cause severe bums. These burns will be characteristic of hydrochloric acid exposures. Vapors and mists evolving from thionyl chloride spills are also extremely corrosive to living tissues.

In an accident situation, if thionyl chloride is leaking and generating fumes, downwind evacuation of the spill area should be considered until properly equipped responders have assessed the nature of the threat. Because of the potential for the generation of large quantities of hydrochloric acid mist, the spill assessment should note the potential for large quantities of thionyl chloride to combine with water.

Thionyl chloride is used in the manufacture of a variety of engineered plastics and as a chlorinating agent in various manufacturing reactions. It is also used in the manufacture of some pesticides and as a laboratory reagent.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Violently decomposes in water.

Solubility in Other Chemicals: Soluble in benzene and carbon tetrachloride.

Specific Gravity (Liquid): 1.638

Vapor Density (Air=1): *4.1*

Boiling Point: 76 to 79°C (168.8 to 174.2°F)

Melting Point: *-105°C* (-157°F)

Freezing Point: -105°C (-157°F)

Molecular Weight: 118.97

Heat of Combustion: Non-flammable.

Vapor Pressure: 94 to 97 mmHg @ 20°C (68°F)

Flash Point: Non-flammable.

Autoignition Temperature: Non-flammable.

Burning Rate: Non-flammable, decomposes.

Stability: Decomposes at 140°C (284°F) forming hydrogen chloride, chlorine, sulfur dioxide, and sulfur chlorides. Not subject to violent polymerization.

Corrosiveness: Corrosive to tissue and metals such as aluminum, magnesium, titanium, and in the presence of moisture, steel.

Reactivity with Water: Violently decomposes in water producing fumes including sulfur dioxide and hydrogen chloride.

Reactivity with Other Chemicals: Reacts violently with alkali materials (acid - base reaction) with the liberation of acid vapors and heat. It reacts with oxygen containing organic compounds, sodium, magnesium, aluminum, and titanium.

IDENTIFICATION

Shipping Names: Thionyl chloride.

Synonyms and Tradenames: Sulfurous oxychloride; sulfur oxychloride; sulphinyl chloride; CAS 7719-09-7.

Chemical Formula: $SOC1_2$

Constituent Components (% each): Typically 99% thionyl chloride.

UN/NADesignation: UN1836

IMO Designation: 8, corrosive.

Physical State as Shipped: Liquid.

Physical State as Released: Liquid.

Color of the Shipped Material: Colorless or pale yellow to red liquid.

Odor Characteristics: Suffocating odor, sharp, irritating.

Common Uses: Used in the manufacture of pesticides, engineering plastics, and as a chlorinating agent.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (202) 483-7616

THIONYL CHLORIDE
Class 8 (Corrosive Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Corrosive to tissues. Reacts with water, violently, to liberate hydrogen chloride and sulfur dioxide gasses or mists.

Short Term Exposure Limits (STEL): Unavailable.

Time Weighted Average (TLV-TWA): 1 ppm (5 mg/m^3) air, OSHA PEL - CEILING.

Conditions to Avoid: Contact with water or incompatible materials; runoff to sewers or water; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Corrosive to skin, mucous membranes and eyes. Reactions with water will liberate vapors composed of hydrogen chloride and sulfur dioxide. Reactions with water may result in the evolution of substantial acid vapor cloud increasing the threat of downwind exposure.

Hazards of Skin and Eye Contact: Eye exposure can result in severe burns to eye tissue. Extent and duration of exposure will determine the severity of the injury which could result in permanent blindness. Severe acid burns to the skin are likely to result from thionyl chloride exposures. Bums may be deep, penetrating below the skin depending on the nature of the exposure. Burns will be typical of those produced by hydrochloric acid exposures.

Hazards of Inhalation: Severe respiratory irritant. Corrosive to respiratory mucous membranes. Symptoms include coughing and wheezing. May progress to acute pulmonary edema and chemical pneumonitis. Inhalation exposures may be fatal depending on the concentration and duration of exposure. Burns may progress even after removal from exposures due to the continued action of hydrochloric acid residues.

Hazards of Ingestion: Highly corrosive to tissues in the mouth, esophagus, and stomach. May result in severe burns to the exposed tissues.

FIRE HAZARDS

Lower Flammable Limit: Non-flammable.

Upper Flammable Limit: Non-flammable.

Behavior in Fire: Thionyl chloride is non-flammable but will decompose if involved in fire. If thionyl chloride is exposed to water, as from fire suppression efforts, it will decompose to sulfur dioxide and hydrochloric acid. Sealed containers, exposed to excessive heat, may rupture due to thionyl chloride decomposition, to gasses and resulting in an increase in pressure.

Hazardous Combustion Products: Likely decomposition products include thionyl chloride vapor, hydrogen chloride, chlorine, and sulfur dioxide gasses.

EXPLOSION HAZARDS

Explosiveness: Contamination of thionyl chloride in closed containers may result in container rupture due to over pressure from gas generation.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: *Full* acid suit, gloves, protective boots and chemical goggles and full face shield or comparable protective equipment is necessary when dealing with thionyl chloride releases. Equipment should protect from all direct contact with thionyl chloride. Suitable materials of construction are reported to include butyl rubber and neoprene.

Respiratory Protection: OSHA/NIOSH approved acid gas canister for low concentrations. Full respiratory protection. Positive pressure, self contained breathing apparatus or supplied air systems with full facepiece (or equivalent) are recommended for high or unknown concentrations.

1836

THIONYL CHLORIDE
Class 8 (Corrosive Material)

FIRST AID

Nonspecific Symptoms: Severe burns to any tissues involved depending on the level of exposure. Eye contact may result in permanent damage or blindness. Severe corrosion of respiratory tissues depending on the level of exposure. Symptoms may include coughing, wheezing, choking, pulmonary edema, chemical pneumonitis. Symptoms may progress after removal from exposure due to residual contamination. Pulmonary symptoms may continue to develop after removal from exposure and victims should be observed for development/progression of pulmonary edema and delayed chemical pneumonia.

First Aid For Inhalation: Remove victim to fresh air. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert to signs of respiratory distress. Edema in respiratory tissues may grow progressively worse following acute exposure resulting in increased respiratory distress with time. Symptoms of pulmonary edema and chemical pneumonia may continue to develop for some time (1-2 days) after exposure. Seek medical assistance immediately.

First Aid For Skin and Eye Contact: Remove contact lenses, if possible without increasing eye injury. Flush eyes immediately with clean water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Severe exposures may result in permanent eye damage or blindness. Remove contaminated clothing and wash contaminated skin with water or soap and water. Seek medical assistance immediately.

First Aid for Ingestion: *Do* not induce vomiting. If victim is conscious, administer large quantities of water or milk. Never give anything by mouth to an unconscious person. Seek medical assistance immediately.

FIRE RESPONSE

Extinguishing Materials: Not flammable. Materials should be appropriate to the fuel involved.

Extinguishing Techniques: The use of water to control fire in the vicinity of spilled thionyl chloride should be weighed against the threat of vapor generation from the reaction of thionyl chloride and water. Introducing water into containers containing thionyl chloride should be avoided. Spilled thionyl chloride should be protected from contact with water runoff to minimize the generation of acid mists.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to spill area. Avoid contact with spilled material. Prohibit unprotected personnel from entering spill area. Seek expert assistance. Protect sewers and waterways from spilled thionyl chloride or contaminated runoff. Notify authorities, downstream of spill, of the potential for contamination. Be alert to conditions which may result in the mixing of water with spilled thionyl chloride. Protect spills from contact with water, if possible, to avoid excess acid mist generation. Keep in mind that thionyl chloride reacts with water to form hydrochloric acid and sulfur dioxide. Choose equipment which is compatible with thionyl chloride. Contact with steel in the presence of moisture can result in the generation of hydrogen gas.

THIONYL CHLORIDE
Class 8 (Corrosive Material)

AIR SPILL

TECHNIQUE

EVACUATION... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Thionyl chloride, when reacting with water, will form sulfur dioxide and hydrochloric acid mist. Releases may expose downwind areas to toxic concentrations over considerable distances depending on the rate of mist generation.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Seek expert assistance. Stop leak if without risk and if proper equipment and trained personnel are available. Allow vapors and gas to dissipate completely before reentering spill area without special protective gear.

TECHNIQUE

MONITOR THE SITUATION... Thionyl chloride may not evolve large amounts of hazardous airborne contaminants if moisture levels are low and thionyl chloride is kept away from water. It may be advisable, in some cases, to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of thionyl chloride vapors may concentrate in the vicinity of the spill area and in nearby enclosed or low lying areas.

MITIGATION

Remove spilled thionyl chloride as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel. Check low lying areas and structures in the spill vicinity for thionyl chloride vapor concentration.

TECHNIQUE

WATER FOG OR SPRAY... Water fog applied to thionyl chloride vapors and mists may accelerate its dispersal in the atmosphere. Thionyl chloride will likely react with water to form hydrochloric acid.

CONSEQUENCE

Adding water to spilled thionyl chloride will result in the generation of significant quantities of acid mist. Water runoff may contain levels of hydrochloric acid from contact with thionyl chloride. Water will become acidic and the pH will depend on the levels of acid generated. High levels of hydrochloric acid in solution will pose a significant hazard. Refer to the **Hydrochloric acid, *Emergency Action Guide*** for further information.

MITIGATION

Do not expose standing pools of thionyl chloride to contact with water. Do not spray water in containers of thionyl chloride. Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may contact spilled thionyl chloride and take steps to prevent such contact. Refer to the **Hydrochloric acid, *Emergency Action Guide*** for further information.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES... Spills of thionyl chloride on land may be contained by building dikes or barriers using soil, sand, or other materials. Where thionyl chloride is likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

CONSEQUENCE

Thionyl chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

LAND SPILL *(CONTINUED)*

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions, such as fire hose runoff or rainwater which may react with contained thionyl chloride. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking product.

CONSEQUENCE

Thionyl chloride may percolate into soil. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination. Excavations will expose moist soil to thionyl chloride and may increase the rate of vapor generation. Excavations exposing groundwater will promote the generation of large amounts of acid mist.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater which may cause increased vapor generation. Where possible, line containment areas with suitable, impervious material. Do not excavate deep enough to risk exposing product to groundwater.

TECHNIQUE

PUMPINGNACUUM SUCTION... Accumulated liquid pools may be recovered using appropriate hoses, pumps, and storage containers or vacuum trucks. Care should be taken to use equipment which is compatible with thionyl chloride as it may react with steel in the presence of moisture to generate flammable hydrogen gas. Equipment should be dry to avoid contact with water.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed. Reaction with steel in the presence of moisture may generate hydrogen gas. Water contained in equipment may increase the generation of mist or vapor.

MITIGATION

Use equipment constructed of compatible materials. Insure equipment is free from water. Arrange to decontaminate equipment after use. Plan for the removal of remaining contaminated soil after product is removed.

TECHNIQUE

ABSORPTION... Spilled thionyl chloride can be absorbed and immobilized with inert, non-combustible materials such as sand, earth, vermiculite, and compatible commercial sorbants.

CONSEQUENCE

Sorbants will become contaminated with thionyl chloride and will pose the same hazards as the spilled product. Use of sorbants will add to the overall volume of the spill.

MITIGATION

Reduce spill volume by removing product directly using mechanical means, if possible. Use sorbants to remove residues which are left behind.

TECHNIQUE

MECHANICAL REMOVAL... Thionyl chloride contaminated soil may be removed by shovels, motorized graders, scrapers, loaders, buldozers and draglines.

THIONYL CHLORIDE
Class 8 (Corrosive Material)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use with soap and water. Use equipment which is compatible with spilled product. Avoid equipment constructed with copper or copper alloys. Store contaminated materials in a safe and secure location.

WATER SPILL

Thionyl chloride will react in water to form hydrochloric acid. Refer to the **Hydrochloric acid**, ***Emergency Action Guide*** for further guidance.

TECHNIQUE

STOP USE... Notify downstream industrial, municipal, and public users to stop intake or monitor water for contamination. Stop recreational water use in downstream areas.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternate water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT/DIVERSION... Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

January 1988

THORIUM ORE
Class 7 (Radioactive Material)

GENERAL INFORMATION

Thorium ore, also known as monazite sand, is a natural material of low radioactivity found in N. Carolina, S. Carolina, Idaho, Colorado, Montana, Florida, Canada, and several other parts of the world. It is used to produce thorium and its compounds, uranium, cerium, and other rare-earth metals and compounds. It is considered insoluble in water and is substantially heavier, so may be expected to sink while dispersing through natural water columns. Some constituents of the material may be flammable and may emit hazardous fumes in fires, but the flammability and several other characteristics of the materials are not well defined. The ore weighs 306 - 331 pounds per cubic foot. Composition varies with source but may include thorium, yttrium, cerium and lanthanide metals and compounds, calcium, iron, silica, uranium 308, and thorium dioxide. The latter compound may constitute as much as 10% of the material. Local, state, or U.S. Department of Energy radiological response teams should be contacted for advice if the ore is released to the environment. Note, however, that thorium ore is only mildly radioactive and that the radiation hazard in transportation is relatively minor.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble
Solubility in Other Chemicals: Thorium dioxide is soluble in hot sulfuric acid.
Specific Gravity (Solid): 4.9 - 5.3
Boiling Point: Unavailable
Melting Point: Unavailable
Freezing Point: Unavailable
Molecular Weight: Unavailable
Heat of Combustion: Unavailable

Vapor Pressure: Unavailable
Flash Point: Unavailable
Autoignition Temperature: Unavailable
Burning Rate: Unavailable
Stability: Unavailable
Corrosiveness: Unavailable
Reactivity with Water: Unavailable
Reactivity with Other Chemicals: Unavailable

IDENTIFICATION

Shipping Names: Thorium ore (USDOT)
Synonyms and Tradenames: Monazite sand
Chemical Formula: $(Ce,La,Y,Th)P0_4$ for monazite
Constituent Components (% each): Varies
49 STCC: 49 264 39
UN/NA Designation: UN2912
IMO Designation: *7,* radioactive substance
Physical State as Shipped: Solid

Physical State as Released: Solid
Color of the Shipped Material: Yellowish to reddish brown
Odor Characteristics: Unavailable
Common Uses: Mfg. of thorium and its compounds, uranium, cerium, and other rare-earth metals and compounds.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

THORIUM ORE

Class 7 (Radioactive Material)

USDOT: Identification numbers
cannot be displayed on the placard
(49 CFR § 172.334).

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Radioactive solid of low specific activity.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Conditions to Avoid: Exposure to fire; entry to sewers or water bodies; inhalation of dust, ingestion, and direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Not well defined but include low level radioactivity. It is best to avoid all exposures. Seek advice from radiological response team.

Hazards of Skin or Eye Contact: None reported.

Hazards of Inhalation: The toxicity of thorium ore dust in single and limited exposures is considered low but some constituents may be carcinogenic and should be avoided.

Hazards of Ingestion: Unavailable

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Some constituents may burn.

Hazardous Combustion Products: Fumes from material in fire may be hazardous.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Data unavailable.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should provide protection from contact with the spilled thorium ore. Seek advice from radiological response team.

Respiratory Protection: *A* dust respirator with high efficiency particulate cartridge(s) is presumably adequate for normal exposures. Seek advice from a radiological response team.

FIRST AID

Nonspecific symptoms: Unavailable

First Aid for Inhalation: Remove victim to fresh air. Get medical attention.

First Aid for Skin and Eye Contact: Brush off loose materials and wash affected areas.

First Aid for Ingestion: Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Data unavailable.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use water to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Prevent entry to water bodies and sewers. Eliminate ignition sources as a safety precaution. Notify proper authorities, downstream sewer and water treatment operations, and other downstream user of potentially contaminated water. Seek advice from local, state, or federal radiological response team.

2912

THORIUM ORE
Class 7 (Radioactive Material)

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Thorium ore may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of thorium ore dust in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid thorium ore with plastic sheet or other compatible material to prevent airborne dust. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to thorium ore dust in air may knock down dust and accelerate its dispersal in the atmopshere.

CONSEQUENCE

Water runoff may contain varying amounts of thorium ore dust from contact with dust.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Thorium ore may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Entry of water to containment area may conceivably spread contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause thorium ore dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

THORIUM ORE
Class 7 (Radioactive Material)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage.

MITIGATION

Consult qualified experts for guidance.

September 1992

TITANIUM DIOXIDE
Non-Regulated

GENERAL INFORMATION

Titanium dioxide is not designated as a hazardous material in transportation. Nevertheless, the substance is consistently ranked among the top 50 chemicals produced in the United States and may therefore be encountered comparatively frequently in transportation or other accidents resulting in a chemical discharge.

Titanium dioxide is usually shipped as solid white crystals or powders, or alternatively, as a slurry in water containing 50 to 80% of the solid by weight. The product is odorless, noncombustible, heavier than water, and insoluble therein. Although generally white or colorless when pure, titanium dioxide is found in nature in various forms containing impurities that impart a variety of different colors. It is primarily used as a pigment and coloring agent to provide a white color to a wide variety of consumer products but also has a number of more specialized uses in commerce. Solid titanium dioxide weighs approximately 240 to 266 pounds per cubic foot.

Titanium dioxide does not react with water or other common materials, is very stable (even when exposed to fire), and is reported to be generally non-corrosive. Toxicity of the product is very low by all routes of exposure. It is reported not to evolve products of thermal decomposition and/or combustion in a fire, and as noted above, is not itself combustible.

The data and information presented below are for relatively pure titanium dioxide. The properties and hazards of the material may be altered if it is mixed with other substances or contains significant amounts of impurities.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble

Solubility in Other Chemicals: Soluble in hot concentrated sulfuric acid; hydrofluoric acid; or alkali.

Specific Gravity (Solid): 3.84 - 3.90 for anatase; 4.13 - 4.17 for brookite; and 4.23 - 4.26 for rutile; all at room temperatures.

Boiling Point: 4530 - 5430°F (2500 - 3000°C) at 1 atm.

Melting Point: Most references list a melting point temperature in the range of 3320 - 3380°F (1825 - 1860°C); some provide a lower value of 2985°F (1640°C).

Freezing Point: See melting point

Molecular Weight: 79.9

Heat of Combustion: Not combustible

Vapor Pressure: Essentially zero at 68°F (20°C)

Flash Point: Not combustible

Autoignition Temperature: Not combustible

Burning Rate: Not combustible

Stability: Stable

Corrosiveness: Simply reported to be non-corrosive

Reactivity with Water: No reaction

Reactivity with Other Chemicals: One authority reports that a reaction between titanium dioxide and lithium occurs at a temperature of about 390°F (200°C) with a flash of light and that the temperature can eventually reach 1650°F (900°C).

IDENTIFICATION

Shipping Names: No particular name is standard but "chemicals, n.e.c." The shipper may or may not provide the specific chemical name of the product.

Synonyms and Tradenames: Anatase; brookite; rutile; titania; titanic acid anhydride; titanic anhydride; titanic oxide; titanium dioxide; titanium peroxide; titanium oxide; titanium white; and many tradenames.

Chemical Formula: $Ti0_2$ for the pure substance

Constituent Components (% each): One authority reports that the product usually contains small amounts of the oxides of aluminum, antimony, silicon (quartz) and zinc, and may sometimes contain very small (ppm) amounts of metals such as iron, chromium and vanadium.

28 STCC: 28 161 25 (titanium dioxide, nec); 28 161 35 (titanium dioxide, ultra fine powder); 28 161 30 (titanium dioxide and water mixed, consisting of not exceeding 78% by weight of titanium dioxide).

UN/NA Designation: Not established

IMO Designation: Not established

Physical State As Shipped: Solid crystals or powders; slurries consisting of solid titanium dioxide mixed with water.

Physical State As Released: Same as shipped

Color of the Shipped Material: Pure titanium dioxide is a white powder or fine, needle-like crystals which may be individually colorless but nevertheless appear white in a container. Crystals of the substance found in nature usually contain impurities which color them yellow, red, reddish-brown, green, blue, black or brown.

Odor Characteristics: Odorless

Common Uses: Widely used as a white pigment and coloring agent in ceramics, cosmetics, floor coverings, food additives, glassware, inks, paints, paper, plastics, rubber, tanners' leather finishes, shoe whiteners, coated textiles, wall coverings, and other products.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

TITANIUM DIOXIDE
Non-Regulated

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Reported to be odorless

Unusual Hazards: None

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limits: 10 mg/m^3 (as total dust containing no asbestos and less than 1% crystalline silica) over each 8 hours of a 40 hour work week (ACGIH TLV, 1990-91); 10 mg/m^3 (as total dust) and 5 mg/m^3 (as respirable fraction) over each 8 hours of a 40 hour work week (OSHA PEL, 1989).

Conditions to Avoid: Generation of airborne dust or mist; contact with incompatible materials at high temperatures; entry or runoff to sewers or water bodies; excessive inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Hazards of public exposures to titanium dioxide in typical spill situations are expected to be minimal.

Hazards of Skin or Eye Contact: Titanium oxide particles are not chemically irritating to the eyes but simply act as common "foreign objects". Some lacrimation, blinking, and mild temporary pain may occur as solid particles are rinsed from the surface of eyes. Rubbing eyes containing solid particles may aggravate irritation. The substance is not irritating to the skin in brief exposures but prolonged or repeated contact may result in mild irritation.

Hazards of Inhalation: Hazard is low if minimal precautions are taken. High concentrations of fairly pure titanium oxide dust in air may at most cause coughing, mild temporary irritation of the nose and throat, and possibly some chest discomfort in brief encounters. Repeated or prolonged exposure to massive concentrations of dust may cause lung injury by blocking blood vessels and distorting the shape of airways.

Hazards of Ingestion: Pure titanium dioxide is reported as being practically non-toxic by ingestion.

FIRE HAZARDS

Lower Flammable Limit: Not combustible

Upper Flammable Limit: Not combustible

Behavior in Fire: Solid titanium is very inert and stable, even in a fire.

Hazardous Combustion Products: None

EXPLOSION HAZARDS

Lower Explosive Limit: Not combustible

Upper Explosive Limit: Not combustible

Explosiveness: See Behavior in Fire section directly above.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Where deemed necessary, equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with significant concentrations of titanium dioxide dust in air. It is considered good practice to wear dust-proof or splash-proof safety goggles (as appropriate) to prevent eye contact and coveralls or long-sleeved shirts and pants to prevent accumulation of titanium dioxide on the skin. Compatible materials are reported as likely to include any material commonly used in protective clothing.

Respiratory Protection: For fire fighting or high concentrations (above 750 mg/m^3 in air), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent), which may also be used for all other levels of exposure. For dusts or mists in air, NIOSH alternatively recommends any dust or mist respirator for concentrations in the range of 10 to 75 mg/m^3 and any dust and mist respirator except single-use or quarter-mask type respirators for concentrations of 150 mg/m^3 or less within the use limitations of these devices. For dust, mist, or fume concentrations in air, NIOSH alternatively recommends any fume respirator or high efficiency particulate filter respirator for concentrations of 150 mg/m^3 or less and a high efficiency particulate filter respirator with a full facepiece for concentrations of 750 mg/m^3 or less within the use limitations of these devices.

TITANIUM DIOXIDE
Non-Regulated

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat or skin.

First Aid for Inhalation: Remove victim to fresh air. In the unlikely event that breathing becomes difficult or stops, administer artificial respiration. Get medical attention immediately if breathing problems are apparent, especially if substances other than titanium dioxide may have been inhaled. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: If irritation occurs, flush eyes with water, occasionally lifting the eyelids, until all particles *of* solid titanium dioxide have been removed. If skin irritation occurs, remove all contaminated clothing. Gently wash affected body areas with large amounts of soap and water. Get medical attention if eye irritation persists after washing.

First Aid for Ingestion: If conscious, have victim rinse mouth out with water and then administer large quantities of water to drink. For incidents involving relatively pure titanium dioxide, do not induce vomiting. Get medical attention if a large amount has been ingested. If the titanium dioxide product contains other substances, attempt to determine what they are, seek medical advice as soon as possible on whether vomiting should be induced, and obtain appropriate medical attention. If vomiting occurs naturally or is induced, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Do not make an unconscious person vomit.

FIRE RESPONSE

Extinguishing Materials: Titanium dioxide is not combustible and is reported as essentially inert in normal fires. Use any extinguishing agent appropriate for the surrounding fire.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk, particularly if the cargo is a slurry of titanium dioxide in water. Use professional judgment to decide if well-sealed containers or tanks of titanium dioxide slurries in water should be kept cool via use of water sprays to avoid the possibility of container rupture due to buildup of steam pressure. If deemed necessary, use water from side and from safe distance to keep such containers cool until well after fire is out. For a massive fire in the cargo area under these circumstances, it may be prudent to use unmanned hose holders or monitor nozzles. In any case, stay away from ends of tanks involved in fire, but realize that shrapnel may travel in any direction.

SPILL RESPONSES

General Information: Keep unprotected personnel away from spill area. Avoid excessive and/or prolonged contact with spilled product. Stop leak if safe to do so. Prevent substance from entering sewers. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Titanium dioxide and its slurries in water will not evolve significant amounts of hazardous airborne contaminants in most spill situations. It may be advisable in such cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Irritating levels of titanium dusts or mists may possibly be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind if necessary.

TITANIUM DIOXIDE
Non-Regulated

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid titanium dioxide with a plastic sheet or other compatible material to prevent airborne dust or contact with water.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Where necessary, water fog or spray applied to titanium dioxide dusts or mists in air may knock them down and accelerate their dispersal in the atmosphere. Apply water at a point downwind if practical if solid titanium dioxide is exposed to prevent spreading of contamination where this may be of concern. Alternatively, consider wetting down the surface of titanium dioxide powder with a gentle water fog to reduce generation of airborne dust.

CONSEQUENCE

Water runoff may contain some amounts of titanium dioxide.

MITIGATION

Contain contaminated water where deemed necessary and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Titanium dioxide, its slurries in water, and/or contaminated water runoff may be contained by building dikes or barriers using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain slurries of titanium dioxide or contaminated water runoff.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged, develop leaks, or possibly react with titanium dioxide under the appropriate conditions. Thick slurries of solid titanium dioxide in water may plug, clog, or cause abrasion damage to equipment.

MITIGATION

Dilute and mix slurry with water prior to recovery by this method where necessary. Use equipment capable of handling slurries and compatible with titanium dioxide as and if necessary. Alternatively, let solids settle and carefully draw off water layer.

TITANIUM DIOXIDE
Non-Regulated

TECHNIQUE

ABSORPTION . . . Spreading of slurries and/or contaminated runoff may be controlled by absorbing the liquid with sand, earth, clay, vermiculite, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of a fire simply on general principles.

TECHNIQUE

MECHANICAL REMOVAL . . . Solid titanium dioxide, its residues, and/or contaminated soil may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may become damaged or corroded, or possibly react with titanium dioxide. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause titanium dioxide dust to become airborne.

MITIGATION

Select removal procedures that do not cause titanium dioxide dust to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid titanium dioxide and particles in slurries will generally sink in water but some fine solid particles may trap air and float for awhile; some may remain suspended in the water column for a time. The product is reported to be of relatively low toxicity to aquatic life but has the potential to physically smother life forms residing on the bottom of a water body.

CONSEQUENCE

Alternative water supplies may be needed to accommodate certain water users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water solids and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

TITANIUM DIOXIDE
Non-Regulated

TECHNIQUE

CONTAINMENT DIKES . . . Water containing suspended titanium dioxide particles may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment (by filtration, clarification, or settling, for example) or for disposal.

September 2006

TITANIUM TETRACHLORIDE

Class 8 (Corrosive Material)

GENERAL INFORMATION

Titanium tetrachloride is a colorless fuming liquid with an acrid, choking, pungent, and irritating odor. It is toxic to humans and the environment. It is used in making pure titanium and its salts, iridescent effects in glass, smoke screens, pigments, and polymerization catalysts. The product is not flammable and weighs approximately 14.4 pounds per gallon.

Titanium tetrachloride will react vigorously with water or moist air to generate heat, hydrochloric acid, titanium dioxide and possibly titanium oxychloride. The liquid product and the dense white fumes evolved in air are highly corrosive to all bodily tissues and will attack many metals when water is present, possibly with the evolution of flammable and potentially explosive hydrogen gas. The product is also highly reactive with a wide variety of other chemicals and substances. Contact with explosives may cause an explosion. There is a limited potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

If titanium tetrachloride is involved in an incident, as an immediate precautionary measure, isolate spill or leak area in all directions for at least 150 feet (50 meters) for liquids and at least 75 feet (25 meters) for solids. In the event titanium tetrachloride is released to the environment, the following evacuation distances should be considered. Note there are different distances for land and water spills due to the reactivity of titanium tetrachloride with water. For **small** spills on ***land***, isolate area for a radius of 100 feet (30 meters) in all directions with a downwind evacuation of 0.1 miles (0.1 kilometers) for daytime and nighttime. For **small** spills in ***water***, isolate area for a radius of 100 feet (30 meters) in all directions with a downwind evacuation of 0.1 miles (0.1 kilometers) for daytime and 0.3 miles (0.5 kilometers) for nighttime. For **large** spills on ***land***, isolate area for a radius of 200 feet (60 meters) in all directions with a downwind evacuation of 0.3 miles (0.5 kilometers) for daytime and 0.5 miles (0.8 kilometers) for nighttime. For **large** spills in ***water***, isolate area for a radius of 400 feet (120 meters) in all directions with a downwind evacuation of 0.7 miles (1.1 kilometers) for daytime and 2.3 miles (3.7 kilometers) for nighttime. These distances should be adjusted when taking into consideration the amount of material spilled, location, local weather conditions and other factors. If a bulk container of titanium tetrachloride is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. Titanium tetrachloride fumes may be heavier than air and collect in low lying areas.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Hydrolyzes
Solubility in Other Chemicals: Soluble in alcohol and dilute hydrochloric acid.
Specific Gravity (Liquid): 1.726 at 68°F (20°C)
Vapor Density: 4.9 – 6.5
Boiling Point: 278°F (136.4°C) at 1 atm.
Melting Point: Unavailable
Freezing Point: –9.8 to –22°F (–23.2 to –30°C)
Molecular Weight: 189.73
Heat of Combustion: Not flammable
Evaporation Rate (butyl acetate=1): Not available
Vapor Pressure: 10 mmHg (0.193 psia) at 70.3°F (21.3°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Flammable Limits: Not flammable
Stability: Stable, but reacts with water or moisture
Polymerization Potential: Will not occur
pH: Not applicable
Corrosiveness: Hydrochloric acid formed in reactions with water is corrosive.
Reactivity with Water: May react vigorously with water or moist air giving off heat with dense white clouds of hydrochloric acid, titanium dioxide and possibly titanium oxychloride.
Reactivity and Incompatibility: Reacts with peroxides, epoxides, explosives, alcohols, reactive metals (sodium, magnesium, potassium, etc.) and a wide variety of other chemicals and substances.

IDENTIFICATION

Shipping Names: Titanium tetrachloride (USDOT & IMO)
Synonyms and Tradenames: Titanium chloride; Tannic chloride; Titanium (IV) chloride; Titanic chloride.
CAS Registry No.: 7550-45-0
Chemical Formula: $TiCl_4$
Constituent Components(% each): Approx. 100% pure
UN/NA Designation: UN1838
IMO Designation: 8, corrosive substances; 6.1 toxic substances
RTECS Number: XR195000
NFPA 704 Hazard Rating: 3 (Health): 0 (Flammability): 2 (Instability): Water reactive
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Colorless to yellow
Odor Characteristics: Acrid, pungent, choking, irritating
Reportable Quantity: See Appendix I
Common Uses: Mfg. of pure titanium and salts, iridescent effects in glass, smoke screens, titanium pigments, and polymerization catalyst.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

TITANIUM TETRACHLORIDE

Class 8 (Corrosive Material)

and

and

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly corrosive and reactive liquid with hazardous fumes. Will react vigorously with water. May evolve hydrogen gas in contact with certain metals when wet. Material is toxic to the environment.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): 0.5 mg/m^3 (Lyondell Millennium Inorganic Chemicals)

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Emergency Response Planning Guidelines (ERPG): 5 mg/m^3 (ERPG-1); 20 mg/m^3 (ERPG-2); 100 mg/m^3 (ERPG-3) (AIHA)

Conditions to Avoid: Heat; contact with incompatible materials, combustible materials such as wood, paper and oils, or water; runoff to sewers or water sources; inhalation, ingestion, and direct physical contact; sparks where hydrogen may be present.

HEALTH HAZARDS

Public Health Hazards: Titanium tetrachloride is highly corrosive to bodily tissues by all routes of exposure. Major hazard to public is inhalation of vapors or fumes in air, but ingestion and direct physical contact are also to be strictly avoided. May be fatal if inhaled.

Hazards of Skin or Eye Contact: Contact of the skin with liquid titanium tetrachloride may cause severe burns. Contact with the eyes may result in permanent eye damage.

Hazards of Inhalation: Vapors and fumes evolved from titanium tetrachloride are irritating and corrosive to the eyes, skin, nose, and throat. Inhalation may cause coughing, headache, dizziness, possible lung damage, and possible bronchial pneumonia with potentially severe consequences or death.

Hazards of Ingestion: Ingestion may result in burns, nausea, vomiting, cramps, diarrhea, and possible tissue ulceration.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: Not flammable

Upper Flammable (Explosive) Limit: Not flammable

Behavior in Fire: Containers may rupture in fire due to overpressurization. May generate large quantities of corrosive vapors and fumes upon release.

Hazardous Combustion Products: Will not burn, but thermal decomposition will generate toxic chlorine gas, hydrogen chloride, titanium oxychloride and titanium oxides.

EXPLOSION HAZARDS

Explosiveness: Very reactive. Not flammable but containers may rupture in fire due to overpressure. Contact with certain other chemicals may result in formation of explosive mixtures. Hydrogen gas evolved in reactions with some metals may explode if ignited in a confined area.

1838

TITANIUM TETRACHLORIDE

Class 8 (Corrosive Material)

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include neoprene, PVC, Saranex® coated Tyvek®, or Viton®. The following materials are reported to have greater than 8 hour breakthrough time: Tychem® BR; Tychem® LV; Tychem® Responder®; Tychem® Responder® CSM; Tychem® TK; Tychem® Reflector®; Tychem® PVC; Tychem® ThermoPro. The following materials are ***not*** recommended for use: Tychem® CPF 2; Tychem® SL; Tychem® CPF 4; butyl rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations: any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode; or any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode.

FIRST AID

Nonspecific Symptoms: Irritations or burns of any bodily tissues; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of water for at least 20 minutes. Get medical attention immediately. (Note: Wipe titanium tetrachloride off skin with dry cloth before applying water. This will reduce potential for severe burns due to reaction with water.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Get medical attention immediately. (Note: Wipe titanium tetrachloride off eyes with dry cloth before applying water. This will reduce potential for severe burns due to reaction with water.)

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. Do not give sodium bicarbonate (baking soda) or other carbonates.

Note to Physician: Titanium tetrachloride reacts with moisture to form hydrochloric acid, both of which are corrosive to all body tissues and will produce chemical and thermal burns. Ingestion may result in delayed development of esophageal or gastric strictures.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide or flooding water. Product reacts with water or foam but may consider using large amounts of water fog or spray if large quantities of combustibles are involved.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Note that addition of water may increase evolution of fumes from leaking product. If using water, use in flooding quantities.

TITANIUM TETRACHLORIDE
Class 8 (Corrosive Material)

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area and determine area for evacuation. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or damage of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Take into account the reactivity of product with many common metals when deciding on the appropriate response and equipment. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Consult a qualified specialist on neutralization techniques. However, some sources suggest neutralizing run-off with slacked lime, soda ash or crushed limestone. Use explosion-proof and spark-proof equipment where necessary. Do not use combustible materials, such as sawdust. Titanium tetrachloride is highly reactive with water. Take into account while planning the response that it is highly corrosive and toxic with heavier than air vapors that may persist for a time in low areas.

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to titanium tetrachloride vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill and should not be allowed to contact pools of titanium tetrachloride.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain titanium tetrachloride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . There is a possibility that foam applied to the surface of liquid pools may slow the release of titanium tetrachloride vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

TITANIUM TETRACHLORIDE

Class 8 (Corrosive Material)

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid titanium tetrachloride may slow the release of vapors into the atmosphere. The response is better suited to smaller spills and entails special risks.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Vapor or fume evolution may be vastly increased during and immediately after water application, thus increasing downwind and local hazards for a time.

MITIGATION

Contain spilled product and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Some possibilities include knockdown of vapors or fumes via water fog or spray and temporary evacuation of downwind populations and other vulnerable resources. Proceed with caution. Consult qualified experts.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent to liquid titanium tetrachloride may eventually slow the release of vapors or fumes into the atmosphere. Possible neutralization agents may include, agricultural lime, slaked lime, crushed limestone, sodium hydroxide or soda ash.

CONSEQUENCE

Depending on the neutralization agent and application technique used, the resulting chemical reaction may produce varying amounts of heat, vapors, fumes and spattering.

MITIGATION

Proceed with caution. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Titanium tetrachloride may be contained by building dikes using soil, dry sand or other materials.

CONSEQUENCE

Contained titanium tetrachloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TITANIUM TETRACHLORIDE

Class 8 (Corrosive Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance. Possible neutralization agents may include, agricultural lime, slaked lime, crushed limestone, sodium hydroxide or soda ash.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards. Possible neutralization agents may include, agricultural lime, slaked lime, crushed limestone, sodium hydroxide or soda ash applied after the reaction subsides.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks and may need special approval from regulatory agencies.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consider treating water using a processing system constructed on land.

September 2006

TOLUENE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Toluene is a clear, colorless aromatic hydrocarbon liquid that occurs naturally in crude oil and in the tolu tree. It has a pungent pleasant odor resembling benzene or model glue. It is used as a solvent, is a common component of hydrocarbon fuels, and is a raw material for making explosives, dyes, benzene, and various other organic chemicals. It is barely soluble in water and lighter, so it may be expected to form a floating surface slick that dissolves at a very slow rate. Its flash point of 40°F indicates that the product can be easily ignited under a wide variety of ambient temperature conditions. Vapors are somewhat heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers have some limited potential to rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 7.2 pounds per gallon.

Toluene does not react with water or many other common materials and is stable in normal transportation. It is primarily incompatible with strong oxidizers that may cause its ignition. Although it is relatively noncorrosive to most metals, the liquid may attack some forms of plastics, rubber and coatings. Toxicity is low to moderate via the various potential routes of exposure. Products of combustion may include toxic constituents.

If toluene is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Barely soluble, 0.05 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetic acid, acetone, alcohol, benzene, ether, ligroin, chloroform, carbon disulfide and other hydrocarbons.

Specific Gravity (Liquid): 0.867 at 68°F (20°C)

Vapor Density: 3.14

Boiling Point: 231.1°F (110.6°C) at 1 atm.

Melting Point: –139°F (–95°C)

Freezing Point: –139°F (–95°C)

Molecular Weight: 92.14

Heat of Combustion: –9686 cal/g

Evaporation Rate (butyl acetate=1): 2.24

Vapor Pressure: 22 mmHg (0.425 psia) at 68°F (20°C)

Flash Point: 40°F (4.4°C), closed cup; 55°F (12.8°C), open cup.

Autoignition Temperature: Reports vary 792°F – 997°F (422°C – 536°C)

Burning Rate: 5.7 mm/minute

Flammable (Explosive) Limits: 1.1% (LEL) – 7.1% (UEL) one source reports 3.3% – 19%

Stability: Stable

Polymerization Potential: Will not occur

pH: Not applicable

Corrosiveness: May attack some plastics, rubber, and coatings; noncorrosive to most metals.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with strong oxidizing materials, halogens or molten sulphur. Toluene forms explosive reactions with nitric acid, especially sulfuric acid, 1,3-dichloro-5,5-dimethyl-2,4-imidazolididione; dinitrogen tetraoxide; N_2O_4; $AgClO_4$; BrF_3; uranium hexafluoride; sulfur dichloride and tetranitromethane.

IDENTIFICATION

Shipping Names: Toluene (USDOT & IMO)

Synonyms and Tradenames: Methylbenzene; Methylbenzol; Phenylmethane; Toluol; Methacide; Antisal 1A; CP 25; Methacide; NCI-C07272; Tolu-sol

CAS Registry No.: 108-88-3

Chemical Formula: $C_6H_5CH_3$

Constituent Components (% each): 94% or more pure (typically) with remainder xylene, some benzene, and other hydrocarbons.

UN/NA Designation: UN1294

IMO Designation: 3, flammable liquids

RTECS Number: XS5250000

NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 0 (Instability)

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Pungent, pleasant, aromatic, like benzene or model glue.

Reportable Quantity: See Appendix I

Common Uses: Solvent in paints, coatings, lacquers, paint thinners, fingernail polish, lacquers, adhesives, rubber, and other products; hydrocarbon fuel component; mfg. of explosives, dyes, benzene, and other organic chemicals. Some printing and leather tanning processes toluene is a major component of JP-8 fuel.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

TOLUENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.17 – 40 ppm; reported values vary, but most fall within 0.2 – 5ppm.

Unusual Hazards: Somewhat volatile flammable hydrocarbon with heavier than air vapors that may travel to a source of ignition and flash back. Flowing product may be ignited by self-generated static electricity.

Short Term Exposure Limits (STEL): 150 ppm (560 mg/m^3) (NIOSH)

Time Weighted Average (TLV-TWA): 100 ppm (375 mg/m^3) (NIOSH); 200 ppm (OSHA)

Ceiling (C) Limit: 300 ppm (OSHA)

IDLH: 500 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations that may be present in the spill area and immediately downwind. Ingestion and direct contact should also be avoided. Be alert to hazards of any benzene (see separate guide) that may be present.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid toluene may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Some amount may be absorbed through the skin. Contact with the eyes may cause irritation and temporary corneal injury.

Hazards of Inhalation: Vapors of toluene may cause coughing, sore throat, irritation of the eyes, mucous membranes, and upper respiratory tract. High concentrations may cause narcosis and central nervous system depression with symptoms including fatigue, weakness, confusion, headache, dizziness, drowsiness, incoordination, peculiar skin sensation or numbness, unconsciousness, and possibly death.

Hazards of Ingestion: Ingestion in significant amounts may result in burning sensation, vomiting, diarrhea, griping, depressed respiration, and possibly death. Aspiration into the lungs during vomiting may cause gagging, coughing, respiratory distress, and rapidly developing pulmonary edema with possibly severe consequences.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 1.1%; one source reports 3.3%

Upper Flammable (Explosive) Limit: 7.1%; one source reports 19%

Behavior in Fire: Flammable liquid. There is some limited potential that containers may rupture violently in fire. May generate significant quantities of flammable vapors upon release. Vapors may be heavier than air and may travel to a source of ignition and flash back.

Hazardous Decomposition Products: Toxic gases, such as carbon dioxide and carbon monoxide, may be released. Contact with nitric and sulfuric acids may form nitrocresols that can decompose violently.

EXPLOSION HAZARDS

Explosive Potential: There is some limited potential that containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

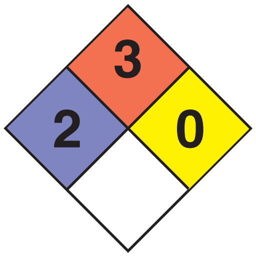
PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include polyurethane, nitrile-butadiene rubber, Saranex®, and fluorine/chloroprene. The following materials are reported to have a breakthrough time greater than 8 hours: Tychem® CPF 3; Tychem® CPF 4; Tychem® BR; Tychem® LV; Tychem® Responder®; Tychem® Responder® CSM; Tychem® TK; Tychem® F; Tychem® Reflector®; Tychem® ThermoPro; polyvinyl alcohol; Viton®; Barricade®; Trellchem® HPS suits; CPF3®; Teflon®; 4H® and Silver Shield® brand gloves; Viton®890 gloves. The following materials are ***not*** recommended: neoprene; latex or rubber; butyl or nitrile latex; Tychem® CPF 1; Tychem® QC; Tychem® CPF 2; Tychem® SL; Tychem® PVC; Tychem® Butyl.

1294

TOLUENE

Class 3 (Flammable Liquid)



Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 500 ppm): a self-contained breathing apparatus (SCBA) with full facepiece; any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 500 ppm): any air-purifying half-mask respirator equipped with organic vapor cartridge(s); any powered air-purifying respirator with organic vapor cartridge(s); any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; any supplied-air respirator; any self-contained breathing apparatus with a full facepiece. NOTE: In certain cases, eye protection may be required in addition to the respirator.

FIRST AID

Nonspecific Symptoms: May cause redness and inflammation of the eyes and eyelids, runny nose, scratchy throat, fatigue, weakness, incoordination, confusion, headache, dizziness, and drowsiness.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of water for 15 minutes, followed by washing with soap and water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Most sources recommend administering large quantities of water, however one source reports *not* to administer water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, and water spray or fog.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Consider wearing full chemical protective suit if contact with material or dense fumes/smoke anticipated. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Toluene may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases. Note that toluene has a flash point of 40°F.

SPILL RESPONSES

General Information: Toluene is a highly flammable and volatile liquid that may cause environmental contamination. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Take into account while planning the response that toluene has limited solubility in water and may float.

TOLUENE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Toluene may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of toluene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to toluene vapors or fumes may accelerate their dispersal in the atmosphere. Toluene may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Water runoff may contain a small amount (if any) of toluene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of toluene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Toluene may be contained by building dikes or barriers using soil, sand or other non-combustible materials.

CONSEQUENCE

Contained toluene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TOLUENE
Class 3 (Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, fly ash, cement powder, vermiculite, fullers earth or other absorbent, non-combustible and compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves, current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TOLUENE

Class 3 (Flammable Liquid)

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating toluene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with toluene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

TOLUENE DIISOCYANATE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Toluene diisocyanate is a colorless to pale yellow liquid or solid with a sweet, pungent, and fruity odor. It is used to make polyurethane foams, plastics, paints, adhesives, and coatings. It is heavier than water and reacts nonviolently to form carbon dioxide gas and insoluble polyureas. Its flash point of 270°F indicates that the product must be heated before ignition may easily occur. The product weighs approximately 10.2 pounds per gallon and has a freezing point of 68-72°F.

Toluene diisocyanate is stable in normal transportation and does not react with many common materials besides water. It may slowly self-polymerize in a non-hazardous fashion above 113°F, and is reactive with various chemicals. Toxicity should be considered high by all routes of exposure due to special hazards described in the following. Products of combustion may include toxic cyanides, oxides of nitrogen, and highly irritating vapors, but these products may actually pose less of an air pollution hazard at times than the unburned chemical.

If toluene diisocyanate is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard, especially if large amounts have spilled or the product is somehow heated.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts; see below

Solubility in Other Chemicals: Data unavailable

Specific Gravity (Liquid): 1.22 at 77°F (25°C)

Boiling Point: 482°F (250°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: 68-72°F (20-22.2°C)

Molecular Weight: 174.16

Heat of Combustion: – 5720 cal/g

Vapor Pressure: 0.038 mm Hg (0.0007 psia) at 59°F(15°C)

Flash Point: 270°F (132.2°C), open cup

Autoignition Temperature: Over 300°F (148.9°C)

Burning Rate: Unavailable

Stability: Stable, but slowly polymerizes above 113°F (45°C) .

Corrosiveness: Avoid copper and its alloys and polyurethane.

Reactivity with Water: Reacts nonviolently with heat evolution to form carbon dioxide and insoluble polyureas that are relatively nontoxic and inert.

Reactivity with Other Chemicals: Reacts violently with amines, alcohols, and acids. Also reacts with aniline, ammonia, strong oxidizers, and bases.

IDENTIFICATION

Shipping Names: Toluene diisocyanate (USDOT and IMO)

Synonyms and Tradenames: 1,3-Diisocyanatomethylbenzene; isocyanic acid, methyl-m-phenylene ester or methylphenylene ester; diisocyanatotoluene; tolylene isocyanate; toluene-2,4-diisocyanate; 2,4-toluene diisocyanate; Hylene T; Mondur TDS; Nacconate 100; methylphenylene isocyanate; tolylene diisocyanate; TDI.

Chemical Formula: $2,4\text{-}CH_3C_6H_3(NCO)_2$

Constituent Components(% each): 99% total diisocyanate; may contain large fraction of similar 2,6-isomer.

UN/NA Designation: UN2078

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid or solid (solidifies at 68-72°F)

Color of the Shipped Material: Colorless to pale yellow

Odor Characteristics: Sweet, fruity, pungent; like chloroform

Common Uses: Mfg. polyurethane foams, plastics, paints, adhesives, and coatings.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

TOLUENE DIISOCYANATE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.049 ppm

Unusual Hazards: Highly toxic substance with special hazards.

Short Term Exposure Limits(STEL): 0.020 ppm for 15 minutes. (ACGIH)

Time Weighted Average(TLV-TWA): 0.005 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat or fire; contact with incompatible materials; entry to water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Although the product is of low volatility, even very low concentrations in air are capable of causing toxic effects. Some people may be sensitized such that any further exposure causes a severe reaction.

Hazards of Skin or Eye Contact: Prolonged contact of the skin with toluene diisocyanate may cause redness, swelling, and blistering with occasional skin sensitization. Contact with the eyes may result in severe irritation, pain, lacrimation, swelling of the lids, and mild damage to the corneal epithelium. Severe iridocyclitis, sensitivity to light, blepharospasm, and secondary glaucoma are also possible.

Hazards of Inhalation: Vapors of toluene diisocyanate cause irritation of the eyes, nose, and throat, a choking sensation, coughing, and chest pain. Concentrations above 0.5 ppm in air may cause pressure in the chest, bronchitis, severe bronchospasm, pulmonary edema, nausea, vomiting, and abdominal pain. Some effects may be delayed in onset. The respiratory system may be sensitized such that any further exposure causes a severe asthmatic reaction that may be delayed and could be fatal. Eye and nose irritation may occur at levels as low as 0.05-0.1 ppm in air.

Hazards of Ingestion: Ingestion may result in burns of the mouth and stomach. Oral toxicity is otherwise low.

FIRE HAZARDS

Lower Flammable Limit: 0.9%

Upper Flammable Limit: 9.5%

Behavior in Fire: Will burn but difficult to ignite. There is an uncertain possibility of violent container rupture in fires.

Hazardous Combustion Products: May include toxic cyanides, oxides of nitrogen, and other irritating gases. These products may actually pose less of an overall air pollution hazard at times than the unburned chemical.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors from hot liquid are ignited in a confined area. There is an uncertain possibility of violent container rupture in fires. Reaction with water may develop high pressures in sealed containers.

PROTECTIVE CLOTHING AND EQUIPMENT

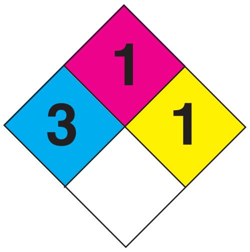
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Compatible materials may include butyl rubber, natural rubber, polyethylene, chlorinated polyethylene, and polyvinyl alcohol.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 0.020 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2078

TOLUENE DIISOCYANATE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, or respiratory system; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Note that water or foam may cause frothing.

Extinguishing Techniques: Unusual toxic vapor or fume hazard. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the special toxic hazards of toluene diisocyanate into account while planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Toluene diisocyanate spills may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to toluene diisocyanate vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of toluene diisocyanate from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TOLUENE DIISOCYANATE

Division 6.1 (Poisonous Material)

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere and react with toluene diisocyanate to form less hazardous products.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Toluene diisocyanate may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained toluene diisocyanate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Product may solidify and plug equipment.

MITIGATION

Use equipment compatible with spilled product. Use alternative method in cool weather.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TOLUENE DIISOCYANATE
Division 6.1 (Poisonous Material)

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance. (Note: Toluene diisocyanate may be reacted with water to form less toxic substances. Small amounts of isopropanol and ammonia speed the reaction. The chemical should be added to water. Exposure to the atmosphere should be minimized.)

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation of solid product may cause dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation from solid product.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. (Note: Toluene diisocyanate reacts with water to form relatively inert and nontoxic substances. There may be cases, however, when the chemical has not fully reacted before entering downstream water intakes.)

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water and form insoluble solid polyureas. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air and if the toluene diisocyanate has not fully reacted.

MITIGATION

Consult qualified experts for guidance.

September 2003

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

2,4-Toluylenediamine is a colorless to brown needle-shaped crystal or powder with a slight odor, possibly resembling ammonia. It is soluble in water as well as benzene, ethanol, acetone ether and aqueous sodium carbonate. It is a suspected human carcinogen and can be absorbed through the skin, thereby increasing exposure. Main routes of entry are inhalation of airborne dust or absorption through the skin. It is used as an intermediate in making polyurethanes and dyes and also as a dye for furs, textiles and hair. Although the substance is not itself flammable, it may support combustion and will produce poisonous gases in fire, including carbon monoxide and nitrogen oxides. It has a high melting point of 210°F at which point it transitions to the molten state. 2,4-Toluylenediamine reacts with acids, acid chlorides, acid anhydrides, chloroformates and strong oxidizing agents. Product oxidizes in air. It is stable under normal pressures and temperatures and will not polymerize. The product weighs approximately 8.7 pounds per gallon.

Initial downwind evacuation should be considered if a spill of 2,4-toluylenediamine is generating large amounts of dust or fumes. If container of 2,4-toluylenediamine is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) in all directions mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 50g/l
Solubility in Other Chemicals: Soluble in benzene, ethanol, acetone ether and aqueous sodium carbonate.
Specific Gravity (Liquid): 1.047 at 212°F (100°C)
Vapor Density: Unavailable
Boiling Point: 558°F (292°C)
Melting Point: 210°F (99°C)
Freezing Point: See melting point
Molecular Weight: 122.17
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): Unavailable
Vapor Pressure: 1 mm Hg at 107°F (42°C)
Flash Point: 300°F (149°C)
Autoignition Temperature: 689°F (365°C)
Burning Rate: Unavailable
Flammable Limits: Unavailable
Stability: Stable under normal temperatures and pressures
Polymerization Potential: Will not occur
pH: 9.5 to 10.5
Reactivity and Incompatibility: Reacts with acids, acid chlorides, acid anhydrides, chloroformates and strong oxidizing agents. Product oxidizes in air and is in molten state between 212°F and 302°F.

IDENTIFICATION

Shipping Name(s): 2,4-Toluylenediamine or 2,4-Toluenediamine (USDOT); 2,4-Toluylenediamine, liquid (IMO)
Synonyms and Tradenames: 2,4-Diaminotoluene; 1,3-Diamino-4-methylbenzene; 2,4-Diamino-1-methylbenzene; 2,4-Diamino-1-toluene; 2,4-Diaminotoluol; 3-Amino-p-toluidine; 4-Methyl-1,3-benzenediamine; 4-Methyl-m-phenylenediamine; 4-Methylphenylene-1,3-diamine; 5-Amino-o-toluidine; Azogen developer h; Benzofur mt; Diaminotoluene, 2,4-; C.I. 76035; C.I. oxidation base; C.I. oxidation base 20; C.I. oxidation base 200; C.I. oxidation base 35; Developer 14; Developer b; Developer db; Developer dbj; Developer mc; Developer mt; Developer mt-cf; Developer mtd; Developer t; Eucanine gb; Fouramine; Fouramine j; Fourrine 94; Fourrine m; MTD; Nako tmt; Pelagol grey j; Pelagol j; Pontamine developer tn; Renal md; Toluene-2,4-Diamine; Toluenediamine; Tolylene-2,4-diamine; Tertral g; Zoba gke; Zogen developer h
CAS Registry No.: 95-80-7
Chemical Formula: $C_7H_{10}N_2$
Constituent Components (% each): 98% or more pure
UN/NA Designation: UN1709
IMO Designation: 6.1, Toxic substances
RTECS Number: XS9625000
NFPA 704 Hazard Rating: 2 (Health): 0 (Flammability): 0 (Reactivity) (Estimated)
Physical Form as Shipped: Solid, flakes or crystals
Physical Form as Released: Solid, flakes or crystals
Color of the Shipped Material: Light brown flakes, may also be colorless
Odor Characteristics: Slight odor, possibly faintly like ammonia
Reportable Quantity: See appendix I
Common Uses: A hair, fur and textile dye ingredient; An intermediate in making polyurethanes and dyes.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Product is highly toxic and a suspected carcinogen. Toxic fumes of nitrogen oxides and carbon monoxide may be produced in a fire.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Dust generation; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: 2,4-Toluylenediamine is irritative to bodily tissues by all routes of exposure. Major hazard to public is inhalation of dust or vapors in air but ingestion and direct physical contact are also to be strictly avoided. Product is a suspected carcinogen.

Hazards of Skin or Eye Contact: Causes eye and skin irritation. May cause severe inflammation and edema of the eye and conjunctiva or deeper structures of the eye, inflammation of the eyelids, keratoconjunctivitis, corneal opacity, tearing or permanent blindness. May cause skin sensitization, allergic reaction, severe dermatitis or hives. If absorbed, may cause symptoms similar to those for ingestion. May cause a deep staining of the skin.

Hazards of Inhalation: Inhalation may cause asthma and shortness of breath or effects similar to those described for ingestion.

Hazards of Ingestion: Ingestion may cause irritation of the digestive tract, gastritis, methemoglobinemia, cyanosis (bluish discoloration of skin due to deficient oxygenation of the blood), convulsions, tremors, coma or death. Methemoglobinemia is characterized by dizziness, drowsiness, headache, breath shortness, cyanosis with bluish skin, rapid heart rate and chocolate-brown colored blood.

FIRE HAZARDS

Lower Flammable Limit: Unavailable

Upper Flammable Limit: Unavailable

Behavior in Fire: Material supports combustion. Containers may rupture violently in fire.

Hazardous Combustion Products: Nitrogen oxides, carbon monoxide, carbon dioxide and nitrogen.

EXPLOSION HAZARDS

Explosive Potential: Containers may rupture violently in fire. As with all organic dust material, there is a possibility of explosions from the airborne dust.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

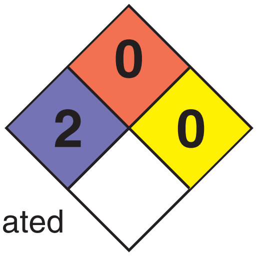
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or dust concentrations in air.

Respiratory Protection: Positive-pressure, self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister or a supplied-air respirator with eye protection may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are within the acceptable levels for their use. Protection provided by air purifying respirators is limited.

1709

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)



Estimated

FIRST AID

Nonspecific Symptoms: Irritation or sensitivity of any bodily tissues. May cause asthma or shortness of breath or discoloration of skin.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult, give oxygen. If breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Consult medical personnel regarding whether or not to induce vomiting. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Dry chemical, carbon dioxide, water spray, fog or regular foam.

Extinguishing Techniques: Secure ignition sources in the immediate spill area and down wind. Approach fire from upwind to avoid hazardous vapors, dust and toxic decomposition products. Avoid all bodily contact. Wear appropriate level of personal protective clothing and equipment. Wear chemical vapor protective clothing if contact with material or dense fumes/smoke anticipated. Use water to protect exposures or prevent containers from failing. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. Move container from fire area if no risk. Be alert to container rupture potential. Dike fire control water for proper disposal since it may contain toxic material.

SPILL RESPONSES

General Information: 2,4-Toluylenediamine is a highly toxic solid that may cause environmental contamination. Secure potential sources of heat, sparks, flame, impact, friction and electricity in the immediate spill area and downwind. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Prevent substance from entering sewers and waterways. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Runoff may be toxic. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . 2,4-Toluylenediamine may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed.

CONSEQUENCE

Hazardous levels of vapors in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind to unprotected personnel. Continually monitor for any conditions that would alter the situation.

TECHNIQUE

SHELTERING IN PLACE . . . Depending on the size, type and duration of the spill, it may be advisable to shelter in place instead of evacuation. This technique is best suited for spills that are of short duration and allows for emergency management personnel to plan and execute an evacuation strategy in the event that evacuation is needed. Persons in the spill area should be directed to seek the closest shelter that can be secured (close doors and windows and shut down HVAC systems) and preferably has communications devices, such as phones or TV's, to advise people when it is safe to leave the shelter.

CONSEQUENCE

Sheltered persons may need to be evacuated if conditions are no longer suitable to shelter in place.

MITIGATION

Stop spill or leak and remove the spilled product as soon as possible. Develop a plan to conduct a safe evacuation. Seek expert advice in planning an evacuation strategy.

TECHNIQUE

EVACUATION . . . If conditions are not suitable for sheltering in place, evacuate local and downwind areas to prevent exposure and to allow vapors or fumes to dissipate. Product may expose downwind areas to toxic concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

PROTECTION FROM THE WIND . . . If necessary, cover solid with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may absorb vapors, knockdown fumes and accelerate their dispersal in the atmosphere. Water should not be applied directly onto the product when using dispersing techniques.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)

TECHNIQUE

BURIAL . . . Under appropriate conditions, product may be temporarily buried under a sufficient layer of dry sand, earth or similar material to retard escape of dust or fumes.

CONSEQUENCE

An additional quantity of sand, earth or similar material will become contaminated.

MITIGATION

Consult qualified experts.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Product may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined material may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Apply this technique only to remove final traces of spilled product.

2,4-TOLUYLENEDIAMINE

Division 6.1 (Poisonous Materials)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TRICHLOROBENZENES, LIQUID

Division 6.1 (Poisonous Materials)

GENERAL INFORMATION

Trichlorobenzene is a colorless liquid with a sweet, chloroform-like odor. It is used as a carrier to apply dyes to polyester materials, a heat transfer medium, a degreaser, a solvent and a lubricant. It also functions as a termite pesticide and an aquatic herbicide. Trichlorobenzene is almost completely insoluble in water. Trichlorobenzene in many cases is a mixture of the 1,2,4 and 1,2,5 isomers, but can also include the 1,3,4 and 1,3,5 isomers. For the purposes of this guide the more common 1,2,4 isomer is predominately covered herein. The use of chlorinated hydrocarbon solvents, of which trichlorobenzene is one, is being phased out due to more stringent environmental standards. The lowest reported flash point of 222ºF indicates the product must be heated before ignition may occur. Trichlorobenzene evaporates slowly when exposed to air. There is a possibility that containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration. The product weighs approximately 12.1 pounds per gallon.

Trichlorobenzene is stable in normal transportation and is incompatible with acids, acid fumes and oxidizers. Sources do not report it having a reaction with water. Liquid product may solidify around 63ºF. The toxicity hazards of the product are considerable by all routes of exposure and primarily derive from the highly irritating nature of the substance. The products of combustion may include toxic and irritating constituents of carbon monoxide, hydrogen chloride, chlorine and other toxic vapors.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Almost completely insoluble (0.003%)
Solubility in Other Chemicals: Methanol.
Specific Gravity (Liquid): 1.45
Vapor Density: 6.26
Boiling Point: 416ºF (213ºC)
Melting Point: See freezing point
Freezing Point: 63ºF (17ºC)
Molecular Weight: 181.4
Heat of Combustion: Unavailable
Evaporation Rate (butyl acetate=1): Unavailable
Vapor Pressure: 1 mmHg
Flash Point: 222ºF (105ºC)
Autoignition Temperature: 1060ºF (571ºC)
Burning Rate: Unavailable
Flammable Limits: 2.5% (LEL) - 6.6% (UEL)
pH: Unavailable
Stability: Stable
Polymerization Potential: Will not occur.
Corrosiveness: None reported.
Reactivity with Water: No reaction reported.
Reactivity and Incompatibility: Acids, acid fumes, oxidizers.

IDENTIFICATION

Shipping Name(s): Trichlorobenzenes, liquid (USDOT & IMO)
Synonyms and Tradenames: 1,2,4-Trichlorobenzene; 1,2,3-Trichlorobenzene; unsym-Trichlorobenzene; 1,2,4-Trichlorobenzol; TCB.
CAS Registry No.: 120-82-1 (1,2,4-Trichlorobenzene); 87-61-6 (1,2,3-Trichlorobenzene)
Chemical Formula: $C_6H_3Cl_3$
Constituent Components (% each): Liquid is reported to be close to 100% pure with the variations being isomers of trichlorobenzene.
UN/NA Designation: UN2321
IMO Designation: 6.1, Toxic substances
RTECS Number: DC2100000
NFPA 704 Hazard Rating: 2(Health): 1(Flammability): 0(Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid; product may solidify around 63ºF
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet chloroform-like odor.
Reportable Quantity: See appendix I.
Common Uses: Used as a carrier to apply dyes to polyester materials, a heat transfer medium, a degreaser, a solvent and a lubricant. It also functions as a termite pesticide and an aquatic herbicide.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

TRICHLOROBENZENES, LIQUID

Division 6.1 (Poisonous Materials)

or

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.88-2.4 ppm; another source reports 3 ppm.
Unusual Hazards: Toxic to the environment.
Short Term Exposure Limit (STEL): Unavailable
Time Weighted Average (TLV-TWA): Unavailable
Ceiling (C) Limit: 5 ppm (40 mg/m^3)
IDLH: Unavailable
Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the immediate spill area and downwind. Direct contact and ingestion are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact with the skin may cause severe irritation or burns. Contact of the liquid with eyes has the potential to cause severe injury and burns.

Hazards of Inhalation: Inhalation may cause irritation of the respiratory tract (nose, throat, lungs) with symptoms of coughing, sneezing, and sore throat. Higher concentrations may cause shortness of breath, dullness, narcosis, and pulmonary edema.

Hazards of Ingestion: Ingestion may cause headache, severe gastrointestinal irritation, sore throat, abdominal pain, vomiting, central nervous system stimulation, liver and kidney damage, unconsciousness and possibly death.

FIRE HAZARDS

Lower Flammable Limit: 2.5%
Upper Flammable Limit: 6.6%
Behavior in Fire: The fire hazard is low due to its high flash point but exposure to fire conditions may cause it to ignite. Exposure of containers to fire or heat may result in container rupture.
Hazardous Combustion Products: Combustion can generate carbon monoxide, hydrogen chloride, chlorine and other toxic vapors.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPEMENT

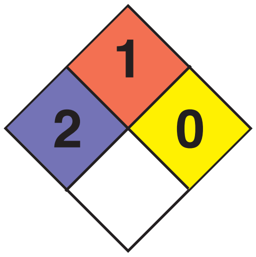
Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof and gas tight safety goggles, and other impervious and resistant clothing. Teflon® is reported to provide more than 8 hours of protection. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary in some cases according to some authorities to prevent contact with high vapor or fume concentrations in air.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece. For lesser concentrations, an air purifying respirator (APR) with organic vapor cartridge with a full facepiece within the use limitations of these devices.

2321

TRICHLOROBENZENES, LIQUID

Division 6.1 (Poisonous Materials)



FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues or eyes and other symptoms of exposure. Ingestion of a few ounces could be fatal to humans.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: In case of skin contact, remove contaminated clothing and wash skin with plenty of soap and water until all traces of material are gone. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with plenty of water for at least 15 minutes, while holding eyelids apart in order to rinse entire surface of eye and lids with water. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Do not attempt to make the victim vomit. Get medical attention immediately. (Note: Authorities disagree on whether or not vomiting should be induced, probably due to the possibility that aspiration into the lungs during vomiting may lead to pulmonary edema or other injury. Seek immediate medical advice on this issue where possible.)

FIRE RESPONSE

Extinguishing Agents: Water spray or fog, dry chemical, carbon dioxide, alcohol type concentrate foam.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to container rupture potential. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Use intrinsically safe tools and equipment where necessary. Note that liquid may solidify around 63ºF.

AIR RELEASE

TECHNIQUE

MONITOR THE SITUATION . . . The product may not produce large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed by product and container specialists.

CONSEQUENCE

Hazardous levels of product in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TRICHLOROBENZENES, LIQUID

Division 6.1 (Poisonous Materials)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vapors or fumes may knock down vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain a small amount (if any) of product from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL TYPE CONCENTRATE FOAM . . . There is a possibility that alcohol type concentrate foam applied to the surface of liquid pools may slow the release of vapors into the atmosphere. The fact that alcohol type concentrate foam is recommended for firefighting indicates it may have value in suppressing vapor evolution.

CONSEQUENCE

The effects of the foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain foam runoff and treat as hazardous waste.

TECHNIQUE

PROTECTION FROM THE WIND . . . If liquid has solidified, it may be advisable to cover solid product with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Decontaminate cover or treat as hazardous waste for disposal.

LAND SPILL

TECHNIQUE

CONFINEMENT DIKES . . . Trichlorobenzene may be confined by building dikes using soil, sand or other materials.

CONSEQUENCE

Confined product may percolate into soil or seep through dike material. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove or neutralize confined product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundmentsWhere possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of confined product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, confinement areas should be lined with suitable, impervious material to prevent penetration into soil.

TRICHLOROBENZENES, LIQUID
Division 6.1 (Poisonous Materials)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material confined in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded. (Note: Liquid may solidify around 63ºF.)

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of solution may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel. Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment. Continually monitor for presence of flammable vapors.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may spread contaminate.

MITIGATION

Excavate as last resort, unless adverse environmental impacts can be minimized.

TRICHLOROBENZENES, LIQUID

Division 6.1 (Poisonous Materials)

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottoms sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent material may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered absorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with the same amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and developing necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

October 1993

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

GENERAL INFORMATION

1,1,1-Trichloroethane is a colorless and moderately volatile liquid with an odor variably described as sweetish, mild, like chloroform or ether, and irritating at higher concentrations. It is practically insoluble in water and heavier, so may be expected to sink and then dissolve at very slow rates. Accumulations of vapors may flash or possibly explode if they encounter a suitable source of ignition in confined spaces such as buildings or sewers. The product weighs about 11.2 pounds per gallon. Commercial grades normally contain one or more inhibitors or stabilizers intended to reduce the potential for corrosion or hazardous reactions.

It is stable in normal transportation when in an undamaged closed container not overly exposed to heat or fire, but otherwise has several unusual characteristics and related hazards. The toxic hazard of the pure substance is generally low to moderate by direct contact and ingestion but very high via inhalation. Products of combustion or thermal decomposition are reported to include irritating, corrosive, toxic, and/or poisonous substances such as hydrogen chloride, hydrochloric acid, carbon monoxide, carbon dioxide, dichloroacetylene, chlorine, phosgene, and possibly other harmful substances.

Downwind evacuation or an alternative protective action should be considered based on the amount of material released, location, weather conditions, and whether or not the product is burning or thermally decomposing if 1,1,1-trichloroethane is leaking from its container. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, an evacuation radius of one-half (1/2) mile will be necessary just for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble.

Solubility in Other Chemicals: Soluble in acetone, benzene, carbon tetrachloride, chloroform, ether, ethanol, and methanol.

Specific Gravity (Liquid): 1.34 - 1.35 at 68°F (20°C).

Boiling Point: 159.8 - 177.8°F (71°C - 81°C).

Melting Point: - 27.4 - 22°F (-33 - 30°C).

Freezing Point: See melting point.

Molecular Weight: 133.41.

Heat of Combustion: - 1,745 cal/g.

Vapor Pressure: 100 mm Hg (1.933 psia) at 68°F (20°C); and 200 mm Hg (3.866 psia) at 97.2°F (36.2°C).

Flash Point: No flash point but can ignite under appropriate conditions of elevated temperature, elevated pressure, and/or presence of a high intensity source of ignition.

Autoignition Temperature: 932°F (500°C) or 999°F (537°C).

Burning Rate: 2.9 mm/minute (est.).

Stability: Stable in normal transportation. Can be decomposed by ultraviolet radiation (sunlight), contact with hot metals, and very high temperatures to form corrosive hydrogen chloride and/or hydrochloric acid, phosgene gas, and dichloroacetylene.

Corrosiveness: Uninhibited or unstabilized grades readily corrode and may react with aluminum and its alloys (see below) but the product may be used with aluminum and many other common materials when inhibited. One authority notes that any hydrogen chloride or hydrochloric acid formed by decomposition (see "Stability" above) or reaction may corrode some metals while evolving flammable and potentially explosive hydrogen gas. The liquid is reported to attack some forms of plastics, rubber, and coatings. Specifically recommended compatible materials include steel, stainless steel, and Teflon.

Reactivity with Water: Reacts slowly. Major end product is vinylidene chloride at 50°F (10°C) according to one source which also says that acetic acid and hydrochloric acid are formed at 77°F (25°C).

Reactivity with Other Chemicals: Highly shock-sensitive explosive materials may be formed by contact with nitrogen tetroxide, potassium or its alloys, potassium-sodium alloy, barium shavings, or lithium. Vapors may react violently with Co/Mo-alumina catalyst. Violent decomposition may occur if it contacts aluminum or its alloys with magnesium under appropriate conditions. A mixture with acetone and a base may possibly result in a highly exothermic reaction. Mixtures with sodium or caustics may form spontaneously flammable substances. Reported to react violently with strong oxidizers or strong caustics and as incompatible with amines, organometallic compounds, and metal hydrides. Reactions of halogenated organic materials such as 1,1,1-trichloroethane with cyanides, mercaptans or other organic sulfides typically generate heat, while those with mineral acids, amines, azo compounds, hydrazines, caustics or nitrides commonly evolve heat and toxic or flammable gases. Reactions with oxidizing mineral acids may generate heat, toxic gases and fires. Those with alkali or alkaline earth metals, certain other chemically active elemental metals like aluminum, zinc or magnesium, organic peroxides or hydroperoxides, or strong reducing agents typically result in heat generation and explosions and/or fires.

IDENTIFICATION

Shipping Names: 1,1,1-Trichloroethane.

Synonyms and Tradenames: Methylchloroform; methyltrichloromethane; polychloropinene; 1,1,1-TCE; alpha-trichloroethane; trichloroethane; trichloro-1,1,1-ethane; trichloromethylmethane; Aerothene or Chlorothene.

Chemical Formula: CH_3CC1_3.

Constituent Components (% each): 100% pure product is available but commercial grades normally contain inhibitors or stabilizers.

UN/NA Designation: UN2831.

IMO Designation: 6.1, poisonous material.

Physical State As Shipped: Liquid.

Physical State As Released: Liquid.

Color of the Shipped Material: Colorless.

Odor Characteristics: Sweetish; mild, like chloroform or ether.

Common Uses: Solvent and extractant; used to clean or degrease many items; used in textile-dyeing, as coolant and lubricant in metal-cutting oils, in aerosol propellants, as fungicide and space fumigant, and for making other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 16 -1200 ppm

Unusual Hazards: The ignition potential and burning characteristics of 1,1,1-trichloroethane are not fully predictable. Inhalation exposures have been associated with cases of "sudden death". See sections on Stability, Corrosiveness, Reactivity with Water, and Reactivity with Other Chemicals for many other unusual characteristics.

Short Term Exposure Limit (STEL): 450 ppm for 15 minutes (ACGIH, 1992 - 93; OSHA, 1989).

Time Weighted Average (TWA) Limit: 350 ppm over each 8 hours of a 40 hour work week (ACGIH, 1992 - 93; OSHA, 1989).

Conditions to Avoid: Heat, fire, strong sparks, hot metal surfaces, and welding arcs; contact with incompatible materials; exposure to ultraviolet radiation (sunlight); runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is clearly from the high concentrations of 1,1,1-trichloroethane vapors that may be present in air in the spill area and over very considerable distances downwind. Direct contact and ingestion should be avoided. There is a possibility, based on experience with similar chemicals, that people who ingest or have ingested alcohol may be at much greater risk of kidney and/or liver damage when exposed to this substance.

Hazards of Skin or Eye Contact: Vapors of 1,1,1-trichloroethane are reported to be slightly irritating to the eyes at concentrations on the order of about 500 ppm in air and above and may cause lacrimation. Contact of the liquid with the eyes is expected to cause slight irritation, pain, and possibly temporary and superficial corneal injury. Brief single exposures of the skin with liquid 1,1,1-trichloroethane may cause a slight prickling or mild burning sensation, mild irritation (if any), and temporary drying of the skin. Prolonged or repeated contact may result in drying, flaking, and cracking of the skin due to defatting action; it may also cause some degree of inflammation. Although the liquid can be absorbed through intact skin, the rate of absorption is so slow that a single skin exposure is not likely to result in absorption of harmful amounts. Do not wear contact lenses when working with this chemical.

Hazards of Inhalation: Vapors are irritating to the nose and throat. Eye irritation and headache are said to result from exposure to 500 ppm for 3 hours. Concentrations above 900 - 1,000 ppm can cause central nervous system depression and symptoms which are variably reported to include dizziness, drunkenness, headache, lightheadedness, drowsiness, fatigue, confusion, loss of equilibrium, vomiting, and incoordination. Concentrations on the order of 5,000 ppm and above may cause respiratory system depression, hypotension, difficult breathing, loss of consciousness and possibly death; they have also been associated with cardiac arrhythmias (irregular heartbeats). More specifically, exposures to 1,000 ppm for 15 - 20 minutes or 2,000 ppm for 5 minutes appear capable of causing lightheadedness, incoordination, and disturbance of equilibrium in the majority of adults. An exposure to 5,000 ppm for 5 minutes is reported as sufficient to cause marked incoordination and anesthesia; prolonged exposure to this level may cause coma and death according to at least one authority. Higher concentrations may cause these effects even sooner. A number of human deaths have been reported in confined spaces, some of which may have been "sudden deaths" due to cardiac sensitization to epinephrine and subsequent cardiac arrest. Autopsies have revealed congestion and edema of the lungs; some cases have involved abdominal pain, liver injury, and congestion of the liver, spleen, kidney and brain. There are also some reports of liver and kidney injury in humans from severe exposures. The NIOSH IDLH (1990) for the substance is 1,000 ppm. The saturated vapor concentration over a pool of liquid 1,1,1-trichloroethane is about 78,950 ppm at 49.1°F (9.5°C); 131,600 ppm at 68°F (20°C); and 263,150 ppm at 97.2°F (36.2°C).

Hazards of Ingestion: The single dose oral toxicity of 1,1,1-trichloroethane is low for most animals tested except dogs. Ingestion is reported to cause many of the symptoms of inhalation as well as irritation and a burning sensation in the mouth, throat and stomach, and severe gastrointestinal irritation characterized by nausea, vomiting and diarrhea, with deaths primarily occurring due to anesthesia in extreme cases. Single oral doses required to kill 50% of rats are in the range of 10.3 to 12.3 grams per kilogram of an animal's body weight. Aspiration into the lungs during vomiting may lead to rapid absorption through the lungs and result in injury to other bodily systems.

FIRE HAZARDS

Lower Flammable Limit: 6 - 10% (See info on flash point earlier).

Upper Flammable Limit: 10.5 -16% (See info on flash point earlier).

Behavior in Fire: Containers may rupture violently in a fire. When within flammable limits in air and upon encountering a suitable source of ignition under appropriate conditions, the vapors of 1,1,1-trichloroethane may ignite and possibly flash back to their source. An explosion or dangerous flash may occur when vapors in a confined space are exposed to a high-energy ignition source. Be advised that ignition will not result in sustained combustion under many circumstances.

Hazardous Combustion Products: Decomposition products at high temperatures or actual combustion products are variably reported to include hydrogen chloride, hydrochloric acid, carbon monoxide, carbon dioxide, dichloroacetylene, chlorine, phosgene, and possibly other highly toxic and/or irritating gases and fumes.

2831

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS *(CONTINUED)*
EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently in a fire. Contact with a variety of other chemicals may result in an explosion or formation of explosive substances. Contact of any hydrochloric acid formed by decomposition of the product or its slow reaction with water may generate flammable and potentially explosive hydrogen gas in contact with certain metals. See "Behavior in Fire" section above for potential vapor explosion hazards.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash- or vapor-proof safety goggles, and other impervious and resistant clothing as needed. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with fumes or smoke generated from burning or thermally decomposing quantities of 1,1,1-trichloroethane. Compatible materials for 1,1,1-trichloroethane itself may include polyvinyl alcohol, Silvershield, Viton/neoprene, and Viton according to one highly respected authority. Another expert source adds that Teflon or a combination of polyethylene and ethylene vinyl alcohol may be appropriate. One authority cautions that polyvinyl alcohol equipment should not be contacted with water. Be advised that many factors affect the suitability of a material for any given application.

Respiratory Protection: A self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

FIRST AID

Nonspecific Symptoms: Irritation of bodily tissues; dizziness, headache, drowsiness, confusion, incoordination, nausea, vomiting, diarrhea, or other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) If vomiting occurs, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Do not administer epinephrine (i.e., adrenalin) or other sympathomimetic drugs to severely exposed individuals unless absolutely necessary since this may possibly result in cardiac sensitization (i.e., myocardial irritability). Do not permit consumption of alcohol after an exposure.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention if irritation persists after washing.

First Aid for Ingestion: Get medical attention immediately. Do not attempt to make the victim vomit. If vomiting occurs naturally, have victim lean forward with head below hips to reduce risk of aspiration of fluids into lungs. Be advised that the danger from lung aspiration must be weighed against toxicity when considering emptying the stomach. See "First Aid for Inhalation" above for discussion of administration of sympathomimetic drugs. Do not permit consumption of alcohol after an exposure.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, water spray. Water may be ineffective.

Extinguishing Techniques: Potential corrosive vapor or fume hazard. Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective clothing if contact with concentrated combustion or thermal decomposition products is anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. If this is impossible, withdraw and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration or bulging of tank due to fire.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind and away from spill area. Avoid contact with spilled product. Eliminate ignition sources. Stop leak if safe to do so. Prevent substance from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

SPILL RESPONSES (CONTINUED)

proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage, rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Ground all equipment and transfer lines as necessary prior to use. Take the unusual flammability, stability, reactivity, and toxicity characteristics of the product into account when planning the response.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors and fumes to dissipate. 1,1,1-Trichloroethane discharges may expose downwind areas to toxic and potentially flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons. Various risks and problems commonly associated with evacuations.

MITIGATION

Stop leak if without risk and if proper equipment available. When evacuation is not judged to be a safe or viable option due to a lack of time or other factors, consider providing downwind populations with the appropriate instructions to seek shelter indoors. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance and advice where necessary.

TECHNIQUE

WATER FOG OR SPRAY.. . Water fog or spray applied to 1,1,1-trichloroethane vapors may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a very small amount (if any) of 1,1,1-trichloroethane and/or other chemicals from contact with its airborne vapors.

MITIGATION

Where deemed necessary, contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of 1,1,1-trichloroethane vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER COVERAGE . . . 1,1,1-Trichloroethane reacts very slowly with water, is heavier than water, and is practically insoluble therein. Gentle application of alight spray of water onto the surface of confined pools of the liquid may form a floating layer of water that reduces vapor emissions.

CONSEQUENCE

Addition of water will increase the volume of contained liquids.

MITIGATION

Contain spilled product and remove as soon as possible. Be alert to conditions that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Liquid 1,1,1-trichloroethane may be contained by building dikes or barriers using soil, sand or other materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCE

Contained liquids may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

LAND RESPONSES (CONTINUED)

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with 1,1,1-trichloroethane or its products of reaction with water may become damaged, develop leaks, and/or cause the initiation of a hazardous reaction. Any hydrochloric acid formed in reactions with water may corrode some metals while generating flammable and potentially explosive hydrogen gas.

MITIGATION

Use dry equipment compatible with the spilled product and other chemicals that may be encountered.

TECHNIQUE

ABSORPTION. . . Spreading of spilled product may be controlled by absorbing liquid with dry sand, earth, clay, fly ash, cement powder, vermiculite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce hazards in the event of afire.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and product residues may be removed by shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Any flammable gases or vapors present in the area may be ignited by motorized removal equipment under appropriate circumstances.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product (and its products or reaction with water where necessary). Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. 1,1,1-Trichloroethane reacts very slowly with water, is heavier than water, and is practically insoluble therein. It may be expected to sink to the bottom of a body of water and dissolve at a very slow rate.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for recovery.

1,1,1-TRICHLOROETHANE
Division 6.1 (Poisonous Material)

WATER SPILL *(CONTINUED)*

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Equipment incompatible with 1,1,1-trichloroethane or its products of reaction with water may become damaged, develop leaks, and/or initiate a hazardous reaction. Any hydrochloric acid formed in reactions with water may corrode some metals while generating flammable and potentially explosive hydrogen gas. Dredged or pumped materials brought to the surface may emit toxic and potentially flammable vapors if exposed to the open air.

MITIGATION

Use equipment compatible with the spilled product and other chemicals that may be encountered. Take appropriate precautions if gases or vapors may pose a fire or explosion hazard. Consult qualified experts for guidance.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards if it is found that significant quantities of acids are present in the water.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

March 1995

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)

GENERAL INFORMATION

Trichloroethylene is a somewhat volatile colorless liquid with an ethereal and sweet odor resembling chloroform. It is used as a solvent, refrigerant, heat exchange fluid, fumigant and disinfectant; for metal degreasing, dry cleaning and electronic part cleaning; and in several other processes and products. It is very slightly soluble in water and heavier, so may be expected to sink and dissolve at a very slow rate. It burns mildly and has a flash point of 90°F, but ignition typically requires high temperatures and a strong flame. Containers of liquid may rupture if exposed to fire or excessive heat for sufficient time duration due to increasing pressure. Vapors are somewhat heavier than air. The weight of the liquid is approximately 12.2 pounds per gallon.

Trichloroethylene is stable in normal transportation and does not react with water. Reactions with granular borium, lithium shavings, high pressure oxygen, sodium or potassium hydroxide, alkali or alkaline earth metals, certain other metals, peroxides, strong reducing agents, and mixtures of dilute hydrochloric acid and aluminum are potentially explosive, however, and the product otherwise reacts with a variety of chemicals. It is additionally considered incompatible with open flames, electrical arcs, aluminum, magnesium, titanium, and zinc. It is a moderately toxic substance, with certain exceptions, but may be present in fairly high concentrations in air. Products of combustion are toxic and irritating. Trichloroethylene has caused cancer in some laboratory animals after repeated or prolonged exposures.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.11 g/100 g water at 77°F (25°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, chloroform, ether, and common organic solvents.

Specific Gravity (Liquid): 1.464-1.466 at 68°F (20°C)

Boiling Point: 180.9°F (82.7°C) or 188.1-188.8°F (86.7-87.1°C) at 1 atm.

Melting Point: – 99.4°F (– 73°C) or – 123.5°F (– 86.4°C); reported values vary.

Freezing Point: See melting point

Molecular Weight: 131.4

Heat of Combustion: Unavailable

Vapor Pressure: 60 mm Hg (1.16 psia) at 68°F (20°C)

Flash Point: 90°F (32.2°C), closed cup reported; but practically nonflammable.

Autoignition Temperature: 770°F (410°C)

Burning Rate: Unavailable

Stability: Stable

Corrosiveness: May attack aluminum or zinc or their alloys when product is uninhibited or lightly inhibited. Listed as incompatible with magnesium and titanium.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with mixture of dilute hydrochloric acid and aluminum, granular barium, nitrogen tetroxide, lithium shavings, magnesium or titanium powder, high pressure oxygen, sodium or potassium hydroxide, caustics, mineral acids, amines, strong oxidizers or reducing agents, nitrides, azo or diazo compounds, hydrazines, cyanides, mercaptans, other organic sulfides, alkali or alkaline earth metals, and peroxides.

IDENTIFICATION

Shipping Names: Trichloroethylene (USDOT and IMO)

Synonyms and Tradenames: Acetylene trichloride; 1-chloro-2,2-dichloroethylene; 1,1-dichloro-2-chloroethylene; ethinyl trichloride; ethylene trichloride; TCE; trichloroethylene; trichloroethene; 1,1,2- or 1,2,2-trichloroethylene; sold under more than 50 tradenames.

Chemical Formula: $CHCl = CC1_2$

Constituent Components(% each): May contain small amounts of stabilizers to prevent decomposition.

UN/NA Designation: UN1710

IMO Designation: 6.1, poisonous substance

Physical State as Shipped: Liquid

Physical State as Released: Liquid

Color of the Shipped Material: Colorless, but may contain dye.

Odor Characteristics: Ethereal, sweet, solventy; like chloroform

Common Uses: Solvent; refrigerant and heat exchange fluid; fumigant and disinfectant; metal degreasing, dry cleaning, electronic part cleaning; mfg. of pharmaceuticals and other chemicals; textile processing; aerospace operations; anesthetic; etc

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800) 424-9300 OR (703) 527-3887 (COLLECT)

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 20 ppm or so appears likely

Unusual Hazards: Moderately toxic and volatile liquid.

Short Term Exposure Limits(STEL): 150 ppm for 15 minutes; 200 ppm proposed. (ACGIH)

Time Weighted Average(TLV-TWA): 50 ppm over each 8 hours of a 40 hour work week.(ACGIH)

Conditions to Avoid: Excessive heat, electrical arcs, sparks, and flames; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air. Ingestion and direct physical contact should also be avoided.

Hazards of Skin or Eye Contact: Liquid trichloroethylene is only mildly irritating to the skin if allowed to evaporate. Repeated or prolonged contact may cause roughness, chapping, erythema, and possibly secondary infection. Contact with the eyes may cause burns of the lids, conjunctiva and cornea, but effects are usually temporary.

Hazards of Inhalation: Vapors are irritating to the eyes, nose, and throat. Higher concentrations in air depress the central nervous system and may result in dizziness, weakness, fatigue, nausea, vomiting, headache, blurred vision, unconsciousness, and possibly death. Levels of 1000-1200 ppm in air cause lightheadedness and dizziness in 6 minutes. Alcohol consumption causes the skin of overexposed personnel to become flushed (i.e., reddish).

Hazards of Ingestion: Ingestion may result in gastrointestinal irritation, nausea, vomiting, and diarrhea. Victim may become drowsy or unconscious and exhibit other symptoms of inhalation. Aspiration into the lungs during vomiting may cause delayed chemical pneumonia with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 8%, but 12.5% also reported

Upper Flammable Limit: 10.5%, but 90% also reported

Behavior in Fire: Will burn but very difficult to ignite. Vapors are heavier than air. Containers may rupture violently in fire due to overpressurization. May generate significant quantities of gas or vapor upon release.

Hazardous Combustion Products: Hydrogen chloride, phosgene, carbon monoxide, various hydrocarbons, and possibly other toxic and irritating gases.

EXPLOSION HAZARDS

Lower Explosive Limit: 14.5% at 212°F (100°C)

Upper Explosive Limit:: 18.4% at 212°F (100°C)

Explosiveness: Stable, generally not explosive, but containers may rupture violently in fire due to overpressurization. Contact with certain other chemicals or substances may result in formation of explosive mixtures (see General Information section). There is a remote chance of explosion if vapors of warm liquid are ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

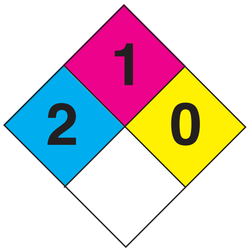
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high fume concentrations in air from decomposed product. Compatible materials may include Viton, chlorobutyl, and nitrile-butadiene rubber.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with an appropriate chin-style or front or back mounted canister within the use limitations of these devices.

1710

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, nose, throat, or skin; other symptoms of inhalation or ingestion.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.) Do not administer epinephrine (adrenalin) as there may be sensitization of the heart.

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact occurs or skin irritation persists after washing.

First Aid for Ingestion: Opinions vary as to whether vomiting should be induced. Contact a physician immediately for instructions and treatment. Keep victim warm and at rest.

FIRE RESPONSE

Extinguishing Materials: Dry chemical, carbon dioxide, foam, or water fog, if needed. Material burns with difficulty.

Extinguishing Techniques: Stay upwind. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with dense fumes/smoke from decomposed material is anticipated. Move container from fire area if no risk. Use water from side and from safe distance to keep fire exposed containers cool.

SPILL RESPONSES

General Information: Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from runoff. Eliminate ignition sources. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of trichloroethylene may result in rupture or explosion of boilers or industrial process equipment. Choose equipment, where possible that is not corroded or otherwise damaged by the spilled product.

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Trichloroethylene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the situation until the spilled product is removed, particularly for smaller spills or in cold weather.

CONSEQUENCE

Hazardous levels of trichloroethylene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Trichloroethylene spills may expose downwind areas to toxic concentrations over considerable distances in some cases, particularly if large amounts have spilled in warm weather.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to trichloroethylene vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of trichloroethylene from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of trichloroethylene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Trichloroethylene may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained trichloroethylene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Streams or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

TRICHLOROETHYLENE

Division 6.1 (Poisonous Material)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon or peat moss to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means. (Note: Dry bentonite clay and powdered dolomitic limestone may also be used for adsorption.)

CONSEQUENCE

Recovery of adsorbents may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

July, 1994

TRIFLUOROCHLOROETHYLENE, INHIBITED
Division 2.3 (Poison Gas)

GENERAL INFORMATION

Trifluorochloroethylene is a colorless and dangerously flammable gas which is shipped as a liquified, compressed gas. It has a faint ether-like odor and low boiling point. When liquids are released they will rapidly boil off, evolving substantial amounts of vapor. Vapors are heavier than air and are likely to concentrate in low lying areas or confined spaces. Vapors may travel a considerable distance to a source of ignition and flashback along the vapor trail. Trifluorochloroethylene is normally stable. However, it will react in the presence of oxygen or air to form unstable peroxides. These peroxides can initiate a rapid, possibly explosive decomposition reaction. Contact with oxygen or air should be avoided.

Trifluorochloroethylene is reported to produce systemic toxic effects specifically acting on the renal (kidney) and liver function. These effects may be delayed in onset. It also behaves as a simple asphyxiant by displacing air and thus, may cause suffocation. Contact with liquids may result in the freezing of exposed tissues.

Containers of trifluorochloroethylene in fire exposed situations may present a threat of violent rupture. Downwind evacuation should be considered to protect persons from exposure to leaking gas. If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for a radius of 1/2 mile. This is to protect personnel from flying debris in the event of a violent rupture. If a cylinder similarly is involved, evacuate for a radius of 1/3 mile to protect from flying debris. When working around trifluorochloroethylene, use only spark-proof tools or explosion-proof (intrinsically safe) equipment. Be alert to conditions which may produce static electrical discharges or other sources of ignition. Under certain conditions, where trifluorochloroethylene is contaminated with unsaturated hydrocarbons (such as ethylene), the reaction may produce shock sensitive products, increasing the risk of explosion.

Trifluorochloroethylene is used in the manufacture chlorofluorocarbon plastics. These plastics are used in a variety of products including gasket materials, electrical insulation, electronic components, and pipes.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Decomposes.
Solubility in Other Chemicals: Soluble in benzene.
Specific Gravity (Liquid): 1.54
Vapor Density (Air= 1): 4.02
Boiling Point: -26 to -28.4°C (-14.8 to -19.2°F)
Melting Point: -157.5°C (251.5°F)
Freezing Point: -157.5°C (251.5°F)
Molecular Weight: 116.47
Heat of Combustion: Unavailable.
Vapor Pressure: 3619 mmHg@ 21.1°C (70°F)
Flash Point: Gas.
Autoignition Temperature: Unavailable.
Burning Rate: Unavailable.
Stability: Normally stable but contact with oxygen or air may result in the formation of peroxides which could initiate an explosive decomposition reaction.
Corrosiveness: Not corrosive.
Reactivity with Water: Decomposes on contact with water. May form toxic carbonyl compounds.
Reactivity with Other Chemicals: May react explosively in the presence of oxidizing agents. Reacts, generating heat, with caustic solutions. Reacts with metals in the presence of water. Will form peroxides in the presence of air or oxygen which may initiate a violent decomposition reaction. Reacts with bromine and unsaturated hydrocarbons (eg. ethylene).

IDENTIFICATION

Shipping Names: Trifluorochloroethylene, inhibited.
Synonyms and Tradenames: 81113; 1-chloro-tirfluoroethylene; CFE; CTFE; 1-chloro-1,2,2-trifluoroethylene; daiflon; ethene, chlorotrifluoro-; ethylene, trifluorochloro; trithene, trifluorovinyl chloride; monochlorotrifluorethylene; CAS 79-38-9.
Chemical Formula: CF_2CFCl
Constituent Components (% each): 99% trifluorochloroethylene inhibited with 1 % tributylamine.
UN/NA Designation: LTN1082
IMO Designation: 2.1, flammable gas.
Physical State as Shipped: Liquefied gas under pressure.
Physical State as Released: Gas and low boiling point liquid.
Color of the Shipped Material: Colorless.
Odor Characteristics: Faint ether-like odor.
Common Uses: Intermediate in manufacture of trifluorochloroethylene resins which are in turn used in the manufacture of piping, gaskets, tank linings, electrical insulation and electronic components

.

TRIFLUOROCHLOROETHYLENE, INHIBITED
Division 2.3 (Poison Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: Trifluorochloroethylene is a dangerous fire risk. Vapors may be easily ignited by spark or static discharge. Ignition may proceed at an explosive rate. It is a liquefied, compressed gas and will produce substantial vapors upon release. It will react to form peroxides if exposed to oxygen or air which may initiate violent decomposition. Vapors may travel a considerable distance to an ignition source and flashback to the source. Systemic toxic effects have been reported affecting kidney and liver function. May behave as a simple asphyxiant.

Short Term Exposure Limits (STEL): Not Established.

Time Weighted Average (TLV-TWA): Not Established.

Conditions to Avoid: Contact with heat, fire, sparks, or incompatible materials; contact with peroxides; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Inhalation exposures may result in systemic effects targeting the liver and kidneys. It may also behave as a simple asphyxiant. May produce cardiac arrhythmia as do other chlorofluorocarbon gasses due to cardiac sensitization to adrenalin and norepinephrine. Contact with liquids may freeze tissue due to intense cryogenic action.

Hazards of Skin and Eye Contact: Skin and eye contact with liquid or escaping gasses will result in deep freezing of affected tissue. Defatting of tissues may also result at the point of contact. Symptoms will result in frostbite of exposed areas, numbness, and if not frostbitten, local irritation and redness caused by defatting of the exposed area.

Hazards of Inhalation: Exposure to high concentrations may cause dizziness, nausea, vomiting, loss of coordination, loss of consciousness, and ultimately death by asphyxiation. It is reported to produce systemic effects targeting the kidney and liver function, particularly in situations involving chronic exposures. Systemic effects may be delayed in onset. By analogy with other chlorofluorocarbons, may produce cardiac arrhythmia. May cause asphyxiation by displacing oxygen.

Hazards of Ingestion: Ingestion of trifluorochloroethylene is highly unlikely as it exists as a gas at normal atmospheric pressures and temperatures.

FIRE HAZARDS

Lower Flammable Limit: 8.4 - 16%

Upper Flammable Limit: 34 - 43.7 %

Behavior in Fire: Extremely flammable. May be ignited by static electrical discharges from transfer equipment or sparks from tools. Will produce a substantial volume of flammable vapors on release. Vapors are denser than air and may travel considerable distance to ignition source and flash back. Contact with strong oxidizers may produce fire. Sealed containers, exposed to heating, may rupture violently. May violently decompose after exposure to air or oxygen.

Hazardous Combustion Products: Includes unburned product, oxides or carbon, chlorides and fluorides, halogen acids, and carbonyl compounds.

EXPLOSION HAZARDS

Explosiveness: Forms peroxides on contact with air or oxygen. Peroxide formation may initiate violent decomposition. May ignite explosively. Containers may rupture violently and rocket if exposed to heat or flame impingement.

1082

TRIFLUOROCHLOROETHYLENE, INHIBITED
Division 2.3 (Poison Gas)

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Protective equipment should be chosen to prohibit direct contact with trifluorochloroethylene. Full eye protection with splash proof face shields or protective goggles, rubber boots and gloves, and impervious clothing are appropriate in situations where the threat of direct contact is low. Impervious outer garments should be thermally protective or worn with thermal protection underneath due to exposure to extremely cold liquids or escaping gas.

Respiratory Protection: Positive pressure self contained breathing apparatus or supplied air systems are recommended in fire situations or when dealing with spills. Cartridge respirators are not suitable as trifluorochloroethylene may displace air, creating an oxygen deficient atmosphere.

FIRST AID

Nonspecific Symptoms: May produce severe frostbite at the site of exposure to liquids or cold escaping gasses. May produce systemic effects to kidney and liver functions. May behave as a simple asphyxiant by displacing oxygen. Cardiac sensitizer and, in severe exposures, may produce arrhythmia.

First Aid For Inhalation: Remove victim to fresh air. Remove liquid contaminated clothing and keep victim warm. If liquid is involved, avoid direct contact due to the risk of exposure to extreme cold. Remove contaminated clothing after thawing. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. (Caution: Administration of mouth to mouth resuscitation may expose the first aid provider to chemical within the victims lungs or vomit). Be alert for signs of cardiac arrhythmia. Seek medical assistance immediately. (Note to physician: Monitor for possible effects on renal function. Epinephrine (adrenalin) is contraindicated due to cardiac sensitization.

First Aid For Skin and Eye Contact: May cause severe frostbite. Flush eyes immediately with clean, lukewarm, water for at least 15 minutes, occasionally lifting the eyelid. Seek medical assistance. Wash affected body areas with lukewarm water (do not use hot water or rub affected areas). Remove contaminated clothing after thawing. Seek medical assistance immediately.

First Aid for Ingestion: Ingestion of trifluorochloroethylene is highly unlikely as it is exists as a gas at normal atmospheric pressures and temperatures.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, water fog or spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact with trifluorochloroethylene. Wear self contained breathing apparatus and appropriate personal protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped or safely contained. Be alert that intact containers may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from direct flame impingement. Cool fire exposed containers, with water, from a safe distance and from the side of the container. For massive fires in cargo area, use unmanned hose holders or monitor nozzles. Withdraw immediately in case of rising sound from venting device or discoloration of cargo tank.

TRIFLUOROCHLOROETHYLENE, INHIBITED
Division 2.3 (Poison Gas)

SPILL RESPONSES

General Information: Trifluorochloroethylene is highly flammable and easily ignited. Response strategies should account for the fact that flammable vapors are heavier than air and may travel some distance to a source of ignition. Intact containers containing trifluorochloroethylene may rupture violently if exposed to extreme heat or fire. Eliminate ignition sources. If introduced into sewer system, notify sewer authorities. Ignition of trifluorochloroethylene may result in explosion. As a liquefied gas, spills of trifluorochloroethylene liquid will quickly evaporate, creating large volumes of flammable vapor. Use only spark proof tools when working around trifluorochloroethylene. Be sure lighting systems are of explosion proof design (intrinsically safe). Be alert to sources of ignition and static electrical discharge. Ground all transfer equipment to prevent static charge buildup.

AIR SPILL

TECHNIQUE

EVACUATION... Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Releases may expose downwind areas to flammable concentrations over considerable distances.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Seek expert assistance. Stop leak if without risk and if proper equipment and trained personnel are available. Allow vapors and gas to dissipate completely before reentering spill area without special protective gear.

TECHNIQUE

WATER FOG OR SPRAY... Water fog applied to trifluorochloroethylene vapors or fames may accelerate their dispersal in the atmosphere. Technique is not suitable for use in enclosed environments such as buildings or storage tanks.

CONSEQUENCE

Water runoff may contain toxic carbonyl compounds from reaction with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

Trifluorochloroethylene is a liquefied gas. If conditions are appropriate, liquid spills may auto-refrigerate and form liquid pools. In this state, pools will continue to boil releasing large amounts of vapor. Addition of water to such pools will increase the rate of boiling as water will add energy to the system. Liquid pools of trifluorochloroethylene will present a severe risk of frostbite due to extremely cold temperatures.

TECHNIQUE

CONTAINMENT DIKES... Spills of trifluorochloroethylene liquid on land may be contained by building dikes or barriers using soil, sand, or other materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled materials.

TRIFLUOROCHLOROETHYLENE, INHIBITED
Division 2.3 (Poison Gas)

LAND SPILL *(CONTINUED)*

CONSEQUENCE

Trifluorochloroethylene will continue to warm releasing flammable. and toxic vapors. This will continue to pose significant risks from fire and personnel exposures.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination and reduce gas generation. Seek expert assistance. Be alert to conditions, such as fire hose runoff or rainwater, which may mix with and warm liquid pools. Use water fog to control vapors.

TECHNIQUE

EXCAVATION... A trench or ditch may be excavated to intercept leaking trifluorochloroethylene.

CONSEQUENCE

Trifluorochloroethylene will continue to warm releasing flammable and toxic vapors. This will continue to pose significant risks from fire and personnel exposures. Deep excavations may increase the potential for contamination of groundwater in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove contained product as soon as possible to prevent spread of contamination. Seek expert assistance. Be alert to conditions, such as fire hose runoff or rainwater which may cause trenches to overflow, contaminate, and warm liquefied trifluorochloroethylene. Where possible, line containment areas with suitable, impervious material.

TECHNIQUE

PUMPINGNACUUM SUCTION... Accumulated trifluorochloroethylene pools may be recovered using appropriate hoses, pumps, and storage containers. Seek expert assistance.

CONSEQUENCE

Equipment which is incompatible with spilled product may become damaged. Contaminated trifluorochloroethylene may react violently or explosively during transfer. Static discharges can cause ignition. Mechanical equipment will become contaminated with removed product. Contaminated soil will likely remain after product removal is completed.

MITIGATION

GROUND ALL TRANSFER EQUIPMENT. Use only explosion proof (intrinsically safe) equipment constructed of compatible materials. Seek expert assistance. Plan for the removal of remaining contaminated soil after product is removed.

WATER SPILL

Trifluorochloroethylene is a gas and will not form spills in water unless gas is release from submerged tank. If released in a liquid form, it will react and boil-off rapidly evolving substantial vapors. Trifluorochloroethylene will react with water to decompose, forming toxic carbonyl compounds.

September 2003

1,1,1-TRIFLUOROETHANE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

1,1,1-Trifluoroethane is a common refrigerant gas, also known as Freon 143a and Refrigerant Gas 143a. It is a flammable, colorless, liquefied compressed gas having a slight ethereal sweetish odor. It is used as refrigerant, blowing agent and aerosol propellant. It is stable, although any source of ignition should be avoided. It is relatively insoluble in water and, as such, liquid spills on water will boil off rapidly with very small amounts dissolving. Contact with strong bases or alkaline materials may provoke violent reactions or explosions. All spills on land or water will evolve relatively large amounts of flammable gases or vapors that are heavier than air, may travel a considerable distance to a source of ignition and flash back and may persist in pits, hollows and depressions. Accumulations of gas in confined spaces such as buildings or sewers may result in explosions if ignited. The primary route of entry is inhalation of the vapors. 1,1,1-Trifluoroethane has no toxicity reported except that it may asphyxiate and cause frost-like burns of the skin or eyes from contact with liquid. Inhalation in moderate amounts may cause headaches, drowsiness and dizziness. Larger amounts may cause unconsciousness and death due to asphyxiation.

The explosive potential for 1,1,1-trifluoroethane is high. It will readily ignite from any source of ignition, including static electricity and friction from escaping gas. Explosive mixtures are formed with air. Products of combustion may include irritating and toxic fumes of carbon monoxide, carbonyl fluoride and hydrogen fluoride. Initial downwind evacuation should be considered for at least one-half (1/2) mile if product is leaking but not on fire. If container of 1,1,1-trifluoroethane is exposed to direct flame or a fire becomes uncontrollable, evacuate for one (1) mile in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble (0.05% at 77°F (25°C))
Solubility in Other Chemicals: Unavailable
Specific Gravity: 0.94
Vapor Density (Air=1): 2.9
Boiling Point: -53°F (-47°C)
Melting Point: -168°F (-111°C)
Freezing Point: See melting point
Molecular Weight: 84.04
Heat of Combustion: Unavailable
Vapor Pressure: 10,1000 mm Hg at 86°F (30°C)
Flash Point: -130°F (-90°C)
Autoignition Temperature: 1382°F (750°C)
Burning Rate: Unavailable
Flammable Limits: 7.1% (LEL) - 17% (UEL)
Stability: Stable. Avoid sparks or flame source that can cause ignition.
Polymerization Potential: Will not occur
Reactivity and Incompatibility: Contact with strong bases or alkaline materials may provoke violent reactions or explosions.

IDENTIFICATION

Shipping Name(s): 1,1,1-Trifluoroethane, compressed <or> Refrigerant gas 143a (USDOT); 1,1,1-Trifluoroethane (IMO)
Synonyms and Tradenames: Freon 143a; HFC-143a; Methylfluoroform; Refrigerant Gas 143a
CAS Registry No: 420-46-2
Chemical Formula: $C_2H_3F_3$
Constituent Components (% each): 99 - 100%
UN/NA Designation: UN2035
IMO Designation: 2.1, Flammable gases
RTECS Number: Unavailable
NFPA 704 Hazard Rating (Gas): 1 (Health): 4 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Compressed gas or liquid
Physical Form as Released: Gas or boiling liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Sweetish, ethereal odor
Common Uses: It is used as refrigerant, blowing agent and aerosol propellant.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

1,1,1-TRIFLUOROETHANE

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Highly flammable. Liquid form of 1,1,1-trifluoroethane can cause frost-like burns. Inhalation of large concentration of gas may cause dizziness, drowsiness and unconsciousness.

Short Term Exposure Limit (STEL): Unavailable

Time Weighted Average (TLV-TWA): Unavailable

Ceiling (C) Limit: Unavailable

IDLH: Unavailable

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity and incompatible materials.

HEALTH HAZARDS

Potential Health Hazards: 1,1,1-Trifluoroethane has no toxicity reported except that it may asphyxiate and cause frost-like burns with skin or eye contact.

Hazards of Skin or Eye Contact: Eye or skin contact with liquid can cause frostbite type injury due to rapid cooling from evaporation.

Hazards of Inhalation: Narcotic or anesthetic effects depend on the duration of exposure and vary from incoordination, headache, dizziness, periods of excitation, inability to see well, to anesthesia and eventual unconsciousness.

Hazards of Ingestion: Ingestion is unlikely due to physical properties of 1,1,1-trifluoroethane. Contact with the extremely cold liquid would, at the very least, cause frostbite of the mouth and throat.

FIRE HAZARDS

Lower Flammable Limit: 7.1%

Upper Flammable Limit: 17%

Behavior in Fire: Flammable gas. It will readily ignite if exposed to sources of heat and flame. Vapors may be heavier than air, may travel along the ground and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity and other potential ignition sources at locations distant from the point of release. Containers exposed to prolonged fire or heat may violently rupture.

Hazardous Decomposition Products: Products of combustion may include irritating and toxic fumes of carbon monoxide, carbonyl fluoride and hydrogen fluoride.

EXPLOSION HAZARDS

Explosive Potential: High. Severe explosion hazard when exposed to heat, flame, strong bases or alkaline materials. Explosive when mixed with air. Escaping gas may ignite spontaneously due to friction. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Containers exposed to prolonged fire or heat may violently rupture.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

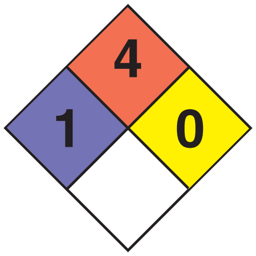
Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Always wear thermal protective clothing when handling refrigerated/cryogenic liquids.

Respiratory Protection: For unknown concentrations, fire fighting or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

2035

1,1,1-TRIFLUOROETHANE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Contact of liquid with skin or eyes may cause frost-like burns. Inhalation is the major route of exposure and can cause headache, drowsiness, dizziness and unconsciousness.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. If victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be administered. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

First Aid for Skin Contact: In case of skin contact with cold liquid, remove contaminated clothing and wash affected body areas with large amounts of warm water. Do not use hot water or rub frozen areas. Let circulation establish itself naturally. Encourage victim to exercise the affected part while it is being warmed. Use other means of warming such as wrapping effected area gently in blankets if warm water is not available. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, flush eyes with large amounts of water while lifting upper and lower eyelids frequently. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Ingestion is unlikely. If liquid is ingested, frostbite-like injury can occur. Drink warm water to relieve frostbite, but do not induce vomiting without medical supervision. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility.

FIRE RESPONSE

Extinguishing Agents: Stop the flow of gas. Use carbon dioxide, dry chemical or water spray (fog). A fine water spray or fog can be used on large discharges to control the fire by preventing its spread and absorbing some of its heat.

Extinguishing Techniques: Stay upwind. Secure ignition sources in the immediate spill area and downwind. Approach fire from upwind to avoid flammable vapors. Wear positive-pressure, self-contained breathing apparatus and appropriate protective clothing. Wear full chemical and/or thermal protective suit as necessary and appropriate. Move container from fire area if no risk. Do not extinguish fire unless flow can be stopped safely. If flames are extinguished, vapors may travel to distant sources of ignition and flash back or explosive re-ignition may occur. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to prolonged heat, such as from a direct flame. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors and to protect personnel. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from area and allow fire to burn out. Immediately withdraw in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to prolonged fire or heat may rupture violently, particularly the ends, and travel considerable distances. Dike fire control water for proper disposal since it may contain flammable gases.

1,1,1-TRIFLUOROETHANE
Division 2.1 (Flammable Gas)

SPILL RESPONSES

General Information: 1,1,1-Trifluoroethane is highly flammable. Eliminate all sources of ignition. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with very cold gas or liquid unless properly equipped for such contact. If transfer operations are anticipated, only use equipment specifically designed for use with the material being transferred and its temperature and pressure at the time of transfer. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof and non-sparking equipment to minimize the potential for ignition. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished safely. Water spray may be used to reduce the generation of vapors. Prevent substance from entering sewers, waterways and confined spaces. Runoff may be flammable. Note that accumulations of cold gas resulting from liquid spills may persist in pits, hollows and depressions. Use combustible gas detectors prior to entering any potentially affected confined space or any low area in which cold, heavier-than-air gases or vapors may have accumulated. Do not direct water at a venting safety device since this may cause icing to occur. Note that the rapid escape of gas under pressure may generate a static electricity charge that could cause gas ignition. Be advised that the very low temperatures associated with 1,1,1-trifluoroethane can cause many materials to become brittle and subject to sudden failure or cracking. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

AIR SPILL

TECHNIQUE

EVACUATION . . . As a general precaution, isolate the area for $^1/_2$ mile in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts and the available safe locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Consult qualified experts for assistance in isolating an area and handling an evacuation.

TECHNIQUE

WATER FOG OR SPRAY . . . Water sprays may be used to reduce vapors.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

MITIGATION

Contain contaminated water and remove or treat as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

1,1,1-TRIFLUOROETHANE

Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . If released to the soil, initially liquid will rapidly boil, generate a large amount of flammable vapors and freeze the ground it is in contact with. Much later, the liquid will reach a less rapid boiling rate thereby evolving less vapors. Containment dikes or barriers using soil, dry sand or other related, non-combustible materials may be effective to confine the spill to a limited area thereby reducing the surface area and volume of gas generated until liquid evaporates. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material.

CONSEQUENCE

Contained material will take longer to evaporate.

MITIGATION

Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater, which may overfill diked areas.

TECHNIQUE

EXCAVATION . . . Spills of material may be contained by building trenches or ditches. Reducing the spill surface area may decrease vapor generation.

CONSEQUENCE

Contained material will take longer to evaporate. Mechanical equipment could ignite material.

MITIGATION

Continually monitor for flammable conditions. Dig a deep pit with small area to reduce vapor generation rate. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill pits.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. Due to its relatively low boiling point, high pressures may develop very rapidly in recovery equipment at moderate to high ambient temperatures.

MITIGATION

Use compatible equipment of proper pressure capacity. Consider using a cold gas such as carbon dioxide or nitrogen to precool transfer lines and receiving containers to avoid high initial vaporization rates when equipment temperatures exceed the boiling point of the liquid to be recovered. Consult qualified experts as necessary for assistance.

TECHNIQUE

MECHANICAL REMOVAL . . . Most if not all the product will rapidly vaporize from soil surfaces once the bulk of the liquid has vaporized. Mechanical equipment can be used to grade frozen ground to eliminate any pockets of material.

CONSEQUENCE

Any flammable vapors present in the area may be ignited by motorized removal equipment.

MITIGATION

Continually monitor for flammable conditions.

1,1,1-TRIFLUOROETHANE

Division 2.1 (Flammable Gas)

WATER SPILL

Note: Liquid 1,1,1-trifluoroethane will boil or rapidly vaporize from the surface of a water body with very little dissolution, if any, in the majority of cases.

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake and monitor situation.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONFINEMENT DAMS . . . Water with spilled chemical may be confined (or diverted to impoundment area) by damming upper and/or lower bounds to limit volume of water affected and spread of contamination. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. Additional water may cause overflow of dammed area or water body boundaries.

MITIGATION

Reinforce or modify dams as necessary. Be alert for conditions that may lead to overflow, saturation or dam collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill confinement booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6-8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current are present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

January 1988

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

GENERAL INFORMATION

Trimethylamine is a colorless gas that may be shipped as a liquid under pressure (anhydrous) or as a volatile 25 - 40% solution in water (aqueous). It has a pungent, fishy, possibly ammoniacal odor and is used as a warning agent for natural gas and in disinfectants, flotation agents, insect attractants, plastics, and the making of other chemicals. It is moderately soluble in water and will quickly dissolve to form an alkaline solution. Flash points for the anhydrous material and the 25% solution are respectively 20°F and 38 - 42°F, thus indicating ease of ignition under a wide range of ambient temperature conditions. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers may rupture violently if exposed to fire or excessive heat for sufficient time duration. The anhydrous product weighs approximately 5.3 pounds per gallon.

Trimethylamine is stable in normal transportation and does not react with water or many common materials. Reactions with mercury may be explosive, however, and the product is otherwise reactive with a wide variety of chemicals. It is also corrosive to aluminum, copper and its alloys, galvanized metal, zinc alloys, and magnesium. Toxicity is relatively high by all routes of exposure. Products of combustion are also toxic, particularly if burning takes place under oxygen starved conditions.

Downwind evacuation should be considered if trimethylamine is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (1/2) mile for the anhydrous material and for a radius of one-third (1/3) mile for aqueous solutions for protection from flying debris if the container should rupture violently.

If the aqueous solution is leaking (not on fire) and generating vapors or fumes, downwind evacuation of the immediate spill area should be considered until properly equipped responders have evaluated the hazard.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Soluble, 41 g/100 g water at 66.2°F (19°C)

Solubility in Other Chemicals: Soluble in alcohol, benzene, chloroform, and ether.

Specific Gravity (Liquid): 0.632-0.636 at 68°F (20°C) for anhydrous

Boiling Point: 37.2°F (2.9°C) for anhydrous; 109°F (43°C) for 25% solution; both at 1 atm.

Melting Point: - 178.8 to - 179.1°F (- 117.1 to - 117.3°C) for anhydrous

Freezing Point: 43°F (6°C) for 25%; 39°F (4°C) for 40% solution

Molecular Weight: 59.11

Heat of Combustion: - 9810 cal/g

Vapor Pressure: 1.9 atm (27.9 psia) for anhydrous, 470 mm Hg (9.09 psia) for 40%, 346 mm Hg (6.69 psia) for 25% solution; all at 68°F (20°C)

Flash Point: 20°F (- 6.7°C), closed cup, for anhydrous; 42°F (6°C), closed cup, for 25% solution.

Autoignition Temperature: 374°F (190°C) for anhydrous

Burning Rate: 8 mm/minute for anhydrous

Stability: Stable

Corrosiveness: Corrosive to aluminum, copper and its alloys, galvanized metal, zinc alloys, and magnesium.

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with oxidizing agents, acids, aldehydes, halogenated organics, certain peroxides, isocyanates, epoxides, alkali and alkaline earth elemental metals, strong reducing agents, dithiocarbamates, mercury when ammonia is present, and nitrosating agents like nitrous acid, sodium nitrite, or nitrogen oxides.

IDENTIFICATION

Shipping Names: Trimethylamine, anhydrous (USDOT); trimethylamine, aqueous solution (USDOT); trimethylamine (IMO)

Synonyms and Tradenames: n,n-Dimethyl, methyl amine; methanamine, n,n-dimethyl; TMA.

Chemical Formula: $(CH_3)_3N$

Constituent Components(% each): 98.5% or more pure when anhydrous, or 25 - 40% solution in water, with traces of ammonia and other methyl amines.

49 STCC: 49 055 40 (anhydrous); 49 078 80 (solution).

UN/NA Designation: UN1083 (anhydrous); UN1297 (aqueous solution).

IMO Designation: 2.1 (anhydrous), flammable gas; 3.2 (solution), flammable liquid

Physical State as Shipped: Liquefied compressed gas (anhydrous) or liquid solution.

Physical State as Released: Gas, boiling liquid, or liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Fishy below 100 ppm; ammoniacal above 100 ppm

Common Uses: Warning agent for natural gas; flotation agent; insect attractant; mfg. of disinfectants, plastics, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

See UN/NA Designation for other ID numbers.

The number 3 will appear at the bottom for the aquous solution.

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.21 ppb

Unusual Hazards: Highly volatile, flammable and toxic substance with heavier than air vapors that may persist in pits, hollows, and depressions.

Short Term Exposure Limits (STEL): 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major health hazard is from inhalation of vapors which may be present at high concentrations in air. Ingestion and direct physical contact are also to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of liquid trimethylamine with the skin may cause severe skin burns while concentrated vapors may produce skin irritation and dermatitis. Contact of the liquid or concentrated vapors with the eyes may result in severe eye damage. The anhydrous liquid may also cause frostbite.

Hazards of Inhalation: *Low* levels in air are irritating to the eyes and respiratory tract. Higher levels (above 100 ppm) may also cause lung irritation with respiratory distress and cough. Severe exposures may result in chemical pneumonitis, pulmonary edema, and delayed scarring of the airway or other organs.

Hazards of Ingestion: Data unavailable, but minimally expect irritations or burns of the mouth, throat, and stomach. It may be possible that aspiration into the lungs during vomiting may cause pulmonary edema or chemical pneumonia with possibly severe consequences.

FIRE HAZARDS

Lower Flammable Limit: 2%

Upper Flammable Limit: 11.6%

Behavior in Fire: Flammable compressed gas or liquid. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Will generate large quantities of flammable and toxic gas or vapor upon release.

Hazardous Combustion Products: Carbon monoxide and nitrogen oxides with sufficient oxygen. Incomplete combustion may also produce hydrogen cyanide, nitriles, cyanic acid, nitrosamines, and other highly toxic substances.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Contact with mercury may in formation of explosive mixtures.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be advisable in some cases to prevent contact with high vapor or fume concentrations in air. Compatible materials may include chlorinated polyethylene.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent).

1083

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

FIRST AID

Nonspecific symptoms: Irritations or bums of any bodily tissues.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately. Control shock if present.

First Aid for Ingestion: If victim is conscious, administer 3 - 4 glasses *of* milk or water immediately. Do not attempt to make the victim vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Alcohol foam, carbon dioxide, dry chemical, water fog or spray. Water may be used in large amounts to dilute solutions below flammable limits.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to a pool of liquid anhydrous trimethylamine may increase vapor evolution for a time.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in rupture or explosion of boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the specific response that trimethylamine is highly volatile, flammable, toxic, and corrosive. Do not use equipment containing mercury. Beware of possible heavy vapor accumulations in pits or depressions.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Trimethylamine spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to trimethylamine vapors or fumes may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. If pools of anhydrous liquid are present, water spray should be applied at a point downwind of the spill and should probably not be allowed to contact the anhydrous liquid, as this may increase vapor evolution.

CONSEQUENCE

Water runoff may contain varying amounts of trimethylamine from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

DILUTION . . . The addition of a relatively large amount of water to liquid trimethylamine may slow the release of vapors into the atmosphere.

CONSEQUENCE

Addition of water will increase the volume of material requiring recovery. Vapor evolution may temporarily increase if liquid pools of anhydrous product are present.

MITIGATION

Contain spilled product and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Proceed with caution.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of trimethylamine vapors into the atmosphere. (Note: The fact that alcohol foam is recommended for fire fighting suggests it may also have value in suppressing vapor evolution.)

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. Application of foam to pools of anhydrous liquid may increase vapor evolution for a short time.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternative technique if the response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES. . . Trimethylamine may be contained by building dikes using soil, sand or other materials.

CONSEQUENCE

Contained trimethylamine may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks. High pressures may be developed in equipment if product is anhydrous liquid.

MITIGATION

Use equipment compatible with spilled product and of proper pressure capacity.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, saw dust, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TRIMETHYLAMINE
Division 2.1 (Flammable Gas) or Class 3 Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

August 1996

TRIPROPYLENE
Class 3 (Flammable Liquid)

GENERAL INFORMATION

Tripropylene is a colorless flammable liquid of the olefin family with a sharp penetrating odor used principally as a lubricant additive. Tripropylene is also used as a chemical intermediate in the manufacture of isodecyl alcohol, nonylphenol and tert-nonyl mercaptan. Tripropylene is manufactured from the polymerization of a C_3 petroleum stream containing 40-60% propylene in the presence of a phosphoric acid catalyst. Tripropylene may be irritating to the eyes, skin and respiratory tract. It is considered a central nervous system (CNS) depressant in high concentrations, and can produce anesthetic effects such as dizziness and suffocation. In poorly ventilated areas or confined spaces, unconsciousness and asphyxiation may result. It may be toxic if inhaled or absorbed through the skin for prolonged periods. The most common routes of exposure are through inhalation, skin and eye contact.

Vapors are heavier than air and may settle in low lying areas. Vapors may travel considerable distances to ignition sources and flash back. Normal structural firefighting protective clothing will only provide a limited level of personal protection for working in contaminated atmospheres. Runoff may be flammable and/or toxic. Tripropylene is not water soluble and will float on the surface of water. Empty containers containing product residue may present a flammability hazard and proper safety precautions should be followed.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble.
Solubility in Other Chemicals: Miscible with alcohol, ether and other organic solvents.
Specific Gravity (Liquid): 0.7 @ 20°C (68°F)
Vapor Density (Air=1): 4.3
Boiling Point: 132°C (270°F)
Melting Point: Unavailable.
Freezing Point: Unavailable.
Molecular Weight: 126.27
Heat of Combustion: -10,600 CAL/G.
Evaporation Rate: Unavailable.
Vapor Pressure: 8 mm Hg at 20°C (68°F)
Flash Point: 24°C (75°F)
Autoignition Temperature: Undetermined.
Flammable Limits: 0.7% (LEL) - 3.9% (UEL): Estimated.
Stability: Stable.
Polymerization Potential: Will not occur.
Reactivity and Incompatibility: Can react with strong oxidizing agents and acids.
Other Characteristics: Products evolved when subjected to heat or combustion include toxic levels of carbon monoxide, and irritating aldehydes and ketones.

IDENTIFICATION

Shipping Name(s): Tripropylene (USDOT & IMO)
Synonyms and Tradenames: Propylene Trimer, Nonene. CAS Registry No.: 27215-95-8.
Chemical Formula: C_9H_{18}
Molecular Formula: C_9H_{18}
UN/NA Designation: UN2057
IMO Designation: 3.2
RTECS Number: NIOSH/RA8550000
OHMTADS Number: Unavailable.
NFPA 704 Hazard Rating: 1 (Health): 3 (Flammability): 0 (Reactivity)
Physical Form as Shipped: Liquid
Physical Form as Released: Liquid
Color of the Shipped Material: Clear/colorless
Odor Characteristics: Sharp, penetrating odor
Common Uses: Tripropylene is used as a lubricant additive, and as a chemical intermediate in the manufacture of isodecyl alcohol, nonylphenol and tert-nonyl mercaptan.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

TRIPROPYLENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable.

Unusual Hazards: It is a central nervous system depressant and may act as an asphyxiant in some situations.

Time Weighted Average (TLV-TWA): 200 ppm.

Short Term Exposure Limit (STEL): Not established.

IDLH: Not established.

Conditions to Avoid: Heat, sparks, flame, impact, friction, static electricity, and incompatible materials such as oxidizing agents and acids.

HEALTH HAZARDS

Potential Health Effects: Tripropylene is an irritant to the skin, eyes and respiratory tract. It may be poisonous if inhaled or absorbed through the skin in high concentrations. Inhalation may cause mucous membrane irritation, cyanosis, headache, dizziness, confusion, and unconsciousness. It is a central nervous system (CNS) depressant. Individuals with pre-existing conditions of the central nervous system or lungs may have increased susceptibility to the toxicity of excessive exposures.

Hazards of Skin Contact: Skin contact may cause skin irritation with rash, redness, and burning. Prolonged exposures may lead to skin burns, blistering and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, swelling, tearing, conjunctivitis, corneal damage or blurred vision.

Inhalation Hazards: Inhalation may cause irritation to the upper respiratory passages and mucous membranes, dyspnea, pneumonitis, and pulmonary edema in high concentrations. Prolonged exposures can produce chemical pneumonitis and central nervous system (CNS) effects such as cyanosis, nausea, headache, dizziness, confusion, and loss of consciousness.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, vomiting, diarrhea, and abdominal pain. Aspiration may occur during swallowing or vomiting resulting in lung damage.

FIRE HAZARDS

Lower Flammable Limit: 0.7%

Upper Flammable Limit: 3.9%

Behavior in Fire: Tripropylene is a flammable liquid with significant fire potential. It will readily ignite and burn if exposed to sources or ignition, heat and flame. Vapors are heavier than air, will travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may be ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic.

Hazardous Decomposition Products: When heated to decomposition, material releases toxic levels of carbon monoxide and irritating aldehydes and ketones.

EXPLOSION HAZARDS

Explosive Potential: Moderate. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas where vapors can accumulate, since it may present a vapor explosion hazard.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

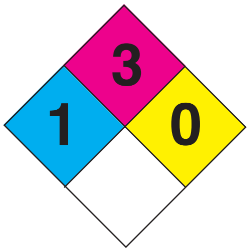
Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Chemical liquid splash protective clothing (EPA Level B Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are nitrile rubber, viton® and neoprene. Structural firefighting protective clothing will provide only a limited level of personal protection for this product. Where the potential threat of direct contact with the material is low, splash-proof face shields or protective goggles, rubber boots, and gloves may be worn.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations. NIOSH/MSHA approved air purifying respirators with an organic vapor cartridge or canister may be permissible under certain circumstances such as post-emergency clean-up operations and where airborne concentrations are expected to exceed exposure limits. Protection provided by air purifying respirators is limited.

2057

TRIPROPYLENE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Skin contact with the liquid may cause redness, swelling, burning, and dermatitis. Excessive exposures may cause temporary central nervous system (CNS) effects such as dizziness, drowsiness, nausea, headache, confusion, and loss of consciousness. Eye contact may cause redness, swelling, tearing, and blurred vision. Inhalation may cause irritation to the upper respiratory passages and mucous membranes with coughing and discomfort.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water for at least 15 minutes. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: Immediately give two (2) glasses of water if victim is conscious and can swallow, BUT DO NOT INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

Note to Physicians: Aspiration of this material during induced emesis may result in severe lung injury. If evacuation of the stomach is necessary, use method least likely to cause aspiration, such as gastric lavage after endotracheal intubation.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog), or foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, protect personnel, and dilute spills to form non-flammable mixtures. Solid streams of water may be ineffective. Use water in flooding quantities as fog. Fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may explode violently, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may be flammable and/or toxic.

SPILL RESPONSES

General Information: Tripropylene is a flammable liquid that may cause environmental contamination. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Secure all potential sources of ignition in the immediate area and downwind. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Non-sparking tools and explosion-proof equipment are recommended to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, storm drains and waterways. Do not flush spills because the material floats on water and may be carried off-site and spread fire. Overflow dams may be used to dike material since it does not mix with water and it is lighter than water. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered loosely. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential sources of ignition such as heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, storm drains, and waterways.

TECHNIQUE

MONITOR THE SITUATION...Based on its vapor pressure, tripropylene is expected to exist almost entirely in the gaseous phase if released into the atmosphere. Since its vapors are heavier than air, the highest concentrations of vapor will be located at ground level in low lying and enclosed areas. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Secure all potential ignition sources in the area. Evacuate the immediate area and downwind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used effectively to control the production of vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, storm drains, and waterways.

TECHNIQUE

FOAM...Aqueous Film Forming Foam (AFFF) or compatible hazardous materials foam agents applied to the surface of liquid pools may reduce the rate of vapor generation.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

TRIPROPYLENE
Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released to water, tripropylene is not expected to strongly adsorb. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion on the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is only slightly water soluble. Dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

Overflow dams may be used to confine the spill to a limited area until appropriate clean-up activities can be initiated. The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may be somewhat effective to recover spilled material since the material is not water soluble and will float on the surface. Barriers of suitable material may also be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Material may travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming may be effective since the material is not water soluble and will float on the surface of the water.

CONSEQUENCE

Material may travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TRIPROPYLENE
Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...If released into soil, tripropylene is not expected to strongly adsorb to soil, but will be expected to exhibit high mobility. It may be susceptible to volatilization from near surface soils based upon the predicted rapid volatilization rates from surface water and its relatively high vapor pressure. Spilled material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed.

CONSEQUENCE

Material is highly mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

January 1988

URANIUM HEXAFLUORIDE
Class 7 (Radioactive Material)

GENERAL INFORMATION

Uranium hexafluoride is a fairly volatile, colorless, white, or pale yellow radioactive solid that is shipped as a fissile material (containing more than 1.0 percent U-235) or as a material with low specific activity (containing 1.0 percent or less U-235). Radioactive materials emit certain rays that may be hazardous, but these shipments are generally of low radioactivity. Fissile materials, however, if improperly handled, may become critical. This means that if too large quantities of these materials are permitted in one place, a very rapid nuclear reaction may occur. This would not be explosive, but large amounts of radiation would be emitted suddenly and might injure nearby personnel. In case of trouble with such shipments, all unauthorized persons should be kept as far away as possible until qualified people with proper equipment can be obtained from the local or state radiological response team, the U.S. Department of Energy, or the shipper.

Note, however, that the primary hazard associated with uranium hexafluoride is its corrosivity.

Uranium hexafluoride reacts vigorously with water, alcohol, ether, and most metals and is a severely corrosive and toxic substance by all routes of exposure to people and animals when concentrated. The reaction with water or moisture in air forms $U0_2F_2$, hydrogen fluoride, and hydrofluoric acid. The latter substance is highly toxic and corrosive to glass, concrete, metals containing silica, natural rubber, leather, and many organic materials. Although uranium hexafluoride itself is not flammable, any hydrofluoric acid formed may generate flammable and potentially explosive hydrogen gas in contact with some metals.

Downwind evacuation should be considered if spilled uranium hexafluoride contacts water or moist air.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Reacts vigorously; see below.
Solubility in Other Chemicals: Soluble in liquid bromine, chlorine, carbon tetrachloride, symtetrachloroethane, and fluorocarbons.
Specific Gravity (Solid): 4.7 - 5.1 at 68 - 77°F (20 - 25°C)
Boiling Point: Sublimes; vapor pressure is 760 mm Hg at 132.3°F (55.7°C)
Melting Point: 148.1-148.6°F (64.5-64.8°C)
Freezing Point: See melting point
Molecular Weight: 352.07
Heat of Combustion: Not flammable
Vapor Pressure: 109 mm Hg (2.11 psia) at 68°F (20°C)
Flash Point: Not flammable
Autoignition Temperature: Not flammable
Burning Rate: Not flammable
Stability: See general information section.
Corrosiveness: Shipped in special steel cylinders. Any hydrofluoric acid formed is highly corrosive.
Reactivity with Water: Reacts vigorously to form uranyl fluoride ($U0_2F_2$) and hydrogen fluoride (hydrofluoric acid).
Reactivity with Other Chemicals: Reacts vigorously with alcohol, ether, and most metals. See guide for hydrofluoric acid for additional data.

IDENTIFICATION

Shipping Names: Uranium hexafluoride, fissile (USDOT); uranium hexafluoride, low specific activity (USDOT).
Synonyms and Tradenames: Uranium fluoride; uranium (VI) fluoride
Chemical Formula: UF_6
Constituent Components(% each): Fissile material has more than 1.0% U-235; low specific activity material has 1.0% or less U-235.
49 STCC: 49 274 90 (fissile); 49 264 90 (l.s.a.)
UN/NA Designation: UN2977 (fissile); UN2978 (l.s.a.)
IMO Designation: 7, radioactive substance
Physical State as Shipped: Crystalline solid
Physical State as Released: Crystalline solid
Color of the Shipped Material: Colorless, white, or pale yellow
Odor Characteristics: Unavailable
Common Uses: Used in gaseous diffusion process for separating isotopes of uranium.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

URANIUM HEXAFLUORIDE
Class 7 (Radioactive Material)

USDOT: Identification numbers
cannot be displayed on the placard
(49 CFR § 172.334).

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Unavailable

Unusual Hazards: Fairly volatile, radioactive, corrosive and toxic substance. Hydrofluoric (HF) acid fumes evolved in reactions with water or moisture in air are exceptionally hazardous.

Short Term Exposure Limits (STEL): 0.6 mg/m^3 as U (6 ppm for HF as F) for 15 minutes (ACGIH)

Time Weighted Average (TLV-TWA): 0.2 mg/m^3 as U (3 ppm for HF as F) over each 8 hours of a 40 hour work week. (ACGIH)

Conditions to Avoid: Heat, fire, and sparks; contact with incompatible materials; entry to sewers or water bodies; inhalation, ingestion, ox direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Uranium hexafluoride is highly corrosive. Inhalation of dust, vapors; or fumes in air, ingestion, and direct physical contact with any form of the substance are to be strictly avoided.

Hazards of Skin or Eye Contact: Contact of the skin with uranium hexafluoride may result in severe and painful hydrogen fluoride burns. Contact of the eyes with the solid or its vapors and fumes may cause severe injury and possibly blindness.

Hazards of Inhalation: Exposure to dust of the solid or its vapors and fumes in air may cause severe burns to the respiratory tract, may injure the kidneys, and may be fatal.

Hazards of Ingestion: Ingestion may result in internal hydrogen fluoride burns.

FIRE HAZARDS

Lower Flammable Limit: Not flammable

Upper Flammable Limit: Not flammable

Behavior in Fire: Containers may possibly explode or rupture in fire. May generate large quantities of corrosive vapors or fumes upon release. Finely divided solid may be pyrophoric.

Hazardous Combustion Products: Toxic and corrosive fumes may be generated in fires.

EXPLOSION HAZARDS

Lower Explosive Limit: Not flammable

Upper Explosive Limit: Not flammable

Explosiveness: Containers may possibly explode or rupture in fire. Any hydrogen gas evolved may explode if ignited in a confined area.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any possibility of skin or eye contact with the corrosive spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. Fully encapsulating suits with self-contained breathing apparatus (SCBA) may be necessary to prevent contact with high vapor or fume concentrations in air. All clothing should be acid resistant since the main hazard is corrosivity.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 2.5 mg/m^3 ppm), a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with chin-style or front or back mounted acid gas canister and a high efficiency particulate filter or an acid gas cartridge respirator with a full facepiece, acid gas cartridge(s), and a high efficiency particulate filter within the use limitations of these devices.

2977

URANIUM HEXAFLUORIDE
Class 7 (Radioactive Material)

See "UN/NA Designation" for other ID numbers.

FIRST AID

Nonspecific symptoms: Irritations or burns due to any route of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention immediately.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: As needed for surrounding fire. Note that water may increase evolution of hydrofluoric acid fumes.

Extinguishing Techniques: Corrosive vapor or fume hazard. Reacts with water. Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Wear full chemical protective suit if contact with material or dense fumes/smoke anticipated. Move container from fire area if no risk. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. Use unmanned hose holder or monitor nozzle. Note that addition of water to any spilled product may cause a vigorous reaction.

SPILL RESPONSES

General Information: May be best to delay cleanup until arrival or instruction of qualified radiological response team. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Prevent product from entering sewers or confined spaces. Protect sewers and waterways from contaminated runoff. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account while planning the response that uranium hexafluoride is highly toxic and corrosive, that contact with water may evolve hydrofluoric acid in a vigorous reaction, and that this corrosive acid may generate hydrogen gas in contact with some metals. Use explosion-proof and spark-proof equipment where necessary.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow airborne contaminants to dissipate. Uranium hexafluoride spills may expose downwind areas to toxic concentrations over considerable distances, particularly if there is contact of the product with water or moist air.

CONSEQUENCE

Avoidance of exposure. Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow dusts ,fumes, and vapors to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

URANIUM HEXAFLUORIDE
Class 7 (Radioactive Material)

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid uranium hexafluoride with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY. . . Water fog or spray applied to uranium hexafluoride vaporsfumes, or dusts may absorb vapors, knockdown fumes, and accelerate their dispersal in the atmosphere. Apply water at a point downwind of the spill. Do not allow water to contact spilled product on ground.

CONSEQUENCE

Water runoff may contain various chemicals.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Uranium hexafluoride may be contained by building dikes using dry earth, soil, sand or other materials.

CONSEQUENCE

Liquid solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. Reinforce diked walls as needed. Keep spilled solid as dry as possible.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product.

TECHNIQUE

NEUTRALIZATION . . . Application of an appropriate neutralization agent may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents involves additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques.

URANIUM HEXAFLUORIDE
Class 7 (Radioactive Material)

TECHNIQUE

MECHANICAL REMOVAL... Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers, and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Excessive agitation may cause toxic dust to become airborne.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Organize work to minimize dust generation.

WATER SPILL

TECHNIQUE'

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES. . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

NEUTRALIZATION . . . Application of a suitable neutralization agent to the contaminated water may reduce environmental hazards.

CONSEQUENCE

Some neutralizing agents are themselves hazardous and must be handled with care. Improper application may lead to increased damage or harm.

MITIGATION

Consult qualified experts for safe neutralizing techniques. Consider treating water via a processing system constructed on land.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier- than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic vapors if exposed to the open air.

MITIGATION

Consult qualified experts for guidance.

January 1991

UREA
Non-Regulated

GENERAL INFORMATION

Urea is not designated as a hazardous material in transportation but nevertheless has potential to cause injury and/or environmental pollution if improperly handled. It is consistently ranked among the top 15 chemicals produced in the United States and may therefore be encountered comparatively frequently in transportation or other accidents resulting in a chemical discharge.

Urea is usually shipped as solid white crystals, powders, prills or pellets, or as clear liquid water solutions containing 50 to 80% urea by weight. It is essentially odorless but may develop a slight odor of ammonia upon long standing, especially in the presence of moisture or humid air. The product is used as a fertilizer and animal feed ingredient, for making plastics, glues, pharmaceuticals and other products, as a stabilizer in explosives, and for separation of hydrocarbons. Solid forms are soluble in water and heavier; solutions will mix freely with water in all proportions.

The flammability hazard of solid urea is not defined as well as might be desired. The product does not meet shipping criteria for designation as a combustible or flammable material and is clearly not flammable under most conditions. This is reflected by the fact that the majority of data sources list the product as nonflammable. There are indications, however, that urea dust will burn under certain circumstances. At least one authority claims that the dust (presumably dispersed in air) can explode if ignited, especially if heated, while another claims this is unlikely. It appears that a possibility exists for well-sealed containers of the solid to rupture if exposed to excessive heat due to the generation and buildup of gases resulting from thermal decomposition of the product. Similarly, excessive heat may possibly have the potential to cause sealed containers of solutions to rupture due to excessive steam pressure.

Urea does not react with water or other common materials and is stable in normal transportation, though the solid will absorb moisture from the atmosphere if exposed to humid air. Reactions with a variety of other chemicals, however, are known to be explosive or otherwise violent. Toxicity of the product is generally low by all routes of exposure but products of thermal decomposition and/or combustion include several that are highly toxic and may provide cause for consideration of a downwind evacuation or alternative protective action if evolved into the atmosphere.

Due to various factors, the data and information found for this substance, although considerable in volume, contained numerous inconsistencies and shortcomings. It should not be expected that each and every item of information presented below is completely accurate.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Approx 78 g/100 g water at 41°F (5°C); 112.4 g/100 g water at 68°F (20°C); 119.3 g/100 g water at 77°F (25°C); solutions of urea in water are soluble in all proportions.

Solubility in Other Chemicals: Soluble in acetic acid, alcohol, benzene, glycerol, hydrochloric acid, and pyrimidine.

Specific Gravity: 1.323 - 1.340 for solid urea; 1.147 for saturated solution; 1.145 for 50% water solution; 1.054 for 20%; 1.027 for 10%; all at 68°F (20°C).

Boiling Point: Both the solid and even apparently water solutions decompose upon heating prior to boiling; see melting point.

Melting Point: Solid melts at about 270.9 °F (132.7°C). Higher temperatures or combustion may produce carbon monoxide, carbon dioxide, toxic oxides of nitrogen and possibly highly toxic hydrogen cyanide according to some sources.

Freezing Point: See melting point

Molecular Weight: 60.06

Heat of Combustion: -2174 cal/g

Vapor Pressure: Essentially zero for pure urea at 68°F (20°C) in the absence of conditions which cause evolution of ammonia gas.

Flash Point: Not applicable

Autoignition Temperature: Not available

Burning Rate: Not applicable

Stability: Stable in normal transportation.

Corrosiveness: Reported only to cause deterioration of unplasticized polyvinyl chloride (PVC) upon long-term use.

Reactivity with Water: No reaction. The pH of a 10% water solution is 7.2, which is close to neutral.

Reactivity with Other Chemicals: Urea reacts with calcium hypochlorite or sodium hypochlorite to form nitrogen trichloride which may explode spontaneously in air; mixtures with sodium nitrite may explode; mixtures with nitric acid may explode when heated; mixtures with chromyl chloride or nitrosyl perchlorate are reported to ignite; may form explosive mixtures subject to spontaneous detonation when contaminated with strong acids (e.g., nitric acid or perchloric acid) or nitrate fertilizers.

IDENTIFICATION

Shipping Names: No particular name is standard but "Chemicals, n.e.c. (non-regulated)" is one possibility. The shipper may or may not provide the specific chemical name of the product.

Synonyms and Tradenames: Amide of carbonic acid; carbamide; carbonyldiamide; carbonyldiamine; carbamimidic acid; isourea; and numerous tradenames.

Chemical Formula: NH_2CONH_2

Constituent Components (% each): Several grades of solid urea are available; most are likely to be 95% or more pure. Solutions in water typically contain 50 to 80% urea by weight.

28 STCC: 28 181 70 (for urea, other than liquor or liquid); 28 181 46 (for urea liquor or urea liquid)

UN/NA Designation: Not established

IMO Designation: Not established

Physical State As Shipped: Solid crystals, powders, prills, or pellets; liquid solutions in water

Physical State As Released: Same as shipped

Color of the Shipped Material: White solid or clear liquid

Odor Characteristics: Urea is essentially odorless but may develop a slight odor of ammonia upon long standing, especially in the presence of moisture or humid air.

Common Uses: Fertilizer; animal feed ingredient; making of resins, plastics, glues, solvents, cosmetics, dentrifrices, flameproofing agents, paper coatings, pharmaceuticals, and other chemicals.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

UREA
Non-Regulated

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: Odorless unless conditions are appropriate for evolution of ammonia gas; any formaldehyde present as an impurity may potentially produce an odor. See the separate Emergency Action Guides provided for these substances for further details.

Unusual Hazards: Reactions with a number of relatively common chemicals in commerce can result in fire, explosion, or other violent action. Solid urea becomes quite slippery when wet.

Short Term Exposure Limit (STEL): Not established

Time Weighted Average (TWA) Limits: 10 mg/ml (total dust) over each 8 hours of a 40 hour work week (ACGIH TLV, 1990 - 91); 15 mg/m^3 (as total dust) and 5 mg/m^3 (as respirable fraction) under similar circumstances (OSHA PEL, 1989); all as exposure limits for "nuisance dusts".

Conditions to Avoid: Generation of airborne dust or mist; contact with incompatible materials; entry or runoff to sewers or water bodies; inhalation, ingestion or direct physical contact; excessive heat or contamination of any kind.

HEALTH HAZARDS

Public Health Hazards: Opinions of various authorities range from "no real hazard" to "moderately toxic by inhalation and contact". Note that urea is a natural product of human protein metabolism and is a major component of urine. Adult male humans excrete about 30 grams of urea per day. The primary hazard of the product is the irritation it may cause to bodily tissues under appropriate circumstances. Toxic products of combustion or thermal decomposition are likely to be of far greater concern if generated.

Hazards of Skin or Eye Contact: Prolonged or repeated contact of the skin with solid urea may result in mild redness, rash, itching, and/or inflammation; contact with the heated material can cause thermal burns. Animal experiments with ointments containing 10 20 and 40% urea by weight somewhat suggest that water solutions of urea are unlikely to cause significant irritation of the skin. One reference reports that urea may cause allergic skin reactions in some individuals, but it appears this is mostly a problem with prills of urea containing a urea-formaldehyde binder that may sensitize some people and cause allergic reactions in subsequent exposures. Exposure to urea does, however, have the potential to increase the probability of skin sensitization to epoxy resins if these should be encountered. The dust of urea is irritating to the eyes but damaging only at high concentrations or with extended exposure. Unspecified but apparently high concentrations of solid urea dust or powder placed in the eye have been shown to cause corneal opacification (clouding) that has required up to several weeks to clear. Exposure of the eyes to saturated urea solutions may cause loss of the corneal epithelium after several minutes contact and produce moderate grayness of the stroma with subsequently slow but apparently complete regrowth of the membrane. Drops of 10% urea solutions in the eye do not cause eye irritation or discomfort. It is recommended by more than one maker of the product that contact lenses not be worn when working with this chemical.

Hazards of Inhalation: High levels of urea dust or mist in air are reported to cause irritation of the nose, throat, and respiratory tract with effects including sore throat, sneezing or coughing, and shortness of breath. Asthmatics exposed to the dust (and presumably mists) may have difficultly in breathing. Exposure to high concentrations of urea in air in long-term occupational exposures has been reported to cause emphysema.

Hazards of Ingestion: Urea is reported to be of low oral toxicity. Ingestion of significant quantities of the product may result in sore throat and gastrointestinal disturbances such as irritation, nausea, vomiting, cramps, abdominal pain, and diarrhea. Relatively large quantities may be fatal. The oral LD50 for rats, the single dose that proves fatal to 50% of the animals, has been reported to range from 8.5 to 15 g/kg of body weight; that for sheep and goats is in the range of 300 to 600 mg/kg in single oral doses but it has been reported that ruminant animals develop tolerance to urea when fed gradually increasing doses.

FIRE HAZARDS

Lower Flammable Limit: Unavailable
Upper Flammable Limit: Unavailable

Behavior in Fire: Urea does not meet shipping criteria for designation as a combustible or flammable material and is clearly not flammable under most conditions. Most data sources list the product as not flammable. One major authority reports, however, that urea dust will burn but will probably not explode (presumably if dispersed in a cloud of dust) while another reports that the dust can indeed be an explosion hazard, especially if heated. Although the hazard is not reported in the literature, it is conjectured that exposure of well-sealed containers to excessive heat may possibly cause decomposition of the solid product and generation of sufficient chemical gases and/or steam pressure (in the case of solutions) to cause rupture of the container. The rupture may take place with violence if the container is of strong construction (such as a metal drum). The solid product will melt and decompose at high temperatures; solutions are also subject to decomposition.

Hazardous Combustion Products: Most authorities report that decomposition of urea at temperatures at or above about 275°F results in generation of ammonia, biuret, and cyanuric acid. One adds that ammelide and triuret may also be formed. Higher temperatures or combustion may produce carbon monoxide, carbon dioxide, highly toxic oxides of nitrogen, and possibly highly toxic hydrogen cyanide gases according to some sources. Data on this topic are not entirely consistent. Little information is available on the toxicity of several of the more unusual products of decomposition and/or combustion.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable
Upper Explosive Limit: Unavailable

Explosiveness: Urea may explode in contact with various other chemicals. Authorities appear to disagree as to whether urea dust poses an explosion hazard, presumably when dispersed in air. Be advised there is a possibility it may be explosive, especially when heated. See Behavior in Fire section directly above for a discussion of container rupture potential.

UREA
Non-Regulated

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of eye contact and repeated or prolonged skin contact with the spilled product. This may include rubber boots, gloves, face shields, tight-fitting dust or splash-proof safety goggles as needed, and other appropriate protective clothing such as coveralls, aprons, long-sleeved shirts, and so forth. Compatible materials may include natural rubber, neoprene, nitrile rubber, polyvinyl chloride, and nitrile rubber/polyvinyl chloride according to one prominent authority. See the section on "Corrosiveness" also. Be advised that urea solutions can degrade leather.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations of dusts or mists in air, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For other conditions in which exposures may occur, a NIOSH approved dust or mist respirator appropriate for the airborne contaminant levels present within the use limitations of these devices. Note that no protection may be necessary if the product has spilled in a non-fire situation and dusts or mists have not become airborne.

FIRST AID

Nonspecific symptoms: Irritation of any bodily tissues; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water or soap and water. Get medical attention if eye or skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer large quantities of water immediately. Do not attempt to make the victim vomit. Get medical attention immediately. If vomiting occurs naturally, have victim lean forward to reduce risk of aspiration into the lungs and then repeat administration of water.

FIRE RESPONSE

Extinguishing Materials: Most fire extinguishing agents may be used in fires involving urea according to various authorities.

Extinguishing Techniques: Stay upwind. Avoid bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Use professional judgment to decide if sealed metal drums or other containers or tanks exposed to excessive heat or fire should be kept cool via use of water sprays to avoid the possibility of container rupture due to buildup and pressurization of gases or steam in the container. If deemed necessary, use water from side and from safe distance to keep containers cool until well after fire is out. For a massive fire in the cargo area under these circumstances, it may be prudent to use unmanned hose holders or monitor nozzles. In any case, stay away from ends of tanks involved in fire (especially of solutions), but realize that shrapnel may travel in any direction. See earlier discussions about the decomposition of urea at elevated temperatures.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel away from spill area. Avoid contact with spilled product. Eliminate ignition sources to be safe, including sources of sparks where significant concentrations of urea dust may be airborne. Stop discharge if safe to do so. Prevent substance from entering sewers and water bodies. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage or other hazard to boilers or industrial process equipment. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Keep the solid product dry if practical to avoid spread of contamination. It may be advisable to keep the solid product in tightly closed containers to avoid absorption of water from the atmosphere.

Consult environmental authorities for advice with respect to disposal options and the need to apply the individual land and water spill containment and cleanup techniques described below. Urea will not present a significant environmental hazard in some cases, particularly if it is sufficiently diluted. Many grades of the solid and its solutions are widely used or are suitable for use as agricultural fertilizers and may either be recovered or simply spread out over soil at suitable rates (e.g., 200 to 400 kg/ha; 180 to 360 lb/acre) when conditions are appropriate. Similarly, routing of solutions to a sewage plant after further dilution may be appropriate at times. Be advised, however, that urea can be toxic to fish when present in water in relatively high concentrations. Any ammonia in the product can be toxic to fish at very low concentrations. As a fertilizer, urea can abet eutrophication of water bodies since it is a source of nitrogen in water. Concentrations in the range of 1 to 15 ppm of the product were found to completely degrade to ammonia and carbon dioxide, and eventually nitrate, in about 4 to 6 days in river water in one experimental observation at a temperature of 68°F (20°C); degradation rates were negligible when the water temperature was less than about 46°F (8°C). The product will degrade in standard sewage plants at rates dependent on temperature of the water, with higher temperatures enhancing degradation. Urea is typically found in domestic sewage in concentrations of 2 to 6 ppm. The product can be tasted in water in concentrations as low as 3 ppm.

UREA
Non-Regulated

AIR SPILL

TECHNIQUE

MONITOR THE SITUATION . . . Urea and its solutions in water will not evolve significant amounts of hazardous airborne contaminants in most non-fire spill situations. It may be advisable in many cases to simply monitor the situation until the spilled product is removed. (Note: In order to pose a significant downwind inhalation hazard, large quantities of urea dusts or mists must somehow become airborne; conditions must be appropriate to generate significant quantities of ammonia gas; and/or toxic products of thermal decomposition or combustion must be generated.)

CONSEQUENCE

Hazardous levels of urea or other chemicals may possibly be found in air in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Remove unprotected personnel from the local spill area and areas immediately downwind.

TECHNIQUE

PROTECTION FROM WIND . . . If necessary, cover solid urea with a plastic sheet or other compatible material to prevent airborne dust or contact with water. Remove spilled product as soon as possible.

CONSEQUENCE

Cover material will become contaminated.

MITIGATION

Handle cover material with care during site cleanup. Dispose or decontaminate properly.

TECHNIQUE

WATER FOG OR SPRAY . . . Where necessary, water fog or spray applied to urea dusts or mists in air may knock them down and accelerate their dispersal in the atmosphere. Apply water at a point downwind if practical if solid urea is exposed to prevent dissolution in water and spreading of contamination.

CONSEQUENCE

Water runoff may contain some amounts of urea and other chemicals from contact with its dusts or mists.

MITIGATION

Contain contaminated water where deemed necessary and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire-hose runoff or rainwater that may add to spill volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Urea and its solutions may be contained by building dikes or barriers using soil, sand or other compatible materials. Storm drains and sewer openings may be sealed using compatible plastic or rubber sheeting covered with rocks and soil or sand, or via other appropriate methods.

CONSEQUENCES

Contained solutions may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Keep solid urea dry to the extent possible. Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product, particularly solutions.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

UREA
Non-Regulated

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with the spilled product.

TECHNIQUE

ABSORPTION . . . Spreading of solutions may be controlled by absorbing the liquid with sand, earth, clay, vermiculite, perlite, commercial sorbents, or other compatible substances according to various authorities.

CONSEQUENCES

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Note that noncombustible sorbents are preferred in order to reduce the hazard in the event of afire.

TECHNIQUE

NEUTRALIZATION . . . Where deemed necessary, application of an appropriate neutralization agent to solutions of urea in water may modify the spilled product to a less hazardous substance.

CONSEQUENCE

Application and removal of chemical agents entail additional environmental risks.

MITIGATION

Consult qualified experts for safe neutralization techniques. Consult environmental officials about the need for neutralization.

TECHNIQUE

MECHANICAL REMOVAL . . . Where deemed necessary, contaminated soil and spilled product or its residues may be removed by brooms, shovels, motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Improper removal techniques may cause urea dusts to become airborne. Use of may possibly result in heating and ignition of urea dust under appropriate conditions.

MITIGATION

Select removal procedures that do not cause urea dusts to become airborne. Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Apply caution if using any equipment that may result in heating and possible ignition of urea dust. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination. Solid urea will sink in water and dissolve at a fairly rapid rate, particularly if water is plentiful compared to the amount of urea spilled. Solutions of the product will dissolve freely in water.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

UREA
Non-Regulated

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water solids that have not dissolved and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged.

MITIGATION

Consult qualified experts for guidance.

September 2006

VINYL ACETATE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Vinyl acetate is a colorless and fairly volatile liquid with a pleasant, sweet, and fruity odor. It is used to make plastics and resins for adhesives, paints, lacquers, films, safety glass, paper coatings, textile finishes, and chewing gum. It is only slightly soluble in water and somewhat lighter, so may be expected to form a floating surface slick that slowly dissolves. Its flash point of 18°F indicates that the product may be easily ignited under a wide range of ambient temperature conditions. Vapors are heavier than air and may travel a considerable distance to a source of ignition and flash back under appropriate conditions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 7.8 pounds per gallon.

Vinyl acetate does not react with water or many other common materials and is stable in normal transportation. Exposure to excessive heat, light, peroxides, or oxidizing agents, however, may initiate self-polymerization resulting in violent container rupture. The product is otherwise reactive with a variety of chemicals. Toxicity is low to moderate by the various potential routes of exposure and the product is primarily considered an irritant. Products of combustion include acrid fumes and possibly other toxic substances.

If vinyl acetate is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 2.3 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, chloroform, and ether.

Specific Gravity (Liquid): 0.934 at 68°F (20°C)

Vapor Density: 3

Boiling Point: 163.2°F (72.9°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: –135°F (–92.8°C)

Molecular Weight: 86.09

Heat of Combustion: –5419 cal/g; –495 Kcal/mole

Evaporation Rate (butyl acetate=1): 8.89

Vapor Pressure: 90 mmHg (1.74 psia) at 68°F (20°C)

Flash Point: 18°F (–7.8°C), closed cup; 23°F (–5°C), open cup

Autoignition Temperature: Reports vary from 725 – 800°F (385 – 427°C)

Burning Rate: 3.8 mm/minute

Flammable (Explosive) Limits: 2.6% (LEL) – 13.4% (UEL)

Stability: Stable, but may polymerize under conditions described below.

Polymerization Potential: May occur when exposed to heat, light, peroxides, high temperatures or oxidizing agents.

pH: Not applicable

Corrosiveness: Generally not corrosive when free of moisture. May be corrosive to copper and its alloys.

Reactivity with Water: No reaction

Reactivity and Incompatibility: Peroxides and strong acids may initiate polymerization under extreme conditions. Also reacts with strong bases, oxidizing materials, 2-amino ethanol, ethylene diamine, ethylene imine, silica gel, alumina, azo compounds and ozone.

IDENTIFICATION

Shipping Names: Vinyl acetate, stabilized (USDOT & IMO)

Synonyms and Tradenames: Acetic acid ethenyl ester; Acetic acid ethenyl ether; Acetic acid vinyl ester; Acetoxyethene; 1-Acetoxyethylene; Ethenyl ethanoate; Ethenyl acetate; VAM; Vinyl acetate monomer; Vinyl ethanoate; VAC; Vinyl a monomer; vyac; zeset T

CAS Registry No.: 108-05-4

Chemical Formula: $CH_3COOCH=CH_2$

Constituent Components (% each): 99.8% pure with small amounts of hydroquinone and/or diphenylamine as inhibitors.

UN/NA Designation: UN1301

IMO Designation: 3, flammable liquids

RTECS Number: AK0875000

NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 2 (Instability)

Physical Form as Shipped: Liquid

Physical Form as Released: Liquid

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant, fruity, sweet, like ether

Reportable Quantity: See Appendix I

Common Uses: Mfg. plastics and resins for adhesives, paints, lacquers, films, safety glass, coatings, textile finishes, and bases for chewing gum.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

VINYL ACETATE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.12 – 0.5 ppm

Unusual Hazards: Fairly volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back. Polymerization resulting in container rupture may occur (see Chemical/Physical Data section). Vapors are uninhibited and may form polymers in vents and flame arrestors resulting in stoppage. Several sources list the material as a possible carcinogen and is toxic to aquatic organisms.

Short Term Exposure Limits (STEL): 15 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 10 ppm over each 8 hours of a 40 hour work week. (ACGIH)

Ceiling (C) Limit: 4 ppm (15 mg/m^3) (NIOSH)

IDLH: Not determined

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact; exposure to penetrating electromagnetic radiation.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from exposure to the high vapor concentrations that may be present in the spill area and downwind. Ingestion and physical contact are also to be avoided.

Hazards of Skin or Eye Contact: Prolonged or repeated contact of liquid vinyl acetate with the skin may result in drying, cracking, inflammation and blistering. Contact with the eyes may cause irritation and temporary eye injury.

Hazards of Inhalation: Vapors of vinyl acetate may be irritating to the eyes, nose, and respiratory tract. High concentrations in air may cause narcosis and central nervous system depression with symptoms including incoordination, drowsiness, confusion, and possibly depression of the respiratory system.

Hazards of Ingestion: Moderately toxic. Ingestion may result in headache, drowsiness, vomiting, stomach pain, emotional disturbances, loss of coordination and unconsciousness. Large amounts may be fatal.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 2.6%

Upper Flammable (Explosive) Limit: 13.4%

Behavior in Fire: Flammable liquid. May generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire or excessive heat may result in polymerization and violent container rupture.

Hazardous Combustion Products: May include acrid fumes, carbon monoxide, and other toxic substances.

EXPLOSION HAZARDS

Explosive Potential: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Excessive heat or light may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in the presence of peroxides or strong acids.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

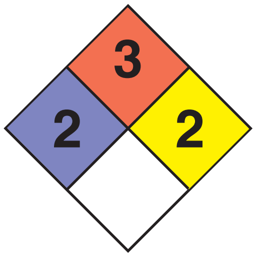
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® BR; Tychem® LV; Tychem® TK; Tychem® Reflector®; Tychem® ThermoPro; Teflon® (gloves, suits, boots); Barricade® coated suits; 4H® and Silver Shield® brand gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Tychem® Responder®. The following materials are ***not*** recommended for use: natural rubber; neoprene; nitrile rubber; Tychem® CPF 2; Tychem® SL; Tychem® CPF 4; Tychem® F.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 4000 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 4000 ppm), any supplied-air respirator* operated in a pressure-demand or other positive-pressure mode. For lesser concentrations (below 200 ppm): any air-purifying full-facepiece

1301

VINYL ACETATE

Class 3 (Flammable Liquid)



respirator equipped with organic vapor cartridge(s); any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister; any powered air-purifying respirator* with a tight-fitting facepiece and organic vapor cartridge(s); any supplied-air respirator with a full facepiece; or any self-contained breathing apparatus with a full facepiece. For lesser concentrations (below 100 ppm): any supplied-air respirator* operated in a continuous-flow mode; or any powered air-purifying respirator with organic vapor cartridge(s). Note: Respirators noted with (*) may require eye protection.

FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, nose, or respiratory tract; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 20 minutes. Get medical attention immediately if irritation persists after washing.

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

Note to Physician: Consider gastric lavage and activated charcoal slurry.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, alcohol-resistant foam, water spray. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Vinyl acetate may float on water and slowly dissolve. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable vapors. Note that vinyl acetate has a flash point of 18°F.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of vinyl acetate may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that vinyl acetate is a highly volatile and flammable liquid that floats on water and will slowly dissolve. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

VINYL ACETATE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Vinyl acetate may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of vinyl acetate in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vinyl acetate vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain vinyl acetate from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

ALCOHOL-RESISTANT FOAM . . . There is a possibility that alcohol-resistant foam applied to the surface of liquid pools may slow the release of vinyl acetate vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase.
Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Vinyl acetate may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained vinyl acetate may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

VINYL ACETATE

Class 3 (Flammable Liquid)

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, commercial sorbents or other compatible substances. Do not use combustible materials.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6 – 8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed.

VINYL ACETATE
Class 3 (Flammable Liquid)

Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating vinyl acetate.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with vinyl acetate may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination. Note: Not much vinyl acetate is expected to dissolve, however, other techniques may be considered, such as Adsorption and Aeration, to remove any dissolved material.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

August 1996

VINYL BROMIDE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Vinyl bromide is a liquefied, highly flammable colorless gas with a pungent odor. Under normal atmospheric conditions, it exists as a gas, and under pressure, it is a liquid. Vinyl bromide can be produced by the catalytic addition of hydrogen bromide to acetylene in the presence of mercury and/or copper halide catalysts, or by partial dehydrobromination of ethylene dibromide with alcoholic potassium hydroxide. It may also be produced from the reaction of 1,2-dibromoethane with hot, aqueous sodium hydroxide. Vinyl bromide is primarily used in polymers as a flame retardant in the production of fibers for carpet backing material, and in the production of plastics. It is also copolymerized with vinyl acetate and maleic anhydride to produce granular products, and it is used in leather and fabricated metal products. Vinyl bromide has relatively low acute toxicity, however, because of its chemical similarity to vinyl chloride, it would be expected to show similar chronic effects at similar exposure levels. It may be toxic if inhaled or absorbed through the skin. In high concentrations, it may produce dizziness, disorientation, and narcosis. The material may polymerize upon exposure to sunlight. Rapid evaporation of the liquid may produce frostbite-type injury to the skin upon contact. The most common routes of exposure are through inhalation and skin contact. Vinyl bromide is an ACGIH (A2) suspected human carcinogen.

The fire potential for vinyl bromide is high. Heating can release highly toxic fumes of the bromide ion. The material can react violently with oxidizing agents. Vapors are heavier than air and may settle in low lying areas to form explosive mixtures with air above its flash point. Vapors may travel considerable distances to an ignition source and flash back. Normal structural firefighting protective clothing will not provide an adequate level of personal protection for personnel working in contaminated atmospheres. Runoff may flammable and/or toxic. Vinyl bromide is not water soluble. Empty containers containing product residue may be hazardous and proper safety precautions should be followed.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Not soluble.
Solubility in Other Chemicals: Chloroform, ethanol (10%), ethyl ether (10%), acetone (10%), and benzene (10%).
Specific Gravity (Liquid): 1.5 @ 20°C (68°F)
Vapor Density (Air=1): 3.7
Boiling Point: 16°C (61°F)
Melting Point: -139°C (-95°F)
Freezing Point: Unavailable.
Molecular Weight: 106.96
Heat of Combustion: Unavailable.
Evaporation Rate: Unavailable.
Vapor Pressure: 895 mm Hg at 20°C (68°F)
Flash Point: <-8°C (<18°F)
Autoignition Temperature: 530°C (986°F)
Flammable Limits: 9.0% (LEL) - 15.0% (UEL)
Stability: Unstable.
Polymerization Potential: Will polymerize immediately when exposed to sunlight, in the presence of air, or if inhibitor is lost.
Reactivity and Incompatibility: Can react violently with oxidizing agents.
Other Characteristics: Can generate toxic and hazardous fumes of the bromide ion when exposed to heat and flames.

IDENTIFICATION

Shipping Name(s): Vinyl bromide, stabilized (USDOT & IMO)
Synonyms and Tradenames: Bromoethene, Bromoethylene, Ethene, Bromo-, NCI-C50373, Monobromoethylene. CAS Registry No: 593-60-2
Chemical Formula: C_2H_3Br
Molecular Formula: C_2H_3Br
UN/NA Designation: UN1085
IMO Designation: 2.1
RTECS Number: NIOSH/KU8400000
OHMTADS Number: 7217315
NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 1 (Reactivity)
Physical Form as Shipped: Liquid under pressure
Physical Form as Released: Gas/liquid
Color of the Shipped Material: Colorless
Odor Characteristics: Pungent, pleasant odor.
Common Uses: Vinyl bromide is primarily used in polymers as a flame retardant in the production of fibers for carpet backing material, and in the production of plastics. It is also copolymerized with vinyl acetate and maleic anhydride to produce granular products, and it is used in leather and fabricated metal products.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR INCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

VINYL BROMIDE

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: None established.

Unusual Hazards: ACGIH (A2) Suspected Human Carcinogen.

Time Weighted Average (TLV-TWA): 5 ppm.

Short Term Exposure Limit (STEL): Unavailable.

IDLH: Unavailable.

Conditions to Avoid: Exposure to sunlight, oxygen, and potential ignition sources such as heat, sparks, flame, impact, friction, static electricity.

HEALTH HAZARDS

Potential Health Effects: Vinyl bromide has relatively low acute toxicity, however, because of its chemical similarity to vinyl chloride, it would be expected to show similar chronic effects at similar exposure levels. These symptoms include: eye and respiratory tract irritation, and central nervous system (CNS) depression with nausea, vomiting, dizziness, disorientation, drowsiness, narcosis, incoordination and unconsciousness. Vinyl bromide is a suspected human carcinogen. Individuals with pre-existing conditions of the central nervous system or lungs may have increased susceptibility to the toxicity of excessive exposures.

Hazards of Skin Contact: Skin contact may cause skin irritation with rash, redness, and swelling. Rapid evaporation of the liquid may cause frostbite-type injury upon contact. Prolonged exposures may lead to skin burns, blistering and dermatitis.

Hazards of Eye Contact: Eye contact with liquid or vapors may cause irritation, redness, swelling, tearing, chemical conjunctivitis, burns, or blurred vision.

Inhalation Hazards: Inhalation may cause irritation to the upper respiratory passages, and mucous membranes, pulmonary edema, wheezing, and dyspnea. Prolonged exposures can produce central nervous system (CNS) effects such as nausea, headache, vomiting, dizziness, disorientation, drowsiness, narcosis, incoordination and unconsciousness.

Ingestion Hazards: Ingestion may cause irritation of the mucous membranes and respiratory tract, followed by headache, nausea, vomiting and abdominal pain.

FIRE HAZARDS

Lower Flammable Limit: 9.0%

Upper Flammable Limit: 15.0%

Behavior in Fire: Vinyl bromide is a highly flammable gas. It will readily ignite if exposed to sources of heat and flame. Vapors are heavier than air, may travel along the ground, and settle in low lying areas to form explosive mixtures with air. Vapors may travel to distant ignition sources and flash back. Vapors may also be affected by ventilation and ignited by heat, pilot lights, static electricity, and other potential ignition sources at locations distant from the point of release. Runoff may be flammable and/or toxic.

Hazardous Decomposition Products: When heated to decomposition, material releases highly toxic and hazardous fumes of the bromide ion.

EXPLOSION HAZARDS

Explosive Potential: High. Welding, cutting or grinding of empty containers should be avoided due to the possibility of ignition of residue. Prevent material and runoff from entering sewers, storm drains and other enclosed areas due to the potential for an explosion. Vinyl bromide will polymerize immediately when exposed to sunlight, or if the inhibitor is lost, or if kept in the presence of oxygen or air.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

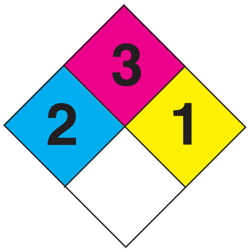
Protective Clothing Requirements: Emergency response personnel must wear specialized chemical protective clothing and equipment compatible with the material in uncontrolled release situations. Full encapsulating chemical vapor protective clothing (EPA Level A Protection) should be worn for spills and leaks with no fire. Suitable materials of construction are nitrile rubber and viton®. Structural firefighting protective clothing does not provide an adequate level of personal protection for this product.

Respiratory Protection: Positive-pressure self-contained breathing apparatus (SCBA) is the minimum level of respiratory protection recommended for uncontrolled release situations.

1085

VINYL BROMIDE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Skin contact with the escaping liquid may cause frostbite-type injury with redness, swelling, burning, and dermatitis. Excessive exposures may cause temporary central nervous system depression with anesthetic effects such as dizziness, drowsiness, nausea, headache, confusion, and loss of consciousness. Eye contact may result in corneal injury. Inhalation may cause irritation to the upper respiratory passages and mucous membranes with coughing, sore throat and discomfort.

First Aid for Inhalation: Immediately remove victim to an uncontaminated environment with fresh air. Remove any contaminated clothing. If the victim is not breathing, cardiopulmonary resuscitation (CPR) should be administered immediately. If the victim is breathing with difficulty, oxygen should be given. DO NOT ADMINISTER MOUTH TO MOUTH RESUSCITATION due to the possibility of chemical exposure. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Skin Contact: In case of skin contact, immediately remove contaminated clothing and flush the affected area(s) with water. Wash the area with soap and copious amounts of water or saline for at least 15 minutes. In case of frostbite, warm affected skin in warm water at a temperature of 107°F. If warm water is not available or impractical to use, gently wrap affected area(s) in blankets. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: In case of eye contact, immediately flush eyes with copious amounts of tepid water or saline for at least 15 minutes, occasionally lifting the upper and lower eyelids. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Ingestion: If swallowed, immediately give two (2) glasses of water and INDUCE VOMITING. Never administer fluids if the victim is unconscious or having convulsions. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical, water spray (fog) or regular foam.

Extinguishment Techniques: Secure ignition sources in the immediate spill area and down wind. Approach release from upwind to avoid hazardous vapors and toxic decomposition products. Wear appropriate level of personal protective clothing and equipment. Water may be ineffective for fire control, however water spray may be used to cool fire-exposed containers, disperse vapors, and to protect personnel. Solid streams of water may be ineffective. Use water in flooding quantities as fog and fight fire from maximum distance. For massive fires in cargo area, use unmanned master stream devices. If this is not feasible, withdraw from the area and let the fire burn out. Withdraw from the area immediately in the event that rising sounds from venting safety devices are heard, or any discoloration of the tank shell is observed. Containers exposed to fire may rupture violently and travel considerable distances, therefore personnel should stay away from ends of containers. Dike fire control water for proper disposal since it may contain flammable and/or toxic gases.

SPILL RESPONSES

General Information: Vinyl bromide is a highly flammable gas that may cause environmental contamination. Do not walk through spilled material. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Non-sparking tools and explosion-proof equipment are recommended to minimize the potential for ignition. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Stop or control the leak if it can be accomplished without undue risk. Water spray may be used to reduce the generation of vapors. Prevent material from entering sewers, waterways, and storm rains. Overflow dams may be an effective means to dike material since it is not water soluble and it is heavier than water. Spills may be absorbed with sand, clay, sawdust, or other non-combustible absorbent material and shoveled into clean, dry containers and covered. Runoff may be flammable and/or toxic. All contaminated material should be treated as hazardous wastes and disposed of in accordance with applicable federal, state and local environmental regulations, and in consultation with technical specialists from the shipper/manufacturer. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. For example, liquid and vapors can saturate protective clothing and be carried off-site. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Use a massive rinse on the outer shell of protective clothing. Maintain respiratory protection throughout the decontamination process.

VINYL BROMIDE
Division 2.1 (Flammable Gas)

AIR SPILL

TECHNIQUE

EVACUATION...As a general precaution, isolate the area for 1/2 miles in all directions if a bulk container is involved. Consult with local officials to determine the extent to which evacuation or protection-in-place procedures may be warranted. Considerations include: the magnitude of the release, the potential exposures and their proximity to the source of the release, the potential for the release to migrate toward populated areas, the time of day, the resources available to assist in evacuation efforts, and the available locations to house evacuees.

CONSEQUENCE

Need to notify, organize, transport and house evacuees.

MITIGATION

Secure potential ignition sources such as of heat, sparks, flame, impact, friction or electricity in the immediate spill area and downwind. Do not walk through spilled material. Ventilate enclosed areas before entering. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Stop or control the leak if it can be accomplished without undue risk. Prevent runoff from entering sewers, waterways, and storm drains.

TECHNIQUE

MONITOR THE SITUATION...Vinyl bromide is expected to exist almost entirely in the vapor phase when released into the atmosphere. Based on its vapor pressure, the highest concentrations of material will usually be located at ground level. Depending on the magnitude of the release, flammable and/or toxic concentrations may take several hours to dissipate. The time frame would depend on the size of the release and atmospheric conditions. Continuous air monitoring of the immediate area and downwind should be conducted to monitor for the presence of hazardous concentrations of flammable and/or toxic vapors.

CONSEQUENCE

Hazardous concentrations of material may concentrate in the immediate spill area and downwind. Vapors may accumulate in low lying and enclosed areas.

MITIGATION

Evacuate the immediate area and down wind of the site of the release as conditions warrant and to allow vapors to dissipate. Personnel should conduct periodic air monitoring of the area to determine if flammable and/or toxic concentrations exist and when conditions are safe to reenter the area. Consult environmental specialists for assistance, as needed.

TECHNIQUE

WATER SPRAY OR FOG...Water sprays may be used reduce vapors. Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation.

CONSEQUENCE

Runoff may contain flammable and/or toxic concentrations of material.

MITIGATION

Contain contaminated runoff and remove as soon as possible to prevent the potential spread of contamination. In enclosed areas, runoff may add to spill volume and overfill impoundments. Prevent runoff from entering sewers, waterways and storm drains.

TECHNIQUE

FOAM...Aqueous Film Forming Foam (AFFF) or compatible hazardous materials foam agents may be applied to the surface of liquid pools.

CONSEQUENCE

The effects of foam application may be short term. As foam breaks down, or in high wind conditions, the integrity of the foam blanket may be compromised. A visible foam blanket on the surface of the liquid does not necessarily ensure an adequate level of vapor suppression.

MITIGATION

Continue foam application until spilled material is removed. Prevent runoff from entering sewers, waterways, and storm drains. Contain foam runoff and treat as hazardous waste and dispose of in accordance with applicable local, state and federal environmental regulations.

VINYL BROMIDE

Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE...Notify downstream industrial, municipal, and public water users to stop intake or monitor for contamination if material has entered sources of drinking water.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until primary water supply is declared safe.

TECHNIQUE

CONTAINMENT...If released into water sources, vinyl bromide should undergo volatilization. The time frame would depend on the size of the release and atmospheric conditions. Contaminated water may be contained or flow diverted by diking the upper and lower bounds to limit the spread of contamination and volume of water affected. Clean water can be diverted around contaminated impoundments by excavation of diversion channels.

CONSEQUENCE

Dikes may fail over time due to saturation and erosion in the vicinity of the diversion structure.

MITIGATION

Monitor dikes and diversion structures for integrity and reinforce as necessary. Arrange to remove impounded, contaminated water as soon as possible.

TECHNIQUE

DIVERSION...Material is not water soluble. Overflow dams may be used to confine or divert the spill to a limited area until the material volatizes.

CONSEQUENCE

Some material will likely continue to migrate down stream despite containment measures. Water-borne releases will be difficult to contain since measures are not 100% effective.

MITIGATION

The integrity of dams and dikes should be monitored periodically since they may fail over time. Monitor down stream users and test for signs of contamination. Water sprays may be used to control the generation of vapors. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas.

TECHNIQUE

FLOATING BOOMS/BARRIERS...Booms may be an effective means to recover spilled material since the material is not water soluble. Barriers of suitable material may be used to confine the spill to a limited area and prevent migration down stream.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

SURFACE SKIMMING...Surface skimming may be effective since the material is not water soluble and it is heavier than water.

CONSEQUENCE

Some material will likely travel beyond barriers and down stream. The rate of migration will depend on the size of the release and atmospheric conditions.

MITIGATION

Confine the spill as quickly as possible using barriers to prevent possible contamination beyond the spill area. Recover spilled product as soon as possible. Use compatible equipment for clean-up operations. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

VINYL BROMIDE
Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES...If released to soil, material may rapidly evaporate or undergo extensive leaching (moist soil), possibly contaminating ground water supplies. Spills of material may be contained by building dikes or barriers using soil, sand, or other related materials. Where liquids are likely to come in contact with water from runoff or rain, containment barriers can be used to prevent the flow of contaminated runoff or block water from contacting spilled material. Containment dikes may be effective to prevent the migration of the spill so that excavation of the contaminated area can be completed, or confine or divert the spill to a limited area until the material volatizes or biodegradation occurs.

CONSEQUENCE

Material is mobile in soil and may seep through dike material, which may result in loss of product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Use compatible equipment for clean-up operations. The integrity of dikes should be monitored periodically since they may fail over time. Water sprays may be used to control the generation of vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. Runoff may be flammable and/or toxic. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

EXCAVATION...Spills of material may be contained by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for contamination of ground water in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Prevent spills and runoff from entering waterways, storm drains, and sewer systems. Use compatible equipment for clean-up operations. Water sprays may be used to reduce vapors, except in enclosed areas where runoff may accumulate and overflow impoundments. Runoff may be flammable and/or toxic. Be alert to conditions such as increasing spill volume with runoff or rain water which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Dispose of contaminated water as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

PUMPING/VACUUM SUCTION...Spilled material contained in diked areas may be recovered using compatible pumps, hoses and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

TECHNIQUE

MECHANICAL REMOVAL...Soil contaminated with spilled material may be removed by shovels, as well as a variety of heavy equipment such as backhoes and loaders.

CONSEQUENCE

Mechanical equipment used in clean-up operations may become contaminated and present a safety and/or health hazard to response personnel.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed.

September 2006

VINYL CHLORIDE

Division 2.1 (Flammable Gas)

GENERAL INFORMATION

Vinyl chloride is a colorless gas that is shipped under pressure as a liquid and has a pleasant, sweet odor. It is used for making plastics, resins, and other chemicals and also has uses as a refrigerant and solvent. It is slightly soluble in water and lighter, so may be expected to boil from the surface of a water body with only a small amount dissolving. Its very low flash point and boiling point temperature of 7.2°F indicate that the product may be easily ignited under all ambient temperature conditions and that large amounts of gas or vapor may be evolved from spills. Vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may result in explosions if ignited. There is also some known potential for explosions involving unconfined vapor clouds. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). The product weighs approximately 8.1 pounds per gallon near its boiling point.

Vinyl chloride does not react with water or many common materials and is stable in normal transportation. Exposure to air, sunlight, or excessive heat, however, may initiate self-polymerization leading to violent rupture of containers. The product also reacts with strong oxidizing materials. It is an irritant to the eyes, skin, and mucous membranes and is regarded to be a potent human carcinogen and a cause of angiosarcoma of the liver in long term occupational exposures. Contact with the liquid may cause frostbite type burns. Products of combustion may include highly toxic phosgene, hydrogen chloride, carbon dioxide and carbon monoxide gases.

If vinyl chloride is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 330 feet (100 meters) in all directions. If the spill is large, consider initial downwind evacuation for one-half (1/2) mile (800 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, isolate and consider evacuation for one (1) mile (1600 meters) in all directions for protection from flying debris if the container should rupture violently. There is a potential for containers to rupture if exposed to excessive heat or fire for sufficient time duration.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly, 1 g/100 g water at 68°F (20°C)

Solubility in Other Chemicals: Soluble in alcohol, hydrocarbons, oil, chlorinated solvents, ether, benzene, carbon tetrachloride and most organic liquids.

Specific Gravity (Liquid): 0.969 at 8.6°F (–13°C)

Vapor Density: 2.2

Boiling Point: 7.2°F (–13.8°C) at 1 atm.

Melting Point: See freezing point

Freezing Point: –244.8°F (–153.8°C)

Molecular Weight: 62.50

Heat of Combustion: –4520 cal/g

Evaporation Rate (butyl acetate=1): >1000

Vapor Pressure: 3.4 atm (49.9 psia) (2530 mmHg) at 68°F (20°C)

Flash Point: Approx. –110°F (–78.9°C), open cup

Autoignition Temperature: 882°F (472°C)

Burning Rate: 4.3 mm/minute

Flammable (Explosive) Limits: 3.6 – 4% (LEL) – 22 – 36% (UEL)

Stability: Stable, but may polymerize, see below.

Polymerization Potential: Polymerizes in air, sunlight, or heat unless stabilized by inhibitors such as phenol.

pH: Not applicable

Corrosiveness: Not corrosive, but may corrode iron and steel if water present. Unsafe in contact with monel, copper and its alloys, and other acetylide forming materials (may form explosive compounds).

Reactivity with Water: No reaction

Reactivity with Other Chemicals: Reacts with copper, aluminum, peroxides, oxidizing materials and acetylide forming materials (see Corrosiveness section). Peroxides may initiate polymerization.

IDENTIFICATION

Shipping Names: Vinyl chloride, stabilized (USDOT & IMO)

Synonyms and Tradenames: Chloroethylene; 1-Chloroethylene; Chloroethene; Ethylene monochloride; Monochloroethene; Monochloroethylene; Monovinyl chloride; Vinyl C monomer; VC; Vinyl chloride monomer; VCM; VCL; MVC

CAS Registry No.: 75-01-4

Chemical Formula: CH_2=CHCl

Constituent Components(% each): 99% or more pure; may contain 40 – 100 ppm phenol as inhibitor

UN/NA Designation: UN1086

IMO Designation: 2.1, flammable gas

RTECS Number: KU9625000

NFPA 704 Hazard Rating: 2 (Health): 4 (Flammability): 2 (Instability)

PPhysical State as Shipped: Liquefied gas

Physical State as Released: Gas or liquid (boils at 7.2°F)

Color of the Shipped Material: Colorless

Odor Characteristics: Pleasant, sweet, ethereal

Reportable Quantity: See Appendix I

Common Uses: Mfg. plastics (polyvinyl chloride), resins, and other chemicals; refrigerant; solvent.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

VINYL CHLORIDE

Division 2.1 (Flammable Gas)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 250 – 3000 ppm; reported values vary.

Unusual Hazards: Extremely volatile and flammable substance. May violently polymerize if exposed to air, sunlight, or excessive heat. Vapors may travel considerable distance to a source of ignition and flash back. Vapors are heavier than air and may persist in pits and depressions. Product may be ignited by static discharge or flowing material.

Short Term Exposure Limits (STEL): Unavailable

Time Weighted Average (TLV-TWA): Potential occupational carcinogen (NIOSH); 1 ppm (OSHA)

Ceiling (C) Limit: 1 ppm (OSHA)

IDLH: Potential occupational carcinogen (NIOSH)

Conditions to Avoid: Heat, fire, or sparks; contact with air, sunlight, or incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the very high vapor concentrations that may be present in air in the spill area and over considerable downwind distances. Contact with the liquid is also to be avoided.

Hazards of Skin or Eye Contact: Contact of the skin with liquid vinyl chloride may cause irritation and frostbite. Contact with the eyes may result in immediate and severe irritation with the possibility of temporary injury.

Hazards of Inhalation: High concentrations of vinyl chloride in air may result in central nervous system depression with symptoms including headache, dizziness, light-headedness, nausea, dulling of visual and auditory senses, loss of consciousness, and possibly death. VCM has narcotic properties and can cause unconsciousness in concentrations of 20,000 ppm.

Hazards of Ingestion: Ingestion of liquid vinyl chloride is unlikely, but toxic effects and tissue damage would be expected.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 3.6 – 4%

Upper Flammable (Explosive) Limit: 22 – 36%

Behavior in Fire: Flammable liquefied gas. Will generate large quantities of flammable gas or vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Exposure of containers to fire or heat may result in violent polymerization.

Hazardous Combustion Products: May include highly toxic phosgene, hydrogen chloride, carbon dioxide and carbon monoxide.

EXPLOSION HAZARDS

Explosiveness: Containers may rupture violently in fire. Explosions may result if vapors are ignited in a confined area. Excessive heat, light, or air may cause spontaneous violent polymerization resulting in container rupture. Contact with acetylide forming materials like monel, copper, and copper alloys may form explosive compounds. There is a known potential for unconfined vapor clouds to explode if ignited.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

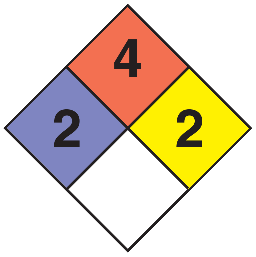
Protective Clothing Required: Equipment should prevent any reasonable probability of skin or eye contact with the spilled product. This may include rubber boots, gloves, face shields, gas tight goggles, and other impervious and resistant clothing providing protection from cold surfaces as well as direct contact with spilled liquid product. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 2; Tychem® SL; Tychem® CPF 3; Tychem® CPF 4; Tychem® BR; Tychem® Responder®; Tychem® Responder® CSM; Tychem® TK; Tychem® F; Tychem® Reflector®; Tychem® ThermoPro; Nitri Solve 727® gloves; Viton 890® gloves. The following materials are reported to have a greater than 4 hour breakthrough time: polyvinyl alcohol (gloves); Teflon® (gloves, suits, boots); Butyl 878 gloves.

Respiratory Protection: For unknown concentrations, fire fighting, or ***any detectable*** concentrations: any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode.

1086

VINYL CHLORIDE

Division 2.1 (Flammable Gas)



FIRST AID

Nonspecific Symptoms: Dizziness, headache, and other symptoms of inhalation.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of lukewarm water until circulation returns. Provide supportive care and seek immediate medical assistance by a physician from the nearest medical treatment facility. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination. (Note: Do not use hot water.)

First Aid for Eye Contact: Flush eyes immediately with water for at least 20 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water. Get medical attention immediately. (Note: Do not use hot water.)

First Aid for Ingestion: Unlikely as product is a gas at normal temperatures. Get medical attention immediately. Treat symptomatically.

FIRE RESPONSE

Extinguishing Agents: Carbon dioxide, dry chemical or water fog or spray.

Extinguishing Techniques: Stay upwind. Avoid all bodily contacts. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Note that addition of water to any pools of liquid vinyl chloride may increase vapor evolution. Vinyl chloride may float on water. Do not use direct stream of water, product may be carried across water surface spreading fire or carrying product to source of ignition.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from contaminated runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of highly contaminated water may result in damage to boilers or industrial process equipment. Use explosion-proof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take into account that vinyl chloride is extremely volatile and flammable with heavier than air vapors that may persist in pits and depressions. Do not use monel, copper, or copper alloy equipment such as brass.

VINYL CHLORIDE

Division 2.1 (Flammable Gas)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Vinyl chloride may not evolve large amounts of hazardous airborne contaminants in certain outdoor spill situations. It may be advisable in some cases outside the isolation area to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed, particularly for small spills or in cold weather.

CONSEQUENCE

Hazardous levels of vinyl chloride in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vinyl chloride vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. NOTE: Water should be applied at a point downwind and should not be allowed to contact pools of liquid vinyl chloride as this may increase gas and vapor evolution.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain vinyl chloride from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

ALCOHOL FOAM . . . There is a possibility that alcohol foam applied to the surface of liquid pools may slow the release of vinyl chloride vapors into the atmosphere.

CONSEQUENCE

The effects of alcohol foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material. The response may be ineffective.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume. Use alternate technique if response is ineffective.

VINYL CHLORIDE

Division 2.1 (Flammable Gas)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Vinyl chloride may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained vinyl chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination. May generate large amounts of vapors which are highly flammable and can be easily ignited.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials. Make sure there are no sources of ignition near the area of the spill.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination. May generate large amounts of vapors which are highly flammable and can be easily ignited.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil. Make sure there are no sources of ignition near the area of the spill.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

VINYL CHLORIDE

Division 2.1 (Flammable Gas)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . **This technique should only be used under the guidance of a VC product specialist.** Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

January 1988

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

GENERAL INFORMATION

Vinylidene chloride is a clear, colorless, and highly volatile liquid that boils at 88.9°F and has a sweet odor like carbon tetrachloride or chloroform. It is primarily used to make plastic films for packaging and latexes used for mortars, concretes, adhesives, paints, fabrics, and lacquers. It is very slightly soluble in water and heavier, so may be expected to sink and dissolve at a very slow rate. Its flash point of 0-5°F indicates that it may be easily ignited under most ambient temperature conditions. Its relatively low boiling point and high vapor pressure indicate that it will boil at higher ambient temperatures or otherwise evaporate rapidly to produce large amounts of toxic and flammable vapors. These vapors are heavier than air, may travel a considerable distance to a source of ignition and flash back, and may persist for a time in pits, hollows, and depressions. Accumulations of vapor in confined spaces such as buildings or sewers may explode if ignited. Containers of liquid may rupture violently if exposed to fire or excessive heat for sufficient time duration (see below also). White solid deposits formed during prolonged storage may explode if heated or shocked. The liquid weighs approximately 10.1 pounds per gallon.

Vinylidene chloride does not react with water and is stable in normal transportation when inhibited to prevent self-polymerization. Polymerization may occur, however, if the product is exposed to sunlight, air, copper, or aluminum and their alloys, or excessive heat, and this also may result in violent rupture or explosions of containers. The product is relatively noncorrosive but is incompatible with oxidizing materials and various other substances. It is of moderate toxicity by the various potential routes of exposure and may be present in air in very high concentrations. Products of combustion may include highly toxic phosgene, chlorine, and hydrogen chloride gases.

Downwind evacuation should be considered if vinylidene chloride is leaking but not on fire. If a fire becomes uncontrollable or a container is exposed to direct flame, evacuate for a radius of one-half (½) mile for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Slightly soluble, 0.5 g/100 g water at 68°F (20°C)
Solubility in Other Chemicals: Soluble in acetone, alcohol, benzene, chloroform, and ether.
Specific Gravity (Liquid): 1.21 at 68°F (20°C)
Boiling Point: 88.9°F (31.6°C) at 1 atm.
Melting Point: See freezing point
Freezing Point: - 187.6°F (- 122°C)
Molecular Weight: 96.95
Heat of Combustion: - 2700 cal/g
Vapor Pressure: 400 mm Hg (7.732 psia) at 58.6°F (14.8°C)
Flash Point: 0 - 5°F (- 17.8 to - 15°C), open cup.
Autoignition Temperature: 955 - 1058°F (513 - 570°C)
Burning Rate: 2.7 mm/minute
Stability: Stable, but may polymerize under conditions described above.
Corrosiveness: Noncorrosive, but avoid copper or aluminum and their alloys.
Reactivity with Water: No reaction, but manufacturer says avoid water or moisture.
Reactivity with Other Chemicals: Reacts with air, sunlight, aluminum or copper and their alloys, oxidizing materials, ozone, chlorosulfonic acid, nitric acid, and oleum.

IDENTIFICATION

Shipping Names: Vinylidene chloride, inhibited (USDOT); vinylidene chloride (IMO)
Synonyms and Tradenames: 1,1-Dichloroethylene; 1,1-dichloroethene; vinylidene chloride monomer; unsym-dichloroethylene; Sconatex; VDC; 1,1-DCE; DCE.
Chemical Formula: $CH_2=CCl_2$
Constituent Components (% each): 99% pure with 200 ppm methyl ether of hydroquinone and 0.6 - 0.8%0 phenol as inhibitors.
49 STCC: 49 072 80
UN/NA Designation: UN1303
IMO Designation: 3.1, flammable liquid
Physical State as Shipped: Liquid
Physical State as Released: Liquid (boils at 88.9°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Sweet, pungent, like chloroform or carbon tetrachloride
Common Uses: Mfg. plastic films for food packaging; latexes used for mortars, concretes, paints, fabric fiber, adhesives, and lacquers; mfg. methyl chloroform.

FOR ADDITIONAL ASSISTANCE OR INFORMATION CALL:
CHEMTREC (800)424-9300 OR (703) 527-3887 (COLLECT)

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 500 ppm

Unusual Hazards: Highly volatile flammable liquid with heavier than air vapors that may travel to a source of ignition. May polymerize and cause violent container rupture or explosion (see General Information section). Toxic vapors may travel considerable distances and may persist in pits, hollows, and depressions. Vapors are uninhibited and may form polymers in vents and flame arrestors resulting in blockage.

Short Term Exposure Limits (STEL): 20 ppm for 15 minutes. (ACGIH)

Time Weighted Average (TLV-TWA): 5 ppm over each 8 hours of a 40 hour work week; 5 ppm proposed. (ACGIH)

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of the high vapor concentrations that may be present in air in the spill area and over considerable downwind distances. Direct contact and ingestion are also to be avoided. Exposure may possible sensitize the heart to epinephrin. Animal studies indicate possible carcinogenicity.

Hazards of Skin or Eye Contact: Liquid vinylidene chloride rapidly irritates the skin. Contact with the eyes may cause pain, conjunctiva) irritation, and transient corneal injury. High levels of phenolic inhibitor in inhibited product may possibly cause burns of the skin or eyes.

Hazards of Inhalation: Vapors of vinylidene chloride are irritating to the nose and respiratory system and may cause lung congestion. High concentrations in air are anesthetic and may result in dizziness, drowsiness, confusion, drunkenness, unconsciousness, and possibly death. Concentrations as low as 25 ppm cause some symptoms in humans.

Hazards of Ingestion: Although the single dose oral toxicity of vinylidene chloride is considered low, significant amounts may cause poisoning. Histological changes may be evident in the liver and lungs.

FIRE HAZARDS

Lower Flammable Limit: 5.6-7.3%

Upper Flammable Limit: 15.5-16.0%

Behavior in Fire: Flammable liquid. Will generate large quantities of flammable vapor upon release. Vapors are heavier than air and may travel considerable distance to a source of ignition and flash back. Containers may rupture violently in fire. Exposure of containers to fire may result in violent polymerization and container rupture.

Hazardous Combustion Products: May include highly toxic phosgene, chlorine, and hydrogen chloride gases.

EXPLOSION HAZARDS

Lower Explosive Limit: Unavailable

Upper Explosive Limit: Unavailable

Explosiveness: Explosion may result if vapors are ignited in a confined area. Containers may rupture violently in fire. Loss of inhibitor or excessive heat or light may cause spontaneous polymerization resulting in violent container rupture. Polymerization may also occur in the presence of aluminum or copper or their alloys or air. White deposit formed on long standing may explode if heated or shocked.

PROTECTIVE CLOTHING AND EQUIPMENT

Protective Clothing Required: Equipment should prevent any reasonable probability of skin contact and any possibility of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations, a self-contained breathing apparatus (SCBA) with full facepiece (or the equivalent). For lesser concentrations, a gas mask with an appropriate chin-style or front or back mounted canister or an appropriate chemical cartridge respirator with a full facepiece within the use limitations of these devices.

1303

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

FIRST AID

Nonspecific symptoms: Irritation of the eyes, skin, nose, or respiratory tract; other symptoms of exposure.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. If breathing becomes difficult or if breathing has stopped, administer artificial respiration. Get medical attention immediately. (Caution: Administration of mouth-to-mouth resuscitation may expose the first aid provider to chemical within the victim's lungs or vomit.)

First Aid for Skin and Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Remove all contaminated clothing. Wash affected body areas with large amounts of water. Get medical attention if eye contact has occurred or if skin irritation persists after washing.

First Aid for Ingestion: If victim is conscious, administer two glasses *of* water immediately and induce vomiting. Do not make an unconscious person vomit. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Materials: Carbon dioxide, dry chemical, foam, water spray. Water may be ineffective but may possibly be used to blanket contained liquid pools.

Extinguishing Techniques: Stay upwind. Avoid all bodily contacts. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish burning cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat (over 800°F), such as from a direct flame. Use water from side and from safe distance to keep fire exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank.

SPILL RESPONSES

General Information: Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Eliminate ignition sources. Prevent liquid from entering sewers and confined spaces. Protect sewers and waterways from runoff. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of vinylidene chloride may result in rupture or explosion of boilers or industrial process equipment. Use explosionproof equipment where necessary. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Take the highly volatile, reactive, flammable, and toxic nature of vinylidene chloride into account while planning the response. Do not use copper or aluminum or their alloys (including brass). Beware of possible heavy gas accumulations in low areas.

AIR SPILL

TECHNIQUE

EVACUATION . . . Evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. Vinylidene chloride spills may expose downwind areas to toxic or flammable concentrations over considerable distances in some cases.

CONSEQUENCE

Need to notify, organize, transport and house displaced persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to vinylidene chloride vapors or fumes may accelerate their dispersal in the atmosphere.

CONSEQUENCE

Water runoff may contain a small amount (if any) of vinylidene chloride from contact with airborne vapors or fumes.

MITIGATION

Contain contaminated water and remove as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of vinylidene chloride vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

TECHNIQUE

WATER APPLICATION. . . Application of water to the surface of liquid pools may reduce emissions of vapors or fumes. Water should float on top of contained product.

CONSEQUENCE

Addition of water will increase the volume of contained material.

MITIGATION

Contain increased volume and remove as soon as possible. Be alert to conditions that may add to volume and overfill impoundments.

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Vinylidene chloride may be contained by building dikes or barriers using soil, sand or other materials.

CONSEQUENCE

Contained vinylidene chloride may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Removed contained product as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection basins with compatible impervious material.

TECHNIQUE

EXCAVATION . . . A trench or ditch may be excavated to contain leaking product.

CONSEQUENCE

There may be increased potential for groundwater contamination in some cases.

MITIGATION

Remove contained products as soon as possible to prevent spread of contamination. Use surface dikes or barriers where groundwater contamination is possible or line collection basin with compatible impervious material.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Accumulated liquid pools may be recovered using appropriate hoses, pumps and storage containers or vacuum trucks.

CONSEQUENCE

Equipment that is incompatible with the spilled product may become damaged or develop leaks.

MITIGATION

Use equipment compatible with spilled product,

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means.

TECHNIQUE

MECHANICAL REMOVAL. . . Contaminated soil and any remaining chemical residue may be removed with shovels or motorized graders, scrapers, loaders, bulldozers, or draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in a safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres. Consult qualified experts for advice where necessary.

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal, and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may be needed to accommodate users.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

CONTAINMENT . . . Spilled product will sink in water. Use natural deep water pockets, excavated lagoons, or sand bag barriers to trap material on bottom and limit spread of contamination.

CONSEQUENCE

Excavation of deep water pocket or lagoon downstream of spill area may be difficult and may have adverse environmental impacts.

MITIGATION

Excavate as last resort.

TECHNIQUE

DREDGING/PUMPING . . . Stream or lake beds may be dredged to remove heavier-than-water spilled products and contaminated bottom sediments. Contaminated materials may be deposited in a barge or pumped ashore. Alternatively, where pools or spilled product have accumulated, hoses and pumps or vacuum trucks may be used for product recovery.

CONSEQUENCE

Dredging may accelerate dispersal of spilled product through the water body and cause other environmental damage. Incompatible equipment may be damaged. Dredged or pumped materials brought to the surface may emit toxic or flammable vapors.

MITIGATION

Consult qualified experts for guidance.

VINYLIDENE CHLORIDE
CLASS 3 (Flammable Liquid)

TECHNIQUE

CONTAINMENT DIKES . . . Water with dissolved chemical may be contained (or diverted to impoundment area) by diking upper and/or lower bounds to limit volume of water affected and spread of contamination.

CONSEQUENCE

Earthen dikes may become saturated with water and seep through or collapse. Additional water may cause overflow of diked area or water body boundaries.

MITIGATION

Reinforce or modify dikes as necessary. Be alert to conditions that may lead to overflow or dike collapse. Remove contaminated water to impoundment or storage area for later treatment or disposal.

TECHNIQUE

ADSORPTION . . . Addition of activated carbon to the contaminated water, followed by effective mixing, may capture spilled product that has dissolved in water. Adsorbent materials may later be removed by mechanical means.

CONSEQUENCE

Recovery of activated carbon may require dredging in a process that poses risk of environmental damage. Recovered adsorbent materials will be contaminated with spilled product, as may recovery equipment.

MITIGATION

Consult qualified experts for safe adsorption techniques. Consider pumping water through tank containing adsorbent on land. Handle and store recovered materials safely. Decontaminate equipment as necessary.

TECHNIQUE

AERATION . . . Water containing dissolved volatile chemicals may be decontaminated to some degree by aeration, air stripping, or air sparging techniques. These involve the use of air compressors and perforated piping to bubble large quantities of air through the contaminated water body.

CONSEQUENCE

The air bubbles entering the atmosphere will be contaminated with some amount of chemical vapors if the technique is effective.

MITIGATION

Consult qualified experts for advice and assistance in obtaining and deploying necessary equipment. Apply alternative techniques where air emissions may pose a downwind hazard.

September 2006

XYLENE

Class 3 (Flammable Liquid)

GENERAL INFORMATION

Commercially available xylene is typically a mixture of three isomeric forms called ortho-, meta-, and para-xylene, with the meta- isomer usually being predominant. All are colorless aromatic hydrocarbon liquids with an odor resembling benzene or gasoline. The mixture is widely used as a solvent and for making pharmaceuticals, epoxy resins, perfumes, insect repellents, dyes and a variety of other chemicals and products. It is almost completely insoluble in water and lighter, therefore, it may be expected to form a floating surface slick. Flash points ranging from 63 – 84°F for the various isomers indicate that the mixture can be easily ignited at warm ambient temperatures. Vapors may be heavier than air and may travel some distance to a source of ignition and flash back. Accumulations of vapor in buildings or sewers may explode if ignited. There is some limited potential for containers to rupture violently if exposed to fire or excessive heat for sufficient time duration. The isomers weigh approximately 7.2 – 7.3 pounds per gallon.

Xylenes do not react with water or many other common materials and are stable in normal transportation. They are primarily incompatible with strong oxidizers and acids that may cause their ignition. Although they are noncorrosive to most metals, they may attack some forms of plastics, rubber and coatings. Toxicity is generally low to moderate via the various routes of exposure. Products of combustion may include toxic constituents.

If xylene is involved in an incident, as an immediate precautionary measure, isolate spill or leak area for at least 150 feet (50 meters) in all directions. If the spill is large, consider initial downwind evacuation of 1000 feet (300 meters). If a bulk container is exposed to direct flame or a fire becomes uncontrollable, evacuate for one-half (1/2) mile (800 meters) in all directions for protection from flying debris if the container should rupture violently.

CHEMICAL/PHYSICAL DATA

Solubility in Water: Insoluble, 0.02% at 68°F (20°C)
Solubility in Other Chemicals: Soluble in carbon tetrachloride, alcohol, ether, petroleum ether, acetone, benzene and organic solvents.
Specific Gravity (Liquid): 0.861 – 0.880 at 68°F (20°C)
Vapor Density: 3.7
Boiling Point: 277 – 293°F (136 – 145°C)
Melting Point: 55.9°F (13.3°C) for p-xylene
Freezing Point: –54.2°F (–47.9°C) for meta-; –13.3°F (–25.2°C) for ortho-
Molecular Weight: 106.16
Heat of Combustion: –9752 to –9755 cal/g
Evaporation Rate (butyl acetate=1): 0.6 – 0.86
Vapor Pressure: 7 – 9 mmHg (0.135 – 0.174 psia) at 68°F (20°C)
Flash Point: 63 – 84°F (17.2 – 28.9°C) closed cup
Autoignition Temperature: 810 – 986°F (432 – 530°C)
Burning Rate: 5.8 mm/minute
Flammable (Explosive) Limits: 0.9 – 1.1% (LEL) – 6.7 – 7.0% (UEL)
Stability: Stable
Polymerization Potential: Will not occur
pH: Not applicable
Corrosiveness: Noncorrosive to most metals; may attack some plastics, rubber and coatings.
Reactivity with Water: No reaction
Reactivity with Other Chemicals: Reacts with strong oxidizers and acids.

IDENTIFICATION

Shipping Names: Xylenes (USDOT & IMO)
Synonyms and Tradenames: Xylol; o-Xylene; ortho-Xylene; 1,2-Dimethylbenzene; m-Xylene; meta-Xylene; 1,3-Dimethylbenzene; p-Xylene; para-Xylene; 1,4-Dimethylbenzene; Methyltoluene; Violet 3.
CAS Registry No.: 1330-20-7 (mixed); 108-38-3 (m-Xylene); 95-47-6 (o-Xylene); 106-42-3 (p-Xylene)
Chemical Formula: $C_6H_4(CH_3)_2$
Constituent Components (% each): Commercial mixtures contain small amounts ethylbenzene, toluene, trimethylbenzene, phenol, thiophene, pyridine and other nonaromatic hydrocarbons.
UN/NA Designation: UN1307
IMO Designation: 3, flammable liquid
RTECS Number: ZE2100000 (mixed); ZE2275000 (m-Xylene); ZE2450000 (o-Xylene); ZE2625000 (p-Xylene)
NFPA 704 Hazard Rating: 2 (Health): 3 (Flammability): 0 (Instability)
Physical State as Shipped: Liquid
Physical State as Released: Liquid (pure para- freezes at 55.9°F)
Color of the Shipped Material: Colorless
Odor Characteristics: Aromatic, characteristic, sweet, like benzene or gasoline.
Reportable Quantity: See Appendix I
Common Uses: Solvent in paints, lacquers, varnishes, inks, dyes, adhesives, cements, cleaning fluids; fuel component; mfg. dyes, insecticides, resins and fibers, pharmaceuticals, quartz crystal oscillators, perfumes, insect repelents, leather, and numerous other chemicals or binder; fiber sizing.

ADDITIONAL INFORMATION AND ASSISTANCE: FOR 24-HOUR TECHNICAL SUPPORT FOR ACCIDENTS INVOLVING SPILLS, LEAKS, FIRES OR EXPOSURES TO CHEMICALS, CONTACT CHEMTREC AT (800) 424-9300 OR (703) 527-3887 (COLLECT).

XYLENE

Class 3 (Flammable Liquid)

POTENTIAL HAZARDS

GENERAL HAZARDS

Threshold Odor Concentration: 0.2 – 4 ppm

Unusual Hazards: Volatile flammable liquid with heavier than air vapors that may travel to a source of ignition and flash back. Vapors may persist for a time in pits, hollows and depressions. There is the potential that flowing product may be ignited by self-generated static electricity. May be toxic to aquatic organisms.

Short Term Exposure Limits (STEL): 150 ppm (655 mg/m^3) (NIOSH)

Time Weighted Average (TLV-TWA): 100 ppm (435 mg/m^3) (NIOSH & OSHA)

Ceiling (C) Limit: Unavailable

IDLH: 900 ppm

Conditions to Avoid: Heat, fire, or sparks; contact with incompatible materials; runoff to sewers or water bodies; inhalation, ingestion, or direct physical contact.

HEALTH HAZARDS

Public Health Hazards: Major hazard is from inhalation of high vapor concentrations in air near the spill site. Ingestion and physical contact should also be avoided.

Hazards of Skin or Eye Contact: Repeated or prolonged contact with liquid xylenes may cause drying, cracking, and inflammation of the skin due to the defatting action of the product. Some amount may be absorbed through the skin and blisters may occur. Contact of the liquid or high vapor concentrations in air with the eyes may cause irritation, burning, redness, swelling and temporary corneal injury.

Hazards of Inhalation: Vapors of xylenes are irritating to the eyes, nose, and throat. High concentrations may cause narcosis and central nervous system depression with symptoms including dizziness, staggering, drowsiness, shortness of breath, coughing, nausea, vomiting, abdominal pain, temporary damage to kidneys and liver, delayed pulmonary edema, loss of appetite, unconsciousness and possibly death.

Hazards of Ingestion: Ingestion of xylenes may result in nausea, vomiting, cramps, headache, kidney and liver injury, coma, and possibly death. Aspiration into the lungs during vomiting may cause coughing, respiratory distress, rapidly developing pulmonary edema, chemical pneumonitis, and hemorrhage with possibly severe consequences.

FIRE HAZARDS

Lower Flammable (Explosive) Limit: 0.9 – 1.1%

Upper Flammable (Explosive) Limit: 6.7 – 7.0 %

Behavior in Fire: Flammable liquid. There is some limited potential that containers may rupture violently in fire. May generate flammable vapors upon release. Vapors may be heavier than air and may travel to a source of ignition and flash back.

Hazardous Combustion Products: Carbon dioxide, carbon monoxide and other organic compounds.

EXPLOSION HAZARDS

Explosiveness: There is some limited potential that containers may rupture violently in fire. Explosion may result if vapors are ignited in a confined area.

PERSONAL PROTECTIVE CLOTHING AND EQUIPMENT

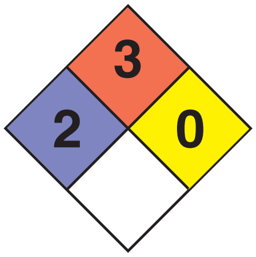
Protective Clothing Required: Equipment should prevent repeated or prolonged skin contact and any reasonable probability of eye contact with the spilled product. This may include rubber boots, gloves, face shields, splash-proof safety goggles, and other impervious and resistant clothing. The following materials are reported to have a greater than 8 hour breakthrough time: Tychem® CPF 4; Tychem® BR; Tychem® LV; Tychem® TK; Viton 890® gloves; and Viton 892® gloves. The following materials are reported to have a greater than 4 hour breakthrough time: Tychem® ThermoPro. The following materials are ***not*** recommended for use: neoprene, latex or rubber, butyl and nitrile latex.

Respiratory Protection: For unknown concentrations, fire fighting, or high concentrations (above 900 ppm): any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. For lesser concentrations (below 900 ppm): any air-purifying half-mask respirator* equipped with organic vapor cartridge(s); any powered air-purifying respirator* with organic vapor cartridge(s); any supplied-air respirator*; or any self-contained breathing apparatus with a full facepiece. Note: Respirators noted with (*) may require eye protection.

1307

XYLENE

Class 3 (Flammable Liquid)



FIRST AID

Nonspecific Symptoms: Irritation of the eyes, skin, nose, or respiratory tract; symptoms of narcosis.

First Aid for Inhalation: Remove victim to fresh air and keep warm and at rest. Administer oxygen if breathing is difficult. If breathing has stopped, administer artificial respiration. Avoid mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Get medical attention immediately.

First Aid for Skin Contact: Remove all contaminated clothing. Wash affected body areas with large amounts of soap and water for at least 20 minutes. Get medical attention immediately if irritation persists after washing. Decontaminate the patient thoroughly before transporting to a medical treatment facility to prevent the potential for secondary contamination.

First Aid for Eye Contact: Flush eyes immediately with water for at least 15 minutes, occasionally lifting the eyelids. Get medical attention immediately if irritation persists after rinsing.

First Aid for Ingestion: Do not attempt to make the victim vomit, rinse mouth thoroughly with water, administer large quantities of water. Get medical attention immediately.

FIRE RESPONSE

Extinguishing Agents: Foam, dry chemical, carbon dioxide, water spray or fog. Water may be ineffective.

Extinguishing Techniques: Stay upwind. Avoid all bodily contact. Wear breathing apparatus and appropriate protective clothing. Move container from fire area if no risk. Do not extinguish cargo unless flow can be stopped safely. Be alert to the possibility that the container may tear or rupture and suddenly release massive amounts of product when exposed to high heat, such as from a direct flame. Stay away from ends of tank involved in fire but realize that shrapnel may travel in any direction. Use water from side and from safe distance to keep fire-exposed containers cool. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. Withdraw immediately in case of rising sound from venting safety device or discoloration of tank. Xylene may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. Dike fire control water for proper disposal since it may contain flammable vapors. Note that xylene has a flash point as low as 63°F.

SPILL RESPONSES

General Information: Xylene is a highly flammable and volatile liquid that may cause environmental contamination even though it is expected to biodegrade to a moderate extent when released into the soil or water. Proceed with caution. Restrict access to area. Keep unprotected personnel upwind of spill area. Avoid contact with spilled product. Personnel must wear the appropriate level of personal protective clothing and equipment for spill response operations. Eliminate ignition sources. Prevent liquid from entering sewers, waterways and confined spaces. Notify proper authorities, downstream sewer and water treatment operations, and other downstream users of potentially contaminated water. Note that intake of xylene may result in rupture or explosion of boilers or industrial process equipment. All containers should be checked for product compatibility and properly bonded and grounded during product transfer operations to eliminate the potential for ignition. Use explosion-proof equipment where necessary. Compatibility of vacuum trucks and equipment must be determined prior to commencing clean-up operations. Choose equipment, where possible, that is not corroded or otherwise damaged by the spilled product. Establish a decontamination area remote from the contaminated zone. Ensure that all protective clothing and equipment is isolated for disposal or cleaning. Ensure proper decontamination of emergency personnel before they leave the scene. Personnel should monitor for the presence of hazardous vapors before removing respiratory protection equipment. Dispose of contaminated material as soon as possible in accordance with applicable local, state and federal environmental regulations. Consult environmental specialists for assistance, as needed. Take into account while planning the response that xylene is a highly flammable substance that may float on water. Beware of possible heavy vapor accumulations in pits, hollows or depressions.

XYLENE

Class 3 (Flammable Liquid)

AIR RELEASE

TECHNIQUE

IMPLEMENT PUBLIC PROTECTIVE ACTIONS . . . Where possible, evacuate local and downwind areas as conditions warrant to prevent exposure and to allow vapors or fumes to dissipate. If evacuation is not possible, or may increase risk to the population, shelter in place. The decision to evacuate or to shelter will be affected by many factors, some of which may be degree of health hazard, amount of spilled material, movement of vapors, weather conditions or number of people affected. For shelter in place, direct the people inside to close all doors and windows, shut off all HVAC (Heating, Venting and Air conditioning) systems, and turn on local AM and FM radio stations for emergency broadcast. Evacuation guidelines can be found under the General Information section on page 1.

CONSEQUENCE

Need to notify, organize, transport, house and communicate with displaced/affected persons.

MITIGATION

Stop leak if without risk and if proper equipment available. Allow vapors and fumes to dissipate completely before reentering spill area without special protective gear. Consult qualified experts for assistance.

TECHNIQUE

MONITOR THE SITUATION . . . Xylene may not evolve large amounts of hazardous airborne contaminants in many outdoor spill situations. It may be advisable in some cases to simply monitor the spill using a combustible gas indicator to check for flammable vapors until the spilled product is removed.

CONSEQUENCE

Hazardous levels of xylene in air may be found in the local spill area and immediately downwind.

MITIGATION

Remove the spilled product as soon as possible. Restrict access to the local spill area and areas immediately downwind by unprotected personnel.

TECHNIQUE

WATER FOG OR SPRAY . . . Water fog or spray applied to xylene vapors or fumes may absorb vapors, knock down fumes and accelerate their dispersal in the atmosphere. Xylene may float on water. Do not use direct stream of water. Product may be carried across water surface spreading fire or carrying product to source of ignition. NOTE: Water should be applied at a point downwind of the spill.

CONSEQUENCE

Increases in spill surface area and atmospheric conditions may increase the rate of vapor generation. In enclosed areas, runoff may add to spill volume and overfill impoundments. Water runoff may contain xylene from contact with its vapors or fumes.

MITIGATION

Contain contaminated water and remove or neutralize as soon as possible to prevent spread of contamination. Be alert to conditions such as fire hose runoff or rainwater that may add to spill volume and overfill impoundments. Consult qualified experts for safe neutralizing techniques.

TECHNIQUE

FOAM . . . Firefighting foam applied to the surface of liquid pools may slow the release of xylene vapors into the atmosphere.

CONSEQUENCE

The effects of foam may be short term. As the foam breaks down, release of vapors will increase. Products of foam breakdown will add to the volume of spilled material.

MITIGATION

Continue foam applications until spilled product is removed. Contain increased volume.

XYLENE

Class 3 (Flammable Liquid)

LAND SPILL

TECHNIQUE

CONTAINMENT DIKES . . . Xylene may be contained by building dikes using soil, dry sand or other non-combustible materials.

CONSEQUENCE

Contained xylene may percolate into soil or seep through dike material. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove or neutralize contained product as soon as possible to prevent spread of contamination. The integrity of dikes should be monitored periodically since they may fail over time. Be alert to conditions such as fire hose runoff or rainwater that may overfill impoundments. Where possible, line collection area with compatible impervious materials.

TECHNIQUE

EXCAVATION . . . Spills of material may be confined by building trenches or ditches.

CONSEQUENCE

Material may leach into soil. Deep excavations may increase the potential for groundwater contamination in some areas. This may result in loss of contained product and spread of contamination.

MITIGATION

Remove material from contaminated area as quickly as possible to prevent possible contamination beyond the spill area. Be alert to conditions such as increasing spill volume with runoff or rainwater which may overfill diked areas. If possible, containment areas should be lined with suitable, impervious material to prevent penetration into soil.

TECHNIQUE

PUMPING/VACUUM SUCTION . . . Spilled material contained in diked areas may be recovered using compatible hoses, pumps and vacuum trucks. All product transfer equipment should be properly bonded and grounded.

CONSEQUENCE

Equipment that is not compatible with the spilled product may become damaged and present a safety hazard for response personnel. Mechanical equipment will become contaminated with removed product.

MITIGATION

Use equipment constructed of materials compatible with the spilled product. Decontaminate equipment.

TECHNIQUE

ABSORPTION . . . Spreading of spilled product may be controlled by absorbing liquid with sand, earth, clay, fly ash, cement powder, peat moss, saw dust, straw, commercial sorbents, or other compatible substances.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material.

MITIGATION

Deplete accumulated liquid pools with pumps or vacuum trucks if possible before applying sorbents. Remove contaminated sorbents to safe storage by mechanical means. Where necessary, neutralize sorbents under guidance of qualified expert.

TECHNIQUE

MECHANICAL REMOVAL . . . Contaminated soil and spilled product may be removed by shovels, motorized graders and scrapers, loaders, bulldozers and draglines.

CONSEQUENCE

Removal equipment may become contaminated and present a hazard to later users. Incompatible equipment may be damaged or corroded. Improper storage of removed materials may result in future spread of contamination. Any flammable vapors or gases present in the area may be ignited by motorized removal equipment.

MITIGATION

Decontaminate all equipment after use. Use equipment compatible with spilled product. Store contaminated materials in safe and secure location. Do not operate motorized equipment in potentially flammable atmospheres.

XYLENE

Class 3 (Flammable Liquid)

WATER SPILL

TECHNIQUE

STOP USE . . . Notify downstream industrial, municipal and public users to stop water intake or to monitor water for contamination.

CONSEQUENCE

Alternative water supplies may need to be established. Consult environmental specialists for assistance, as needed.

MITIGATION

Provide alternative water supplies as needed until water supply is declared safe.

TECHNIQUE

FLOATING BOOMS/BARRIERS . . . Oil spill containment booms of compatible material may be deployed. Alternatively, mesh or nets may be strung across stream and anchored every 6–8 feet. Straw or peat placed on upstream side of mesh should absorb and retard spreading of spilled product.

CONSEQUENCE

Leakage may occur under or through barrier if high waves or current present or if not properly deployed. Incompatible materials may be damaged by spilled product. Booms, barrier materials, and deployment equipment may be contaminated. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Stage barriers in series where necessary. Recover spilled product as soon as possible. Decontaminate equipment after use. Dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

TECHNIQUE

UNDER-FLOW DAMS . . . Streams may be provided with a by-pass dam. This is a dam made of compacted earth, clay, or other material with open tubes or pipes passing through under water. Upstream ends of pipes or tubes should be well below the layer of floating contaminant. Downstream ends should be at a higher elevation but still below the floating layer. Valves may be installed on downstream ends to control water flow.

CONSEQUENCE

Earthen dams may become saturated with water and seep through or collapse. An insufficient number of by-pass tubes or pipes or additional water may cause overflow.

MITIGATION

Use sufficient number and capacity of tubes or pipes. Be alert to conditions that may lead to dam overflow or collapse. Remove spilled product as soon as possible.

TECHNIQUE

DIVERSION . . . Where other means are unavailable, floating slicks may be temporarily herded, diverted, or controlled using water hose streams, small boat propeller wash or chemical surface tension modifiers known as spill herders.

CONSEQUENCE

Hose streams and propeller washes have limited applicability and effectiveness. The latter may cause undesired mixing of spilled product and water due to extreme agitation. Chemical spill herders should not be used until approval is obtained from authorized environmental officials.

MITIGATION

Use other means if available.

TECHNIQUE

SURFACE SKIMMING . . . Oil spill skimming devices may be deployed to recover floating xylene.

CONSEQUENCE

Incompatible equipment may be damaged. Equipment may be contaminated and pose hazard to future users. Fire hazard may pose risk to response personnel and equipment.

MITIGATION

Decontaminate equipment after use. Use compatible equipment. Store recovered product in safe and secure location. Eliminate ignition sources.

TECHNIQUE

ABSORPTION . . . Straw, hay, peat, or commercial sorbent materials compatible with xylene may be used to absorb spilled product from the water surface, preferably after the spill has been contained.

CONSEQUENCE

Once used, sorbent materials pose the same hazards as the spilled product. Their use adds to the overall volume of contaminated material. Deployment and recovery can be difficult. Fire hazards pose risk to response personnel and equipment.

MITIGATION

Proceed with caution. Decontaminate equipment after use. Store and dispose of waste materials in proper and safe manner. Use compatible equipment. Eliminate ignition sources.

When required on tank cars,portable tanks or cargo tanks,identification numbers,as specified in §172.101,shall be displayed on an orange panel or placard.§172.332.An identification number may not be displayed on a Dangerous,Radioactive or Explosives placard.172.334(a); but if a tank car, portable tank or cargo tank carrying such a commodity requires an identification number, it must be displayed on an orange panel.§172.332.

APPENDIX B
NATIONAL FIRE PROTECTION ASSOCIATION (NFPA Fire Diamonds)
(NFPA No. 49-1994)

Degrees of Health Hazard Color Code: BLUE		Degrees of Flammability Hazard Color Code: RED		Degree of Reactivity (Instability) Hazard Color Code: YELLOW	
Severity of the Effects of Exposure		Susceptibility of Materials to Burning		Quantity of Energy Release	
Degree		Degree		Degree	
4	Materials that, on very short exposure, could cause death or major residual injury, including those that are too dangerous to be approached without specialized protective equipment	4	Materials that will rapidly or completely vaporize at atmospheric pressure and normal ambient temperature or that are readily dispersed in air, and which will burn readily.	4	Materials that in themselves are readily capable of reaction at normal temperatures and pressures. This degree usually includes materials that are sensitive to localized thermal or mechanical shock at normal temperatures and pressures
3	Materials that, on short exposure, could cause serious temporary or residual injury, including those requiring protection from all bodily contact.	3	Liquids and solids that can be ignited under almost all ambient temperature conditions. Materials in this degree produce hazardous atmospheres with air under almost all ambient temperatures or, through unaffected by ambient temperatures, are readily ignited under almost all conditions.	3	Materials that in themselves are capable of detonation or explosive decompositions or explosive reaction, but that require a strong initiating source or that must be heated under normal confinement before initiation.
2	Materials that, on intense or short exposure, could cause temporary incapacitation or possible residual injury, including those requiring the use of respiratory protective equipment that has an independent air supply.	2	Materials that must be moderately heated or exposed to relatively high ambient temperatures before ignition can occur. Materials in this degree would not under normal conditions form hazardous atmospheres with air, but under high ambient temperature or moderate heating may release vapor in sufficient quantities to produce hazardous atmospheres with air.	2	Materials that readily undergo violent chemical change at elevated temperatures and pressures.
1	Materials that, on short exposure, could cause irritation, but only minor residual injury, including those requiring the use of an approved air-purifying respiratory.	1	Materials that must be preheated before ignition can occur. Materials in this degree require considerable preheating, under all ambient temperature conditions, before ignition and combustion can occur.	1	Materials that in themselves are normally stable, but that can become unstable at elevated temperatures and pressures.
0	Materials that on short exposure under fire conditions, would no other hazard beyond that or ordinary of ordinary combustible materials	0	Materials that will not burn. This degree usually includes any material that will not burn in air when exposed to a temperature of 1500°F (815.5°C) for a period of 5 minutes	0	Materials that in themselves are normally stable, even under fire conditions

Excerpted from NFPA 49, Hazardous Chemicals Data 1994 Edition with permission from NFPA in 1980. For complete information on the types of materials usually included within each degree please refer to NFPA 49.

THIS PAGE INTENTIONALLY LEFT BLANK

APPENDIX C

INTERNATIONAL MARITIME ORGANIZATION (IMO) International Maritime Dangerous Goods (IMDG) Code

CLASS DEFINITIONS

CLASS 1—EXPLOSIVES

Class 1 comprises:

(a) Explosive substances (a substance which is not itself an explosive but which can form an explosive atmosphere of gas, vapor or dust is not included in class 1), except those which are too dangerous to transport or those where the predominant hazard is one appropriate to another class;

(b) Explosive articles, except devices containing explosive substances in such quantity or of such a character that their inadvertent or accidental ignition or initiation during transport should not cause any effect external to the device either by projection, fire, smoke, heat or loud noise; and

(c) Substances and articles not mentioned under (a) and (b) which are manufactured with a view to producing a practical, explosive or pyrotechnic effect.

Class 1 is Divided into five divisions:

Division 1.1 Substances and articles which have a mass explosion hazard

Division 1.2 Substances and articles which have a projection hazard but not a mass explosion hazard

Division 1.3 Substances and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard

This division comprises substances and articles:

(a) which give rise to considerable radiant heat; or

(b) which burn one after another, producing minor blast or projection effects or both.

Division 1.4 Substances and articles which present no significant hazard

This division comprises substances and articles which present only a small hazard in the event of ignition or initiation during transport. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire must not cause virtually instantaneous explosion of almost the entire contents of the package.

Note: Substances and articles in this division are in compatibility group S if they are so packaged or designed that any hazardous effects arising from the accidental functioning are confined within the package unless the package has been degraded by fire, in which case all blast or projection effects are limited to the extent that they do not significantly hinder fire fighting or other emergency response efforts in the immediate vicinity of the package.

Division 1.5 Very insensitive substances which have a mass explosion hazard

This division comprises substances which have a mass explosion hazard but are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport.

Division 1.6 Extremely insensitive articles which do not have a mass explosion hazard

This division comprises articles which contain only extremely insensitive detonating substances and which demonstrate a negligible probability of accidental initiation or propagation.

Note: The risk from articles of division 1.6 is limited to the explosion of a single article.

CLASS 2—GASES

A gas is a substance which:

(a) at 112°F (50°C) has a vapor pressure greater than 300 kPa; or

(b) is completely gaseous at 68°F (20°C) at a standard pressure of 101.3 kPa.

The transport condition of gas is described according to its physical state as:

(a) Compressed gas - a gas (other than in solution) which, when packaged under pressure for transport, is entirely gaseous at 20°C;

(b) Liquefied gas - a gas which, when packaged for transport, is partially liquid at 20°C;

(c) Refrigerated liquefied gas - a gas which, when packaged for transport, is made partially liquid because of its low temperature; or

(d) Gas in solution - compressed gas which, when packaged for transport, is dissolved in a solvent.

Note: In cases (a), (b) and (d) above, the gases are normally under pressure.

Class 2 is subdivided further, namely:

Class 2.1—Flammable gases
Class 2.2—Non-flammable, non-toxic gases
Class 2.3—Toxic gases

CLASS 3—FLAMMABLE LIQUIDS

Flammable liquids are liquids, or mixtures of liquids, or liquids containing solids in solution or suspension (such as paints, varnishes, lacquers, etc., but not including substances which, on account of their other dangerous characteristics, have been included in other classes) which give off a flammable vapor at or below 141.8°F (61°C) closed cup test (corresponding to 150°F (65.6°C) open cup test), normally referred to as the flashpoint. This also includes:

(a) Liquids offered for transport at temperatures at or above their flashpoint; and

(b) Substances transported or offered for transport at elevated temperatures in a liquid state, which give off a flammable vapor at temperatures equal to or below the maximum transport temperature.

CLASS 4—FLAMMABLE SOLIDS; SUBSTANCES LIABLE TO SPONTANEOUS COMBUSTION; SUBSTANCES WHICH, IN CONTACT WITH WATER, EMIT FLAMMABLE GASES

Class 4 deals with substances, other than those classified as explosives, which, under conditions of transport, are readily combustible or may cause or contribute to a fire. Class 4 is subdivided as follows:

Class 4.1 Flammable solids. Solids which, under conditions encountered in transport, are readily combustible or may cause or contribute to fire through friction; self-reactive substances (solids and liquids) which are liable to undergo a strongly exothermic reaction; solid desensitized explosives which may explode if not diluted sufficiently;

Class 4.2 Substances liable to spontaneous combustion. Substances (solids and liquids) which are liable to spontaneous heating under normal conditions encountered in transport, or to heating up in contact with air, and being then liable to catch fire;

Class 4.3 Substances which, in contact with water, emit flammable gases. Substances (solids and liquids) which, by interaction with water, are liable to become spontaneously flammable or to give off flammable gases in dangerous quantities.

CLASS 5 - OXIDIZING SUBSTANCES AND ORGANIC PEROXIDES

Class 5 is divided into two classes as follows:

Class 5.1 Oxidizing substances. Substances which, while in themselves not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. Such substances may be contained in an article;

Class 5.2 Organic peroxides. Organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. Organic peroxides are thermally unstable substances which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties:
- be liable to explosive decomposition;
- burn rapidly;
- be sensitive to impact or friction;
- react dangerously with other substances;
- cause damage to the eyes.

CLASS 6 - TOXIC AND INFECTIOUS SUBSTANCES

Class 6 is subdivided into two classes as follows:

Class 6.1 Toxic substances. These are substances liable either to cause death or serious injury or to harm human health if swallowed or inhaled, or by skin contact.

Class 6.2 Infectious substances. These are substances known or reasonably expected to contain pathogens. Pathogens are defined as micro-organisms (including bacteria, viruses, rickettsiae, parasites, fungi) or recombinant micro-organisms (hybrid or mutant), that are known or reasonably expected to cause infectious disease in animals or humans.

CLASS 7 - RADIOACTIVE MATERIAL

Radioactive material means any material containing radionuclides where both the activity concentration and the total activity in the consignment exceed the values specified in the IMDG Code.

CLASS 8 – CORROSIVE SUBSTANCES

Class 8 substances (corrosive substances) means substances which, by chemical action, will cause severe damage when in contact with living tissue or, in the case of leakage, will materially damage, or even destroy, other goods or the means of transport.

CLASS 9 - MISCELLANEOUS DANGEROUS SUBSTANCES AND ARTICLES

Class 9 substances and articles (miscellaneous dangerous substances and articles) comprise:

(a) Substances and articles not covered by other classes which experience has shown, or may show, to be of such a dangerous character that the provisions of the Code should apply; these include substances that are transported or offered for transport at temperatures equal to or exceeding 212°F (100°C) in a liquid state, and solids that are transported or offered for transport at temperatures equal to or exceeding 464°F (240°C); and

(b) Substances which are considered marine pollutants.

THIS PAGE INTENTIONALLY LEFT BLANK

APPENDIX D

GLOSSARY

ACGIH: American Conference of Governmental Industrial Hygienists, 6500 Glenway Ave., Bldg. D-5, Cincinnati, OH 45211 (513-661-7881)

Acidic: Acid forming; having a pH below 7.

Acidosis: An abnormal state of reduced alkalinity of the blood and body tissues.

Active metals: This refers to metals such as aluminum, calcium, magnesium, potassium, sodium, tin, zinc, and their alloys.

Acute exposures: An acute exposure to a chemical is one that takes place over a short period of time and that is unlikely to be repeated in the immediate future.

Alkali: Any substance, which in a water solution, is bitter, irritating, or caustic to the skin and has a pH value greater than 7.0. Alkali/water solutions turn litmus blue. Examples include sodium hydroxide and sodium carbonate (soda ash).

Alkali metals: Metals (in Group IA of the Periodic Table,) such as lithium, sodium, potassium, rubidium, cesium, and francium. Except for francium, the alkali metals are all soft, silvery metals, which may be readily fused and turned into vapor, the melting and boiling points becoming lower with increasing atomic weight. They react vigorously, at times violently, with water. These metals present a dangerous fire risk when in contact with moisture or oxidizing materials.

Alkaline earth metals: Calcium, barium, strontium, and radium (Group IIA of Periodic Table). In general alkaline earth metals are various shades of white, malleable, extrudable, and machinable, and may be made into rods, wire, or plate. These are less reactive than sodium and potassium and have higher melting and boiling points.

Alkyl: A straight or branched hydrocarbon group, which may be derived by dropping one hydrogen molecule from the chemical formula. Examples are methyl, CH_3-; ethyl, C_2H_5-; propyl, $CH_3CH_2CH_2$-; and isopropyl, $(CH_3)2CH_3$-.

Allergen: A substance that may produce an allergic reaction (e.g., plant pollens, some chemicals). Allergens produce antibodies when they come into contact with body tissues by inhalation, ingestion or skin absorption.

Amines: A class of organic compounds of nitrogen that may be considered as derived from ammonia WHO by replacing one or more of the hydrogen atoms (H) with straight or branched hydrocarbon (alkyl) groups. All amines are basic in nature and usually combine readily with hydrochloric or other strong acids to form salts.

Ammonracal: Relating to, containing, or having the properties of ammonia.

Amyl nitrate pearle: This is a drug used in treating the effects of cyanide poisoning.

Anhydrous: Free from water.

Anion: A negatively charged ion; when put in a liquid subjected to electric potential, anions collect at the positive pole or anode. Examples are hydroxyl, OH-; carbonate, $C0_3$-; and phosphate, $P0_4$-.

Anoxia: A condition where the deficiency of oxygen reaching the tissues of the body is of such severity that it results in permanent damage.

Anuria: Absence or a defect in the excretion of urine.

Aqueous: Relating to or resembling water; made from, with, or by water.

Aromatic: A major group of hydrocarbons containing one or more rings like benzene, which has a six-carbon ring containing three double bonds. Most compounds in this group are derived from petroleum and coal tar and are reactive and chemically versatile. The name characterizes the strong and pleasant odor of most substances of this group. *Note:* The term "aromatic" is often used in perfume and fragrance industries to describe essential oils, which are not aromatic in the chemical sense.

Asphyxiation: An action to kill or to make unconscious through lack of adequate oxygen.

Autoignition Temperature: The minimum temperature at which the material will ignite without a spark or flame being present. Along with the flash point, autoignition temperature gives an indication of relative flammability.

Azeotrope: A liquid mixture of two or more substances, which behaves like a single substance in that the vapor produced by partial evaporation of the liquid, has the same composition as the liquid.

Base: Bases are caustic and corrosive to skin, eyes, and mucous membranes. The pH range of base solutions is from 7.1 to 14. This class of compounds has one or more of the following properties: bitter taste, slippery feeling in solution, ability to turn litmus blue, ability to react with (neutralize) acids to form salts. This includes both hydroxides and oxides of metals.

Behavior in Fire: Any characteristic behavior that might increase significantly the hazard presented by the burning material (e.g., dense smoke, flammable vapors, toxic smoke, polymerization or explosion potential).

Blepharaspasm: A twitching or spasmodic contraction of one of the eye muscles due to habit, spasm, eyestrain, or nervous irritability.

Blephar: Eyelid; cilium; flagellum.

BLEVE: Boiling Liquid Expanding Vapor Explosion. In addition to its technical meaning, this acronym has acquired a common usage definition in which the term has come to stand for virtually any rupture of a tank of liquid or liquefied compressed gas. It has been expanded to include all vapor explosions. The technical definition of BLEVE presents the hypothesis that rapid depressurization of a hot, saturated liquid may result in an explosion. The temperature of the hot liquid must be above the superheat limit temperature at one atmosphere and the drop in tank pressure must be very rapid. This requires instantaneous homogeneous nucleation of the hot liquid. This phenomenon has NOT been observed as the cause of a failure of a transportation container. See the discussion about BLEVE in the Introduction.

Boiling Point: The temperature at which the material boils.

Burning Rate: The rate, in millimeters per minute, at which the depth of a pool of a liquid decreases as the liquid burns.

Carbonate: A salt or ester of carbonic acid. These compounds result from the reaction of either a metal or an organic compound with carbonic acid. The reaction with a metal yields a salt (i.e., calcium carbonate), and that with an organic compound forms an ester, (i.e., diethyl carbonate, or diphenyl carbonate).

Cation: An ion having a positive charge. Cations in a liquid subjected to electric potential collect at the negative pole or cathode.

Chemical Abstract Service (CAS) Number: Often used by state and local Right-To-Know regulations for tracking chemicals in the workplace and the community. Sometimes referred to as a chemical's "social security number." Sequentially assigned CAS numbers identify specific chemicals and have no chemical significance.

Chemical Formula: The most common chemical formula or formulation for the commodity.

Chemically active metals: This phrase generally refers to metals such as aluminum, calcium, magnesium, potassium, sodium, tin, zinc, and their alloys.

Chronic exposures: A chronic exposure to a chemical is one that takes place repeatedly over a long period of time. Chronic exposures are typically associated with long-term presence of chemical contaminants in an individual's environment or place of work.

Chronic: Marked by long duration or frequent recurrence; the opposite of acute.

Cold Zone: See Hazard Control Zones.

Color of the Shipped Material: Normal observed color of the material.

Common Uses: Primary commercial and household uses of the commodity.

Conditions to Avoid: Conditions that increase the level of hazard when encountered by the commodity.

Conjunctiva: The mucous membrane that lines the inner surface of the eyelids and is continued over the forepart of the eyeball.

Consequence: A potentially adverse result of implementing a given technique.

Constituent Components (% each): Typical product purity for single component materials or components of mixtures, including typical added stabilizers and inhibitors.

Cornea: The transparent part of the coat of the eyeball that covers the iris and pupil and admits light to the interior of the eye.

Corrosiveness: The ability of the commodity to react with, specifically to reduce or oxidize, commonly encountered materials such as metal, glass, rubber, etc.

Defatting: To remove or eliminate fat.

Delirium: A condition of mental excitement, confusion, and clouded sensorium, usually with hallucinations, illusions, and delusions. It is precipitated by toxic factors in diseases or drugs.

Dermatitis: Inflammation of the skin.

Edema: An abnormal accumulation of watery fluid in connective tissue or in a watery cavity; this water accumulation may cause swelling.

Encephalo-: A prefix meaning brain.

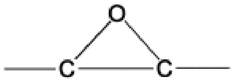
Encephalopathy: Disease of the brain.

Epinephrine: A hormone of the adrenal glands that is readily soluble in aqueous solutions of mineral acids, sodium hydroxide, and potassium hydroxide. It is used as a heart stimulant, a vasoconstrictor, and a muscle relaxant.

Epidermis: The outer layer of the skin of an animal with a backbone.

Epithelium: A tissue composed of cells that have a minimum of substances between them. It forms the epidermis (skin) and lines hollow organs and all passages of the respiratory, digestive, genital, and urinary organs.

Epoxide: An organic compound containing a reactive group resulting from the union of an oxygen atom with other atoms (usually carbon) that are joined as shown below:



This group, commonly called "epoxy," characterizes the epoxy resins. Epichlorohydrin and ethylene oxide are well-known epoxides.

Erythema: Abnormal redness of the skin due to capillary congestion (as in inflammation).

Evaporation Rate. The rate at which a particular substance will vaporize (evaporate) when compared to the rate of a known substance typically n-butyl acetate, but also can be compared to ethyl ether. This term is especially useful for health and fire-hazard considerations.

Evacuate means move all people from a threatened area to a safer place. To perform an evacuation, there must be enough time for people to be warned, to get ready, and to leave an area. If there is enough time, evacuation is the best protective action. Begin evacuating people nearby and those outdoors in direct view of the scene. When additional help arrives, expand the area to be evacuated downwind and crosswind to at least the extent recommended in this guidebook. Even after people move to the distances recommended, they may not be completely safe from harm. They should not be permitted to congregate at such distances. Send evacuees to a definite place, by a specific route, far enough away so they will not have to be moved again if the wind shifts.

Exothermic: A process or chemical reaction that is accompanied by evolution of heat, as combustion reactions.

Explosion proof equipment: Equipment that will not spark and is intrinsically safe.

Explosiveness: An indication of the susceptibility of the material to detonation by spark, shock, fire, etc.

Extinguishing Materials: Materials that may be used to extinguish the burning commodity.

Extinguishing Techniques: Techniques that may be used to extinguish the burning commodity.

First Aid for Ingestion: Initial first aid treatment for persons who have swallowed the commodity.

First Aid for Inhalation: Initial first aid treatment for persons who have breathed the airborne commodity.

First Aid for Skin and Eye Contact: Initial first aid treatment for persons suffering from skin or eye contact with the commodity.

Flammable (Explosive) Range; The range of gas or vapor concentration (percentage by volume in air) that will burn or explode if an ignition source is present. Limiting concentrations are commonly called the "lower flammable (explosive) limit" and the "upper flammable (explosive) limit." Below the lower flammable limit, the mixture is too lean to burn; above the upper flammable limit, the mixture is too rich to burn. If the gas or vapor is released into an oxygen enriched atmosphere, the flammable range will expand. Likewise, if the gas or vapor is released into an oxygen deficient atmosphere, the flammable range will contract.

Flash Point: The lowest temperature at which vapors above a volatile, combustible, substance will ignite in air when exposed to a flame. This gives an indication of the relative flammability of the material.

Flocculant: A substance that causes clumping (flocculation). Flocculants are used in water purification, liquid waste treatment, and other special applications. Inorganic flocculants are lime, alum, and ferric chloride. Polyelectrolytes are examples of organic flocculants.

Freezing Point: The temperature at which a material changes from a liquid to a solid.

Frostbite: The freezing or the local effect of a partial freezing of some part of the body.

Full protective clothing: This phrase refers to the fully encapsulating suits discussed in the Protective Clothing sections of the guides. Such suits are typically recommended where high chemical gas, vapor, or fume concentrations in air may have a corrosive effect on exposed skin and/or where the chemical in air may be readily absorbed through the skin to cause toxic effects. These suits are impervious to chemicals, offer full body protection, and include self-contained breathing apparatus (SCBA).

Fully encapsulating suits: This includes full chemical protective suits that are impervious to chemicals, offer full body protection from chemicals and their vapors/ fumes, and are to be used with self-contained breathing apparatus (SCBA).

Fume: The particulate, smoke-like emanation from the surface of heated metals. The vapor evolved from concentrated acids (sulfuric, nitric), from evaporating solvents or as a result of combustion or other decomposition reactions (exhaust fume). Many of these fumes are toxic.

General Cleanup Information: Non-specific approaches to cleaning up spilled material.

Halogen: One of the electronegative elements of Group VII A of the Periodic Table: fluorine, chlorine, bromine, iodine, and astatine. Fluorine is the most active of all chemical elements.

Hazard to Skin and Eye Contact: Situations that may result from skin or eye contact with the commodity.

Hazard Class: The hazard class shown in the guides is that currently used by the U.S. DOT and is published in 49 CFR §172.101. This hazard class represents the main hazard of the commodity in U.S. transportation. The hazard classes used in the U.S. are: explosives (Class 1), flammable gas (Division 2.1, non-flammable gas (Division 2.2), poison (or toxic) gas (Division 2.3, flammable liquid (Class 3), combustible liquid, flammable solid (Division 4.1), spontaneously combustible material (Division4.2), dangerous when wet material (Division 4.3), oxidizer (Division 5.1), organic peroxide (Division .2), poisonous material (Division 6.1), infectious substance (Division 6.2), radioactive material (Class 7), corrosive materials (Class 8), and miscellaneous hazardous material (Class 9).

Hazard Control Zones: The designation of areas at a hazardous materials incident based upon safety and the degree of hazard. Many terms are used to describe these hazard control zones; however, for the purposes of this text, these zones are defined as the hot, warm and cold zones.

Hot Zone: An area immediately surrounding a hazardous materials incident, which extends far enough to prevent adverse effects from hazardous materials releases to personnel outside the zone. This zone is also referred to as the “exclusion zone”, the “red zone”, and the “restricted zone” in other documents. Law enforcement personnel may also refer to this as the inner perimeter.

Warm Zone: The area where personnel and equipment decontamination and hot zone support takes place. It includes control points for the access corridor and thus assists in reducing the spread of contamination. This is also referred to as the “decontamination”, “contamination reduction”, “yellow zone”, “support zone”, or “limited access zone” in other documents.

Cold Zone: The hazard control zone of a hazmat incident that contains the incident command post and other support functions as are deemed necessary to control the incident. This zone may also be referred to as the clean zone or the support zone.

Hazardous Combustion Products: Any known materials in smoke from which may be hazardous.

Hazards of Ingestion: Situations that may result from introduction of the commodity into the gastrointestinal tract (e.g., swallowing).

Hazards of Inhalation: Situations that may result from breathing the airborne commodity.

HazMat Code (49 Series): The HazMat 49 series Code is a seven digit code that is used by the railroads to identify specific hazardous materials moving in their systems.

HCN: Hydrogen cyanide

Heat of Combustion: Amount of heat liberated during combustion one gram of material.

Hemoglobinuria: The presence of free hemoglobin (a blood protein) in the urine.

Hemoglobin: The respiratory protein of the red blood cells. It transfers oxygen from the lungs to the tissues and carbon dioxide from the tissues to the lungs.

Hemolysis: Liberation of hemoglobin from red blood cells.

Hemorrhage: An escape of blood from the vessels and organs either through intact walls or by flow through ruptured walls.

Hemorrhagic gastritis: The escape of blood from a ruptured vessel(s) within the lining of the stomach.

Hepatomegaly: Enlargement of the liver.

Hot Zone: See Hazard Control Zones.

Hydrocarbon: An organic compound (as acetylene or benzene) consisting exclusively of the elements carbon and hydrogen and often occurring in petroleum, natural gas, coal, and bitumens.

IMDG Designation: A hazardous material identifier published by the International Maritime Organization in their Dangerous Goods Code.

Immediately Dangerous to Life or Health (IDLH): An atmospheric concentration of any toxic, corrosive or asphyxiant substance that poses an immediate threat to life or would cause irreversible or delayed adverse health effects or would interfere with an individual's ability to escape from a dangerous atmosphere.

IMO: International Maritime Organization, London.

Impervious: Not allowing entrance or passage, impenetrable.

Insidious: Having a gradual and cumulative effect; developing so gradually as to be well established before becoming apparent.

Iridocyclitis: Inflammation of the iris and the lens of the eye.

Isolating the Scene: The process of preventing persons and equipment from becoming exposed to a actual or potential hazmat release. Includes establishing isolation perimeter and control zones.

Isolation Perimeter: The designated crowd control line surrounding the Hazard Control Zones. The isolation perimeter is always the line between the general public and the Cold Zone. Law enforcement personnel may also refer to this as the outer perimeter.

Isotopes: Any of two or more species of atoms of a chemical element with the same atomic number and position in the Periodic Table. These species have nearly identical chemical behavior but with differing atomic mass or mass number and different physical properties.

Lacrimation: The secretion of tears especially when abnormal or excessive; crying.

Lower Explosive Limit: See Flammable (Explosive) Range.

Lower Flammable Limit: See Flammable (Explosive) Range.

LRQ: Local Reportable Quantity—used only in these guides to identify the reportable quantity of extremely hazardous substance under SARA when no CERCLA reportable quantity has been established.

Malaise: An indefinite feeling of debility or lack of health often indicative of or accompanying the onset of an illness; a vague sense of ill-being.

Mania: Excitement manifested by mental and physical hyperactivity, disorganization of behavior, and elevation of mood; excessive or unreasonable enthusiasm.

Melting Point: The temperature at which the material changes from a solid to a liquid. (See freezing point)

Methemoglobinemia: The presence of methemoglobin, a blood pigment, in the blood that causes cyanosis (a bluish purplish coloring of the skin and lips), dizziness, headache, diarrhea, and anemia.

Mitigation: Techniques that may be used to control the negative results of implementing a response technique.

Molecular Weight: (also known as formula weight) The weight of the molecule; the sum of the atomic weight of its constituent atoms. This weight is usually computed to nearest hundredth.

Mordant: A substance capable of binding a dye to a textile fiber. The most important mordants are trivalent chromium complexes, metallic hydroxides, tannic acid, etc. Mordants are used with acid dyes, basic dyes, direct dyes, and sulfur dyes. Premetalized dyes contain chromium in the dye molecule. A mordant dye is a dye requiring use of a mordant to be effective.

NA: North American-When this precedes a four digit number, it indicates that this identification number is used in the United States to identify a commodity or group of commodities.

NFPA: National Fire Protection Association, Batterymarch Park, Quincy, MA 02269

NFPA 704: A system used by the National Fire Protection Association to simplify determining the degree of health, flammability and instability hazards of chemicals. The system also provides for the recognition of unusual water reactivity and oxidizers. The *NFPA 704* ratings are displayed in markings that are commonly referred to as the "NFPA hazard diamond", which is discussed in Appendix B. The "NFPA hazard diamond' is shown on page 3 of each of the Guides.

NIOSH: National Institute of Occupational Safety and Health, 4676 Columbia Parkway Cincinnati, OH 45226.

Narcosis: A state of stupor, unconsciousness, or arrested activity produced by the influence of narcotics or other chemicals.

Nitride: Compounds of nitrogen with N= as the anion. These compounds may react with moisture to evolve flammable ammonia gas.

Non-Specific Symptoms: Catalog of symptoms which may appear when the person is exposed the commodity and the route of entry is not known.

Odor Characteristics: The perceived quality and comparative characteristics of the odor of the material.

Olefin: Organic compounds with straight or branched chain carbon arrangement of the atoms that contain at least one double bond. They are named by adding "- ene", or "-ylene" to the base chemical name, e.g., octene, ethylene, and propylene.

Opacification: The process of becoming opaque and impervious to light such as in the opacity of the cornea or lens.

Opacity: The optical density of a material, usually a pigment.

OSHA: Occupational Safety and Health Administration, 950 Upshur Street, N.W., Washington, D.C. 20011.

Oxidizing materials: Any compound that spontaneously evolves oxygen either at room temperature or under slight heating. The term includes such chemicals as peroxides, chlorates, perchlorates, nitrates, and permanganates. These can react vigorously at ambient temperatures when stored near or in contact with reducing materials such as cellulosic (i.e., cotton, paper, rayon) and other organic compounds. In general, storage areas for oxidizing materials should be well ventilated and kept as cool as possible.

Photophobia: Intolerance or sensitivity to light.

Physical State as Released: Whether the material is released as a solid, liquid, or gas.

Physical State as Shipped: Whether the material is shipped as a solid, liquid, or gas.

Pneumo-: A prefix that means air, gas, lung, or pulmonary; i.e., pneumothorax.

Pneumonitis: Inflammation of the lung.

Polymerization: A chemical reaction, usually carried out with a catalyst, heat, or light, and often under high pressure. In this reaction a large number of relatively simple molecules combine to form a chain-like macromolecule. This reaction can occur with the release of heat. In a container, the heat associated with polymerization may cause the substance to expand and/ or release gas and cause the container to rupture, sometimes violently. The polymerization reaction occurs spontaneously in nature; industrially it is performed by subjecting unsaturated or otherwise reactive substances to conditions that will bring about the combination.

Protection In-Place: See Shelter-In Place.

Protective Clothing Required: Characteristics and OSHA criteria for required protection against contact with the material.

Pulmonary: Relating to or associated with the lung.

Pulmonary edema: A condition in which watery fluid fills the air vesicles and interstitial tissue of the lungs.

Reactivity with Other Chemicals: Chemical reactivity with common industrial or research chemicals, including rates and products if known.

Reactivity with Water: Chemical reactivity with water, including rates and products if known.

Reducing agents: These agents act to extract and liberate hydrogen from organic substances and may generate toxic and/or flammable gases and heat in contact with water. Many reducing agents may be pyrophoric and may ignite combustible materials in the presence of air. Contact with oxidizing materials may result in violent or explosive reactions. Examples of reducing agents include calcium, phosphorus, sodium, hydrazine, arsine, and metallic acetylides, aluminates, boranes, bromides, carbides, chlorides, hydrides, hydroborates, hyposulfites, iodides, phosphides, selenides, and silanes, as well as metal alkyls such as triethyl aluminum and diethyl zinc.

Reportable Quantity: The minimum amount of the substance spilled in the United States that must be reported to the National Response Center at 800-424-8002; in DC 202-426-2675.

Respiratory Protection Requires: Characteristics with OSHA criteria for required protection against inhalation of the material.

SCBA: Self-contained breathing apparatus.

Serous: Thin watery constitution.

Shipping Names: Synonyms under which the commodity may be shipped legally.

Shelter In-Place means people should seek shelter inside a building and remain inside until the danger passes. Sheltering in-place is used when evacuating the public would cause greater risk than staying where they are, or when an evacuation cannot be performed. Direct the people inside to close all doors and windows and to shut off all ventilating, heating and cooling systems. In-place protection may not be the best option if (a) the vapors are flammable; (b) if it will take a long time for the gas to clear the area; or (c) if buildings cannot be closed tightly. Vehicles can offer some protection for a short period if the windows are closed and the ventilating systems are shut off. Vehicles are not as effective as buildings for in-place protection.

Short Term Exposure Limit (STEL): See definition for Threshold limit value (TLV).

Solubility in Other Chemicals: Solubility of the commodity in non-aqueous solvents (i.e., not water). The same conventions as for solubility in water are used (i.e., soluble, insoluble, etc.).

Solubility in Water: Whether or not the material dissolves in water. Range is from insoluble, slightly soluble, soluble, very soluble, to miscible or soluble in all proportions.

Specific Gravity (Liquid): Ratio of the density of the commodity to the density of water. If greater than one, the material will sink; if less than one, the material will float.

Sputum: Expectorated matter made of saliva discharged from the respiratory passages; spit.

Splenomegaly: Enlargement of the spleen.

Stability: The potential for decomposition of the material during shipment. This rating *does not* apply during a fire.

STEL: Short Term Exposure Limit—see definition for Threshold limit value.

Sublime: To cause to pass from the solid to the vapor state by heating and again condensing to solid form (without going through the liquid state).

Substernal: Beneath the sternum (breastbone).

Synonyms and Trade names: Alternative systematic chemical names and commonly used names, including commercial or trade names.

Techniques: Techniques, which have been used to contain, or otherwise control the spilled commodity.

Tepid: Moderately warm.

Threshold Odor Concentration: The lowest concentration in air at which most people can detect and/or recognize the odor of the material.

Time Weighted Average (TLV-TWA): See definition for Threshold Limit Value.

TLV: Threshold Limit Value. Threshold Limit Values are specified as follows:

Threshold Limit Value/Ceiling (TLV/C):. The maximum concentration that should not be exceeded, even instantaneously. The lower the value, the more toxic the substance.

Threshold Limit Value/Short Term Exposure Limit (TLV/STEL): The 15-minute, time-weighted average exposure which should not be exceeded at any time, nor repeated more than four times daily with a 60-minute rest period required between each STEL exposure. The lower the value, the more toxic the substance.

Threshold Limit Value/Skin (Skin): Indicates a possible and significant contribution to overall exposure to a material by absorption through the skin, mucous membranes, and eyes by direct or airborne contact.

Threshold Limit Value/Time Weighted Average (TLV/TWA): The airborne concentration of a material to which an average, healthy person may be exposed repeatedly for 8 hours each day, 40 hours per week, without suffering adverse effects. The young, old, ill and naturally susceptible will have lower tolerances and will need to take additional precautions. TLVs are based upon current available information and are adjusted on an annual basis by organizations such as the American Conference of Governmental Industrial Hygienists (ACGIH). As TLVs are time weighted averages over an eight-hour exposure, they are difficult to correlate to emergency response operations. The lower the value, the more toxic the substance.

Toxicity: The quality of being toxic or poisonous; the kind and amount of poison or toxin produced by a microorganism.

TWA: Time Weighted Average-see definition for Threshold Limit Value.

Ulceration: The process that produces a break in skin or mucous membrane with loss of surface tissue, disintegration, and localized death of epithelial tissue. The break often festers and has an open sore.

UN: United Nations-When this precedes a 4-digit number, it indicates that this identification number is used internationally to identify a commodity or group of commodities.

Unusual Hazards: Any special hazards displayed by the material.

Upper Explosive Limit: See Flammable (Explosive) Range.

Upper Flammable Limit: See Flammable (Explosive) Range.

USDOT: United States Department of Transportation, 400 Seventh Street, S.W., Washington, D.C. 20590.

Vapor: An air dispersion of molecules of a substance that is liquid or solid in its normal state, i.e., at standard temperature and pressure. Examples are water vapor and benzene vapor. Vapors of organic liquids are also loosely called fumes.

Vapor Density: The ratio of the vapor density of the commodity compared to that of air. If the ratio is greater than 1, the vapors are heavier and may settle to the ground; if lower than 1, the vapors will rise.

Vapor Pressure: The pressure of the vapor in equilibrium with the liquid at the specified temperature. Higher values indicate higher volatility.

Ventricular fibrillation: An alteration in the rhythm of the heartbeat characterized by extremely rapid, irregular, and ineffective twitching of the heart chambers (ventricles). Ventricular fibrillation is a frequent cause of cardiac arrest.

Ventricle: A chamber of the heart that receives blood from a corresponding atrium and from which blood is forced into the arteries.

Warm Zone: See Hazard Control Zones.

APPENDIX F
ALPHABETIC CROSS REFERENCE

CHEMICAL	GUIDE
Acetene	Ethylene
Acetic acid, anhydride	Acetic anhydride
Acetic acid, butyl ester	Butyl acetate
Acetic acid ethenyl ester	Vinyl acetate
Acetic acid ethylene ether	Vinyl acetate
Acetic acid, 2-ethoxyethyl ester	Ethylene glycol monoethyl ether acetate
Acetic acid, ethyl ester	Ethyl acetate
Acetic acid (aqueous)	Acetic acid
Acetic acid, isobutyl ester	Isobutyl acetate
Acetic acid, 2-methylpropyl ester	Isobutyl acetate
Acetic, popyl ester	Propyl acetate
Acetic acid vinyl ester	Vinyl acetate
Acetic aldehyde	Acetaldehyde
Acetic anhydride	Acetic anhydride
Acetic ester	Ethyl acetate
Acetic ether	Ethyl acetate
Acetonyl bromide	Bromoacetone
2-Acetooxy propane	Isopropyl acetate
Acetoxyethane	Vinyl acetate
1-Acetoxyethylene	Vinyl acetate
Acetoxyl	Benzoyl peroxide
1-Acetoxypropane	Propyl acetate
Acetyl ether	Acetic anhydride
Acetylene trichloride	Trichloroethylene
Acetylenogen	Calcium carbide
Acetyl methyl bromide	Bromoacetone
Acetyl oxide	Acetic anhydride
Acid oil of vitriol	Sulfuric acid
Acifloctin	Adipic acid
Acinetten	Adipic Acid
ACN	Acrylonitrile, stabilized
Acquinite	Chloropicrin
Acraldehyde	Acrolein
Acroleic acid	Acrylic acid
Acrylaldehyde	Acrolein
Acrylic acid, butyl ester	Butyl acrylate
Acrylic acid, ethyl ester	Ethyl acrylate
Acrylic acid, 2-ethylhexyl ester	2-Ethylhexyl acrylate
Acrylic acid, methyl ester	Methyl acrylate, inhibited
Acrylic aldehyde	Acrolein
Acrylic amide	Acrylamide
Acrylic resin monomer	Methyl methacrylate
Acrylon	Acrylonitrile
Acrylonitrile	Acrylonitrile
Acrylonitrile monomer	Acrylonitrile
Acrylonitrile, inhibited	Acrylonitrile
Adilactetten	Adipic acid
Adipic acid dinitrile	Adipic acid
Adipic acid nitrile	Adipic acid
Adipic nitrile	Adipic acid
Adipinicc acid	Adipic acid
ADN	Adiponitrile
Aethylis	Ethyl chloride
Aethylis chloridum	Ethyl chloride
AHF	Hydrogen fluoride
Albone	Hydrogen peroxide
Alborn	Hydrogen fluoride
Alcohol C-8	Octanol
Alcohol of sulfur	Carbon disulfide
Aldehyde	Octyl aldehydes
C-8 aldehyde	Octyl aldehydes
Aldehido C-8	Octyl aldehydes
Allyl aldehyde	Acrolein
Allylic alcohol	Allyl alcohol
Aluminum sodium oxide	Sodium aluminate
Aminic acid	Formic acid
Aminobenzene	Aniline oil
2.2-Aminodiethanol	Diethanolamine
Aminoethane	Ethylamine
2-Aminoethanol	Ethanolamine
Aminoethyl alcohol	Ethanolamine
beta-Aminoethyl alcohol	Ethanolamine
Aminoethylene	Ethyleneimine
Aminomethane	Methylamine, anhydrous or aqueous solution
Aminomethane, anhydrous	Methylamine, anhydrous or aqueous solution
1-Amino-2-nitrobenzene	ortho-Nitroaniline
2-Aminopentane	Diethylamine
Aminophen	Aniline oil
1-Aminopropane	Propylamine
2-Aminopropane	Isopropylamine
3-Aminopropane	Allylamine
2-Aminopropylene	Allylamine
3-Amino-p-toluidine	2,4-Toluylenediamine
5-Amino-p-toluidine	2,4-Toluylenediamine
Ammonia monohydrate	Ammonium hydroxide
Ammonium solution (containing 44% or less ammonia in water)	Ammonium hydroxide
Ammonium solution (containing more than 44% ammonia)	Anhydrous ammonium
Ammonia water	Ammonium hydroxide
Ammonium bisulfide	Ammonium sulfide solution
Ammonium hydrate	Ammonium hydroxide
Ammonium hydrogen sulfide	Ammonium sulfide solution
Ammonium hydrosulfide	Ammonium sulfide solution
Ammonium hydrosulphide	Ammonium sulfide solution
Ammonium mercaptan	Ammonium sulfide solution
Ammonium nitrate-carbonate mixture	Ammonium nitrate
Ammonium nitrate mixed fertilizers	Ammonium nitrate
Ammonium nitrate-phosphate	Ammonium nitrate
Ammonium sulfhydrate	Ammonium sulfide solution
Ammonium sulphide, solution	Ammonium sulfide solution
AMS	Isopropylbenzene
Amsco tetramer	Propylene tetramer

CHEMICAL	GUIDE
Amyl hydride	Pentane
6-Aminocaproic acid lactam	Caprolactam
Amino caproic lactam	Caprolactam
6-Aminohexanoic acid cyclic lactam	Caprolactam
AN	Acrylonitrile, stabilized
Anhydrol	Ethyl alcohol
Anhydrous ethanol	Ethyl alcohol
Anhydrous hydrobromic acid	Hydrogen bromide
Anhydrous hydrochloric acid	Hydrogen chloride
Anhydrous hydrofluoric acid	hydrogen fluoride
Anilin	Aniline oil
Aniline	Aniline oil
Aniline, 2-nitro	ortho-Nitroaniline
Annulene	Benzene
Antisal 1A	Toluene
Anodynon	Ethyl chloride
Anprolene	Ethylene oxide
Anthracene oil	Coal Tar
Antiknock compound	Motor fuel antiknock compound
Aqua ammonia	Ammonium hydroxide
Aqua fortis	Nitric acid, red fuming
Aqualin	Acrolein
Aqueous ammonia	Ammonium hydroxide
Aqueous HF	Hydrofluoric acid
Aqueous hydrogen chloride	Hydrochloric acid
Arsenic chlorice	Arsenic trichloride
Arsenic (III) oxide	Arsenic trioxide
Arsenic oxide	Arsenic trioxide
Arsenic sesquioxide	Arsenic trioxide
Arsenic (III) trichloride	Arsenic trichloride
Arsenic, white, solid	Arsenic trioxide
Arsenious acid, solid	Arsenic trichloride
Arsenious chloride	Arsenic trichloride
Arsenious oxide	Arsenic trioxide
Arsenite	Arsenic trioxide
Arsenolite	Arsenic trioxide
Arsenous acid	Arsenic trioxide
Arsenous acid anhydride	Arsenic trioxide
Arsenous anhydride	Arsenic trioxide
Arsenous chloride	Arsenic trichloride
Arsenous oxide	Arsenic trioxide
Arsodent	Arsenic trioxide
Asphaltum	Asphalt
Arabenzene	Pyridine
Azacyclopropane	Ethyleneimine
Automotive gasoline	Gasoline
Aviation gasoline	Gasoline
Azine	Pyridine
Aziran	Ethyleneimine
Azirane	Ethyleneimine
Aziridine	Ethyleneimine
Azogien developer h	2,4-Toluylenediamine
Azotic acid	Nitric acid, red fuming
Basilin	Hydrogen chloride
Battery acid	Sulfuric acid
Benoxyl	Benzoyl peroxide
Benzenamine	Aniline oil
Benzene chloride	Chlorobenzene
p-Benzenediol	Hydroquinone

CHEMICAL	GUIDE
1,4-Benzenediol	Hydroquinone
Benzene, 1-chloro-2-niro	ortho-Nitrochlorobenzene
Benzene, 1-chloro-3-niro	meta-Nitrochlorobenzene
Benzene, 1-chloro-4-niro	para-Nitrochlorobenzene
Benzene-p-dicarboxylic acid	Terephthalic acid
1,4-Benzenedicarboxylic acid	Terephthalic acid
p-Benzenedicarboxylicacid	Terephthalic acid
Benzene, 1,2-dichloro	o-Dichlorobenzene
Benzene hexahydride	Cyclohexane
1,2-Benzenedicarboxylic acid anhydride	Phthalic anhydride
1,2-Benzenedicarboxylic anhydride	Phthalic anhydride
Benzene-o-dicarboxylic acid anhydride	Phthalic anhydride
Benzene, nitro	Nitrobenzene
Benzene sulfonic acid, dodecyl Ester	Dodecylbenzenesulfonic acid
Benzenol	Carbolic acid or phenol
Benzin	Gasoline
Benzine	Petroleum distillates, n.o.s.
Benzinoform	Benzoyl peroxide
Benzohydroquinone	Hydroquinone
Benzoic acid peroxide	Carbon tetrachloride
Benzol	Benzene
Benzole	Benzene
Benzolene	Petroleum distillates, n.o.s.
Benzophenol	Carbolic acid or phenol
Benzoquinol	Hydroquinone
Benzoyl superoxide	Benzoyl peroxide
beta-Methyl acrolein	Crotonaldehyde
Bicarburretted hydrogen	Butadiene
Binitrotoluene	Dinitrotoluenes
Biocide	Acrolein
BIO-SOFT®	Alcohol ethoxylates
bis (2-Hydroxyethyl) amine	Diethanolamine
Bitumen	Asphalt
Bivinyl	Butadiene
Bleaching powder	Calcium hypochlorite
Blended gasoline	Gasoline
Blue oil	Aniline oil
Boroethane	Diborane
Boron chloride	Boron trichloride
Boron hydride	Diborane
Bottled gas	Petroleum gas, liquefied
BOV	Sulfuric acid
BP	Benzoyl peroxide
BPO	Benzoyl peroxide
Bromallyene	Allyl bromine
Bromoethane	Vinyl bromide
Bromoethylene	Vinyl bromide
Bromofume	Ethylene dibromide
Bromomethane	Methyl bromide
Brom-o-gas	Methyl bromide

CHEMICAL	GUIDE
1-Bromo-2-propanone	Bromoacetone
Bromo-2-propanone	Bromoacetone
3-Bromopropene	Allyl bromide
3-Bromo-1-propene	Allyl bromide
3-Bromopropylene	Allyl bromide
Bromosol	Methyl bromide
Brown oil	Sulfuric acid
Brozone	Methyl bromide
Bunker C	Fuel oil
alpha-Butadiene	Butadiene
Buta-1,3-diene	Butadiene
1,3-Butadiene	Butadiene
gamma-Butadiene	Butadiene
trans-Butadiene	Butadiene
Butal	Butyraldehyde
Butahyde	Butyraldehyde
Butane, 1-chloro	Chlorobutanes
Butan-2-one	Methyl ethyl ketone
Butanal	Butyraldehyde
n-Butanal	Butyraldehyde
n-Butane	Butane
Butane,1,4-epoxy	Tetrahydrofuran
1,4-Butanedicarboxylic acid	Adipic acid
Butanol	Butyl alcohol
Butanol acetate	Butyl acetate
sec-Butanol	Butyl alcohol
tert-Butanol	Butyl alcohol
1-Butanol	Butyl alcohol
2-Butanol	Butyl alcohol
Butanone	Methyl ethyl ketone
2-Butanone	Methyl ethyl ketone
2-Butenal	Crotonaldehyde
alpha-Butene	Butylene
Butene	Butylene
1-Butene	Butylene
cis-Butenedioic anhydride	Maleic anhydride
1,4-Butindiol	1,4-Butynediol
2-Butin-1,4-diol	1,4-Butynediol
2-Butoxy-1-ethanol	Ethylene glycol monobutyl ether
2-Butoxyethanol	Ethylene glycol monobutyl ether
Butter of arsenic	Arsenic trichloride
Butyl Cellosolve®	Ethylene glycol monobutyl ether
Butyl 2-propenoate	Butyl acrylate
n-Butyl acetate	Butyl acetate
n-Butyl acrylate	Butyl acrylate
sec-Butyl alcohol	Butyl alcohol
tert-Butyl alcohol	Butyl alcohol
Butyl aldehyde	Butyraldehyde
n-Butyl-1-butanamine	Butylamine
n-Butyl chloride	Chlorobutanes
Butyl ester	Butyl acetate
Butyl ethanoate	Butyl acetate
alpha-Butylene	Butylene
Butylene hydrate	Butyl alcohol
Butylene oxide	Tetrahydrofuran
Butyl ethylene	1-Hexene
Butyl hydride	Butane
Butylic ester	Butyl acetate
Butyi oxitol	Ethylene glycol monobutyl ether
2-Butyne-1,4-diol	1,4-Butynediol

CHEMICAL	GUIDE
2-Butynediol	1,4-Butynediol
Butynediol	1,4-Butynediol
Butynediol-1,4	1,4-Butynediol
Butyral	Butyraldehyde
Butyric alcohol	Butyl alcohol
Butyric aldehyde	Butyraldehyde
Calcium acetylide	Calcium carbide
Calcium dicarbide	Calcium carbide
Calcium chlorhydrochlorite	Calcium hypochlorite
Calcium hypochloride	Calcium hypochlorite
Calcium oxychloride	Calcium hypochlorite
Calcium salt	Calcium hypochlorite
Caliche	Sodium nitrate
Camphor tar	Naphthalene
Capryl alcohol	Octanol
Caprylaldehyde	Octyl aldehydes
Caprylene	1-Octene
Caprylic alcohol	Octanol
Caprylic aldehyde	Octyl aldehydes
Cabacryl	Acrylonitrile
Carbamide	Urea
Carbamimidic acid	Urea
Carbide	Calcium carbide
Carbide of calcium	Calcium carbide
Carbinamine	Methylamine, (anhydrous or aqueous solution)
Carbinamine, anhydrous	Methylamine, anhydrous
Carbinol	Methanol
Carbona	Carbon tetrachloride
Carbon bisulphide	Carbon disulfide
Carbon bisulphuret	Carbon disulfide
Carbon chloride	Carbon tetrachloride
Carbon disulphide	Carbon disulfide
Carbon fluoride oxide	Perchloryl fluoride
Carbon hydride nitride	Hydrocyanic acid
Carbonic acid dichloride	Phosgene
Carbonic acid gas	Carbon dioxide
Carbonic anhydride	Carbon dioxide
Carbonic dichloride	Phosgene
Carbonice	Carbon dioxide
Carbonic oxide	Carbon monoxide
Carbon nitride	Cyanogen
Carbonochloride acid, 1-methylethyl ester	Isopropyl chloroformate
Carbonochloridic acid, ethyl ester	Ethyl chloroformate
Carbonochloridic acid, methyl ester	Methyl chloroformate
Carbonochloride acid, 1-methylethyl	Isopropyl chloroformate
Carbon oxychloride	Phosgene
Carbon sulfide	Carbon bisulfide
Carbon tet	Carbon tetrachloride
Carbonyl chloride	Phosgene
Carbonyldiamide	Urea
Carbonyldiamine	Urea
Carboxyethane	Propionic acid

CHEMICAL	GUIDE
Cat cracker feedstock	Fuel oil
Casing head gasoline	Gasoline
Caustic arsenic chloride	Arsenic trichloride
Caustic oil of arsenic	Arsenic trichloride
Caustic potash	Potassium hydroxide or sodium hydroxide
Caustic potash, dry, solid, flake, bead, or granular	Potassium hydroxide
Caustic potash, liquid or solution	Potassium hydroxide or sodium hydroxide
Caustic soda (liquor, liquid or solution)	Sodium hydroxide
Celfume	Methyl bromide
Cellosolve	Ethylene glycol monoethyl ether
Cellosolve acetate	Ethylene glycol monoethyl ether
Celphos	Phosphine
Chelen	Ethyl chloride
Chamber acid	Sulfuric acid
Chile niter	Sodium nitrate
Chile nitrate	Sodium nitrate
Chile saltpeter	Sodium nitrate
Chloroacetic acid	Chloroacetic acid (solid or solution)
Chloroallylene	Allyl chloride
Chlorate of soda	Sodium chlorate
Chlorcyan	Cyanogen chloride
Chlorene	Ethyl chloride
1-Chlor-2,3-epoxypropane	Epichlorohydrin
Chloric acid, sodium salt	Sodium chlorate
Chloride of lime	Calcium hypochlorite
Chloride of phosphorus	Phosphorus trichloride
Chloride of sulfur	Sulfur chloride
Chloridum	Ethyl chloride
Chlorinated lime	Calcium hypochlorite
Chlorine cyanide	Cyanogen chloride
Chlorine oxyfluoride	Perchloryl fluoride
Chlorobenzol	Chlorobenzene
Chlorobutadiene	Chloroprene
1-Chlorobutadiene	Chloroprene
1-Chloro-1,3-butadiene	Chloroprene
1-Chlorobutane	Chlorobutanes
Chlorocyan	Cyanogen chloride
Chlorocyanide	Cyanogen chloride
Chlorocyanogen	Cyanogen chloride
1-Chloro-2,2-dichloroethylene	Trichloroethylene
Chlorodimethyl ether	Methylchloromethyl ether
3-Chloro-1,2-epoxypropane	Epichlorohydrin
Chloroethane	Ethyl chloride
Chloroethanoic acid	Chloroacetic acid (solid or solution)
Chloroethane	Vinyl chloride
Chloroethene	Vinyl chloride
Chloroethylene	Vinyl chloride
1-Chloroethylene	Vinyl chloride
Chloroformic aid, ethyl ester	Ethyl chloroformate
Chloroformic acid, isopropyl ester	Isopropyl chloroformate
Chloroformic aid, methyl ester	Methyl chloroformate
Chloroformyl chloride	Phosgene
Chlorohydric acid	Hydrogen chloride
Chloromethane	Methyl chloride
Chloromethoxymethane	Methylchloromethyl ether
Chloromethyl ethylene oxide	Epichlorohydrin
Chloromethylmethyl ether	Methylchloromethyl ether
Chloromethyloxirane	Epichlorohydrin
Chloronitrobenzenes	(meta, ortho, or para)-Nitrochlorobenzene
1,2-Chloronitrobenzene	ortho-Nitrochlorobenzene
1,3-Chloronitrobenzene	meta-Nitrochlorobenzene
1,4-Chloronitrobenzene	para-Nitrochlorobenzene
4-Chloronitrobenzene	para-Nitrochlorobenzene
m-Chloronitrobenzene	meta-Nitrochlorobenzene
o-Chloronitrobenzene	ortho-Nitrochlorobenzene
p-Chloronitrobenzene	para-Nitrochlorobenzene
1-Chloro-2-nitrobenzene	ortho-Nitrochlorobenzene
1-Chloro-3-nitrobenzene	meta-Nitrochlorobenzene
2-Chloro-1-nitrobenzene	ortho-Nitrochlorobenzene
4-Chloro-1-nitrobenzene	para-Nitrochlorobenzene
Chloro-m-nitrobenzene	meta-Nitrochlorobenzene
Chloro-o-nitrobenzene	ortho-Nitrochlorobenzene
Clor-O-Pic	Chloropicrin
Chloropicrin and methyl chloride mixture	Chloropicrin
Chloropicrin and methyl bromide mixture	Chloropicrin
beta-Chloroprene	Chloroprene
1-Chloropropene-2	Allyl chloride
1-Chloro-2-proprene	Allyl chloride
3-Chloroproprene	Allyl chloride
3-Chloro-2-proprene	Allyl chloride
3-Chloroproprene	Allyl chloride
3-Chloro-1-proprene	Allyl chloride
3-Chloroproprene-1	Allyl chloride
alpha-Chloropropylene	Allyl chloride
gamma-Chloropropylene oxide	Epichlorohydrin
2-Chloropropylene oxide	Epichlorohydrin
3-Chloro-1,2-propylene oxide	Epichlorohydrin
Chlorosulfuric acid	Chlorosulfonic acid
Chlorosulphonic acid	Chlorosulfonic acid
1-Chloro-1,2,2-trifluoroethylene	Trifluorochloroethylene, inhibited
Chlorotrifluoroethylene	Trifluorochloroethylene, inhibited
Chlorsulfonic acid	Chlorosulfonic acid
Chloryl	Ethyl chloride
Chloryl anesthetic	Ethyl chloride

CHEMICAL	GUIDE
Chromic acid, solid	Chromium trioxide, anhydrous
Chromic anhydride	Chromium trioxide, anhydrous
Chromic anhydride	Chromium trioxide, anhydrous
Chromium (VI) oxide	Chromium trioxide, anhydrous
C.I. 76035	2,4-Toluylenediamine
Cinnamene	Styrene monomer, stabilized
Cinnamenol	Styrene monomer, stabilized
Cinnamol	Styrene monomer, stabilized
Claudetite	Ethyl chloride
C.I. oxidation base	2,4-Toluylenediamine
C.I. oxidation base 20	2,4-Toluylenediamine
C.I. oxidation base 200	2,4-Toluylenediamine
C.I. oxidation base35	2,4-Toluylenediamine
Claudetite	Ethyl chloride
Cloretilo	Methylchloromethyl ether
CNME	Benzene
Coal naphtha	Kerosene
Coal oil	Petroleum crude oil
Coal tar creosote	Coal tar
Coal tar light oil	Petroleum distillates, n.o.s.
Coal tar naphtha	Coal tar
Coal tar oil	Coal tar distillates
Colamine	Ethanolamine
Colophony solution	Rosin solution
Columbia spirits	Methanol
Compressed petroleum gas	Petroleum gas, liquefied
Creosote oil	Coal tar
m-Cresol	Cresol
o-Cresol	Cresol
p-Cresol	Cresol
Cresole	Cresol
Cresylic acid	Cresol
Crolean	Acrolein
Crotonal	Crotonaldehyde, stabiloized
Crotonic aldehyde	Crotonaldehyde, stabiloized
Crude arsenic	Arsenic trioxide
Crude oil	Petroleum crude oil
CSA	Chlorosulfonic acid
Cubic niter	Sodium nitrate
Cumene	Isopropylbenzene
Cyanide of sodium	Sodium cyanide, solid
Cyanoethylene	Acrylonitrile
Cyclohexatriene	Benzene
Cyclohexyl ketone	Cyclohexanone
Cyclon	Hydrocyanic acid
1-3,-Cyclopentadiene, 1,2,3,4,5,5-hexachloro-	Hexachlorocyclopentadiene
Cyclotetramethylene oxide	Tetrahydrofuran
DBE	Ethylene dibromide
DCB	o-Dichlorobenzene
DCE	Vinylidene chloride
1,1-DCE	Vinylidene chloride
DCM	Dichloromethane
1,3-DCP	Propylene dichloride
DDBSA	Dodecylbenzenesulfonic acid
DEA	Diethanolamine
Deanol	2-Dimethylaminoethanol
De-fol-ate	Sodium chlorate
Developer 14	2,4-Toluylenediamine

Developer mt-mc	2,4-Toluylenediamine
Developer mtdj	2,4-Toluylenediamine
Developer t	2,4-Toluylenediamine
Deumabietis	Pine oil
Diamide	Hydrazine
Di (2-hydroxyethyl) amine	Diethanolamine
Diamine hydrate	Hydrazine
1,2-Diaminoethane	Ethylenediamine
1,6-Diaminohexane	Hexamethylene diamine solution
2,4-Diaminotoluene	2,4-Toluylenediamine
Diaminotoluene, 2,4-	2,4-Toluylenediamine
1,3-Diamino-4-methylbenzene	2,4-Toluylenediamine
2,4-Diamino-4-methylbenzene	2,4-Toluylenediamine
2,4-Diaminotoluol	2,4-Toluylenediamine
Diammonium sulfide	Ammonium sulfide solution
Diarsenic trioxide	Arsenic trioxide
Diarex HF 77	Styrene monomer, stabilized
Dibenzoyl peroxide	Benzoyl peroxide
Diboron hexahydride	Diborane
1,2-Dibromoethane	Ethylene dibromide
Dibutylamine	Butylamine
n-Dibutylamine	Butylamine
Di(n-butyl)amine	Butylamine
p-Dicarboxybenzene	Terephthalic acid
1,2-Dichlorobenzene	o-Dichlorobenzene
o-Dichlorobenzol	o-Dichlorobenzene
ortho-Dichlorobenzol	o-Dichlorobenzene
1,3-Dichloro-bix (2-chloroethyl) ether	Dichloropropene
1,1-dichloro-2-chloroethylene	Trichloroethylene
Dichlorodimethylsilane	Dimethyldichlorosilane
Dichlorodimethylsilicon	Dimethyldichlorosilane
1,1-Dichloroethane	Vinylidene chloride
1,1-Dichloroethylene	Vinylidene chloride
unsym-Dichloroethylene	Vinylidene chloride
Dichlorohydridomethylsilicon	Methyldichlorosilane
Dichloromethylsilane	Methyldichlorosilane
Dichloropropane	Propylene dichloride
1,3-Dichloropropene	Dichloropropene
Dichlorosilicane	Dichlorosilane
Dicyan	Cyanogen
1,4-Dicyanobuatane	Adiponitrile
Dicyanogen	Cyanogen
alpha-Dicyclopentadiene	Dicyclopentadiene
Diesel oil	Fuel oil
Diethyl	Butane
Diethylene oxide	Tetrahydrofuran
Diethylolamine	Diethanolamine
Difluorochloromethane	Chlorodifluoromethane
Difluoroethane	1,1-Difluoroethane
Difluoroethane, 1,1-	1,1-Difluoroethane
Difluoromonochloromethane	Chlorodifluoromethane

CHEMICAL	GUIDE
Dihydroazirene	Ethyleneimine, inhibited
Dihydroazirine	Ethyleneimine, inhibited
Dihydro-1H-azirine	Ethyleneimine, inhibited
Dihydro-2,5-dioxofuran	Maleic anhydride
1,3-Dihydro-1,3-dioxoisobenzofuran	Phthalic anhydride
Dihydrogen dioxide	Hydrogen peroxide
Dihydrogen monosulfide	Hydrogen sulfide
Dihydrogen selenide	Hydrogen selenide
Dihydrogen sulfide	Hydrogen sulfide
Dihydrooxirene	Ethylene oxide
1,4-Dihydroxy-2-butyne	1,4-Butynediol
Dihydroxybenzene	Hydroquinone
2,2-Dihydroxydiethylamine	Diethanolamine
1,2-Dihydroxyethane	Ethylene glycol
B,B-Dihydroxyethylamine	Diethanolamine
Diisobutene	Diisobutylene
alpha-Diisobutylene	Diisobutylene
beta-Diisobutylene	Diisobutylene
1,3-diisocyanatomethylbenzene	Toluene diisocyanate
Diisocyanatotoluene	Toluene diisocyanate
Diisopropyl oxide	Diisopropyl ether
n,n-Dimethyl	N,N-Dimethylformamide
Dimethylaminoethanol	2-Dimethylaminoethanol
beta-Dimethylaminethyl alcohol	2-Dimethylaminoethanol
1,2-Dimethylbenzene	Xylene
1,3-Dimethylbenzene	Xylene
1,4-Dimethylbenzene	Xylene
Dimethyl-13C2 ether (gas)	Dimethyl ether
Dimethylcarbinol	Isopropanol
Dimethylchloroether	Methylchloromethyl ether
Dimethylene oxide	Ethylene oxide
Dimethyleneimine	Ethyleneimine, inhibited
Dimethyleimine	Ethyleneimine, inhibited
Dimethylethanolamine	2-Dimethylaminoethanol
1,1-Dimethylethane	Isobutane
N,N-Dimethyl-N-ethanolamine	2-Dimethylaminoethanol
N-N,Dimethylethanolamine	2-Dimethylaminoethanol
Dimethyl formaldehyde	Acetone
Dimethyl formamide	N,N-Dimethylformamide
N,N-Dimethyl-2-hydroxyethyl amine	2-Dimethylaminoethanol
N,N-Dimethyl-N-(2-hydroxyethyl) amine	2-Dimethylaminoethanol
Dimethyl ketal	Acetone
Dimethyl ketone	Acetone
n,n-Dimethyl methylamine	Trimethylamine
Dimethyl monosulfate	Dimethyl sulfate
Dinitrophenylmethane	Dinitrotoluenes
Dinitrogen monoxide	Nitrous oxide
Dinitrogen oxide	Nitrous oxide
2,4-Dinitrotoluenes	Dinitrotoluenes
2,6-Dinitrotoluenes	Dinitrotoluenes
Dinitrotoluol	Dinitrotoluenes
1,3-Dioxophthalan	Phthalic anhydride
Diphenylmethane diisocyanate	Methylene diphenyl diisocyanate
Diphosgene	Phosgene
Dipping acid	Sulfuric acid
Dipropylamine	Di-n-propylamine
n-Dipropylamine	Di-n-propylamine

CHEMICAL	GUIDE
Dipropylmethane	Heptane
Disulfur dichloride	Sulfur chloride
Disulphuric acid	Oleum
Dithiocarbonic anhydride	Carbon bisulfide
Dithionic acid	Sulfuric acid
Dithionite, hyposulfite	Sodium hydrosulfite
Divinylene oxide	Furan
Divinyl, inhibited	Butadiene
DMA	Dimethylamine, anhydrous
DMAE	2-Dimethylaminoethanol
DMF	N,N-Dimethylformamide
DMF (amide)	N,N-Dimethylformamide
DMFA	N,N-Dimethylformamide
DMS	Dimethyl sulfate
DNPA	Di-n-propylamine
DNT	Dinitrotoluenes
Dodecene	Propylene tetramer
Dodecylene	Propylene tetramer
Dolochor	Chloropicrin
Dowanol® EB	Ethylene glycol monobutyl ether
Dowanol 33b	1-Methoxy-2-propanol
Dowanol pm	1-Methoxy-2-propanol
Dowtherm 209	1-Methoxy-2-propanol
Dry ice	Carbon dioxide
Dublofix	Ethyl chloride
Dytol M-83	Octanol
E6	Ethylene glycol
EA	Ethylamine
ECH	Epichlorohydrin
EDB	Ethylene dibromide
Edco	Methyl bromide
EGBE	Ethylene glycol monobutyl ether
EHA	2-Ethylhexylacrylate
Ektasolve EB®	Ethylene glycol monobutyl ether
Ektasolve EE®	Ethylene glycol monoethyl ether
Ektasolve EE acetate	Ethylene glycol monoethyl ether
Elayl	Ethylene
Eldopaque	Hydroquinone
Eldoquin	Hydroquinone
Electro-CF12	Dichlorodifluoromethane
Electro-CF22	Chlorodifluoromethane
Elemental phosphorus	Phosphorus, white or yellow
Embafume	Methyl bromide
Emkanol	Ethylene glycol monoethyl ether
EO	Ethylene oxide
EPI	Epichlorohydrin
alpha-Epichlorohydrin	Epichlorohydrin

CHEMICAL	GUIDE
2,3-Epoxpropyl chloride	Epichlorohydrin
1,2-Epoxy -3-chlorpropane	Epichlorohydrin
Epoxyethane	Ethylene oxide
1,2 Epoxyethane	Ethylene oxide
Epoxy propane	Propylene oxide
1,2-Epoxypropane	Propylene oxide
Essence of mirbane	Nitrobenzene
Essence of myrbane	Nitrobenzene
EtO	Ethylene oxide
Ethanal	Acetaldehyde
Ethane carboxylic acid	Propionic acid
Ethanedinitrile	Cyanogen
1,2-Ethanediol	Ethylene glycol
Ethanediol	Ethylene glycol
1,2-Ethanediol, dipropanoate	Crotonaldehyde, stabilized
Ethanethiol	Ethyl mercaptan
Ethanoic acid	Acetic acid
Ethanoic anhydride	Acetic anhydride
Ethanol	Ethyl alcohol
Ethanolamine	Ethanolamine
Beta-Ethanolamine	Ethanolamine
Ethene	Ethylene
Ethene, bromo	Vinyl bromide
Etheneoxide	Ethylene oxide
Ethenylbenzene	Styrene monomer, inhibited
Ethenyl ethanoate	Vinyl acetate
Ether	Diethyl ether
Ether chloratus	Ethyl chloride
Etherin	Ethylene
Ethinyl trichloride	Trichloroethylene
Ethirydine	Ethyleneimine, inhibited
Ethoxy acetate	Ethylene glycol monoethyl ether acetate
Ethoxyethane	Diethyl ether
2-Ethoxyethanol	Ethylene glycol monoethyl ether
2-Ethoxyethanol acetate	Ethylene glycol monoethyl ether acetate
Ethoxyethyl acetate	Ethylene glycol monoethyl ether acetate
2-Ethoxyethyl acetate	Ethylene glycol monoethyl ether acetate
beta-Ethoxyethyl acetate	Ethylene glycol monoethyl ether acetate
Ethoxylated alcohols	Alcohol ethoxylates
Ethyl aldehyde	Acetaldehyde
Ethyl alpha-methylacrylate	Ethyl methacrylate
Ethyl benzol	Ethyl benzene
Ethyl cellosolve	Ethylene glycol monoethyl ether
Ethyl clorocarbonate	Ethyl chloroformate
Ethyldimethylmethane	Isopentane
Ethylenyl acetate	Vinyl acetate
Ethylene aldehyde	Acrolein
Ethylene carboxamide	Acrylamide
Ethylene carboxylic acid	Acrylic acid, stabilized
Ethylene dihydrate	Ethylene glycol
Ethylene dipropionate	Crotonaldehyde, stabilized
Ethylene fluoride	1,1-Difluoroethane
Ethylene glycol, dipropionate	Crotonaldehyde
Ethylene glycol ethyl ether	Ethylene glycol monoethyl ether
Ethylene monochloride	Vinyl chloride

CHEMICAL	GUIDE
Ethylene propionate	Crotonaldehyde, stabilized
Ethylene trichloride	Trichloroethylene
n-Ethylethanamine	Diethylamine
Ethyl ethanoate, acetic ester	Ethyl acetate
Ethyl ether	Diethyl ether
Ethylethylene	Butylene
Ethyl fluid	Motor fuel antiknock compound
Ethylformic acid	Propionic acid
Ethyl glycol acetate	Ethylene glycol monoethyl ether acetate
2-Ethyl hexanol	Octanol
2-Ethyl-hexyl alcohol	Octanol
2-Ethylhexyl-2-propenoate	2-Ethylhexyl acrylate
Ethyl hydrate	Ethyl alcohol
Ethyl hydrosulfide	Ethyl mercaptan
Ethyl hydroxide	Ethyl alcohol
Ethylic acid	Acetic acid
Ethyidene difluoride	1,1-Difluoroethane
Ethyidene fluoride	1,1-Difluoroethane
Ethyl-2-methcrylate	Ethyl methacrylate
Ethyl methyl acrylate	Ethyl methacrylate
Ethyl 2-methyl-2-propenoate	Ethyl methacrylate
Ethylolamine	Ethanolamine
Ethyloxide	Ethylene oxide
Ethyl propenoate	Ethyl acrylate
Ethyl 2-propenoate	Ethyl acrylate
Ethyl sulfhydrate	Ethyl mercaptan
Ethyl thioalcohol	Ethyl mercaptan
Ethyne, calcium derivative	Calcium carbide
ETN	Ethylamine
EtOH	Ethyl alcohol
Eucanine gb	2,4-Toluylenediamine
2-Furancarbinol	Furfuryl alcohol
Factitious air	Nitrous oxide
Fannoform	Formaldehyde solution
Fasciolin	Carbon tetrachloride
FC-12	Dichlorodifluoromethane
FC-22	Chlorodifluoromethane
Fermenicide liquid or powder	Sulfur dioxide
Fermentation alcohol	Ethyl alcohol
Ferric perchloride, solution	Ferric chloride, solution
Fertilizer acid	Sulfuric acid
Filmcol	Ethyl alcohol
Flukoids	Carbon tetrachloride
Fluohydric acid	Hydrofluoric acid
Fluorhydric acid	Hydrofluoric acid
Fluoric acid	Hydrofluoric acid
Fluorocarbon-12	Dichlorodifluoromethane
Fluorocarbon-152a	1,1-Difluoroethane
Fluorohydric acid	Hydrogen fluoride
Fluoromethane	Methyl fluoride

CHEMICAL	GUIDE
Fluorosilicic acid	Hydrofluorosilicic acid
Fluosilicic acid	Hydrofluorosilicic acid
Formacel®	1,1,1,2-Tetrafluoroethane
Formalin	Formaldehyde solution
Formalith	Formaldehyde solution
Formamide	N,N-Dimethylformamide
Formic acid, amide	N,N-Dimethylformamide
Formic aldehyde	Formaldehyde solution
Formic anammonide	Hydrocyanic acid
Formonitrile	Hydrocyanic acid
n-Formyldimethylamine	N,N-Dimethylforma-mide
Formylic acid	Formic acid
Formyl trichloride	Chloroform
Fouramine	2,4-Toluylenediamine
Fouramine j	2,4-Toluylenediamine
Fouramine 94	2,4-Toluylenediamine
Fouramine m	2,4-Toluylenediamine
Freon 10	Carbon tetrachloride
Freon 12	Dichlorodifluoromethane
Freon 20	Chloroform
Freon 22	Chlorodifluoromethane
Freon 30	Dichloromethane
Freon 40	Methyl chloride
Freon 143a	1,1,1-Trifluoroethane
Freon 152a	1,1-Difluoroethane
Freon F-12	Dichlorodifluoromethane
Frigen 12	Dichlorodifluoromethane
Fuel oil no. 1	Kerosene
Fuel oil no. 2	Fuel oil
Fuel oil no. 4	Fuel oil
Fuel oil no. 5	Fuel oil
Fuel oil no. 6	Fuel oil
Fumigant-1	Methyl bromide
Fumigrain	Acrylonitrile
Fuming liquid arsenic	Arsenic trichloride
Fuming sulfuric acid	Oleum
Fuming sulphuric acid	Oleum
Fumo-gas	Ethylene dibromide
2,5-Furandione	Maleic anhydride
Furanidine	Tetrahydrofuran
2-Furanmethanol	Furfuryl alcohol
Furfuralcohol	Furfuryl alcohol
Furfural alcohol	Furfuryl alcohol
Furfuran	Furan
Furyl alcohol	Furfuryl alcohol
2-Furylcarbinol	Furfuryl alcohol
alpha-Furylcarbinol	Furfuryl alcohol
Fyde	Formaldehyde solution
GAA	Phosphine
Genetron 100	1,1-Difluoroethane
Genetron 12	Dichlorodifluoromethane
Genetron 22	Chlorodifluoromethane
Genetron 152a	1,1-Difluoroethane
Glacial acetic acid	Acetic acid
Glacial acrylic acid	Acrylic acid, stabilized
Getlysolve C	Heptane
Glycerol epichlorohydrin	Epichlorohydrin
Glycidyl chloride	Epichlorohydrin
Glycinol	Ethanolamine
Glycol	Ethylene glycol
Glycol alcohol	Ethylene glycol
Glycol bromide	Ethylene dibromide
Glycol dibromide	Ethylene dibromide
Glycol ether EE acetate	Ethylene glycol monoethyl ether acetate
Glycol ether pm	1-Methoxy -2-propanol
Glycol monoethyl ether	Ethylene glycol monoethyl ether
Glycol monoethyl ether acetate	Ethylene glycol monoethyl ether acetate
Grain alcohol	Ethyl alcohol
Halocarbon-12	Dichlorodifluoromethane
Halocarbon 134A	1,1,1,2-Tetrachloroethane
Halon 104	Carbon tetrachloride
Halon 122	Dichlorodifluoromethane
Halon 1001	Methyl bromide
Halon 1220	Dichlorodifluoromethane
HCCPD	Hexachlorocyclopentadiene
HCN	Hydrocyanic acid
HE-5	Hydroquinone
Hemiterpene	Isoprene
Heptyl carbinol	Octanol
Heptyl hydride	Heptane
Hexachloro-1,3-cyclopentadiene	Hexachlorocyclopentadiene
1,1,1,3,3,3-Hexafluoro-2-propanone	Hexafluoroacetone
Hexahydrobenzene	Cyclohexane
Hexamethylene	Cyclohexane
Hexanaphthene	Cyclohexane
n-Hexane	Hexane
1,6-Hexanediamine	Hexamethylene diamine solution
Hexanedinitrile	Adiponitrile
Hexanedioc acid	Adipic acid
Hexanedioic acid dinitrile	Adiponitrile
1,6-Hexanedioc acid	Adipic acid
1-Hexanol,2-ethyl-, acrylate	2-Ethylhexyl acrylate
Hexanon	Cyclohexanone
Hexene	1-Hexene
Hex-1-ene	1-Hexene
Hexone	Methyl isobutyl ketone
sec-Hexyl alcohol	Methyl isobutyl carbinol
Hexylene	1-Hexene
Hexyl hydride	Hexane
HF	Hydrogen fluoride
HF-A	Hydrogen fluoride
HFA	Hexafluoroacetone
HFC-134a	1,1,1,2-Tetrachloroethane
Hioxy	Hydrogen peroxide
HMDA	Hexamethylene diamine solution

CHEMICAL	GUIDE
Home heating oil	Fuel oil
HTH	Calcium hypochlorite
Hydrazine hydrate	Hydrazine
Hydrazomethane	Methyl hydrazine
Hydrobromic acid, anhydrous	Hydrogen bromide
Hydrochloric acid, anhydrous	Hydrogen chloride
Hydrochloric ether	Ethyl chloride
Hydrochloride	Hydrogen chloride
Hydrocyanic acid, sodium salt	Sodium cyanide, solid
Hydrofluoric acid, anhydrous	Hydrogen fluoride
Hydrofluorosilicic acid	Hydrofluorosilicic acid
Hydrofuran	Tetrahydrofuran
Hydrogen carboxylic acid	Formic acid
Hydrogen chloride, solution	Hydrochloric acid
Hydrogen cyanide	Hydrocyanic acid
Hydrogen dioxide	Hydrogen peroxide
Hydrogen fluoride aqueous solution	Hydrofluoric acid
Hydrogen hexafluorosilicate	Hydrofluorosilicic acid
Hydrogen nitrate	Nitric acid, red fuming
Hydrogen oxide	Hydrogen peroxide
Hydrogen phosphide	Phosphine
Hydrogen phosphate solution	Phosphoric acid
Hydrogen sulphide	Hydrogen sulfide
Hydroperoxide	Hydrogen peroxide
Hydroquinol	Hydroquinone
Hydrosilicofluoric acid	Hydrofluorosilicic acid
Hydrosulfite of soda	Sodium hydrosulfite
Hydrosulfuric acid	Hydrogen sulfide
Hydroxybenzene	Carbolic acid or phenol
Hydroxy biacetyl	Acetic anhydride
1-Hydroxybutane	Butyl alcohol
2-Hydroxybutane	Butyl alcohol
2-Hydroxyethanol	Ethylene glycol
Hydroxyether	Ethylene glycol monoethyl ether
2-Hydroxyethylamine	Ethanolamine
beta-Hydroxyethylamine	Ethanolamine
beta-Hydroxyethyldimethylamine	2-Dimethylaminoethanol
alpha-Hydroxyisobutyronitrile	Acetone cyanohydrin, stabilized
bis(Hydroxymethyl) acetylene	1,4-Butynediol
1-Hydroxy -2-methylbenzene	Cresol
1-Hydroxy -3-methylbenzene	Cresol
1-Hydroxy -6-methylbenzene	Cresol
2-Hydroxymethyl furan	Furfuryl alcohol
2-Hydroxy -2-methylpropanenitrile	Acetone cyanohydrin, stabilized
2-Hydroxy -2-methylpropionitrile	Acetone cyanohydrin, stabilized
4-Hydroxyphenol	Hydroquinone
Hydroxy phenol	Hydroquinone
Hydroxypropene	Allyl alcohol
Hydroxytoluene	Cresol
Hyfluoric acid	Hydrofluoric acid
Hylene T	Toluene diisocyanate
Hypochlorous acid	Calcium hypochlorite
Hyponitrous acid anhydride	Nitrous oxide
2,2-Iminobisethanol	Diethanolamine
2,2-Iminodiethanol	Diethanolamine
Incidol	Benzoyl peroxide
Inerton DW-DMC	Dimethyldichlorosilane
Inhibine	Hydrogen peroxide
IPA	Isopropanol
Iron chloride	Ferric chloride solution
Iron (2+) chloride	Ferrous chloride solution
Iron (II) chloride	Ferrous chloride solution
Iron (III) chloride	Ferric chloride solution
Iron dichloride	Ferrous chloride solution
Iron muriate	Ferric chloride solution
Iron pechloride, chloride	Ferric chloride solution
Iron trichloride	Ferric chloride solution
Isceon 12	Dichlorodifluoromethane
Iscobrome	Methyl bromide
Iscobrome D	Ethylene dibromide
Isoamylhydride	Isopentane
1,3-Isobenzofurandione	Phthalic anhydride
Isobutanal	Isobutyraldehyde
Isobutyl methyl ketone	Methyl isobutyl ketone
Isobutyric aldehyde	Isobutyraldehyde
Isocyanatomethane	Methyl isocyanate
Isocyanic acid methyl ester	Methyl isocyanate
Isocyanic acid, methyl-m-phenylene ester	Toluene diisocyanate
Isocyanic acid, methylphenylene ester	Toluene diisocyanate
Isopentadiene	Isoprene
2-Isopropoxy propane	Diisopropyl ether
Isopropyl acetone	Methyl isobutyl ketone
Isopropyl alcohol	Isopropanol
Isopropyl chlorocarbonate	Isopropyl chloroformate
Isopropyl chloroformate	Isopropyl chloroformate
Isopropyl chloromethanoate	Isopropyl chloroformate
Isopropylcyanohydrin	Acetone cyanohydrin, stabilized
Isopropyl ester	Isopropyl acetate
Isopropyl ether	Diisopropyl ether
Isopropyl formaldehyde	Isobutyraldehyde
Isotron 12	Dichlorodifluoromethane
Isotron 22	Chlorodifluoromethane
Isourea	Urea
Ivalon	Formaldehyde solution
Jaysol S	Ethyl alcohol
Jefferssol	Ethylene glycol monobutyl ether
JP-1	Kerosene
Judean pitch	Asphalt
KOH	Potassium hydroxide
Kayafume	Methyl bromide
Kelene	Ethyl chloride
Ketohexamethylene	Cyclohexanone
Ketone propane	Acetone
beta-Ketopropane	Acetone
Klorex	Sodium chlorate
Kopfume	Ethylene dibromide
Kresol	Cresol
K-stoff, ester	Methyl Chloroformate

CHEMICAL	GUIDE
Kusatol	Sodium chlorate
Kyanol	Aniline oil
Larvacide	Chloropicrin
Laughing gas	Nitrous oxide
Laurylbenzenesulfonic acid	Dodecylbenzenesulfonic acid
Lead tetraethyl	Motor fuel antiknock compound
Lead tetramethyl	Motor fuel antiknock compound
Ledon 12	Dichlorodifluoromethane
Light gasoline	Gasoline
Light ligroin	Petroleum distillates, n.o.s.
Ligroin	Petroleum distillates, n.o.s.
Lime chloride	Calcium hypochlorite
Liquefied hydrocarbon gas	Petroleum gas, liquefied
Liquid pitch	Coal tar
LNG	Liquefied natural gas
Lorol 20	Octanol
LOX	Oxygen
LPG	Petroleum gas, liquefied
Lucidol	Benzoyl peroxide
Lye	Sodium hydroxide or potassium hydroxide
Lysoform	Formaldehyde solution
Lythene	Petroleum distillates, n.o.s.
Magnicide H	Acrolein
Maleic acid anhydride	Maleic anhydride
MB	Methyl bromide
M-B-C fumigant MEGR	Methyl bromide
MBX	Methyl bromide
MCA	Chloroacetic acid, (solid or solution)
MCB	Chlorobenzene
MDI	Methylene diphenyl diisocyanate
MEG	Ethylene glycol
MEA	Ethanolamine
MEK	Methyl ethyl ketone
Mercaptoethane	Ethyl mercaptan
Mercaptomethane	Methyl mercaptan
Mercurialin	Methylamine, (anhydrous or aqueous solution)
Mercurialin, anhydrous	Methylamine, anhydrous
Metacetonic acid	Propionic acid
Metafume	Methyl bromide
Metallic sodium	Sodium (metal)
Methacide	Toluene
alpha-Methacrylic acid	Methacrylic acid, inhibited
Methacrylic acid, ethyl ester	Ethyl methacrylate
Methacrylic acid, methyl ester	Methyl methacrylate
Methanal	Formaldehyde solution
Methanamine	Methylamine, (anhydrous or aqueous solution)
Methanamine, anhydrous	Methylamine, anhydrous
Methanamine, n,n-dimethyl	Trimethylamine
Methane carboxylic acid	Acetic acid
Methane dichloride	Dichloromethane
Methane, refrigerated liquid	Liquefied natural gas
Methane tetrachloride	Carbon tetrachloride
Methanethiol	Methyl mercaptan
Methanoic acid	Formic acid
Methionol	4-Thiapentanal
Methogas	Methyl bromide

CHEMICAL	GUIDE
Methoxycarbonyl chloride	Methyl chloroformate
Methoxychloromethane	Methylchloromethyl ether
Methoxy ether of propylene glycol	1-Methoxy -2-propanol
1-Methoxy -2-hydroxypropane	1-Methoxy -2-propanol
1-Methoxy -2-propanol	1-Methoxy -2-propanol
1-Methoxypropan-2-ol	1-Methoxy -2-propanol
Methyoxymethane	Dimethyl ether
Methoxymethylchloride	Methylchloromethyl ether
Methoxypropanol, alpha isomer	1-Methoxy -2-propanol
Methyl acetaldehyde	Propionaldehyde
Methyl acetic acid	Propionic acid
Methyl acetone	Methyl ethyl ketone
Methyl alcohol	Methanol
Methylaldehyde	Formaldehyde solution
Methyl-alpha-methylacrylate	Methyl methacrylate
Methylamy a;cpjp;	Methyl isobutyl carbinol
Methylated spirit	Ethyl alcohol
Methyazacyclopropane	Propyleneimine
2-Methylaziridine	Propyleneimine
Methylbenzene	Toluene
4-Methy-1,3-benzenediamine	2,4-Toluylenediamine
Methylbenzol	Toluene
beta-Methylbivinyl	Isoprene
2-Methyl-1,3-butadiene	Isoprene
3-Methyl-1,3-butadiene	Isoprene
2-Methylbutadiene	Isoprene
Methlcarbamodithoic acid	Metam sodium
Methylcarbinol	Ethyl alcohol
Methyl carbonmide	Methyl isocyanate
Methylcarbylamine	Methyl isocyanate
Methyl chloroform	1,1,1-Trichloroethane
Methyldithiocarbamate	Metam sodium
1-Methyl-2,4-Dinitrobenzene	Dinitrotoluenes
1-Methyl-2,6-Dinitrobenzene	Dinitrotoluenes
Methyldinitrobenzene	Dinitrotoluenes
Methylene bichloride	Dichloromethane
Methylene bisphenyl isocyanate	Methylene diphenyl diisocyanate
Methylene dichloride	Dichloromethane
Methylene di-p-phenylene	Methylene diphenyl diisocyanate
Methylene oxide	Formaldehyde solution
4,4-Methylene diphenyl diisocyanate	Methylene diphenyl diisocyanate
Methyl ester	Methyl isocyanate
Methyl ether	Dimethyl ether
Methylethylcarbinol	Butyl alcohol
(1-Methylethene) benzene	Isopropylbenzene
n-(1-Methylethyl)	Diisopropylamine
1-Methylethyl alcohol	Isopropanol
1-Methylethylamine	Isopropylamine
1-Methylethyl ester	Isopropyl acetate
Methylethyleneimine	Propyleneimine
1-Methylethyleneimine	Propyleneimine
2-Methylethyleneimine	Propyleneimine
Methylethylene oxide	Propylene oxide

CHEMICAL	GUIDE
Methylethylmethane	Butane
n-(Methylethyl)-2-propanamine	Diisopropylamine
Methylfluoroform	1,1,1-Trifluoroethane
6-Methyl-1-hepptanol	Isooctyl alcohol
1-Methylhydrazine	Methylhydrazine
Methyl hydroxide	Methanol
Methyl ketone	Acetone
2-Methyl laconirile	Acetone cyanohydrin, stablilized
Methylmercaptopropionaldehyde	4-Thiapentanal
3-(Methylmercapto) propionaldehyde	4-Thiapentanal
beta-(Methylmercapto) propionaldehyde	4-Thiapentanal
n-Methylmethanamine	Dimethylamine, anhydrous
Methyl 2-methyl-2-propenoate	Methyl methacrylate
Methyl methanoate	Methyl formate
Methyl oxide	Dimethyl ether
2-Methyl-4-pentanol	Methyl isobutyl carbinol
4-Methyl-2-pentanol	Methyl isobutyl carbinol
4-Methylpentanol-2	Methyl isobutyl carbinol
4-Methylpentan-2-ol	Methyl isobutyl carbinol
Methyl-2-pentanol	Methyl isobutyl carbinol
Methylpentanol	Methyl isobutyl carbinol
Methylol	Methanol
Methyl o-silicate	Methyl orthosilicate
Methyl oxirane	Propylene oxide
4-methyl-2-oxopentane	Methyl isobutyl ketone
2-methyl-4-oxotanone	Methyl isobutyl ketone
4-methyl-2-pentanone	Methyl isobutyl ketone
Methyl phenol	Cresol
4-Methyl-m-phenylenediamine	2,4-Toluylenediamine
4-Methylphenylene-1,3-diamine	2,4-Toluylenediamine
Methyl phenylene isocyanate	Toluene diisocyanate
Methyl phenylethene	Isopropylbenzene
2-Methyl-1-propanal	Isobutyraldehyde
3-Methylpropanal	Isobutyraldehyde
2-Methylpropane	Isobutane
iso-Methylpropane	Isobutane
2-Methyl-2-propanol	Butyl alcohol
2-Methyl propenal	Isobutyraldehyde
2-Methylpropenoic acid	Methyl methacrylate
2-Methyl-2-propenoic acid, ethyl ester	Ethyl methacrylate
alpha-Methylpropionaldehyde	Isobutyraldehyde
2-Methylpropionaldehyde	Isobutyraldehyde
2-Methylpropyl acetate	Isobutyl acetate
2-Methyl-1-propyl acetate	Isobutyl acetate
beta-Methylpropyl acetate	Isobutyl acetate
Methyl silicate	Methyl orthosilicate
Methylsilicon trichloride	Methyltriclorosilane
Methylsilyl trichloride	Methyltriclorosilane
alpha-Methyl styrene	Isopropenylbenzene
Methylsulfhyrate	Methyl mercaptan
Methylthioalcohol	Methyl mercaptan
Methyltrichloromethane	1,1,1-Trichloroethane
3-(Methylthio) propanol	4-Thiapentanal
3-(Methylthio) propionaldehyde	4-Thiapentanal
beta-(Methylthio) propionaldehyde	4-Thiapentanal
MIBC	Methyl isobutyl carbinol
MIBK	Methyl isobutyl ketone

CHEMICAL	GUIDE
Mibrane oil	Nitrobenzene
MIC	Methyl isocyanate
Microlysin	Chloropicrin
MIK	Methyl isobutyl ketone
Millers fumigrain	Acrylonitrile
Mineral Oil	Petroleum crude oil
Mineral pitch	Asphalt
MMH	Methyl hydrazine
MMP	4-Thiapentanal
Mondur 577	Methylene diphenyl diisocyanate
Mondur TDS	Toluene diisocyanate
Monoallylamine	Allylamine
Monobromoethylene	Vinyl bromide
Monobromomethane	Methyl bromide
Monochloroacetic acid	Chloroacetic acid, (solid or solution)
Monochlorethane	Ethyl chloride
Monochlorobenzene	Chlorobenzene
Monochloroethane	Ethyl chloride
Monochloroethene	Ethyl chloride
Monochloroethanoic acid	Chloroacetic acid, (solid or solution)
Monochloroethylene	Vinyl chloride
Monochloromethane	Methyl chloride
Monoethylene glycol	Ethylene glycol
Monohydroxymethane	Methanol
Monohydroxybenzene	Carbolic acid or phenol
Monoisopropylamine	Isopropylamine
Monomethylamine	Methylamine, (anhydrous or aqueous solution)
Monomethylamine, aqueous	Methylamine, (anhydrous or aqueous solution)
Monomethyl hydrazine	Methylhydrazine
Monomethyltriclorosilane	Methyltriclorosilane
Mononitrogen monoxide	Nitric oxide
Monovinyl chloride	Vinyl chloride
Moricid	Formaldehyde solution
Moth balls or flakes	Naphthalene
Motor fuel	Gasoline
Motor spirit	Gasoline
MTD	2,4-Toluylenediamine
Muriatic acid	Hydrochloric acid
Muriatic ether	Ethyl chloride
MVC	Vinyl chloride
Nacconate 100	Toluene diisocyanate
Nadone	Cyclohexanone
Nako-tmt	2,4-Toluylenediamine
Naphtha	Petroleum distillates, n.o.s.
Naphtha, coal tar	Petroleum distillates, n.o.s.
Naphthalene oil	Coal tar distillates
Naphthalin	Naphthalene
Naphthene	Naphthalene
Narcotile	Ethyl chloride
Natrium	Sodium (metal)
Natural gasoline	Gasoline

CHEMICAL	GUIDE
Natural gas, refrigerated liquid	Liquefied natural gas
Necatorina	Carbon tetrachloride
Necatorine	Carbon tetrachloride
NEODOL®	Alcohol ethoxylates
Neosol	Ethyl alcohol
Nephis	Ethylene dibromide
Nickel tetracarbonyl	Nickel carbonyl
Nital	Nitric acid, red fuming
Niter	Potassium nitrate
Nitratine	Sodium nitrate
Nitre	Potassium nitrate
Nitric acid, potassium salt	Potassium nitrate
Nitric acid, red fuming	Nitric acid, red fuming
Nitric-sulfuric acid mixtures	Nitrating acid
Nitriloacetontrile	Cyanogen
Nitroaniline	ortho-Nitroaniline
2-Nitroaniline	ortho-Nitroaniline
o-Nitroaniline	ortho-Nitroaniline
Nitroanilines	ortho-Nitroaniline
Nitro-sil	Anhydrous ammonia
Nitrobenzol	Nitrobenzene
(o-, m-, p-) Nitrochlorobenzene	(ortho, meta, para) Nitrochlorobenzene
Nitrochloroform	Chloropicrin
Nitrogen monoxide	Nitric oxide
Nitrogen oxide	Nitric oxide
Nitrogen (II) oxide	Nitric oxide
Nitrotrichloromethane	Chloropicrin
Nitryl hydroxide	Nitric acid, red fuming
Nonene	Tripropylene
NCS 8819	Acrolein
NSFO	Fuel oil
NTM	Naphthalene
n-Octan-1-ol	Octyl aldehydes
1-Octanol	Octyl aldehydes
n-Octanol	Octyl aldehydes
normal-Octanol	Octyl aldehydes
n-Octan-1-ol	Octanol
1-Octanol	Octanol
n-Octanol	Octanol
Oct-1-ene	1-Octene
Octene-1	1-Octene
Octilin	Octanol
Octyl acrylate	2-Ethylhexyl acrylate
Octyl alcohol	Octanol
1- Octyl alcohol	Octanol
n-Octyl alcohol	Octanol
n-Octyl aldehyde	Octyl aldehydes
normal-Octyl aldehyde	Octyl aldehydes
1- Octylene	1-Octene
1- Octylene	1-Octene
ODB	o-Dichlorobenzene
ODCB	o-Dichlorobenzene
Oil of Mirbane	Nitrobenzene
Oil of Bitter Almonds	Nitrobenzene
Oil of Five-Siberian	Pine oil
Oil of Myrbane	Nitrobenzene
Oil of pine	Pine oil
Oil of vitriol	Sulfuric acid
Olamine	Ethanolamine

CHEMICAL	GUIDE
Olefiant gas	Ethylene
ONCB	ortho-Nitrochlorobenzene
Ortho C-11	Sodium chlorate
ortho-Xylene	Xylene
Oxacyclopentadiene	Furan
Oxacyclopentane	Tetrahydrofuran
Oxalic acid dinitrile	Cyanogen
Oxalonitrile	Cyanogen
Oxalyl cyanide	Cyanogen
Oxane	Ethylene oxide
Oxideoethane	Ethylene oxide
Oxirane	Ethylene oxide
Oxitol	Ethylene glycol monoethyl ether
Oxolane	Tetrahydrofuran
Oxole	Furan
Oxomethane	Formaldehyde solution
Oxyacyclopropane	Ethylene oxide
Oxybenzene	Carbolic acid or phenol
1,1'-Oxybisethane	Diethyl ether
Oxybismethane	Dimethyl ether
2,2'-Oxybispropane	Diisopropyl ether
Oxyfume 12	Ethylene oxide
Oxylite	Benzoyl peroxide
Oxymethylene	Formaldehyde solution
Oxytol acetate	Ethylene glycol monoethyl ether acetate
Oxytoluene	Cresol
Padiscol	Ethyl alcohol
PAN	Phthalic anhydride
Panoxyl	Benzoyl peroxide
Paracetat	Isopropyl acetate
Paraform	Formaldehyde solution
PCL	Hexachlorocyclopentadiene
PCNB	para-Nitrochlorobenzene
PDC	Propylene dichloride
Pelagol grey j	2,4-Toluylenediamine
Pelagol j	2,4-Toluylenediamine
Pentanol, 4-methyl-	Methyl Isobutyl carbinol
Pentamethylene	Cyclopentane
n-Pentane	Pentane
normal Pentane	Pentane
Perchlorocyclopentadiene	Hexachlorocyclopentadiene
Perchloroethylene	Tetrachloroethylene
Perchloromethane	Carbon tetrachloride
Perfluoroacetone	Hexafluoroacetone
Perfluoro-2-propanone	Hexafluoroacetone
Perhydrol	Hydrogen peroxide
Peroxan	Hydrogen peroxide
Peroxide	Hydrogen peroxide

CHEMICAL	GUIDE
Persadox	Benzoyl peroxide
Petroleum	Petroleum crude oil
Petroleum naphtha	Petroleum distillate, n.o.s.
Petroleum ether	Petroleum distillate, n.o.s.
Petroleum pitch	Asphalt
Petroleum spirit	Petroleum distillate, n.o.s.
Phene	Benzene
Phenethylene	Styrene monomer, inhibited
Phenic acid	Carbolic acid or phenol
Phenol	Carbolic acid or phenol
Phenol, liquid	Carbolic acid or phenol
Phenol, solution	Carbolic acid or phenol
Phenol, molten	Carbolic acid or phenol
Phenol alcohol	Carbolic acid or phenol
Phenylamine	Aniline oil
Phenyl chloride	Chlorobenzene
Phenylethane	Ethyl benzene
Phenylethene	Styrene monomer, stabilized
Phenylethylene	Styrene monomer, stabilized
Phenyl hydrate	Carbolic acid or phenol
Phenyl hydride	Benzene
Phenyl hydroxide	Carbolic acid or phenol
Phenylmethane	Toluene
Phenylic acid	Carbolic acid or phenol
Phenylic alcohol	Carbolic acid or phenol
2-Phenylpropene	Isopropylbenzene
beta-Phenylpropene	Isopropylbenzene
2-Phenylpropylene	Isopropylbenzene
beta-Phenylpropylene	Isopropylbenzene
p-Phthalic acid	Terephthalic acid
Phosphorated hydrogen	Phosphine
o-Phosphoric acid	Phosphoric acid
ortho-Phosphoric acid	Phosphoric acid
Phosphoric sulfide	Phosphorus pentasulfide
Phosphorus (III) chloride	Phosphorus trichloride
Phosphorus chloride	Phosphorus trichloride
Phosphorus chloride oxide	Phosphorus oxychloride
Phosphorous (III) hydride	Phosphine
Phosphorous trihydride	Phosphine
Phosphorus oxide trichloride	Phosphorus oxychloride
Phosphorus oxytrichloride	Phosphorus oxychloride
Phosphorus pentasulphide	Phosphorus pentasulfide
Phosphorus persulfide	Phosphorus pentasulfide
Phosphorus sulphide	Phosphorus pentasulfide
Phosphorus trichloride oxide	Phosphorus oxychloride
Phosphoryl chloride	Phosphorus oxychloride
Phthalandione	Phthalic anhydride
Phthalic acid anhydride	Phthalic anhydride
Picfume	Chloropicrin
Picride	Chloropicrin
Pic-Chlor, PS	Chloropicrin
Pimelic ketone	Cyclohexanone
Pimelin ketone	Cyclohexanone
Plastiazan 60	Ethylene glycol monoethyl ether
PNCB	para-Nitrochlorobenzene
Polychloropinene	1,1,1-Trichloroethane
Polypropylene glycol methyl ether	1-Methoxy-2-propanol
Poly-solve mpm	1-Methoxy-2-propanol
Poly-solv EE	Ethylene glycol monoethyl ether
Poly-solv EE acetate	Ethylene glycol monoethyl ether acetate
Pontamine developer tn	2,4-Toluylenediamine
Potable spirits	Ethyl alcohol
Potash liquor	Potassium hydroxide
Potash nitrates	Potassium nitrate
Potassa	Potassium hydroxide
Potassium hydrate	Potassium hydroxide
Profume	Chloropicrin
Prop-2-en-1-al	Acrolein
Propanal	Propionaldehyde
Propanal,3-(methylthio)-(9Cl)	4-Thiapentanal
Propane	Petroleum gas, liquefied
1-Propanamine	Propylamine
2-Propanamine	Diisopropylamine
2-Propaneamine	Isopropylamine
Propane motor fuel	Petroleum gas, liquefied
2-Propanol	Isopropanol
Propanone	Acetone
2-Propanone	Acetone
Propanol solvent m	1-Methoxy-2-propanol
Propellant-12	Dichlorodifluoromethane
2-Propenal	Acrolein
2-Propenamide	Allylamine
2-Propenamine	Allylamine
2-Propen-1-amine	Allylamine
1-Propene	Dichloropropene
Propene acid	Acrylic acid, stabilized
Propene nitrile	Acrylonitrile
Propene oxide	Propylene oxide
2-Propenenitrile	Acrylonitrile
Propene tetramer	Propylene tetramer
2-Propen-1-ol	Allyl alcohol
Propen-1-ol-3	Allyl alcohol
2- Propen-1-one	Acrolein
Propenoic acid	Acrylic acid, stabilized
2-Propenoic acid	Acrylic acid, stabilized
Propenoic acid amide	Acrylamide
2-Propenoic acid, butyl ester	Butyl acrylate
2-Propenoic acid, ethyl ester	Ethyl acrylate
2-Propenoic acid, 2-ethylhexyl ester	2-Ethylhexyl acrylate
2-Propenoic acid, methyl ester	Methyl acrylate, inhibited
2-Propenoic acid, 2-methyl-, ethyl ester	Ethyl methacrylate
2-Propenoic acid, 2-methyl-, methyl ester	Methyl methacrylate
Propenol	Allyl alcohol
1-Propenol-3	Allyl alcohol
Propenyl alcohol	Allyl alcohol
2-Propenyl alcohol	Allyl alcohol
2-Propenyl amine	Allylamine
Propional	Propionaldehyde
Propionic aldehyde	Propionaldehyde
n-Propyl acetate	Propyl acetate
1-Propyl acetate	Propyl acetate
2-Propyl acetate	Isopropylacetate

CHEMICAL	GUIDE
sec-Propyl alcohol	Isopropanol
Propyl aldehyde	Propionaldehyde
n-Propyl-carbinol	Butyl alcohol
n-Propylcarbinyl	Chlorobutanes
n-Propyl-1-propanamine	Di-n-propylamine
Propylene aldehyde	Crotonaldehyde
Propylene glycol 1-methyl ether	1-Methoy-2-propanol
Propylene glycol methyl ether	1-Methoy-2-propanol
Propylene glycol monomethyl ether (PGME)	1-Methoy-2-propanol
1,2-Propyleneimine	Propyleneimine
1,2-Propylene oxide	Propylene oxide
Propylene trimer	Tripropylene
2-Propyl ethanoate	Isopropyl acetate
Propylic aldehyde	Propionaldehyde
Prozion	Propionic acid
Prussic acid	Hydrocyanic acid
Pseudoacetic acid	Propionic acid
Purssite	Cyanogen
Pyroacetic ether	Acetone
Pyrobenzol	Benzene
Pyrobenzole	Benzene
Pyrofax	Petroleum gas, liquefied
Pyroligneous spirit	Methanol
Pyrosulphuric acid	Oleum
Pyroxylic spirit	Methanol
Pyrrolylene	Butadiene
Quinol	Hydroquinone
R-12	Dichlorodifluoromethane
R-20	Chloroform
R-22	Chlorodifluoromethane
R-40	Methyl chloride
R1113	Trifluorochloroethylene, inhibited
Range oil	Kerosene
Refrigerant-12	Dichlorodifluoromethane
Refrigerant gas 143a	1.1.1-Trifluoroethane
Renal md	2.4-Toluylenediamine
Rock oil	Petroleum crude oil
Rotex	Methyl bromide
Rubbing alcohol	Isopropanol
Saltpeter	Potassium nitrate
Sand acid	Hydrofluorosilicic acid
SBA	Butyl alcohol
Sconatex	Vinylidene chloride
Selane	Hydrogen selenide
Selenium anhydride	Hydrogen selenide
Selenium dihydride	Hydrogen selenide
Selenium hydride	Hydrogen selenide
Sewer gas	Hydrogen sulfide
Sextone	Cyclohexanone
Silicic acid, tetramethyl ester	Methyl orthosilicate
Silicofluoric acid	Hydrofluorosilicic acid
Silicon chloride	Silicon tetrachloride
Skelly solve	Pentane
Soda chlorate	Sodium chlorate
Soda, lye	Sodium hydroxide
Soda niter	Sodium nitrate
Soda saltpeter	Sodium nitrate
Sodium aluminum dioxide	Sodium aluminate
Sodium aluminum oxide	Sodium aluminate

CHEMICAL	GUIDE
Sodium bisulfide	Sodium hydrosulfide
Sodium cyanide, cyanobrik	Sodium cyanide, solid
Sodium cyanide, solution	Sodium cyanide, solid
Sodium dithionite	Sodium hydrosulfite
Sodium hydrate	Sodium hydroxide
Sodium hydrogen sulfide	Sodium hydrosulfide
Sodium hydrosulphide	Sodium hydrosulfide
Sodium mercaptan	Sodium hydrosulfide
Sodium mercaptide	Sodium hydrosulfide
Sodium metaaluminate	Sodium aluminate
Sodium Methyldithiocarbamate	Metam sodium
Sodium sulfoxylate	Sodium hydrosulfite
Sodium sulhydrate	Sodium hydrosulfite
Solvent ether	Diethyl ether
Solvent naphtha	Coal tar distillates
Spirit of hartshorn	Ammonia, anhydrous
Spirit of salts	Hydrochloric acid
Styrol	Styrene monomer, stabilized
Styrole	Styrene monomer, stabilized
Styrolene	Styrene monomer, stabilized
Styron	Styrene monomer, stabilized
Styropol	Styrene monomer, stabilized
Sulfonic acid, monochloride	Chlorosulfonic acid
Sulfuretted hydrogen	Hydrogen sulfide
Sulfur hydride	Hydrogen sulfide
Sulfur oxychloride	Thionyl chloride
Sulfur monochloride	Sulfur chloride
Sulfur oxide	Sulfur dioxide
Sulfur subchloride	Sulfur chloride
Sulfuric acid, dimethyl ester	Dimethyl sulfate
Sulfuric anhydride	Sulfur trioxide, inhibited
Sulfuric chlorohydrin	Chlorosulfonic acid
Sulfuric dimethyl ester acid	Dimethyl sulfate
Sulfuric ether	Diethyl ether
Sulfurous acid anhydride	Sulfur dioxide
Sulfurous anhydride	Sulfur dioxide
Sulfurous oxide	Sulfur dioxide
Sulfurous oxychloride	Thionyl chloride
Sulfurous chloride	Thionyl chloride
Sulphocarbonic anhydride	Carbon disulfide
Sulphur chloride	Sulfur chloride
Sulphur dioxide	Sulfur dioxide
Sulphur monochloride	Sulfur chloride
Sulphuric acid	Sulfuric acid
Sulphuric acid, fuming	Oleum
Sulphuric acid, spent	Sulfuric acid, spent
Superoxol	Hydrogen peroxide
sym-Dibromoethane	Ethylene dibromide
Tannic chloride	Titanium tetrachloride
Tar	Asphalt
Tar camphor	Naphthalene
Tar oil	Coal tar distillates
TCB	Trichlorobenzenes, liquid
TCE	Trichloroethylene

CHEMICAL	GUIDE
1,1,1-TCE	Trichloroethylene
TDI	Toluene diisocyanate
Tecquinol	Hydroquinone
Tetrachlorocarbon	Carbon tetrachloride
Tetrachloromethane	Carbon tetrachloride
Tetrachlorosilane	Silicon tetrachloride
Tetraethyl lead	Motor fuel antiknock compound
Tetrafinol	Carbon tetrachloride
Tetraform	Carbon tetrachloride
Tetrafluoroethane	1,1,1,2-Tetrafluoroethane
Tetral g	2,4-Toluylenediamine
Tetramethoxysilane	Methyl orthosilicate
Tetramethyl lead	Motor fuel antiknock compound
Tetramethyl orthosilicate	Methyl orthosilicate
Tetramethyl silicate	Methyl orthosilicate
Tetramethylene cyanide	Adiponitrile
Tetramethylene dicyanide	Adiponitrile
Tetramethylene oxide	Tetrahydrofuran
Tetramethyloxsilane	Methyl orthosilicate
Tetrapropylene	Propylene tetramer
Tetrasol	Carbon tetrachloride
Tetrole	Furan
THF	Tetrahydrofuran
Thia-4-pentanal	4-Thiapentanal
Thioethanol	Ethyl mercaptan
Thioethyl alcohol	Ethyl mercaptan
Thiomethyl alcohol	Methyl mercaptan
Thiophosphoric anhydride	Phosphorus pentasulfide
Titanic chloride	Titanium tetrachloride
Titanic (IV) chloride	Titanium tetrachloride
Titanium chloride	Titanium tetrachloride
TMA	Trimethylamine
Toluene-2,4-diamine	2,4-Toluylenediamine
Toluenediamine	2,4-Toluylenediamine
2,4-Toluene diisocyanate	Toluene diisocyanate
Toluene-2,4-diisocyanate	Toluene diisocyanate
Toluene isocyanate	Toluene diisocyanate
Toluol	Toluene
Tolu-sol	Toluene
Tolyiene-2,4-diisocyanate	Toluene diisocyanate
Tolyene diisocyanate	Toluene diisocyanate
Tolyene isocyanate	Toluene diisocyanate
Toxilic anhydride	Maleic anhydride
TPA	Terephthalic acid
trans-Acrolein	Acrolein
1,2,3-Trichlorobenzene	Trichlorobenzenes, liquid
1,2,4-Trichlorobenzene	Trichlorobenzenes, liquid
unsym-Trichlorobenzene	Trichlorobenzenes, liquid
1,2,4-Trichlorobenzol	Trichlorobenzenes, liquid
Trichloroborane	Boron trichloride
Trichloroethene	Trichloroethylene
1,1,2-Trichloroethylene	Trichloroethylene
1,2,2-Trichloroethylene	Trichloroethylene
Trichloroform	Chloroform
Trichloromethane	Chloroform
Trichloromethylmethane	1,1,1-Trichloroethane
Trichloromethylsilane	Methyldichlorosilane
Trichloromethylsilicon	Methyldichlorosilane
Trichloronitromethane	Chloropicrin

CHEMICAL	GUIDE
Trichlorophosphorus oxide	Phosphorus oxychloride
Trichlorophosphine oxide	Phosphorus oxychloride
Tri-chlor	Chloropicrin
Tricresol	Cresol
Trifluorovinyl chloride	Trifluorochloroethylene, inhibited
Trimethylcarbinol	Butyl alcohol
Trimethylmethane	Isobutane
2,4,4-Trimethylpentane	Diisobutylene
2,4,4-Trimethylpentane-2	Diisobutylene
2,4,4-Trimethyl-1-pentene	Diisobutylene
Triosulfurous dichloride	Sulfur chloride
Trioxychlorofluoride	Perchloryl fluoride
T-stuff	Hydrogen peroxide
UF_6	Uranium hexafluoride
Uranium fluoride	Uranium hexafluoride
Uranium (VI) fluoride	Uranium hexafluoride
Valine aldehyde	Isobutyraldehyde
VAM	Vinyl acetate
Vatrolite dithionous, disodium salt	Sodium hydrosulfite
VC	Vinyl chloride
VCL	Vinyl chloride
VCM	Vinyl chloride
Ventox	Acrylonitrile, stabilized
Vinegar acid	Acetic acid
Vinyl acetate monomer	Vinyl acetate
Vinyl amide	Acrylamide
Vinylamine	Ethyleneimine
Vinylbenzene	Styrene monomer, stabilized
Vinylbenzol	Styrene monomer, stabilized
Vinyl carbinol	Allyl alcohol
Vinyl C monomer	Vinyl chloride
Vinyl cyanide	Acrylonitrile, stabilized
Vinyl formic acid	Acrylonitrile, stabilized
Violet 3	Xylene
Vyac	Vinyl acetate
White phosphoric acid	Phosphoric acid
White tar	Naphthalene
Wood alcohol	Methanol
Wood ether	Dimethyl ether
Wood naphtha	Methanol
Wood spirit	Methanol
m-Xylene	Xylene
meta-Xylene	Xylene
o-Xylene	Xylene
ortho-Xylene	Xylene
p-Xylene	Xylene
para-Xylene	Xylene
Xylol	Xylene
Zeset T	Vinyl acetate
Zoba gke	2,4-Toluylenediamine
Zoba developer h	2,4-Toluylenediamine

THIS PAGE INTENTIONALLY LEFT BLANK

APPENDIX G
UN CROSS REFERENCE
(All numbers have the prefix UN unless otherwise indicated)

ID NO	GUIDE
1005	Anhydrous ammonia
1006	Argon
1010	Butadiene
1011	Butane
1012	Butylene
1013	Carbon dioxide
1016	Carbon monoxide
1017	Chlorine
1018	Chlorodifluoromethane
1026	Cyanogen, liquefied
1028	Dichlorodifluoromethane
1032	Dimethylamine, anhydrous
1033	Ethylene amine
1037	Ethyl chloride
1038	Ethylene
1040	Ethylene oxide
1046	Helium, compressed
1048	Hydrogen bromide, anhydrous
1049	Hydrogen, compressed
1050	Hydrogen chloride, anhydrous
1051	Hydrocyanic acid
1052	Hydrogen fluoride, anhydrous
1053	Hydrogen sulfide, liquefied
1055	Isobutylene
1061	Methylamine, anhydrous
1062	Methyl bromide
1063	Methyl chloride
1064	Methyl mercaptan
1066	Nitrogen, compressed
1067	Nitrogen tetroxide/Dinitrogen tetroxide, liquefied
1070	Nitrous oxide, compressed
1072	Oxygen, compressed
1073	Oxygen, refrigerated liquid
1075	Liquefied petroleum gas
1076	Phosgene
1077	Propylene
1079	Sulfur dioxide, liquefied
1083	Trimethylamine, anhydrous
1085	Vinyl bromide, inhibited
1086	Vinyl chloride
1089	Acetaldehyde
1090	Acetone
1092	Acrolein, inhibited
1093	Acrylonitrile, inhibited
1098	Allyl alcohol
1100	Allyl chloride
1114	Benzene
1120	Butyl alcohol
1123	Butyl acetate
1125	Butylamine
1127	Chlorobutanes
1129	Butyraldehyde
1131	Carbon disulfide/Carbon bisulfide

4915407	Ethylene glycol monobutyl ether
4916141	Phosphorus, white or yellow
4916179	Sodium dithionite or sodium hydrosulfite
4916180	Sodium hydrosulfide
4916320	Phosphorus pentasulfide
4916365	Methyldichlorosilane
4916408	Calcium carbide
4916456	Sodium (metal)
4918310	Ammonium nitrate fertilizer
4918311	Ammonium nitrate
4918335	Hydrogen peroxide, stabilized
4918506	Ammonium nitrate
4918510	Chromium trioxide, anhydrous or chromic acid, anhydrous
4918511	Chromic acid, solid
4918689	Hydrogen peroxide aqueous solution
4918697	Ammonium nitrate fertilizer, n.o.s.
4918698	Ammonium nitrate fertilizer, n.o.s.
4918705	Ammonium nitrate mixed fertilizer
4918715	Calcium hypochlorite, dry
4918723	Sodium chlorate
4918737	Potassium nitrate
4918746	Sodium nitrate
4918774	Ammonium nitrate, liquid
4918775	Hydrogen peroxide, aqueous solution
4918784	Ammonium nitrate fertilizer
4918795	Calcium hypochlorite, hydrated
4918802	Ammonium nitrate fertilizer
4918803	Ammonium nitrate fertilizer
4918806	Calcium hypochlorite mixtures, dry
4920107	Diborane
4920122	Hydrogen selenide, anhydrous
4920160	Phosphine
4920178	Cyanogen chloride, inhibited
4920184	Phosgene
4920349	Boron trichloride
4920353	Ethylene oxide
4920355	Methyl mercaptan
4920349	Boron trichloride
4920359	Ammonia, anhydrous
4920395	Cyanogen
4920399	Carbon monoxide, compressed
4920502	Ammonia, anhydrous
4920511	Carbon monoxide, refrigerated liquid
4920503	Hydrogen chloride, compressed
4920504	Hydrogen chloride, refrigerated liquid
4920508	Sulfur dioxide
4920513	Hydrogen sulfide
4920518	Methyl bromide
4920523	Chlorine
4921004	Allylamine
4921005	Epichlorohydrin
4921019	Allyl alcohol
4921020	Ethyl chloroformate
4921028	Hydrocyanic acid, aqueous solution
4921030	Motor fuel antiknock compound
4921032	Motor fuel antiknock compound
4921045	Motor fuel antiknock compound
4921062	Chloroacetic acid, molten
4921210	Phenol solutions or carbolic acid
4921248	Crotonaldehyde, stabilized
4921221	Carbolic acid or phenol
4921224	Dinitrotoluenes
4921252	Isopropyl chloroformate
4921401	Acetone cyanohydrin, stabilized
4921405	Dimethyl sulfate
4921410	Aniline or anilin oil
4921414	Chloropicrin
4921416	Chloropicrin mixtures, n.o.s.
4921417	Hydrocyanic acid, aqueous solution
4921445	Motor fuel antiknock mixtures or compounds
4921455	Nitrobenzene
4921459	Chloronitrobenzene or nitrochlorobenzene
4921466	Nitroanilines
4921467	Nitroanilines
4921492	Aniline or anilin oil
4921497	Ethylene dibromide
4921575	Toluene diisocyanate
4921598	Carbolic acid or phenol
4921603	Chloronitrobenzene or nitrochlorobenzene
4921638	Chloronitrobenzene or nitrochlorobenzene
4921640	Nitroanilines
4921706	Cresol
4921718	Dinitrotoluenes
4921722	Hexachlorocyclopentadiene
4921727	Bromoacetone
4921738	Dinitrotoluenes
4921767	Chloroform
4921769	Chloroform
4921830	Carbon tetrachloride
4921831	Carbon tetrachloride
4923106	Arsenic acid, liquid
4923114	Chloroacetic acid, solution
4923115	Arsenic trioxide
4923116	Chloroacetic acid, solid
4923209	Arsenic trichloride
4923227	Sodium cyanide, solid
4923228	Sodium cyanide, solid
4925021	Phenol solutions or carbolic acid

HAZMAT CODE	GUIDE
4925121	Trichlorobenzenes, liquid

APPENDIX I
LIST OF REPORTABLE QUANTITIES FOR EAG CHEMICALS

GUIDE	REPORTABLE QUANTITY
Acetaldehyde	1000/454
Acetic acid	5000/2270
Acetic anhydride	5000/2270
Acetone	5000/2270
Acetone cyanohydrin	10/4.54
Acrolein	1/0.454
Acrylamide	5000/2270
Acrylic Acid	5000/2270
Acrylonitrile	100/45.4
Adipic acid	5000/2270
Adiponitrile	—
Alcohol ethoxylates	—
Allyl alcohol	100/45.4
Allylamine	—
Allyl bromide	—
Allyl chloride	1000/454
Aluminum chloride, solution	—
Aluminum sulfate	5000/2270
Ammonia, anhydrous	100/45.4
Ammonium hydroxide	1000/454
Ammonium nitrate	—
Ammonium sulfate	—
Ammonium sulfide solution	100/45.4
Aniline oil	5000/2270
Argon	—
Arsenic acid, liquid	1/0.454
Arsenic trichloride	1/0.454
Arsenic trioxide	1/0.454
Asphalt	—
Benzene	10/4.54
Benzoyl peroxide	—
Boron trichloride	—
Bromine	—
Bromoacetone	1000/454
Butadiene	10/4.54
Butane	—
Butyl acetate	5000/2270
Butyl acrylate	—
Butyl alcohol	5000/2270
Butylamine	1000/454
Butylene	—
1,4-Butynediol	—
Butyraldehyde	—
Calcium carbide	10/4.54
Calcium hypochlorite	10/4.54
Caprolactam	—
Carbolic acid or phenol	1000/454
Carbon disulfide	100/45.4
Carbon dioxide	—
Carbon monoxide	—
Carbon tetrachloride	10/4.54
Chlorine	10/4.54
Chloroacetic acid, solid	100/45.4
Chloroacetic acid, solution	100/45.4
Chlorobenzene	100/45.4
Chlorobutanes	—
Chlorodifluoromethane	—
Chloroform	10/4.54
Chloropicrin	—
Chloroprene	100/45.4
Chlorosulfonic acid	1000/454
Chromic acid solution	10/4.54
Chromium trioxide, anhydrous	—
Coal tar distillates	—
Cresol	100/45.4
Crotonaldehyde, stabilized	100/45.4
Cyanogen	100/45.4
Cyanogen chloride	10/4.54
Cyclohexane	1000/454
Cyclohexanone	5000/2270
Cyclopentane	—
Denatured alcohol	—
Diborane	—
Di-n-butylamine	—
o-Dichlorobenzene	100/45.4
Dichlorodifluoromethane	5000/2270
Dichloromethane	1000/454
Dichloropropene	100/45.4
Dichlorosilane	—
Dicylopentadiene	—
Diethanolamine	100/45.4
Diethylamine	1000/454
Diethyl ether	100/45.4
1,1-Difluoroethane	—
Diisobutylene	—
Diisopropylamine	—
Diisopropyl ether	—
Dimethylamine, anhydrous	1000/454
2-Dimethylaminoethanol	—
Dimethyldichlorosilane	—
Dimethyl ether	—

GUIDE	REPORTABLE QUANTITY
N,N-Dimethylformamide	100/45.4
Dimethyl sulfate	100/45.4
Dinitrotoluenes	10/4.54
Di-n-propylamine	5000/2270
Dodecylbenzenesulfonic acid	1000/454
Epichlorohydrin	100/45.4
Ethanolamine	—
Ethyl acetate	5000/2270
Ethyl acrylate	1000/454
Ethyl alcohol	—
Ethylamine	—
Ethyl benzene	1000/454
Ethyl chloride	100/45.4
Ethyl chloroformate	—
Ethylene	—
Ethylenediamine	5000/2270
Ethylene dibromide	1/0.454
Ethylene dichloride	100/45.4
Ethylene glycol	5000/2270
Ethylene glycol monobutyl ether	—
Ethylene glycol monoethyl ether	1000/454
Ethylene glycol monoethyl ether acetate	—
Ethyleneimine, inhibited	1/0.454
Ethylene oxide	10/4.54
2-Ethylhexyl acrylate	—
Ethyl mercaptan	—
Ethyl methacrylate	1000/454
Ferric chloride, solution	1000/454
Ferrous chloride, solution	100/45.4
Fluorine, compressed	10/4.54
Formaldehyde solution	100/45.4
Formic acid	5000/2270
Fuel oil	—
Furan	100/45.4
Furfuryl alcohol	—
Gasoline	—
Helium	—
Heptane	—
Hexachlorocyclopentadiene	10/4.54
Hexafluoroacetone	—
Hexamethylene diamine solution	—
Hexane	5000/2270
1-Hexene	—
Hydrazine	1/0.454
Hydrochloric acid	5000/2270
Hydrocyanic acid	10/4.54
Hydrofluoric acid	100/45.4
Hydrofluorosilicic acid	—
Hydrogen	—
Hydrogen bromide	—
Hydrogen chloride	5000/2270
Hydrogen fluoride	100/45.4
Hydrogen peroxide	—
Hydrogen selenide	—
Hydrogen sulfide	100/45.4
Hydroquinone	100/45.4
Isobutane	—
Isobutyl acetate	—
Isobutylene	—
Isobutyraldehyde	—
Isooctyl alcohol	—
Isoprene	100/45.4
Isopropanol	—
Isopropenylbenzene	—
Isopropyl acetate	—
Isopropylamine	—
Isopropylbenzene	—
Isopropyl chloroformate	—
Kerosene	—
Liquefied natural gas	—
Liquefied petroleum gas	—
Maleic anhydride	5000/2270
Metam sodium	—
Methacrylic acid, inhibited	—
Methanol	5000/2270
1-Methoxy-2-propanol	—
Methyl acrylate, inhibited	—
Methylacrylic acid, inhibited	—
Methylamine, anhydrous	100/45.4
Methylamine, aqueous solution	100/45.4
Methyl bromide	1000/454
Methyl tert-butyl ether	1000/454
Methyl chloride	100/45.4
Methyl chloroformate	1000/454
Methylchloromethyl ether	1/0.454
Methyldichlorosilane	—
Methylene diphenyl diisocyanate	5000/2270
Methyl ethyl ketone	5000/2270
Methyl fluoride	—
Methyl formate	—
Methylhydrazine	10/4.54
Methyl isobutyl carbinol	—
Methyl isobutyl ketone	5000/2270
Methyl isocyanate	10/4.54
Methyl mercaptan	100/45.4
Methyl methacrylate	1000/454
Methyl orthosilicate	—
Methyltrichlorosilane	—
Motor fuel antiknock compound	—
Naphthalene	100/45.4
Nickel carbonyl	10/4.54
Nitrating acid	1000/454
Nitric acid, red fuming	1000/454
Nitric oxide	10/4.54
ortho-Nitroaniline	—
Nitrobenzene	1000/454
meta-Nitrochlorobenzene	—
ortho-Nitrochlorobenzene	—
para-Nitrochlorobenzene	—
Nitrogen	—

GUIDE	REPORTABLE QUANTITY
Nitrogen tetroxide	—
Nitrogen trioxide	—
Nitrous oxide	—
Octanol	—
1-Octene	—
Octyl aldehydes	—
Oleum	1000/454
Oxygen	—
Pentane	—
Perchloryl fluoride	—
Petroleum crude oil	—
Petroleum distillates, n.o.s.	—
Phenyl mercaptan	100/45.4
Phosgene	10/4.54
Phosphine	100/45.4
Phosphoric acid	5000/2270
Phosphorus oxychloride	1000/454
Phosphorus pentasulfide	100/45.4
Phosphorus trichloride	1000/454
Phosphorus, white or yellow	1/0.454
Phthalic anhydride	5000/2270
Pine oil	—
Potassium hydroxide	1000/454
Potassium nitrate	—
n-Propanol	—
Propionaldehyde	1000/454
Propionic acid	5000/2270
Propyl acetate	—
Propylamine	5000/2270
Propylene	—
Propylene dichloride	1000/454
Propylene tetramer	—
Propyleneimine	1/0.454
Propylene oxide	100/45.4
Pyridine	1000/454
Resin solution	—
Silicon tetrachloride	—
Sodium aluminate	—
Sodium carbonate	—
Sodium chlorate	—
Sodium cyanide, solid	10/4.54
Sodium hydrosulfide	5000/2270
Sodium hydrosulfite	—
Sodium hydroxide	1000/454
Sodium (metal)	10/4.54
Sodium nitrate	—
Styrene monomer, stabilized	1000/454
Sulfur or molten sulfur	—
Sulfur chloride	1000/454
Sulfur dioxide	—
Sulfur trioxide, inhibited	—
Sulfuric acid	1000/454
Sulfuric acid, spent	1000/454
Terephthalic acid	—
Tetrachloroethylene	100/45.4
1,1,1,2-Tetrafluoroethane	—
Tetrahydrofuran	1000/454
4-Thiapentanal	—
Thionyl chloride	—
Thorium ore	—
Titanium dioxide	—
Titanium tetrachloride	1000/454
Toluene	1000/454
Toluene diisocyanate	100/45.4
2,4-Toluylenediamine	10/4.54
Trichlorobenzenes, liquid	100/45.4
1,1,1-Trichloroethane	1000/454
Trichloroethylene	100/45.4
Trifluorochloroethylene, inhibited	—
1,1,1-Trifluoroethane	—
Trimethylamine	100/45.4
Tripropylene	—
Uranium hexafluoride	—
Urea	—
Vinyl acetate	5000/2270
Vinyl bromide	100/45.4
Vinyl chloride	1/0.454
Vinylidene chloride	100/45.4
Xylene	100/45.4
